When the ancient civilization seemed to die out, and the barbarous though fresh and vigorous sons of the North came into possession of Southern Europe, Christianity, which had already been warped in applying it to the condition of the ignorant pagan masses, suffered still further retrogradation. Religion, as it were, had to begin over again. Like the beautiful Scylla in the myth, she was changed to a brood of serpents,—a huge malformation of Hebrew and Greco-Roman polytheism, savage theology, and ritual mummery. The ethical element was pushed far into the background,—indeed, quite out of sight; and it has been the work of modern civilization, especially in these latter days, to reinstate it again. A not dissimilar line of march to that trod by the ancients seems traceable through the Christian centuries.

True, ethics is more than Bacon said, "the handmaid to religion." It is to religion—yea, to civilization—as the heart to the human body, or, better yet, as the soul is to man. It is the indestructible and eternal part. The rites, forms, and creeds are but as the clothes of man,—the temporary trappings which are swept out of use by the broad fans of the onward movements of the race. It is the theological dogmatic element, which divides men and encourages hypocrisy and self-stultification, which has been the upas in the history of the Church, so poisoning the atmosphere of the human mind that God himself was transformed into the devil.

Men, howsoever diverse in their intellectual opinions, are united by belief in the great moral principles. Difference in knowledge may cause difference of judgment as to what constitutes justice in a given case; but can we get back far enough in the perspective of the ages when man had no principle of justice? What is love? who is my neighbor? what is humanity, veracity, chastity? are questions receiving different answers in different times, localities, and individuals; but, in all times and localities and in all individuals, an obligation to exercise love, justice, humanity, veracity, chastity, is recognized. Mr. Buckle, in maintaining with vehement and almost irresistible eloquence that the moral principle of man is stationary and the intellectual alone progressive, states that nothing has undergone so little change as the great dogmas of which ethical systems are composed. What does this fact signify? What does it signify that all the religions of earth have relied for success with man upon the inculcation, more or less, of moral obligations? What signifies it that the Stoic and Epicurean philosophies of the ancients, or the intuitive and utilitarian of the moderns, starting from widely different postulates, converge at last in affirmation of the transcendent need of virtue? What religion or philosophy ever affirmed that man ought to exercise injustice, hate, unchastity, ingratitude? Is not herein blazed forth a more profound and luminous fact than seems provided for in Mr. Buckle's philosophy?

The first principles of human duty, so aged

we cannot find their natal day, are, of a truth, stationary and unchangeable, because they are absolutely true, they are universal and eternal attributes of the soul. Therefore it is, as the above writer declares, that the great moral systems have been fundamentally the same; while the great intellectual systems have been fundamentally different. Therefore it is, too, that, however much theology may change, however much rites and ceremonies—the formal and accidental part of religion—may change, the religious sentiment abides forever in man, to construct new temples of worship. This it is which lies behind and constitutes largely the motive power to the operation of the intellectual principle which, Mr. Buckle proclaims, has effected such vast and permanent results. Not merely transcendentalists, as Plato, Swedenborg, and Emerson, but scientists, like Van Helmont, Pascal, and Newton, have believed “piety an essential condition of science.”

It is this incarnation of God in man which is the unseen force of his evolution, making him a progress working forever upward from the valley of sense to the Alpine region of spirit. Knowledge is the agency of this divinity within, which instructs man in the performance of duty by enlarging his apprehension of love, justice, truth, purity. These are the bread of life upon which have fed the great souls who have exercised most enduring influence on the ages. Is it not the utterances of the seers who have dwelt most in the presence of these universal verities which are a perennial inspiration to man, moulding his thought and directing his action? The vast movements in behalf of civil and religious liberty,—how have they been set on foot? What has been the fountain of the stream which turned the wheels? What has fired the poet, the prophet, the seer, the reformer, to protestation against grievous error and oppression but the moral sentiment illuminating and energizing the soul with lofty conceptions of justice and brotherly love, of duty to man and to God? A wise American does well to say that “the civil history of men might be traced by the successive meliorations, as marked in higher moral generalizations,—virtue meaning physical courage, then chastity and temperance, then justice and love,—bargains of kings with peoples of certain rights to certain classes, then of rights to masses, then at last came the day when, as the historians rightly tell, the nerves of the world were electrified by the proclamation that all men are born free and equal.”

Let us learn in this money-getting age the lesson taught by Luther crying out: “God hurries and drives me. I am not master of myself. I wish to be quiet, and am hurried into the midst of tumults”; or that taught by barefoot and snub-nose Socrates, under the control of his demon, conspicuous and revered through ages; or, better still, learn it from that kindred spirit of Judea, who, without learning of books, without property, without the great facts of modern science, has become the prince of religious teachers and the central figure in the highest civilization yet realized by man. Socrates and Jesus, martyr heretics of their times,—is not the true secret of their imperishable glory and influence that they stood squarely, fearlessly, and trustfully on their moral intuitions?

The capital crime of the Christian Church for generations has been the divorcement of religion from ethics. “Men talk of ‘mere morality,’ which is much,” exclaims Mr. Emerson, “as if one should say, ‘Poor God, with nobody to help him.’” But morality, which has been used so long by the clergy as a term almost of reproach, is being pushed rapidly to the front by the rationalism of

the age. Herein lies the deep significance of the religious transition of these days. Recognizing religion as an individual, and not a conventional relation; as endogenous, not exogenous,—a loving attitude of mind toward God, and not subscription to the dogma of any man or council of men about man or God; recognizing self-consciousness of right and wrong as God in the human soul, to whom every knee shall bend, whom every tongue shall confess,—and we have found where realities centre. Under the royal guidance of this sovereign in religion,—this sovereign, indeed, of human progress, which is older than the Church, older than the State,—men of the most diverse opinions about the unknowable can come together to worship in the beauty of holiness, truth, and liberty.

Go to nature, said Job to his reprovers, and she shall teach thee,—teach that it is a fundamental law of normal growth that her forces shall operate in freedom. It is a condition of perfect crystallization, remarks Mr. Tyndall, “that every molecule be permitted, without disturbance from its neighbors, to exercise its own rights.” The stars contribute to give increased splendor and light in the firmament, but each shines in its own sovereign individuality; each swings in its own orbit, despite the deflecting influences of other stars. Is it not even thus with man in his religious growth? It is only normal, harmonious, and self-sustaining, when he is permitted to exercise the divine right of private judgment. Only in the maintenance of this shall he give to organization, under the name of church or whatsoever name, the vital energy of sincerity and truth and faith.

Mr. Lecky, discerning clearly the religious trend of man, declares idolatrous worship, church feeling, and moral culture to be the central ideas of three stages of religious progress. Are we not entering upon the latter stage, when religion, as with the cultivated class of Greek and Roman civilization, comes to be synonymous with a philosophy of life, the end being to moralize character and conduct? In this last stage, the relation of the clergy to the people assumes a new form. Divested of sacerdotal authority, they must come to contemplate themselves as ethical teachers, relying for influence and drawing force on superiority in intellect, character, and spiritual discernment. Their mission is to foster the ought sentiment in man; to be what Matthew Arnold so justly denominated Mr. Emerson, “the friend and aider of those who wish to live in the spirit.”

The conscience of men is more divine than the theology which, as Coleridge puts it, they only believe that they believe; and the clergymen of to-day who cast behind them this dead thing, as the youth casts aside the garment he has outgrown or as the tree sheds its decayed leaves, and stand squarely and confidently on the moral sentiment, the religious sentiment, are a tower of strength; for they have a basis to rest worship upon, “not made with hands,” eternal as the heavens, because rooted in the heart of man, a basis of unity for religious association of unmeasured and unmeasurable power.

When Christianity shall be exfoliated of the unchristian accretions which were formed in barbarous social conditions, and which have concealed, quite smothered, the life-giving spiritualism of that divine hero of Gethsemane; when it shall have shed theological dogmatism,—then shall we behold the Church of the living God of which Mr. Emerson had vision: “There shall be a new church founded on moral science, at first cold and naked, a babe in a manger again, the algebra and mathematics of ethical law, the church of men to come; . . . but it will have heaven and earth for its beams and rafters, science for symbol and illus-

tration; it will fast enough gather beauty, music, picture, poetry.” The faith that shall be authoritative in this new church is faith in the victory of spirit over matter, of right over wrong; faith in the behest of duty, in the sovereignty of the moral law. The only creed required shall be as simple as this, borrowing from Goethe’s *Faust*, with a little changing: I believe in

The all-enfolding
The all-beholding,
Who folds and upholds
Man, Nature, Himself.

GEORGE W. BUCKLEY.

GEORGE SAND’S LATER YEARS.

During the first years of George Sand’s literary career, the sense of strength of an inward mysterious power impelled her this way and that; and, in itself, the highest good had driven her toward the knowledge to be found only in restless searching. So far, her force had been expended for the amusement of mankind in the vivid images her mind had translated from the varied sights that appealed to her imagination; but, from a want of completer self-knowledge, the highest good of genius—the sense of security in peace—was withheld from her for many years, until the outward world became mirrored from within. Then the greatness of her soul shone upward, irradiating the whole world anew, explaining mysteries before disturbing, and making harmonious her great and noble life. An error frequently to be met with among the learned is a tendency toward an idolatry of the intelligence. Often, in fact, the thought of all besides the intelligence is kept studiously in the background by those who might otherwise be strong and great. While this was not the case with George Sand, as she yielded to the varied demands of her varied nature, finding courage and strength in all that appealed to her marvellously acute sense (for she was a lover of music and art), she yet, during her earlier life, sacrificed her peace to that artist quality within which made her always eager to give to others from her ample supply, so that she allowed the vessel of her intelligence to tip and overflow before it was filled to the brim. Her goodness tended, during her earlier years, toward the portraying of certain ideals to which she constitutionally, though unconsciously, was unequal. She had left the convent too early, perhaps, to have learned the words of St. Teresa:—

“Let nothing disturb thee,
Nothing affright thee:
All things are passing;
God never changeth;
Patient endurance
Attaineth to all things;
Who God possesseth
In nothing is wanting.
Alone God sufficeth.”

But, in her six hundred and sixty-seventh letter to Mme. Lamber, she began with these words: “You wish to become calm. If that were a possible thing, I should say to you, Be quick about it for the sake of your health, your rest and sleep, and your happiness in consequence; for continual suffering can only be combated by amusement, and in this way the well-being of the soul may not be attained to. But can one reach this point even in greatly desiring it? I know that for myself I longed for it; but is it not old age which has accomplished the miracle?” It is unfortunate that the decline of life alone had brought her peace; that, together with the vigor and gladness of youth, the more necessary condition of the soul might not have been possible. Happiness, she then had thought, was the aim of human destiny; and she had illustrated this need in her own personality. George Eliot’s mind worked out the

"Choir Invisible," which her moral nature had conceived; while George Sand's masterpiece of moral enthusiasm was the *Consuelo*, in which every character seems a reality beyond question, not excepting the *bizarre* Albert, who, by his suffering and final emancipation, stands as a type of the philosophy which suffers until it can apply itself to the world's needs.

There may be many Alberts in the world; and let us hope there may be many a *Consuelo*, many a divine priestess of art, who, in her union with philosophy, makes the completed character which love can blend. One of her shorter works—a pastoral story, which would please when one is in the mood to be pleased by a somewhat melancholy landscape—shows us repeatedly her philosophy of calm: "The most happy of men would be he who, possessing skill in his labor and working with his hands, deriving his well-being and liberty from the exercise of his intellectual force, still would have the leisure to live by his affections and his brain, to understand his work and to love the work of God. The artist has joys of this kind in the contemplation and reproduction of the beauties of nature; but, often seeing the torments of the men who people this paradise of the earth, the artist with a just and humane heart is troubled in the midst of his joy. Happiness is there where the mind, the heart, and the arm, working in concert under the influence of Providence, make a holy harmony in the midst of the munificence of God and the bliss of the human soul." This is in *La Mare au Diable*.

We congratulate ourselves, when we read the history of the ancients and of the castes which then existed, that such distinctions are gradually vanishing from our part of the world; but do we, practically, do anything to lessen the differences which yet remain? By practically is meant personally; for, certainly, small armies are at work relieving the oppressed and raising the ignorant.

Gradually and persistently, Mme. Dudevant placed herself in contact with inferior classes of people, exhorting them to what seemed to her the truest patriotic views, and giving workingmen new aspirations for themselves and their families. It must have been an extraordinary sight,—this self forgetful woman, standing in a *café* in one of the streets of Paris, admonishing all such as would stand to hear her.

Has she been properly appreciated yet? Certainly, only by a few. Not one Frenchman in fifty understands or values the work of her later years, or realizes that living and acting in their midst has been the frail form of a woman with Titan intellect, who reached the foremost ranks of the world's great ones.

C. A. OLCOTT.

EDITORIAL NOTES.

BY B. F. U.

THE first number of the *Unitarian*, a monthly magazine edited by Revs. Brooke Herford and J. T. Sunderland, and published in Chicago and Boston, has appeared this month. Its aim, say the editors, is to foster a broad Christianity.

A COMPLETE account, by Gen. John Newton, of the operations for the removal of the obstructions at Hell Gate, from their beginning to the explosion of Flood Rock in October last, will appear, with illustrations, as the leading article in the *Popular Science Monthly* for February.

THE fifteenth annual meeting of the Massachusetts Woman Suffrage Association will be held in this city, Meionaeon Hall, next week, beginning on

Tuesday evening, the 26th inst., at 7.30 P.M., and continuing on Wednesday at 10.30 A.M. and 2.30 and 7.30 P.M. A sociable will be held on Thursday evening, with a supper, short speeches, and music.

THE *Philanthropist* is a new monthly paper, published in New York, and edited by Aaron M. Powell and Mrs. Anna Rice Powell, the object of which will be "the promotion of social purity, the better protection of the young, the suppression of vice, and the prevention of its regulation by the State. It will affirm the unity of the moral law for both sexes, and that the practice of impurity is as reprehensible in men as in women." The subscription price of the paper is 50 cents a year; three copies, \$1.25; five copies, \$2.00. All communications and remittances should be addressed to the *Philanthropist*, P.O. Box 2554, New York City.

In criticism of the *Transcript's* statement that the disfranchisement of the women of Utah "will powerfully aid in the suppression of polygamy," the *Woman's Journal* remarks as follows: "But just how it will aid, neither the *Transcript* nor anybody else can tell us. Since the male population of the Territory is so overwhelmingly Mormon, disfranchising the women evidently will not give the Gentiles a majority. The suppression of polygamy should be sought by all just and efficacious means; but the proposed measure is a glaring injustice, and has not even the poor excuse of expediency to recommend it."

In reply to a recent paragraph in *The Index*, the *Christian Register* has this to say in defence of the Unitarian press:—

We think our neighbor is mistaken in regard to the disinclination of the Unitarian press to heed the objections of radical thinkers like Prof. Adler against Unitarianism. But we are more interested in the positive side of that movement than in its critical or negative side. We have given space, from time to time, to show what both Mr. Salter and Mr. Adler were doing; and Dr. Adler has himself given an admirable exposition of his view in the *Unitarian Review*. On the Unitarian side, Mr. Chadwick's sermon ought to be read, and also the admirable and thorough article by Mr. Gannett, published in a *Unity* supplement, in which he considers the movement on its own merits and also in relation to Unitarianism.

SAYS the London *Inquirer*: "Almost the greatest service that can be rendered to Christianity in these days is to show that in its very heart and essence it can be retained without belief in miracles, which the scientific intellect regards not only as incredible, but as inconsistent with faith in the reign of divine order and unchangeable law." If we say that "Christianity, in its very heart and essence," is that which is fundamental in all the great religious systems, including the principles and precepts of morality, it is doubtless true that "it can be retained without belief in miracles." But why omit from Christianity all that makes it distinctive, and then apply to the universal element which remains the special name of one particular form of religion? Why select an individual from a group, disregard all that distinguishes it from other individuals, all that marks it as a species, all that has given it a distinct name, and then insist that this name be given to those general and fundamental characteristics which are possessed in common by all the members of the group?

DAKOTA has chosen as the motto on its seal the words, "Under God the people rule." One of the free-thinking opponents said, "They have God in the preamble, and God in the bill of rights, and now we must have God in the motto." The happy reply was, "Yes: you will find that you meet God everywhere, and you had better get ready for him."—*Presbyterian*.

Our esteemed contemporary seems to mistake the free thinker's objection to the witchcraft superstition which supposes there is a divine charm in a name, and to the crude, fetichistic notion that there is a divine efficacy in having "God" put into a preamble or into a motto, for fear or unwillingness to "meet God everywhere." It is not the universal Presence and Power, by whatever name called, that free thinkers wish to keep out of the Constitution, for it asserts itself everywhere; but theological names which have, with the mass of people, certain distinct connotations, and the insertion of which would virtually commit the government of the United States to a theological creed and thereby threaten religious freedom.

A WRITER in the *Westerly Call*, published at Westerly, R.I., replies to an article which appeared in that paper, in favor of taxing Church property, as follows:—

I answer that the existence of the churches is as necessary for the public welfare as the existence of the public schools. We might as well tax one as the other. Our safety as a nation depends upon the churches and schools. We could not get along without them. It seems to me that it is policy to encourage and foster them in all possible ways. One of the easiest ways is to exempt them from taxation. . . . If any man wants to get a proper return for the aid which he, by paying a little over tax, gives, let him go to church every Sunday, and take his pay in listening to the religious teachings he will there hear. It will not hurt him. There is little doubt in my mind that a law compelling church attendance on the part of all would be conducive to the public good. . . . The Church wishes to make this nation a Christian nation. Those who are not believers in our creed and faith are at liberty to depart for other quarters. . . . I hope the day is not to come soon when churches and church members will be thought to be entitled to no more rights than unbelievers. If it does, what profit will it be to belong to the Church, or even for the Church to exist? I say not tax the churches.

PRESIDENT ELIOT, of Harvard College, read an essay last week, in this city, before the Unitarian Club, in which he said that he believed religious teaching should be admitted as part of the regular public school course; that room should be provided for it at stated times in the school-room programme, and that it should be paid for from the public purse; that three varieties of religious teaching—Protestant, Roman Catholic, and Jewish—should be provided wherever these three religious bodies exist side by side; that the children should be assigned to one teacher or "another, according to the religious convictions of their parents; that the instruction should be given simultaneously, either in different rooms of the several school buildings or, if more convenient, in neighboring churches, or partly in one way and partly in the other; and that the subject-matter of the instruction should be determined by the religious teacher." This is the position of the President of Harvard College in this "year of grace," 1886. We are glad to see that Rev. James Freeman Clarke, in reply to the essay, took the ground that religion should not be brought into the public schools, outside of teaching the scholars the golden rules of honesty of heart and purpose, and such secular instruction as is needed to fit the pupil for the battle of life. He thought that, if there were sects dissatisfied with the way religion was taught in the public school, it would be safe to let the matter alone, and time would right such dissatisfaction as at present existed.

THE Boston *Transcript* has some very sensible comments on President Eliot's essay, referred to above: "The State and municipal governments," it says, "cannot in any way recognize religious denominations, nor provide for any classification of school apartments, teachers, or pupils, by secta-

rian instructions. The embarrassments, disputes, controversies, and annoying responsibilities that would be involved in any such attempted scheme would be endless, and would be sure to result in strife and disaster. It is a scandal and grievance to many persons—an evidence of something very wrong under our present enlightenment—that our houses of worship should be known by so many sectarian names. But it would be deplorable if the tablets on our school-houses bearing the names of our civic worthies should be removed, in order that sectarian designations might be substituted. The State must resolutely cling to its original, traditional, and noble fundamental of providing for the elementary education of all its children. It cannot assume the office of training them in denominational religion."

A LONDON journal publishes statistics which imply a beautiful compliment to the ministries of married women, and at the same time contain a warning to bachelors which they cannot afford to disregard. It seems that, of a given one hundred thousand bachelors between twenty and twenty-five years of age, twelve hundred die annually, whereas, of the same number of married men of the same ages, only about six hundred die annually. Between the ages of thirty and thirty-five, fifteen hundred bachelors die and but nine hundred married men to the hundred thousand. If these figures be correct, they contain an argument which can hardly fail to impress men who would lessen the chances of untimely death, even if the charms of woman have failed to allure them into matrimony. But it may be that the effects of marriage upon those who, but for the reason mentioned, would prefer to live a celibate life would not be as salutary as it is, according to the figures given, upon those whose natures crave the companionship and love of woman. Possibly, the average longevity of men who are inclined to marry is naturally greater on constitutional grounds than that of men who are unsusceptible to the tender passion, and are content to remain single.

THE ANCESTRY OF PERIKLES.

Rich Lydia was the foreworld's California,
With golden-gleaming streams and ore-veined hills;
And Croesus, Gyges, ass-eared Midas, were
The world's primeval millionnaires, the first
To history known. A Greek, Alkmaion named,
Befriended Croesus in some juncture grave;
And, to reward him, Lydia's monarch took
Him to his treasury, and bade him thence
Bear all the gold which on his person he
Could carry. Whereupon, with boots capacious,
And cloak, one pocket vast, the greedy Greek
His vesture stuffed with gold, his boot-legs, too;
Sprinkled his hair with gold-dust o'er; his mouth
Filled full, until, all human semblance lost,
He issued, stuffed, distended, overweighted
With precious metal, so that Croesus burst
In laughter loud at sight of his Greek guest,
Shapeless, effulgent with metallic sheen.
Thus, with the ore of Lydia enriched,
Alkmaion breeder of fleet steeds became,
And with his chariot won the prize at Elis,
As an Olympic victor thenceforth famed,
And 'mong the eupatrids his family
Was ranked. Megakles, a son of him,
By King of Sicyon chosen was to wed
His daughter, Agarista, o'er a crowd
Of wealthy, high-born suitors for her hand
Preferred, and from their union sprung at last
A grandchild, Agarista named, who dreamed
She brought a lion forth, and shortly bore
Great Perikles, Athenai's grandest son.

B. W. BALL.

The Index.

BOSTON, JANUARY 21, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, : : : : : } Editors.
BENJAMIN F. UNDERWOOD, : : : : : }

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

JOSEPH PRIESTLEY.

BY DAVID H. CLARK.

A Paper read before the Cambridge Sunday Club,
also before the Parker Memorial Science
Class, and on other occasions.

There is no one who has journeyed along the Susquehanna River who can have failed to be delightfully impressed with the ever-varying outline and exceedingly picturesque beauty of its scenery. Taking its rise in one of the small lakes which, like sparkling gems upon a royal robe, adorn the State of New York, it flows on upon its winding way, with a branch here and there, through Pennsylvania, until it finds, on the shore of Maryland, at last an outlet to the sea.

It was my fortune to pass a few years of my life beside this tranquil and beautiful river in a small and somewhat slow and antiquated town, though now becoming of more material importance through recent industrial progress, which is destined to lasting distinction from its association with one of the foremost intellectual champions and leaders of a hundred years ago. I refer to Joseph Priestley, in later life generally known as Dr. Priestley, of eminent renown in his day as a theologian, scientific discoverer, philosopher, and reformer.

Northumberland, the name alike of the town and the county, suggests its English settlers. It lies at the junction of the north and west branch of the river, about fifty miles from Harrisburg, upon a wide, far-stretching, slightly ascending slope, which gradually flattens out to a narrow level toward the shore. A steep and rugged, rocky bluff rises in an almost perpendicular ascent upon the opposite side to a height of two hundred feet or more. It was here, in what must have seemed very like the "forest primeval" then, that Priestley found, in his old age, a refuge from the persecutions which beset him in England, the land of his birth, where he had hitherto pursued

his long career of enlightened and manifold labors, and that release at last which awaits even the most troubled and storm-tossed life at its close. It was but natural that the circumstances which brought me in contact with surviving reminders of this remarkable man—remarkable, not alone for the angry and malignant opposition that he aroused, but also for the reverence and love he inspired—and a familiar and daily association with some of his lineal descendants, should have awakened a renewed interest in his biography and an enlarged appreciation of his character and the inspiration of his example, which gradually assumed the nature of a new revelation.

The life of Priestley, as has been intimated, was in a large degree a tempestuous one. It was not, as is sometimes the case of the gifted of mankind, borne along upon the unruffled wave of popular adulation and applause. During the greater portion of it, he was involved in more or less exciting controversies, often of extreme bitterness, which provoked not alone the clamor of ignorance and prejudice, but also the hatred of those who filled the high places of civil and ecclesiastical power. It was his lot, as it is ever that of the solitary thinker and reformer, to be compelled to find encouragement and support chiefly in the inward calm of a mind conscious of the disinterestedness and rectitude of its aims, in an unquenchable faith in the supreme excellence and ultimate victory of truth, however much it might be for a time impeded or overborne by the hostile forces of falsehood and error, unenlightened adherence to the traditions and teachings of the past, self-interest, and compromising timidity.

But his pursuits were not wholly of an aggressive and iconoclastic character. They included also those of the less obtrusive and aggressive nature, which, in the words of Milton, are described as "beholding the bright countenance of truth in the quiet air of delightful studies." It is a curious fact that it was in the latter sphere of his occasional or side occupations, which might almost be considered the by-play to those which chiefly absorbed his attention, that his most imperishable achievements were wrought and his most lasting fame was won. For vigorous, unremittent, and invincible a champion of truth as Priestley was in the domain of theology and politics, it is through his contributions to science that he is principally known and is destined to be the longest remembered.

The long night of superstition and ecclesiastical rule, which was at last broken by the Reformation and kindred precursors of modern enlightenment, set in operation correspondent liberating and quickening tendencies, which eventually pervaded all relations of life and departments of thought. They gave an irresistible impulse to that method of investigation and research of which Bacon in England and Descartes in France were the leading representatives. Buckle, in his *History of Civilization*, has sketched with a master's hand the rapid and important changes that succeeded the era thus initiated, the relaxing effect produced upon the oppressive and ruthless tyranny which had so long enthralled the human mind, and the spirit of independent inquiry and scepticism which followed in all directions. By the middle of the eighteenth century, this movement had acquired a powerful headway, and was more or less invading and affecting every class of ideas. It was particularly manifest by the sudden appearance of a brilliant constellation of conspicuous persons in literature, science, and speculative thought. It was the lot of Priestley to have been cast amid these quickening and liberating influences. There was in him a peculiar

susceptibility to them, an instinctive yearning toward the truth,—the freshest thought and freest spirit of his time. With an insatiable craving for knowledge and uncommon power for its acquisition, he possessed a fidelity to the dictates of conscience and his convictions, irrespective of the consequences which might follow, that in an earlier age would have subjected him to severer penalties even than he experienced. It is interesting to trace the course of a great man's life from its beginning.

In common with so many who are conspicuous in the annals of mankind, Joseph Priestley was of humble origin. He was born at a small village called Fieldhead, about six miles from Leeds, in Yorkshire, England, on the 13th of March, 1733. The house in which his eyes first beheld the light was standing a few years since. It is described as "a little house of three small rooms, built of stone, and slated with flags." The circumstances of the family were too humble to afford much prospect for the education of the children, three sons and five daughters. Both of the parents were ultra-Calvinists. And here one is reminded of what is frequently illustrated in such instances,—that it is from parents like these, those of the most positive mental traits, the most inflexible devotion to conscience and their convictions, that are transmitted those characteristics to their descendants which go to make them not unfrequently the most decided and persistent opponents of the faith of their fathers. It is thus that the spirit of the Puritan is repeated in the uncompromising heresies and protests of the more enlightened faith and high moral ideals of our later New England. The mother of Priestley appears to have exercised special pains in regard to his moral and religious training. As evidence of this, it is related that he could repeat, when four years of age, in full, the Assembly's Catechism. It is quite probable that the good woman supposed that there would be some counteracting or atoning virtue for his infant depravity in this precocious feat. But she sought no less earnestly to ground him in essential ideas of veracity and duty. The following example is cited to show with what precision she exercised this training. It is related that she made him once carry back to a neighbor's a pin which he had picked up while playing there. Perhaps it is safe to conclude that Hamlet's words, a "pin's fee," signified a greater value than in our day of improved mechanical processes. The principle, nevertheless, was the same.

This devoted and pious mother did not remain long with him. She died when he was but six years of age, which caused him to be transferred to the care of an aunt, who seems to have sought to replace by her kind and sympathetic interest in him the loss he had sustained. She is represented to have been a person of superior intelligence and character, in easy circumstances, and without children, "who knew no other use of wealth than to do good with it." Her sympathies inclined to the side of the dissenters, and her home became a favorite resort for this class of ministers. As a proof of her liberality, it is mentioned that her hospitality extended to the most heterodox clergymen,—a circumstance which, it has naturally been inferred, may have had some influence upon the future of her nephew. Of a sensitive and serious nature, and brought up in a home atmosphere in which religion was so largely predominant, the childhood of Priestley manifested abnormal activity in this direction. He was distinguished also by a remarkable intellectual precocity. Even in youth, he read Bunyan and the great standard religious writers. At twelve years of age, he was sent to an endowed school, conducted

by a clergyman, where he made rapid progress in Greek and Latin, and during holidays studied Hebrew under a dissenting minister.

Failing health led him for a time to abandon the purpose of becoming a clergyman and to contemplate a mercantile life. The offer of a situation in his uncle's countinghouse at Lisbon induced him to take up the study of French, Italian, and German, in which he made good progress without a teacher. The plans for the voyage were completed, when his health improved, and he returned to the work of preparing for his chosen profession. The cravings of his active and voracious mind were insatiable, and hence the circle of his studies was constantly enlarging. To those already pursued, he added, within the next few years, Chaldee, Syriac, and Arabic, mathematics, metaphysics, drawing, and shorthand writing. The self-asserting and independent character of his mind was shown even at the beginning of his professional studies, and was a cause of discomfort to himself and anxiety to his friends. He began to raise questions, even thus early, in regard to the theological doctrines in which he had been reared, to which he could find no satisfactory answer. These doubts concerning original sin and eternal punishment were regarded of sufficient consequence to debar him from the communion at the chapel where his aunt was accustomed to worship. This event caused him much grief for a time, it being considered due even more to the unsoundness and perversity of his spiritual condition than to the incapacity of his mental faculties for correct perceptions. But the occurrence was simply in keeping with the whole course of his life, which made him at the age of twenty, he declares, ready "to embrace what is generally called the heterodox side of every question." It was this disposition to prove all things, this unwillingness to rest in the conclusions of others any further than they had been verified to his understanding, that led him, step by step, from one stage of religious belief to another, until he had passed all the intervening ones between a stern and rigid Calvinism and the more rational Unitarianism of his day. It was proposed that he should enter the academy of Mile End. But to this he objected, because he should be obliged to relate his experience, to subscribe to ten printed Calvinistic articles, and repeat them every six months, with his implied assent to them, as the condition of pursuing in that institution his ministerial studies. This intractableness to theological discipline began to be a serious obstacle in respect to his professional prospects. At length, he entered, in his nineteenth, the academy of Daventry, which appears to have been conducted in a very liberal spirit. Here he remained three years, chiefly occupied in the study of theology. It need not surprise us, in view of his record of previous habits and attainments, that "he was excused all the studies of the first year, and a great part of those of the second." It was his custom, while at Daventry, to read every day ten pages of Greek, and every week a Greek play, with some of his fellow-students,—a practice which they kept up after leaving the academy, corresponding with each other on the subject of their studies. It may be mentioned here, as an indication of his tendency, even thus early, to devise comprehensive, intellectual plans, that he composed during his term at this school his first theological work, *The Institutes of Religion*, which was not published, however, until twenty years afterward. At the expiration of his stay at Daventry, he accepted the charge of a small Presbyterian congregation at Needham, on a salary of thirty pounds a year. The famous Dr. Doddridge was his predecessor, and seldom received more than thirty five

pounds per year. This was hardly up to Goldsmith's village preacher,—"passing rich with forty pounds a year."

The unsoundness of Priestley's views soon became apparent to his little Presbyterian flock at Needham, and trouble ensued. It is quite probable, as has been intimated, that his congregation regarded the eternity of hell torments as a peculiar privilege of which he was disposed rudely to deprive them. As a consequence of this, his hearers became much reduced in number. "Even the dissenting clergymen in the neighborhood considered it a degradation," we are told, "to associate with him, and durst not ask him to preach, not from any dislike to his opinions,—for several of them thought as freely as he did,—but because the genteeler part of their audience always absented themselves when he appeared in the pulpit. A good many years afterward, when his reputation was high, he preached in the same place; and multitudes flocked to hear the very same sermons which they had formerly listened to with contempt."

In his extremity, he endeavored to establish a school, and issued proposals to teach the classics and mathematics for half a guinea a quarter, and to board the pupils for ten guineas a year; but his unpopularity was so great that the enterprise was a failure. He next attempted a course of popular scientific lectures, and began with twelve on "The Use of the Globes," but was unable to get more than enough from the proceeds barely to pay for the globes.

After three years at Needham, Priestley removed to Nantwich, where he resided for three years, engaged in the double occupation of a preacher on Sunday and the teacher of a small school during the week. It is interesting to reflect, in view of the early predispositions exhibited by eminent persons, how different their careers might have been sometimes, if the circumstances among which they were reared had been different. It is not difficult to conceive that, with such a change in their moulding influences, the famous theologian might now and then have become scarcely less noted as a devotee of science. Jonathan Edwards is an example of this. It is related that he was distinguished in boyhood for his powers of observation, and wrote, when but twelve years of age, "of the wondrous way of the working of the spider," whose habits he had watched in the forest. Similar testimony is on record relative to the pleasure he found when about the same age in an acquaintance with natural objects. "I made a catalogue," he tells us, "of all the vegetable productions, trees, and shrubs which grew upon the farm. The foreign fruits which I saw at my first visit to Boston, the tropical husks and leaves which came wrapped around bales of merchandise, tea-chests, and other boxes, stimulated my love of nature still more." Of Priestley, it is related that he showed, as a boy, correspondent tendencies. It is said that he was accustomed to try the experiment of putting insects in bottles to see how long they would live in the same air. "A curious anticipation," Prof. Huxley remarks, "of the investigations of his later years." Through his engrossing and varied labors at Nantwich, where he frequently taught twelve hours a day, in addition to preaching on Sunday, he was enabled by the practice of a very rigid economy to purchase a few books, an air-pump, an electrical machine, and some other philosophical apparatus. Experimental illustrations in electricity and physics were less common in teaching in those days than at present. Indeed, science entered but little into education. There was, in fact, comparatively speaking, as yet but little science to teach. These facilities for illustrating his lectures and

scientific instruction contributed much to the interest of his pupils as well as the reputation of his school. Among the literary fruits of his fertile mind at this period was the production of an English grammar, which became quite generally adopted in the schools of England. This was followed, soon after, by a series of historical charts, designed as aids to education, which met with similar favor.

A position more worthy of his abilities now opened to him as "tutor in languages" at a dissenting academy at Warrington. The six years passed in the latter position well exemplify his marvellous energy and great mental capacity. In addition to the duties devolving upon him in his special sphere of instruction, he gave lectures on oratory, history, civil law, anatomy, and other branches. Indeed, it would be rather difficult to name any branch of the learning of the day which he did not at one time or another teach or pursue as his private study. In common with some other eminent persons, of whom there would be little suspicion of the fact but for some chance testimony that survives, he wrote poetry,—of no merit, as he frankly confesses, which probably was a correct estimate of it, as none of it appears to have come down to posterity. He also practised upon the flute, as a recreation,—a kind of diversion which he recommends to students, "especially such," as he remarks dryly, "as have no fine ear; for they will be less annoyed by bad music." It is evident that he was fond of teaching, and combined in a rare degree the gifts of the teacher,—an equitable disposition, genial sympathy, originality, a clear intellect, the power of awakening enthusiasm in pursuit of knowledge. His methods, too, were not of the stereotype or traditional kind, but were much in contrast to those that prevailed and to those in practice even to some extent at present.

There is the following testimony to this effect from one of his pupils: "At the conclusion of his lectures, he always encouraged his students to express their sentiments relative to the subject, and to urge any objections to what he had delivered without reserve. It pleased him whenever any one commenced such a conversation. In order to excite the freest discussion, he occasionally invited the students to drink tea with him, in order to canvass the subject of his lecture. I do not recollect that he ever showed the least displeasure at the strongest objections that were made to what he delivered; but I distinctly remember the smile of approbation with which he usually received them, nor did he fail to point out in a very encouraging manner the ingenuity or force of any remarks that were made, when they merited these characters." It would be difficult, as Prof. Huxley has said, to give a better description of a model teacher than that conveyed in these words. Though engaged mainly in teaching at this time, he continued to preach as opportunity presented. But his success in the latter vocation was much affected by a tendency to stammer in speaking, which he, however, eventually succeeded in largely overcoming. Although this infirmity was, no doubt, a serious obstacle to his success as a speaker, it seems to have had a much less depressing influence upon him than we should suppose. It was characteristic of his amiable nature to endeavor to find a cheering philosophy in even the most adverse and disheartening circumstances. It is thus that he is consoled in respect to this defect of speech "Without some such check," he says, "as this, I might have been disputatious in company, or seduced by the love of popular applause as a preacher, whereas, my conversation and my delivery having nothing in them that was gen-

erally striking, I hope I have been attentive to qualifications of a superior kind." An important event took place in Priestley's life while at Warrington. This was his marriage with the daughter of Isaac Wilkinson, an iron-master of Wrexham. The union proved a very happy one. The wife entered with a hearty sympathetic interest into all his pursuits, and bore with patient resignation the trials of their joint experience. Several loving children added to the joy of their home, but one of whom survived them. It was the custom of Priestley to spend one month in each year in London. It was on one of these visits that he met for the first time Benjamin Franklin, an event which marked a turning point in his career. A friendship sprang up between them, which continued unbroken. Through Franklin's influence, Priestley was induced to give his attention more directly to philosophical pursuits, and to undertake a history of electricity, a department of science in which he had already made some original observations. "In the course of my writing," he says, "I was led to ascertain several facts which were disputed; and this led me by degrees into a large field of original experiment, in which I spared no expense that I could possibly furnish. These experiments employed a great proportion of my leisure time; and yet, before the complete expiration of the year in which I gave the plan to Dr. Franklin, I sent him a copy in print." This large and important work, which was published in 1767, and bore the title *History and Present State of Electricity*, contained an exhaustive account of everything that was known about electricity at the time, and was composed in the midst of various other exacting pursuits. It attracted at once the attention of scientific men, and greatly added to his reputation. It was translated into a number of languages of Europe, and procured his election as a member of the Royal Society. In 1767, Priestley became the minister of the Mill Hill Chapel at Leeds, and entered upon some of his most important literary and scientific labors. Among these was embraced the preparation of a work upon discoveries in relation to vision, light, and colors, which was designed as the first part of a general history of experimental philosophy. But the enterprise, failing to receive sufficient support to pay for the expense, was abandoned. It was at this time, also, that he began that series of varied investigations and experiments pertaining to the chemistry of aeriform or gaseous bodies, with the results of which his name is so illustriously and enduringly associated.

In order properly to appreciate the value of these investigations and experiments, and what they led to, it will be well to cast a look backward upon what had preceded them in the line of science to which they belong. There is nothing that more forcibly suggests the progress of chemical science than the fact that, up to this time, the human mind had not yet outgrown the ancient idea that air, water, and fire are each simple and homogeneous elements. It is true, to quote from Prof. Huxley, that "Von Helmont, a century before, had distinguished different kinds of air as *gas ventosum* and *gas sylvestre*, and Boyle and Hales had experimentally defined its physical properties; but no one suspected that the air we breathe and the water we drink are compounds of gaseous elements." The first important step in the direction of this knowledge was made by Dr. Black, a Scotch physician, in 1754. By a series of experiments with limestone, water, and acid, he was enabled to produce what he called "fixed air," or what is now known as carbonic acid gas. The name proceeded from the conception that this air

was fixed in certain bodies, until, by such a process as his experiment, it was forced out or expelled. The discovery of Black was carried forward by Bergmann, a Swedish chemist, and eventually taken up by Priestley, with his characteristic insight and ingenuity, with important results. But, before this, Cavendish had given to the world his discovery of what he called "inflammable gas," or hydrogen, as it is known at present. We see here how one thing is linked with another in the course of intellectual progress, and how correlated lines of investigation and evolution tend to share a simultaneous and correspondent impulse to that imparted to any one of the group to which they belong: it is thus that the precursors to Priestley's crowning discoveries were a preparation for his later achievements. The human mind was working, it is seen, somewhat widely, yet inevitably and distinctly toward these results. These facts, which may be ever observed behind all great occurrences and personal achievements, do not detract from the merit of those who thus arrest the attention of mankind. They simply supply the conditions which exceptional acumen and sagacity turn to account. The most seemingly trifling things are pregnant with momentous results unsuspected by the ordinary observer. It is the attentive and penetrating eye of the reflecting intelligence alone that is enabled to catch hints of their significance, and effectually disclose it to others. Priestley was a continued exemplar of this. While living at Leeds, his house adjoined a brewery; and, as he was accustomed always to keep a sharp look-out for discovery, in even the commonest things about him, he chanced to notice that the beer in the process of brewing gave forth a peculiar gaseous substance, which sometimes overflowed the vats and ran along the floor. If a stick were lighted and put into it, the flame went out at once. It was also perceived that this gas was very dense, and could be poured from one vessel to another. It was still further ascertained that water could be charged with it, or that it could be so diffused through water as to produce an effervescent and sparkling fluid of a "pleasant acidulous taste" and exhilarating character, since known as soda water,—a service," Prof. Huxley remarks, "to naturally and still more to artificially thirsty souls, which those whose parched throats and hot heads are cooled by morning draughts of that beverage cannot too gratefully acknowledge." Finally, there was the testimony of those who had witnessed its effects, to show that it possessed the fatal property of extinguishing life, when inhaled in too large a quantity. All this, so simple and familiar to us now, seemed then like a marvellous revelation. These observations of Priestley, just noticed, were intimately associated with certain others in respect to plant respiration. The following description of one of these experiments is given: "By keeping a pot of mint under a bell-jar in which the air had been spoilt by burning or breathing, he proved that plants take up the bad air, and render the remainder fit again to support a flame of life." There may also properly be mentioned in this connection an invention by him, about this time, which is known to chemists as the pneumatic trough,—a happy device for the collection and cleansing of gases. He also resorted to various experiments for producing gases from different substances. An account of the processes and results of the series of investigations just referred to was communicated by Priestley to the Royal Society, under the title of "Observations on Different Kinds of Air," and won for him its highest award, the Copley gold medal. The publication of a paper by Priestley, on the prevention of scurvy at sea, attracted considerable attention

from those of nautical pursuits, and may have had some connection with an incident which may here be referred to as an illustration of the temper of the times toward its author. The famous navigator, Capt. Cook, was about to sail on his second expedition to the South Seas, when an invitation was tendered to Priestley to accompany it, as the astronomer of the voyage, which he at once accepted. But permission as to his going rested with what was called the Board of Longitude. This chanced to include among its members some clergymen, who seemed to have concluded that his religious opinions were of greater consideration than the scientific service he might render the expedition, and accordingly decided against his going for this reason. This drew forth a letter from Priestley to Sir Joseph Banks, who had charge of the scientific arrangements of the voyage, and from whom the invitation had come. Here is a portion of Priestley's part of the correspondence: "In the former letter there was far from being the most distant hint of any objection to me, provided I would consent to accompany you. You now tell me that, as the different professors of Oxford and Cambridge will have the naming of the persons, and they are all clergymen, they may possibly have some scruples on the head of religion; and that, on this account, you do not think you could get me nominated at any rate, much less on the terms that were first mentioned to me. Now, what I am, and what they are in respect to religion, might easily have been known before the thing was proposed to me at all. Besides, I thought that this had been a business of philosophy, and not of divinity. If, however, this be the case, I shall hold the Board of Longitude in extreme contempt, and make no scruple of speaking of them accordingly, taking for granted that you have just ground for your suspicions. I most sincerely wish you a happy voyage, as I doubt not it will be greatly to the emolument of science; but I am surprised that the persons who have the chief influence in this expedition, having (according to your representation) minds so despicably illiberal, should give any countenance to so noble an undertaking."

CORRESPONDENCE.

THE SONNET.

Editors of *The Index* :—

Among all the poetical forms, the sonnet undoubtedly is the most philosophical, and therefore the most difficult both for the poet to write and the public to read. The sonnet does not belong to lyric poetry; for the latter, as its name suggests, admits of being sung. The sonnet could never be set to music; nor is it, on the other hand, didactic. It brims with sentiment, and does not assume to instruct. It constitutes a class of poetry of its own. Petrarka's sonnets to Laura are not so much love songs as meditations and reflections on love; and, accordingly, I should call the sonnet philosophical. Its structure in inflexible regularity is severe, like logical thought. But let the fourteen lines of which it consists be uniformly balanced in equal proportions, like the symmetrical shape of a crystal, it reflects, at the same time, the rays of thought, as a cut diamond plays in various colors under the beams of light.

The sonnet consists of three parts, the first and second of which (lines 1-4 and 5-8) are parallel, and equal in both structure and rhyme (hendekasyllables); while two tercets (lines 9-14) form the consummation of the whole. As a rule, the lines 1, 4, 5, 8 have one, and 2, 3, 6, 7, the other rhyme. The order of the rhymes in the two tercets is not so rigid. Generally, 9, 11, 13, agree, and so do 10, 12, 14. But many variations abound, and the poet is more at liberty than in the two quatrains. The tripartition of the sonnet is essential, and must be marked by a strong *cæsura* between line 8 and line 9. Thus in logic there are

two premises and one conclusion; and thus the Greek chorus consists of *strophe*, *antistrophe*, and *epodos*. *Strophe* and *antistrophe* are equal in structure, and also in modern songs (for instance, the "Lorelei" or "Robin Adair") the melody of the second lines is the exact repetition of the first; while the rest of the verse takes a new turn, leading to a conclusion.

Not every thought is adapted to a sonnet, but only such as is fit for a philosophical contemplation. It must form, in part 1, the thesis; in part 2, the antithesis; and, in part 3, the synthesis. Or we may say, it is: 1, a position; 2, an opposition, sometimes a contradiction; and 3, a combination of both. You find first an idea of allegory, then its counterpart, or a parallelism; and, in the end, their consummation in a *finale*.

The sonnets of Shakspeare, although similar to their Italian prototypes, have suffered a radical change. Other English poets have taken more license still more or less deviating from and altering the character of the sonnet.

I have been asked lately so much about the significance of the original structure of a sonnet that I have thought a few remarks on the subject might be welcome to the readers of *The Index*.

PAUL CARUS.

QUESTIONS.

Do no impressions ever come to you
To claim that life invisible is true?
Are all our bright anticipations o'er?
And are they only dreams, and nothing more?
Is there no ghost from out the vasty deep,
Returning from that misty land of sleep,
That plays fantastic tricks with senseless things,
To prove with broken sense a sense that clings
In vital union with a spirit part
That moulds the dust with true designing art?
Can fountains ever rise above their source
Or turn their currents from their downward course?
What right have you your bank to overdraw,
And by the magic of evolving law
Produce a thing you never owned before,
And claim that matter grows to something more?
Is great Elohim, with all other gods,
Outcast from earth by earth's evolving clods?
Is there no truth in universal faith
That will not vanish like a sunlit wrath?
And down the vista dim of coming years
Will people then, as now, be ruled by fears?

A. D. MARCKRES.

WHAT has he done? That was Napoleon's test. What have you done? Turn up the faces of your picture-cards! You need not make mouths at the public, because it has not accepted you at your own fancy valuation.—O. W. Holmes.

A MELLOWING rigorist is always a much pleasanter object to contemplate than a tightening liberal, as a cold day warming up to thirty-two Fahrenheit is much more agreeable than a warm one chilling down to the same temperature.—O. W. Holmes.

NEARLY all our associations are determined by chance or necessity, and restricted within a narrow circle. We cannot know whom we would, and those whom we know we cannot have at our side when we most need them. All the higher circles of human intelligence are to those beneath only momentarily and partially open.—Ruskin.

BOOK NOTICES.

CHARLES DARWIN. By Grant Allen. *English Worthies* series. Edited by Andrew Lang. New York: D. Appleton & Co., 13 and 15 Bond Street. 1885. pp. 206.

It is well known that Mr. Francis Darwin is now engaged upon a life of his father; but none the less welcome will be Mr. Grant Allen's little volume, which deals mainly with the distinguished naturalist as a thinker and a worker in relation to those who preceded him and to those who came later. Mr. Allen points out what is not generally known: that among those qualities which enabled him to do the great work he accomplished were most important ones which he owed to his maternal ancestry; that in him "the brilliant but discursive and hazardous genius of Erasmus Darwin," author of *Zoonomia* and *Temple of Nature*, was balanced and regulated by the more staid and sober qualities—the patience, caution, carefulness, and persistence—derived from Josiah

Wedgwood, the father of Charles Darwin's mother. "A man, indeed," says Mr. Allen, "owes, on the average, quite as much to his mother's as to his father's family. It is a mere scientific, old world prejudice which makes us for the most part count ancestry in the direct ascending male line alone, to the complete neglect of the equally important maternal pedigree."

Especially needed by the average reader and by many who imagine that they are competent to write and speak on Evolution is the information contained in the chapters entitled "The Darwinian Revolution begins" and "Darwin's Place in the Evolutionary Movement." The writer points out that the *Origin of Species*, so far as the scientific world was concerned, fell like a grain of mustard seed upon well-prepared ground,—ground that had been ploughed and harrowed by Lamarck, Saint-Hilaire, Spencer, and Chambers; that it had, in its author, the weight of an already distinguished name in science; that the array of facts, the logic and learning of the book, were irresistible; and that it was therefore the occasion of a revolution, the force of which had long been gathering head and energy. Theologians opposed it, as did some of the older naturalists. Sir Joseph Hooker and Prof. Huxley were among the first to give in their adhesion. "To Herbert Spencer, an evolutionist in fibre from the first beginning, the fresh doctrine of natural selection came like a powerful ally and an unexpected assistant in deciphering the deep fundamental problems on which he was at that moment actually engaged; and in his *Principles of Biology*, even then in contemplation, he at once adopted and utilized the new truth with all the keen and vigorous insight of his profound analytic and synthetic intellect. . . . It is to Mr. Spencer that we owe the pellucid expression, 'survival of the fittest,' which conveys, even better than Darwin's own phrase, 'natural selection,' the essential element added by the *Origin of Species* to the pre-existing evolutionary conception." Prof. Henslow, Darwin's old Cambridge teacher, and Lubbock soon accepted Darwin's conclusions; and, subsequently, Lyell, after opposing them, reluctantly gave in his adhesion to their conclusions, and wrote ably in their defence. Philosophical Germany welcomed the novel ideas. Fritz Müller, Ritzemeyer, Haeckel, and others, by fresh researches, "carried forward the evolutionary impulse." In America, Asa Gray gave it the weight of his well-known name; and "Chauncy Wright helped it onward on the road with all the restrained force of his singular and oblique but powerful and original personality." "If Agassiz and Dawson still hesitated, Fiske and Youmans were ardent in the faith. If critical Boston put up its eyeglass doubtfully, Chicago and St. Louis were ready for conversion." The *Origin of Species* was translated into all the civilized languages of Europe; and its ideas revolutionized not only biological opinion, but every mode of thought and feeling. From 1860 to 1870, the progress of Darwinism was rapid. Spencer's *First Principles, Biology*, and remodelled *Psychology*, Huxley's *Man's Place in Nature, Lectures on Comparative Anatomy, and Introduction to the Classification of Animals*, Wallace's *Malay Archipelago* and *Contributions to the Theory of Natural Selection*, Galton's *Hereditary Genius*, and writings of Tyndall and Lewes, Tylor and Lubbock, with others, helped to diffuse and strengthen evolutionary thought.

That the complex forms of life came into existence by some process of development had long been believed by many, but Mr. Darwin brought to light an important principle by which these changes have been effected. "Therein lies the true secret of his rapid, his brilliant, and his triumphant success." There are some, Mr. Allen says, who "cannot even understand the distinctive Darwinian addition to the evolutionary doctrine," and who are "still really at the prior stage of Lamarckian evolutionism." While giving Darwin the highest place in his own field,—in the work of explaining the diversity of life and proving descent by modification,—our author regards the system of evolution "as a slow growth of the past two centuries, a progressive development of the collective, scientific, and philosophic mind of humanity, not due in its totality to any one single commanding thinker, but summing itself up at last in our own time more fully in the person and teaching of Mr. Herbert Spencer than of any other solitary mouth-piece."

B. F. U.

VIEWS OF RELIGION. By Theodore Parker. With an Introduction by James Freeman Clarke. Boston: American Unitarian Association. 1885. pp. 466. Price \$1.00.

"Time and death," says the author of the introduction to this work, "soften animosities. The Unitarians have forgiven and forgotten his [Parker's] sharp speeches against them and—what is harder to forgive—their own sharp speeches against him. To-day, they only remember his loyalty to truth, his devotion to humanity, his scholarship, intelligence, and loving heart. Few persons would subscribe to his theology. To many, he still seems only partially to understand the work of Jesus, and to ignore some of the deeper experience of the human soul. On the other hand, the current of what is called 'advanced thought' has carried others far beyond his position. If he were living now, he would be thought by many to be much too conservative." The Directors of the American Unitarian Association, in publishing this volume, "believe that they are meeting a want. Without professing to indorse or to reject the views expressed in this volume, they are glad to assist in circulating the ideas of one of the most able, earnest, and devout men of our time." The selections are from some of Parker's best writings, and contain much of his best thought. The volume is published at a very low price, putting it within the reach of all who wish to become acquainted with the religious views of one of the most courageous thinkers and one of the most noble reformers of this century.

The January number of the *Unitarian Review* opens with an article on "Count Zinzendorf and the Moravians," by Dr. F. H. Hedge. Rev. S. C. Beach writes on "Confirmation," Rev. Edward H. Hall on "Certain Tendencies of American Fiction," and Prof. C. H. Toy on "The Present Position of the Pentateuch." An article in "Editor's Note-Book," on "Prayers at Harvard College," says that the "effort being made to have the morning prayers at Appleton Chapel a voluntary thing on the part of the students . . . has not a little of the character of an insult to the memory of the religious founder of this institution, as well as to the motto which its seal bears." That a "large majority desire the abolition of compulsory attendance upon prayers," this article says, "ought to have no weight against customs of worship which the religious sense of the ages has established and found of value." With this writer, "customs of worship," even when their observance is made compulsory, are of more importance than rights of conscience and freedom in religious matters. "Review of Current Literature" is unusually interesting.

INVARIABLY interesting as every number of *St. Nicholas* is, the January number for 1886 is exceptionally so. W. D. Howells tells, in a charmingly home-like manner and his little daughter grotesquely illustrates, the horrors of having "Christmas Every Day in the Year." The story and illustrations will be delightful reading to every child, a great many parents, and some appreciative uncles and aunts who are readers of *St. Nicholas*. Mrs. Burnett's "Little Lord Fauntleroy" grows more charming with every instalment. That "H. E.," Rose Hawthorne Lathrop, "Susan Coolidge," Hezekiah Butterworth, Edith Thomas, H. H. Boyesen, Horace E. Scudder, "Sophie May," and Edmund Alton are among the writers who contribute to this number, is sufficient guarantee of the quality of this first-class youth's magazine.

We have received the *Freethinker's Magazine* for January, which is to be published hereafter as a monthly. The "contents" are as follows: An Address, by A. B. Bradford; "The Church," by J. J. McCabe; "Spiritualism," by William Henry; "A Plea for Anarchy," by John A. Broadbeck; "Christmas," original poem, by J. J. McCabe; "A Modern Queen of Reason," by Uncle Lute; "Extracts from Letters," "This Magazine," by the editor; "Elizur Wright Dead," editorial; "Consolation," editorial; "Book Review," by the editor; "All Sorts," by the editor; "Freethought Directory." Price 25 cents a number, \$2 a year. Address H. L. Green, publisher, Salamanca, N.Y.

"WIDE AWAKE" for January recalls Whittier's poem on "Floyd Ireson's Ride" in the story and pictures by Henry Bacon, entitled "The Dumb Betty Lamp"; but we are sorry that the story does not more clearly

reveal poor Floyd Ireson innocent of the wrongdoing imputed to him in that stirring poem, as authentic history has already done. Cella Thaxter's ballad poem of "The Lost Bell" is finely illustrated by F. C. Hassam. Mrs. M. E. W. Sherwood writes about Queen Marguerite of Italy. Amanda B. Harris gives a sketch of Emerson for young readers. Mrs. Mary Treat describes some "Interesting Spiders." George E. Vincent tells about "Virgil, the Poet," and his work. The three serials, "A Midshipman at Large," by C. R. Talbot; "A Girl and a Jewel," by Harriet Prescott Spofford; and "Dilly and the Captain," a bicycle story, by Margaret Sidney,—have all unusually interesting instalments in this number, whose articles, it is needless to say, are profusely and beautifully illustrated.

The *Journal of Speculative Philosophy* for July, 1885, has made its appearance. The opening essay is on "The Dial," by George Willis Cooke, who has brought together a large amount of information in regard to the famous magazine which represented New England Transcendentalism for a short time,—the authorship of its articles, the lives of its contributors, etc. Other articles are translations of "Hegel's Introduction to the Philosophy of Religion," by F. L. Soldan; "Leibnitz's Critique of Locke," by Alfred G. Langley; and "Goethe's article on the Immortality of the Soul," by Susan E. Blow. Mrs. C. K. Sherman's article on Goethe's *Elective Affinities*, reprinted from *The Index*, "Ion: A Monody," and "The Atom and the Void: A Sphinx Riddle for Materialism," make up "Notes and Discussions." The "Book Notices" complete a number of the *Journal* which contains much deep interest to philosophic thinkers.

The January number of the *Atlantic* begins with the first two chapters of Charles Egbert Craddock's new serial, "In the Clouds." There is a paper on "The Free Negroes of North Carolina." The editor of the *Atlantic*, Mr. Aldrich, has a very bright short story called "Two Bites at a Cherry." Dr. Holmes' paper in the New Portfolio series is "A Cry from the Study." "The Political Consequences in England of Cornwallis' Surrender" forms the subject of a thoughtful article by Mr. John Fiske. The recent *Life of William Lloyd Garrison*, Stedman's *Poets of America*, and the last number of *L'Art* form the subject of able criticisms; while the "Contributors' Club" has four short discussions which are full of the stimulating thought and pleasant fancy that distinguish this department. Houghton, Mifflin & Co., Boston.

The most important article in the *Revue de Belgique* for December is a new chapter of "The Religious History of Fire," by Count Goblet d'Alviella, who gives some curious cases of the long continuance of fire worship,—for instance, in lighting the yule log at Christmas. These articles, with that on "The Origin of Idolatry," recently republished in pamphlet form from the *Revue de l'Histoire des Religions*, show that much new light will be thrown by the Brussels professor, not only on the history, but on the future prospects of religion. As to the latter question, much may be learned from an article following that first noticed, and showing that there is at present no sufficient basis for religious art.

The *Catholic World* for January is a holiday number, and has therefore a more than usual proportion of stories and poems, all bright and interesting. Among the few contributions outside of these departments, we note as of interest: "A Tour in Catholic Teutonia," by St. George Mivart; "Old Galway," by J. B. Killen; "The Priest at Castle Garden," by Rev. J. J. Riordan; and a caustic review of Sauborn's *Life and Letters of John Brown*, by J. R. G. Hassard, entitled "The Apology for John Brown." Among other book reviews are *Italian Popular Tales* and *Under the Pine*.

The *New York Fashion Bazar*, published by George Munro, of Munro's publishing house, New York City, for January, has two handsomely colored fashion plates of the latest designs in ladies' and children's styles, in addition to other illustrations of the newest fashions in dresses, bonnets, hats, outside apparel, inner wear, and patterns in embroidery. A number of its large pages are devoted to the discussion and description of these; but most of the reading matter

consists of interesting stories and poems by leading writers, like "The Duchess," "Mary E. Bryan," and others. \$2.50 per year.

The *Journal of the American Akademi* for January contains a paper on "The Finite and the Infinite: the Temporal and Eternal," by Dr. C. A. F. Lindore, and two articles by the editor, Alexander Wilder, one on "Zoroastrianism: An Afterword," and the other on "The Chinese Philosophy."

Dr. PAUL CARUS

Has arranged the following courses of instruction in the German Language at 4 BOYLSTON PLACE.

Lessons for Beginners on Mondays, Wednesdays, and Fridays, at 2.30 P.M. Twenty Lessons, \$10.00. After one course, any one is expected to be able to join the

By FREDERICK MAY HOLLAND,

Author of *The Reign of the Stoics*. Price \$3.50.

For sale at THE INDEX office, 44 Boylston Street, Boston, Mass.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC TELEOLOGY, and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart." 1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cts. a copy; 10 copies for 40 cts.; 30 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

STANDARD PUBLICATIONS

FROM THE PRESS OF

Charles H. Kerr & Co.

THE UNIVERSITY. A LITERARY AND CRITICAL WEEKLY. Popular, but not sensational; scholarly, but not pedantic; conservative, but not old foggy; progressive, but not iconoclastic. It numbers among its contributors many of the brightest writers of the day. Its matter is wholly original and is edited with discrimination. \$2.50 per year; three months on trial for 50 cents.

UNITY. A LIBERAL RELIGIOUS WEEKLY FOR THE HOME. Seeks to adjust religion and culture; to make thought worshipful and worship thoughtful; to find a unity beneath conflicting dogmas; a community in all denominations; a sympathy between all religions. It seeks to emphasize the abiding elements of religion—love, justice, truth—practically applied among all men. \$1.50 per year; six months, trial subscription, 50 cents.

THE UNITARIAN. A MAGAZINE OF LIBERAL CHRISTIANITY. Aims to popularize and carry far and wide the best thought of rational Christianity. Its writers are the ablest; its matter fresh, varied, practical; its price, 50 cents a year.

SPECIAL COMBINATION OFFER.—For \$1.00 we will send THE UNIVERSITY, UNITY, and THE UNITARIAN to any address four months on trial.

VALUABLE BOOKS OF INTEREST TO INTELLIGENT READERS.

The Consolations of Science. By Jacob Straub \$2.00

THE "FREIDENKER."

Freedom, Culture, and Prosperity for all!

(Organ of the Freethinkers of North America, of the Union of Radicals, and the North American Turnerbund.)

Editor, C. Hermann Beppe.

TERMS, PER ANNUM, IN ADVANCE:
UNITED STATES AND CANADA:

Freidenker \$2.50
Turnerische Ausgabe des Freidenker (Amerikanische Turnzeitung) 3.00

EUROPE:

Freidenker \$3.00
Turnerische Ausgabe des Freidenker (Amerikanische Turnzeitung) 3.50

Sample copies sent, on application, free of charge.

In this weekly, which is now in the thirteenth year of its existence, political, social, and religious matters are discussed with a view to general enlightenment and progress. The *Amerikanische Turnzeitung* is especially devoted to the discussion of topics pertaining to physical culture and matters of interest to lovers of the gymnastical art.

Since Jan. 1, 1885, the *Freidenker* has been enlarged, thus furnishing considerably more reading matter, while the price remains the same as before.

For the convenience of those of our readers who are chiefly interested in matters relating to gymnastics, the *Freidenker* and its former supplement, the *Turnzeitung*, have been consolidated into one paper, called *Amerikanische Turnzeitung*, with the sub-heading, "Turnerische Ausgabe des Freidenker."

This paper contains more reading matter than furnished by both the *Freidenker* and *Turnzeitung* heretofore. In making these changes, the publishers have incurred great expense; and we therefore solicit the hearty co-operation of all friends of the cause in securing for the *Freidenker* and the *Amerikanische Turnzeitung* a wider circulation.

We also publish

"Erziehungsblaetter,"

fuer Schule und Haus.

A Liberal German Educational Monthly.
(Organ of the German-American Teachers' Association.)

Editor:

MAXIMILIAN GROSSMANN, Milwaukee, Wis.

Associate Editors:

H. H. FICK, Chicago, Ill.

H. SCHUBERT, Chicago, Ill.

16 large quarto pages, with four-page cover.
Terms: \$2.12 per annum, in advance.

"Freidenker-Almanach"

FOR THE YEAR 1885.

The almanac, which is now in the eighth year of its existence, is devoted to the propagation of free-thought principles. Price 25 cents.

"Amerikanischer Turnerkalender"

FOR THE YEAR 1885.

This annual, which is now published for the sixth time, is principally intended to promote the culture of gymnastics, and is pervaded by a thoroughly liberal spirit. Price 25 cents.

Orders for all kinds of books promptly filled. Radical and Freethought Publications a specialty.

BY B. F. U.

BISHOP A. CLEVELAND COXE is opposed to cremation. In the *New York Sun*, he is reported as saying: "None but cranks will patronize the horrible practice. No respectable person will consent to be cremated after death. Why, think of the shudder of horror that will go through the family whose father is a victim,—the son anxious to stick the body into an oven, and the girls broken-hearted. I tell you it is outrageous." The strength of this argument against cremation is only less wonderful than the bishop's dignity and grace of expression.

A PETITION was presented to the Connecticut Legislature, last week, from citizens of Canterbury, praying for reparation to Mrs. Prudence Philleo, formerly Miss Prudence Crandall, for injuries inflicted upon her in that town in 1883, because of her persistence in teaching a free school for negro girls. "This revives," says an exchange, "a memory of the early days of the anti-slavery movement, when Miss Crandall was insulted and finally arrested and put in jail by prominent citizens of Canterbury. Her story became a celebrated one, and is told at length in Henry Wilson's *Rise and Fall of the Slave Power*. She is now living in advanced age and poverty."

THE Boston correspondent of the *Springfield Republican* writes: "Not only is the new Browning society growing rapidly, but small clubs are forming, and Browning is now a favorite topic for parlor-club discussion. It looks as if there is to be quite a Browning craze here; that ultra devotion at the shrine of Browning is to be the 'fad'—to borrow an expressive London term—of the season. Like other crazes here, especially literary ones, it attacks social triflers—those who feel that they must be in the swim, must show a culture if they have it not—as well as earnest, serious students and would-be true disciples of the poet. . . . Occultism and theosophy, this Asiatic lore, which if it has any virtue is religious, is also being made the

subject of more dilettanti study in many circles as the winter advances."

THERE is a marked change of sentiment in England regarding the treatment of Bradlaugh. The Bishop of Peterborough, says the *London Inquirer*, "is saying with equal truth and courage the very things for which Liberals have been bitterly denounced by the whole Tory party, and especially by the clergy, as atheists, blasphemers, and sympathizers with Mr. Bradlaugh. We, at least, have never hesitated to express our sympathy with Mr. Bradlaugh, when we have believed him to be in the right; and the manner in which he has been treated will make a dark page in the future history of religious persecution. We should not now be greatly surprised if the whole Tory party adopted the bishop's principle of affirmation for all members, and tried to convince the world that they had formerly opposed Mr. Gladstone's bill because it did not go far enough for them."

THE enormous evils of the liquor traffic are everywhere being forced upon the attention of the best men and women, with whom the temperance question is a subject of serious and anxious thought. In his recent speech to the members of the Ohio Legislature, thanking that body for his re-election to the United States Senate, John Sherman said: "This question ought not to assume a political character. The Legislature of Ohio should address itself to this question, and enact wise laws, going as far as is consistent with the rights of citizens. The prohibition party has not a single representative upon this floor; and it is the sentiment of fully one-half of those composing the two great political parties, and they demand of you some legislation upon this subject. If you will not lay party aside and represent the people, a higher power will bring about this legislation."

THE committee appointed by the Society for Psychical Research to investigate phenomena connected with the Theosophical Society have published their report in London, which says of Madame Blavatsky: "We regard her neither as the mouth-piece of hidden seers nor as a mere vulgar adventuress. We think that she has achieved a title to permanent remembrance as one of the most accomplished, ingenious, and interesting impostors in history." The committee unanimously arrived at the conclusion that this woman, whose wonderful narratives have impressed so many credulous minds, "has been engaged in a long-continued combination with other persons to produce, by ordinary means, a series of apparent marvels, for the support of the Theosophic Movement"; that "the shrine at Adyar, through which letters purporting to come from Mahatmas were received, was elaborately arranged, with a view to the secret insertion of letters and other objects through a gliding panel at the back, and regularly used for this purpose by Madame Blavatsky or her agents." There is, the committee affirm, "a strong general presumption that all the marvellous narratives put forward as evidence of the

existence and occult power of the Mahatmas are to be explained as due either (a) to deliberate deception carried out by or at the instigation of Madame Blavatsky or (b) to spontaneous illusion or hallucination or unconscious misrepresentation or invention on the part of the witnesses." After examining Mr. Hodgson's report of the result of his personal inquiries, the committee declare that, in their opinion, "the testimony to these marvels is in no case sufficient, taking amount and character together, to resist the force of the general presumption above mentioned."

LONDON *Light*, "a journal of psychical, occult, and mystical research," says that there "can be little reasonable doubt that the conclusion at which the committee have arrived is a just one." This journal further states, in substance, that it has always regarded the evidence for Mr. Sinnett's alleged facts, as well as for his theories, as "exceedingly weak"; and it does not wonder now that the committee are compelled to report that they "cannot discover sufficient evidence for the occurrence of any occult phenomena whatever in connection with the Theosophical Society." Still, *Light*, which is thoroughly devoted to Spiritualism, thinks that, "despite all the frauds perpetrated, there have been genuine phenomena" produced, through Madame Blavatsky, by "spirits of a low order." But, if the evidence is conclusive that Madame Blavatsky has been engaged with other persons in deliberate and carefully planned deception for the support of the Theosophic Movement, there seems to be no good reason for believing that "spirits" have had anything to do with her performances.

"Oh, I have been thinking this whole day long; and that is (I could not get it out of my mind) salvation is free." These words concluded a speech at a religious meeting by one who referred to himself as "a man-o-war's man with the biggest old sins upon earth," "one of the miserablest old drunken sailors that ever came to this city." The speaker dwelt with apparent pride upon his exceptionally wicked life,—no common sinner was he,—and the easy, simple, inexpensive method of which he had taken advantage to escape the natural effects of his misdeeds, even his "biggest old sins." "Salvation is free." This thought seemed to fill him with joy. But it might be better for him and others like him, if a small price were attached to salvation. That which can be obtained without price comes to be regarded as of little value. The sort of salvation that is "free," that can be had for the asking, that comes without intellectual growth or moral discipline, without sacrifice, without the pain of failure and disappointment, the lessons of experience, is a salvation that does not save. Orthodox Christianity, which teaches that "salvation is free," that "Jesus paid it all," that men must believe in and look to him for salvation, not rely upon their own intellectual and moral powers, is responsible for the condition of multitudes who have descended to the lowest depths of vice in the belief, all the time, that "salvation is free."

LAWS THAT NEED MENDING.

On no subject, perhaps, have the opinions of intelligent people been making greater progress in the last fifty years than on that of religion. Yet on no subject is it more difficult than on this to secure from legislative bodies a reformation of the laws to correspond with the progress. The statute-books in their provisions pertaining to religion are behind the age,—in many cases wofully and ludicrously behind it. The old laws may be practically obsolete; but, if an attempt be made to abolish or amend them, fossil theologians start up in protest, legislators become timid, and the fossil laws are permitted to remain. These laws, however, are by no means always a dead letter. So long as they are on the statute-book, they may be revived on occasion and become very potent, much to the surprise and even injury of many innocent people.

A few years ago, it was decided in the law department of the national administration at Washington that an old Maryland law of 1723 was still in force in the District of Columbia. This law declared that it was an offence punishable as blasphemy if any person shall "deny our Saviour Jesus Christ to be the Son of God, or shall deny the Holy Trinity, the Father, Son, and Holy Ghost, or the Godhead of any of the three persons, or the unity of the Godhead." And the penalty for the crime was, for the first offence, to be bored through the tongue and to be fined twenty pounds sterling, or, if the fine could not be levied, six months' imprisonment in lieu of it; for the second offence, the offender was to be "stigmatized" by burning in the forehead with the letter "B," and fined forty pounds sterling, or, failing to have the wherewith to pay the fine, to suffer imprisonment for one year; for the third offence, the offender was "to suffer death without benefit of clergy." We know not whether this old law on thus being brought to light as operative in the District of Columbia was abolished or not. Presumably, it was; for, at last accounts, Brother Shippen, pastor of the Unitarian Church in Washington, who must have violated the law more than once or twice, had not been put to death, nor had the letter "B" branded on his forehead, nor even had his tongue bored. But, unless there has been a recent change, we think that the laws of Maryland still define the denial of the Trinity as a blasphemous offence, though the appended penalties may have been made less stringent. Such laws may rarely be enforced to the practical harm of anybody; but they are relics of a religious bigotry which, in the interest of truth and sincerity, ought to be removed.

There are other religious laws on the statute-books not so harmless. Those that relate to the testimony of witnesses in court are often invoked to the detriment of justice. There are twenty States and Territories in the United States where the testimony of an atheist or an agnostic is excluded in a judicial trial. Only a few weeks since, in a court at Chicago, the right of a well-known and esteemed citizen of that city—Mr. Ernst Prussing—to testify in a pending suit was questioned on this ground. Mr. Prussing is an officer of the Ethical Culture Society and an agnostic in respect to religious beliefs. So far as character is concerned, he is the kind of witness that every lawyer rejoices to secure in behalf of a client; that is, a man of eminent integrity. It so happened that, in this case, his testimony was the most important in the suit. The judge admitted it, but an exception was taken to his ruling by the counsel who opposed the admission; and an appeal on this ground was made to the Supreme Court of the State. Now, justice in this case cannot be

secured, probably, without Mr. Prussing's testimony; and, since it is the office of the State to do justice between citizens, it is a monstrous enormity of law which would prevent his being a witness. On the contrary, the laws should be so clear that by no possibility could his testimony be excluded.

Again, there are eight States and Territories, of which Massachusetts is one, which forbid the exclusion of testimony on account of religious belief, but permit the religious belief of a witness to affect the credibility of his evidence. And in the courts of these States and Territories, not infrequently, where a witness is known or supposed to hold atheistic or agnostic opinions, the counsel on the opposite side will make inquisition into his opinions, and strive to break down the force of his testimony by appealing to the *odium theologicum* in the minds of the jury. In such cases, justice may be defeated. But it may not be the witness who is thus made to suffer, but some innocent party,—perhaps a good Orthodox believer,—whose witness is in this way invalidated. The argument for this law appears to be that a person who holds atheistic or agnostic views is not so likely to tell the truth as a theist and Christian. But those who are most conversant with the character of witnesses in courts will hardly assent to this argument. It is precisely those persons who have the courage to make known their convictions, though on the unpopular side, who have a good reputation for veracity and integrity. They are the kind of witnesses needed in courts, as the majority of lawyers themselves will admit; and the law should not present to a lawyer the temptation to win his suit by appealing to the religious prejudices of a jurymen against such witnesses. Think of Darwin, a man whose life was devoutly consecrated to discovering and telling the exact truth in nature, having his word doubted in court and his credibility as a witness impeached, because he was an agnostic! The attempt will be renewed, we understand, in the Massachusetts Legislature this winter for the repeal of this unjust provision, by which evidence may be discredited because of the religious opinions of a witness. It is to be earnestly hoped that the effort will be successful, and Massachusetts thus placed among the eighteen States and Territories which have already rescinded this relic of religious prejudice, and found the amendment as safe as it is just.

Other laws that are sadly out of repair and behind the times are the Sunday laws. They are nowhere fully enforced as they stand on the statute-books, because they have really been outgrown by public sentiment. Were they all for a short time to be rigidly put into operation, it would probably not be difficult to secure a revision of them, on Gen. Grant's theory,—that stringently to enforce a bad law is the best way to get it abolished. Could the Sunday laws in the different States have a thorough overhauling and reformation in accordance with the enlightened public opinion of the age, the result would be a great boon to civilization. The question of popular education and of physical and moral health is, to a large extent, involved in the settlement of the problem. In New York there is a lively agitation in progress for opening the Central Park Museums on Sundays. In other cities, the move is for opening public libraries and reading-rooms. Of course, many pious people are alarmed and oppose such innovations. But we doubt whether many of these alarmists and alarmed ones, were they to visit the Public Library or the Art Museum in Boston on Sunday, would discover anything to warrant their fears. Few could be so

blinded by bigotry as not to see the perfect decorum of the places, and that they are resorts on that day for a class of people who specially prize the opportunity for thus enlarging their knowledge and to whom Sunday brings the only daylight hours of leisure which they have from physical labor. There are few people to-day who think it wrong to read other books besides the Bible or to look at other pictures than Fox's Martyrs on Sunday in their own houses. How can it become wrong for those who have no such private privilege in their homes, or no homes even which they can call their own, to go to orderly public rooms on that day for any good reading or seeing good pictures or inspecting objects of natural history? And is it not a blessing rather than a harm that the same cars which bring suburban residents into cities on Sunday to attend the churches of their choice may carry the occupants of crowded tenement houses and of close shops out into the country on that day, that they may have a sight of free fields and a breath of fresh air?

But that there will be any general revision of the Sunday laws at once is too much to hope. The needed amendments will come, probably, piecemeal; and some of them are already coming by a general acquiescence in a changed custom, though the law remain the same. But, in these latter cases, a change of law should follow the custom, in order that no injustice may be sprung upon a person by a surprise, when he is wholly unaware of having risked any danger. An amendment of this sort is to be asked of the Massachusetts legislature this winter, and there is good reason to hope for its passage. Under the present Massachusetts law by which a business contract made on Sunday is void, the Supreme Court of the State has decided that a person who has suffered from fraud in a business transaction on that day cannot bring an action for damages, and that payment cannot be enforced for goods sold and delivered on Sunday, even though the goods are kept by the buyer. The law in these cases—and such cases are actual occurrences—makes itself an accomplice in acts of meanness and dishonor. It should not be difficult to secure an amendment to the Sunday laws on this point, which would prevent their shielding from punishment transactions so dishonest and unjust. The amendment asked for is in the same direction with the change that was made only two years ago in Massachusetts in the section of the law referring to Sunday travel. Up to that time, a person who met with an accident on Sunday in journeying upon a town way or upon a railroad or by steamer could not recover for damages, even though the accident were clearly shown to be the result of no neglect of his, unless he could prove that he was travelling for "necessity or charity"; and, under this rendering of the law, wealthy and powerful railroad corporations, who were violating the Sunday ordinances by running cars on that day, were in the habit of evading payment for damages in Sunday accidents, and were sustained by the courts in such refusal, though they were clearly responsible for the accident and would have been mulcted in damages therefor on any other day. Sometimes, the damaged man whose case was thus thrown out of court was one of their own employes. By the amended law of 1884, such an outrage against justice was made impossible. The proposed amendment this year is of a similar nature. It leaves the law as it is which makes Sunday contracts illegal; but it will not allow a fraud to be perpetrated in such contract and the perpetrator to escape under cover of the sacredness of the day. If a business contract on Sunday be wrong, let those who are parties to it be brought

to trial and punished for that offence; but let neither of them be legally free to cheat the other on Sunday more than on any other day.

WM. J. POTTER.

AN INSTINCT THAT LEADS TO DEATH.

On the Galapagos Islands, a group of volcanic islands between five and six hundred miles from South America, situated exactly on the equator, opposite the little Republic of Ecuador, are flora and fauna, resembling those of the distant continent, yet unlike them. Time and distance have so modified the forms of life on the islands that they are scarcely recognizable for the same species. On the continent, we had grown to know the iguana, as it glinted in the sun, frisking joyously on the banks of the rivers. We had come to know the value of some of the lizard family as articles of diet, for they taste like chicken. Near villages, they are wild and shy, for the Indians slay them for food; but, away from the busy haunts of men, I have sat and watched them for hours, gleaming with all the colors of the rainbow, as they ran from tree to tree or scampered over the river banks to hide in the holes they seemed to have burrowed. On the Galapagos Islands, all was different. The lizard there was dark, strong, fierce-looking. A horrid, black, armor-plated reptile took the place of the beautiful forms of the mainland. Along the shores of the islands, we have precipitous masses of lava; no gently sloping beaches, no pleasant coves, no verdure creeping down to the water's edge. Sitting on a crag of lava, one could see deep down into the crystal waters, where

"The sea flower spreads its leaves of blue,
That never are wet with the falling dew."

Among the rough and rugged rocks of these inhospitable shores, the native lizard crawled. It seemed little at home there. It ran, after a fashion; but it was slow and ungraceful, not at all like the lithe and beautiful animal of the mainland. Sitting on a rock fishing, one could see this same lizard coming ashore, swimming near the bottom, with its fore limbs pressed close to its side, waving the tail with an easy motion, and gliding as gracefully along as one of our own little water newts. We had known it as a terrestrial animal; but here it was become a marine animal, all its beauty gone in the change. Our men used to kill them mercilessly, not because they were poisonous or hurtful, not for any other reason than because they were ugly-looking. Some of our own species might suffer, if that were made a reason for death!

One curious thing about this lizard was that it never took to the water when chased. It could hardly escape from a man by running; and, though it had just come out of the water, where it was so much at home, yet it would never return to the water for safety. Thousands of people must have noticed this; yet none ever seemed able to give a reason for it, until the great master of modern thought visited those islands. He sought for a reason; for he believed there was a reason for everything, and the reason for this was so simple that I felt ashamed for not having seen it myself. Yet, for this power of looking through things to find causes,—for this mighty power of looking into the heart of things,—he was sorely abused; but he spake no word in reply. When he died, a little while ago, we laid him gently down beside the kings and queens, the scholars and statesmen in England's Valhalla; and all the world, all the intelligent world, joined in the anthem that was sung that day,—“His body hath been buried in peace, but his name liveth for evermore.”

Darwin found the reason, then, for the reptile's strange course. In the long, long ago, when the

eggs of the lizard, in their leathery integuments, were first borne to the island by wind and wave, the poor terrestrial animal found itself where food was scarce. The conditions of life were different. The quiet life beside the still waters of the tropic river had passed away, and now came the struggle for existence under new circumstances. The lizard has teeth, and can eat flies, insects, and many small forms of life; but most of these small lizards are vegetarians. On the island, insect life was scarce, so they made the most of what vegetable life there was. From the ancient type or types which first landed there soon came a new form; that is, by the death of the unfit, the feeble, and the helpless, there was soon left a form of lizard unlike the parent stock on the mainland, yet a true terrestrial lizard. But, provisions being scarce, one part of the family learned to live on the sea weeds, the sea flowers, the sea grasses, which make the bottom of a tropical sea resplendent. By gradual slight modifications, the terrestrial form gave place to one capable of living for a long time under water. The reptile is not far removed from the amphibian, so the change was not so great as it would at first sight appear. The change has not been so complete as to make the terrestrial lizard into a fish-like animal, as with the whale, the seal, and some others; for a great obstacle interposed. Round the shores of the islands, sharks are very plentiful and very fierce. The swimming iguanas fell an easy prey to the swift sharks, so the poor lizard had always to fly for refuge to the rocks. How keen is the struggle for existence in the sea none can tell. There is no pity there. The weak must ever go to the wall. The law of nature seems to be, “Increase, vary: let the weak perish, and the strong survive.” The iguanas learned then that, while they might find sustenance under the water, they would perish if they met a shark. They could not hope to contend with the shark in either strength or speed. It was only by flight they could save themselves. The iguanas which learned that escaped and left descendants: those that did not so learn perished. So it came to pass that on the poor brain of this marine lizard was written the lesson that its only safety lay in reaching the land. So long as there were no men on the shore, that lesson held good; but new conditions have changed again. Man, who is quite as merciless as the shark, has appeared on the scene. The poor lizard recognizes danger in the new form, but he cannot learn to escape it. Thousands of generations have taught him that death is in the sea: the old inherited habit has become an “instinct”; and, though it leads him to death, yet he cannot change his “instinct.” Poor lizard! He cannot see that new conditions of life require new modes of action. The way his father did is good enough for him; and so he will perish himself, and all his race will perish with him, unless he learns to adapt himself to the altered times. The essence of an instinct is its lack of reason.

R. McMILLAN.

THE AUTHORITY OF MORALITY.

I.

An Evolutionist, a Transcendentalist, and a Materialist of the old school may be imagined as conversing together thus:—

The Transcendentalist to the Evolutionist. While I see many excellences in your system, I cannot help feeling that it has, at least, one great defect. Suppose I were to admit that Darwin, Spencer, and Fiske have explained fully the origin of conscience, and that it is simply the result of those social sympathies which man has inherited from lower animals: I should be none the less obliged to complain that this theory of its origin

does not establish its authority. No theory about conscience is worth much, unless it shows why it should be obeyed.

The Evolutionist. Conscience ought to be obeyed, in so far as it represents the moral law. There, we both agree. I don't think it ought to be obeyed, when it doesn't represent the moral law? Do you?

T. Is that possible?

E. Paul says that, when he persecuted the Christians, he felt bound in conscience to do so. Garrison, John Brown, and Stonewall Jackson were all three thoroughly conscientious.

T. Well, at all events, I agree with you that conscience ought to be followed, whenever it embodies the moral law. But be so good as to answer one more question. Why should the moral law be obeyed?

E. It is the one indispensable condition of universal happiness.

T. And how do you prove that it is our duty to promote universal happiness?

E. You don't deny it?

T. Certainly not. To me, it is an intuition too sacred to be questioned. But you don't accept that authority. What is your reason for promoting the happiness of your fellow-men?

E. Why, in the first place, it is necessary to my own. Our happiness depends on such an interchange of good offices as would not be possible, unless all were prosperous. I could not enjoy inward or outward peace, if my neighbors were suffering. The more widely happiness spreads through the community, the higher it can rise in each individual. As I enlarge the happiness of others, I elevate and secure my own.

The Materialist. That is exactly the view of Epicurus and Helvetius. I ought to take for my highest end my own happiness, properly understood, and work for that of others as a necessary means. I know you go further; but tell us why?

E. We ought to be grateful for what our race has given us in conscience, in reason, in language, in literature, in government.

M. And why ought we to be grateful for any favor, except partly because the feeling is a pleasant one, and partly because expressing it helps us to stand well with our neighbors and to get further favors?

T. Is not gratitude an instinct whose authority is established by our intuitions?

E. I am like a shuttlecock between two battle-dores. I must insist on the fact that we have disinterested impulses, which have been developed by natural selection, and which urge us to gratify them.

M. It is also the fact that this gratification is in itself an immediate pleasure as well as, in all probability, an ultimate gain. Our disinterested impulses would not have been preserved by natural selection, if they had not been found useful.

E. They have proved more useful to the race and the family than to the individual. The bee's readiness to sting often is fatal to herself, when she runs in her sting so deep that it cannot be drawn out without tearing her to pieces. It is her death, but the salvation of the swarm. The safety of a tribe of savages depends on the willingness of warriors to lay down their lives in battle. In these cases, as in taking care of children, the welfare of the race has developed impulses of such strength that they are followed without regard to selfish interests.

T. But you don't mean that our disinterested impulses are right on account of their strength? That would make it our duty always to follow the strongest motive, whatever it may be.

E. The strength of this motive is due largely to its being shared by all men. I know that others wish me to obey the conditions of universal happiness. I must re-echo that wish, or cease to be in proper harmony of thought and feeling with my race.

T. What makes this harmony proper?

M. Are you sure that the desire to maintain it is perfectly disinterested?

E. I should have mentioned earlier that public opinion requires obedience to the moral law.

M. It is certainly our interest to conform to public opinion.

T. But why is it our duty?

E. All men agree in recognizing the sanctity of morality.

M. No more fully than they did, but two centuries ago, in recognizing the sanctity of priests.

T. I believe that the moral law is holier than any priest. Have I any better authority than conscience for feeling this?

E. Conscience has usually been far too ready to honor priests. The moral law rests on the fact that all individual interests are included in that of the race.

M. Then let each one take care of himself, and the race will not be badly off.

T. The interests of the next generation might suffer; and I have yet to learn why an evolutionist is there to serve them.

E. Universal happiness includes that of all posterity, and universal happiness is the only end which all men can agree to seek harmoniously.

M. And why should we be harmonious? I don't feel sure that the time has come for it yet.

E. Society embodies the rights of all men, and therefore has more right than any single individual.

M. Which shows how much to blame Paul and Luther and Voltaire were in not believing and acting as society wished.

T. And we have still to be told what is the new foundation on which individual rights may rest.

E. They correspond to our duties. If it is my duty to do anything, I have a right to what I need in order to perform it.

T. But you have not yet told us why it is our duty to do anything.

E. I am a member of the race, and it is the duty of the part to serve the whole.

M. That sounds like an intuition.

E. The mere existence of the words *ought*, *right*, *duty*, proves that they have a basis of fact.

M. So does that of the words *ghost*, *hell*, *devil*. Perhaps the only fact underlying your set of words is that we can find our own happiness in that of our neighbors'.

E. We must obey the moral law, or our race would pass away.

M. Thus morality rests on enlightened self-interest.

T. You must admit that, or else say with me that morality is self-evident truth.

M. If it is self-evident, why has there been such need of teaching it? And why have there always been such wide differences between the moral ideas of different ages and lands? It might be very difficult to get together any large number of thoughtful people who agree perfectly about what is right and wrong.

T. Of course, I only mean that the general principles are self-evident intuitions.

M. And how am I to distinguish a self-evident intuition from an inexplicable prejudice?

T. Our moral intuitions embody the will of God.

M. So you say. Others say that the will of God is: "Obey the Pope," "Take the Bible as

infallible," "Follow the Koran," "Listen to the Spirits." How am I to know what the will of God really is? Perhaps it is simply that we should observe the bidding of enlightened self-interest.

T. All men agree that there are moral laws.

M. There are also chemical and botanical and geological laws. The law by which water is composed of oxygen and hydrogen has no exceptions. For aught I know, it has existed from all eternity, and will never pass away. It has not the same authority as the moral law; but is not that simply because men agree to enforce belief in one and not in the other?

E. In observing the moral laws, we come into harmony with that great march of evolution in which is secured, first of all, the welfare of the race; and then, as a secondary consideration, the interests of living individuals. Nature always subordinates the part to the whole.

M. The order of nature creates pestilences and volcanoes, and many causes of temptation. Should I imitate nature in this?

E. Nature, on the whole, promotes universal happiness.

M. And so should we, on the whole. But why should we do so in the exceptional case, in which the happiness of others conflicts with our own?

E. You referred a moment ago to public opinion, and that certainly commands us to act disinterestedly.

M. It also commands us to go to church. Why should I conform to it in one case rather than in the other?

T. And why do we honor most deeply the men who were in advance of public opinion, like Jesus and Roger Williams and Theodore Parker? And how are we to be able to say what is in advance of public opinion and what is behind the age?

E. It is easy to see where the errors of the past have been brought to light by further progress.

T. But can we not know the errors of the age in which we live? Surely, you do not mean to say that whatever is, is right. We need some higher standard than the public opinion of the day.

E. You are right in insisting on what evolutionism ought to furnish; and I must confess that this task has not, so far as I know, yet been completed. You must not expect a new theory to do in a few years more than its rivals have done in many centuries. But I think I could speak about the authority of morality to better purpose, if you will give me time to reconsider the question and write out fully my solution.

F. M. HOLLAND.

FIRST PRINCIPLES IN BELIEF.

III.

Could it be an aimless energy that worked itself out in the forests, that lies dormant in the coal, that is steadfast in the soils men till? Shall we worry about the creeds of the silver and the brass, and fear for Nature's prescience, when our jack-knives are more effective with pine than hickory? And yet this would be but a translation of the philosophy by which we mark men for doom, and deny the unaccustomed goodness that struggles in them for recognition. The clouds that ride gloriously above us, and at their radiant pleasure nourish our fields with timely rain, are not universal, but particular. Lest they stimulate our arrogance as well as our wheat, let us remember that their area is comparative, and that Pennsylvania and Ohio have their bounds! We sit too contentedly nursing our theories. Hope, that does not find its source in our visions, we too hastily discard. If life is altogether as we arrange it, how can we account for Spencer

and Huxley and Haeckel, who confound the best arguments for conformity? Are these men cut off from the beneficence of their origin? Is existence to them a burden, under which they tremble? If we are right, it must be; and yet, because it is not, we surely are wrong. Are we at enmity with those to whom truth chooses to come in disguises we cannot penetrate? If we love virtue, shall we deplore that it is revealed in unexpected places? Think of Socrates, of Confucius, of Emerson: they came in offence to all anticipation, and added to the shrines of the earth. Suppose you tell me such broad sympathy is dismal, and foreshadows spiritual night. We know from science that more rays of light escape us than are utilized, and that men who grope are not always conscious of their inefficiency!

We may remark the tendency of men to harden to immediate and melt toward distant antagonism. I have known this evidence to crop out in a tenderness for fetichism and a scurrility toward agnostic thought that are wholly unaccountable as coming consistently from the same person. The voice of the savage is granted to represent an outpouring of divine excellence. The measure may not be full, but it is wholesome. Physicists, however, whose view of the world takes in some degree of alleged grossness, are strangely accused of lessening divine glory by inquiring into the majesty of its expression; and it is not allowed that they maintain any intercourse with the higher forces of the spheres. The degrading effect of this enchantment is found in a grasping after the remote truth at the expense of the near. It follows that neither debt can be justly paid on such principles.

The scientific commonplace, that "nature abhors a vacuum," can have no meaning to those who assure us, concerning our spiritual affairs, that, when we lose thought we once shared with them, we can have taken up no other. Can we think higher than the universe, or discard this magic sphere that bends our being? Can we ever do that which relieves us of our connection with the suns and soils that rear us? Men who inform us we cannot tell us likewise that, if we dare to offend them, we can. What does this portend? Higher than Shakspeare is Shakspeare's Christianity. Higher than Milton is his creed. Lower than Æschylus is his paganism. Virtue in a Christian is the result of Christianity; in a heathen, of accident. Nature has not a necessary share in the product. From error thus distorted, we are led on to a strange commentary, by which we learn that what is so hard a fabric out of religion's hands is open to creation by chance! Yet, in moments of calmer thought, all men can perceive that in Shakspeare, in Milton, in Æschylus, was something at work that is not explained by the credal auspices under which it is supposed they wrote. This, certainly, does not assume that there is no analysis of their individualities possible, or that the poets could ever be separated from their songs: it simply pushes us back to the natural enlightenment of condition. We have always to build the man of flesh and bones and what not rather than of imagined ingredients. We too often try to devise historic, as we do humble figures, by projection from our own personality. What is in us is in them; what is our need is theirs; and "one man's meat" and "another man's poison" we convene to such confusion as robs the old proverb of all wise description.

Men are not satisfied with virtue or justice simply, but must have the rich waters drawn from their fount. Somehow, we wax jealous of good will in an antagonist. We hate to find honor in the opposite political party. We disparage the

politician who claims to proceed to benefit by other premises than those we favor. We become sectarians, and, if we are Presbyterians, look askance at Methodism. We even have some emulative selfishness when a neighbor lures sweeter flowers to his garden or possesses daughters of superior loveliness. The same arrogance that accounts for military braggadocio and makes petty corporals jealous of minor honor proceeds in our religious thought to vitiate its purity. What we elevate into patriotism, faith, social generosity, is too often a selfish enclosure that narrows our lives and makes us content with narrowness. When Europe was younger, and knew nothing of Eastern life, it banked up in prejudice what it has taken a long lease of growing sight to withdraw. Why should we tremble at the thought of the Lord Buddha or Charles Darwin or Herbert Spencer? Is it because we distrust the virtue we so long professed? Was the god who could legislate for a nation so much more excellent than the god who makes races equally his children? Was the power morally explicable that could hold sovereignty of special mercy superior to that of general good? Shall we, in evil passion, quarrel with Nature that she has formed man, as she has all things of space, in images various? Dare we say that the force that gave the one virtue has not the right to give the many, while we forget that who or what is privileged to choose one form may adopt more than one?

Man is not endowed with power to form and develop man in the cosmic sense, and therefore has no wise contest with Nature's expression of virtue. He is interested in the fact, not in Nature's credentials. When we put ourselves before the acts of our fellows, we usurp moral prestige. And as it is with our persons, so it must be with our faiths. The course of belief demands unrestricted issue. Time will satisfy all questions of warrant and jurisdiction. The popes who put their burly spirituality before Galileo have long since disappeared, while the seer has gone on to eternal remembrance. The mob that lacerated Garrison had its day; while the moralism that found it obstructive has not even now, with all the effulgence that has accrued, paused in its accumulation of glory. Had popes and mobs reflected before the permanent rather than the temporary significance of the lives they assailed, they might have urged history to a different line. Their mistake was in endeavoring to make one sign answer for every direction of development. Nobility was not honored for its merit: it was received only on the word of its credal sponsor. Men quarrelled because Nature had given colors various to the rose, and blessed each with sweet incense. How could this be? Where was revelation in the face of variety? It was altogether a doubting and halting spirituality that was non-plussed by these expressions of Nature's disposition.

We are bound in by strange forces whose whole intent we may never discern. We are born, and have our mellow or tragic careers, and are gone. What does it all portend? To what end are endeavor and trust? Life has *some* meaning: what man but is convinced of *that*? And yet we who assemble subtly together to study these momentous hints and longings show less love in our doubt, when every hand represents so much more of need, than we would in times of certainty. We cannot separate man from the fields. We cannot rob earth of its skies, or the great orbs above of their attendant globe that we call ours to-day. To imagine disunion in these vast processes is to picture insanity. To think that Infinite Energy employs itself upon an atom as separate from all

other atoms is an absurdity. If there is not meaning in every life, there is meaning in none. Nor can this meaning be expressed in terms of degradation. The great glimpses of truth broaden as they descend from barbaric visions. To men who lived in the forests, I am content to let earth be an imagined fastness. To my own fathers and my own sons, I offer thought on a different basis. Man once supposed his objects the centre of divine intention. Even the private person presumed his own little body to be the explanation of the universe. To-day, as we contemplate these stubbles of human weakness, we see that more and more appears in the vista, the higher mental power ascends. When I am at the foot of the great oak, how should I know but that here was the one emission of divinity? But, as I go with the seers upon the mountains, I cast eyes more broadly upon the universal plan. Not in *me* is majesty now focussed: I am one out of all, with certain just relations to my fellows. In the presence of the larger circle, my limitations are well defined. As this consciousness grows, desire, trust, energy,—all powers that go to constitute character,—merge themselves in the common fund. In my sorrow, the universe grieves; in my joy, the universe laughs; in my aims, the universe is interested.

Thus, we go deeply into the question of human fellowship, using no marks of doubt when virtue speaks, and loving rather than hating Nature's frank adoption of the many vehicles of truth, where man would fain have her choose but one. We ask from men for men the same consideration that is given the flowers of the field and the trees of the forest. Each puts forth of its kind. The magic beauty that blushes in the rose must transform difference into unity, and explain human emotion and human reason by rules as generous as those applied to the physical worlds. We must not confuse our ends with our conditions. Life has its sacredness to all, and we should seek more manfully to know what confers this conception of value to individuals before we attempt to trace variability back to cosmical lunacy. As the numberless stars reflect a virtue, each priceless in its sphere, so may men, with compositions intricate beyond ordinary analysis, be taken to master and repeat the impressions of the Infinite Heart.

HORACE L. TRAUBEL.

EDITORIAL NOTES.

BY B. F. U.

SAYS the *Jewish Messenger*: "And now a critic objects to the title 'Reformed Jew.' He will have Ethical Monotheism. Let us amend by reading *Ethical Monologist*, or *Mythical Morphologist*, or *Rabbinical Pantomimist*. Shades of Holdheim & Co.!"

NEVER before in the same length of time have come to us so many or such cordial words in approval of the conduct and in praise of *The Index* as since the beginning of the new year. For these kind expressions, the writers have the editors' thanks.

SAYS the *Boston Courier*: "There is an oddly paradoxical sound to the phrase 'compulsory prayers,' concerning which Harvard College is chronically agitated. Compulsory supplications must have a curious effect both upon the person offering them and the power to which they are addressed."

PAUL BERT says, "Let us begin by disarming the priest, by combating clericalism, by destroy-

ing the confessional, then I shall be only too ready to give women the ballot." French radicals say that such is the influence of the priest and the confessional upon women in France that, with the ballot in their hands, the maintenance of the Republic and of religious liberty would be impossible.

THE *Pittsburg Despatch* attributes the trouble with the coke operators and the rolling-mill company at Newburg to "the foreign element brought in by the employers to squeeze down the wages of the old workingmen," and adds, "Perhaps employers will profit by the lesson that it does not pay to encourage the growth of ignorance and recklessness among their laborers for the sake of saving a few thousand dollars' wages each year."

ABOUT five hundred and twenty-five signatures have been obtained to the petition asking the Legislature of Massachusetts for a law to punish those who cheat on Sunday or refuse afterward to pay for goods purchased on that day. Mr. Leonard Chandler, of West Sterling, collected one hundred and forty-four of these names. Now is the time for those interested in this movement to exert what influence they can at the State House.

DR. JOHNSON, on being asked whether there was not imagination in a certain poem, answered, No, sir, there is what was imagination once. In like manner, we may say that in instinct there is not intelligence, but what was once intelligence: the specially intelligent character has disappeared in the fixed tendency. The action which formerly was tentative, discriminative, has now become automatic and irresistible; but the impulse is always guided by feeling.—*Lewes*.

WE have received the third number of the *Jewish Reformer*, published at 29 and 31 Chatham Street, New York, and edited by Dr. K. Kohler, Dr. E. G. Hirsch, and Dr. Adolph Moses. From the leading editorial, on "Ethical Judaism," the following passage is given:—

Judaism stands and falls with *ethical monotheism*. Reform stands for ethical monotheism. Therefore, reform is Judaism. That is our syllogism. Perhaps its parts require further elucidation: The "law" which went out of Zion was naught but the law of highest morality. Heathenism is immoral; religion is a bargain between God and man; Christianity denies the possibility of a moral life without supernatural regeneration. The Islam is fatalism. The will of God crushes the freedom of man. Its morality is conditioned upon belief, and is hedonistic. Buddhism is despair. Pessimism is immoral, Ed. von Hartmann to the contrary, notwithstanding. The morality of Unitarianism is sentimental. Certainly, its ideal is of the past. The moral man has come. The neo-Kantian morality fails to grasp the truth that morality is the law of the universe upon which we are dependent while it is not dependent upon us. It fails, in other words, to give its ethics the keystone,—*God*.

THE editor of the *Popular Science Monthly* thinks that Spiritualism has been "an agency for discrediting the ghost, or, at least, for narrowing and regulating his heretofore wilful activities. The Spiritualistic ghost, in a word, has been tamed by the medium. He no longer goes gliding or skulking about on his terrifying nocturnal errands. On the contrary, he comes meekly at the call of his master or mistress, and, the conditions being favorable, utters through the table leg such harmless platitudes as seem most suited to the average intelligence of the audience. This is a great improvement upon the old plan, according to which every man met this ghost in solitude, at the midnight hour, and, with his blood in a state of distressing coagulation, was compelled to listen to some dire prediction of coming doom. All our methods nowadays are more or less scientific;

and the comfortable séance may be compared to the beneficent lightning-rod, with its many points for draining off the otherwise dangerous electrical accumulations of the atmosphere. Instead of meeting the ghost alone, and encountering the full weight of his supernatural terrors, we meet him in pleasant company, where his force is so dispersed that no one gets more than a proper, moderate, and enjoyable share."

A New York correspondent of the Philadelphia *Times* writes: "The Society for Ethical Culture is one of the curious gatherings of this city on Sunday. I do not know exactly what its aims and purposes are; but it is a semi-religious body, with no particular creed. It meets in Chickering Hall every Sunday morning, and Prof. Felix Adler is the leader of the flock. He is just now the reigning sensation of the religious world here. His congregations are a queer mixture of intellectual people, quite exceptional in character and make-up. Mr. Adler is an ex-Jewish rabbi, and is to-day the most conspicuous leader of respectable free thought in unorthodox New York. He is a bold, fearless thinker, who is not afraid to push his logic to its conclusions. People whose views are from his as wide apart as the poles crowd to hear his Sunday morning addresses. He has been a hard student, and his remarks are always worth hearing. While within the pale of the Jewish faith, he became dissatisfied, and cast about the other creeds in the hope of finding a safe anchorage in some one of them; but he says that he failed to find it in any of the established Churches. . . . He could not accept any known type of religion, and, on the other hand, he could not wholly reject it all. He got out of the difficulty by saying: 'I will retain the moral principles which are the common basis of all the religions; and I will reject the dogmatic parts, the formulæ, the ritual and mythological fables, which deface and obscure the human characters of the various denominational creeds.' . . . Substantially, this is his platform: To accept with your whole heart and soul, and maintain to the death, all the moral good, and to ruthlessly cut off, as with a surgeon's knife, all the dogmatic errors and the fables of all the creeds."

GIVING.

For The Index.

The fruit is juiceless hanging on the tree,
And gold but dross until it spended be;
The flower when plucked, if ever, then is sweet,
'Tis dying embers give the greatest heat.

Only when used does life's web ever wear
The sheen of beauty that most makes it fair.
Whate'er we save is only thrown away,
And all we give awaits a brighter day.

E. B. CALLENDER.

IDOLS.—A SONNET.

For The Index.

The charming fairy-tales which gently soothe
Our childhood's easy griefs must melt away,
And sad Reality will soon dismay
The bright phantasmal idols of our youth.

But from them our Ideals spring forsooth.
The childish frolic doth the man display.
As fruit grows, whilst the blossom must decay,
Thus from romantic errors springs the truth.

But, when the creed of Christianity
Breaks down, it merely is the husk, which shows
The evil fate of transient vanity.

Out of the bursting germ the fruit-tree grows,
And Idols of religion will disclose
The high Ideal of Humanity.

The Index.

BOSTON, JANUARY 28, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, : : : : : } Editors.
BENJAMIN F. UNDERWOOD, : : : : : }

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsolicited editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

JOSEPH PRIESTLEY.*

BY DAVID H. CLARK.

A Paper read before the Cambridge Sunday Club,
also before the Parker Memorial Science
Class, and on other occasions.

At the close of his six years at Leeds, Priestley was secured, through the kind offices of friends, the situation of librarian and "literary companion" of Lord Shelburne, afterward distinguished as the Marquis of Lansdowne. The offer was readily accepted, as its terms were exceedingly generous and afforded special advantages for the prosecution of his intellectual pursuits. The arrangement included a salary of \$1,250, with the assurance of a life pension of \$750 in case the relation should be dissolved. An allowance of \$200 was also to be granted for expenditure in experiments and scientific research. Priestley accompanied Lord Shelburne, as his travelling companion, in Holland and Germany, and spent some time in Paris, where he made the acquaintance of many of the most distinguished scientific and intellectual personages of the day. While at Paris, he was present at a discussion between two chemists as to the nature of red precipitate, now called mercuric oxide. "It is not improbable," remarked Prof. Croft, at the Centennial of Chemistry, held at Northumberland a few years ago, "that what he heard that day led to his future experiments, and hence to this meeting." "When in Paris," continues Prof. Croft, "he was told by certain savans that he was the only sensible man they had ever seen who believed in Christianity. Hence, while laughed at in France for being a Christian, he was decried in his own country as being what some persons called an atheist. The latter is entirely untrue, for there was probably never a more truly religious man than Joseph Priestley." The year 1774 is a very notable one in the history of chemistry. It is associated with

* Concluded from last week.

so many important discoveries in this science that it is designated its modern starting-point. But there are none of these discoveries that have contributed so much to its distinction as the great one with which the name of Priestley is pre-eminently and permanently connected. I refer to that of oxygen gas. This occurred Aug. 1, 1774, and as follows:—

Priestley had been for some time, as we have seen, deeply engaged in investigations in respect to air and the evolution of gases from various substances. In the course of these experiments, he was induced to select for trial a red powder, called mercuric oxide, one of the compounds of mercury or quicksilver, which he knew contained mercury and something else besides. This he put into a glass bulb with a tube connecting with a basin and running up at the end into an inverted jar, the rest of the tube, the basin, and the jar being filled with mercury. Then he took a powerful burning glass, and concentrated the rays of the sun upon the powder in the bulb. Soon the powder became very hot, and a gas arose out of it, and passed along the tube into the jar, driving out the mercury; while the red color began to disappear in the bulb, and only pure shining mercury remained behind. So far, he had only proved that red mercuric oxide is made up of mercury and gas. This gas, he found, possessed very peculiar properties. Unlike "fixed air," it would not dissolve in water. Instead of putting out a lighted taper, it greatly enhanced the brilliancy of the flame. Even such solid substances as iron and other metals burned in it like wood. It was clear that it could not be either "fixed air" (carbonic acid gas) or "inflammable air" (hydrogen gas), since neither of these was capable of such effects. It occurred to him to test the effect of this wonderful gas upon living beings. Upon putting two mice under a glass receiver, they were found to be greatly exhilarated by its influence. The same experiments were tried with carbonic acid gas, but with an entirely opposite result. When he inhaled this newly discovered gas, he experienced a singularly enlivening sensation. "Who can tell," he said, "whether this pure air may not become a fashionable luxury? As yet, only two mice and myself have had the privilege of breathing it." "When we reflect," says Prof. Youmans, in referring to this great discovery of oxygen gas, "that this wonderful substance is the active element of the atmosphere, and essential to the activity and existence of the entire living world; that it enters largely into the composition of all natural objects around us, forming three-fourths of the weight of the rocky strata and eight-ninths of the oceans; and, moreover, that it is an element of great chemical energy, and is involved in nearly every transformation of nature and in the processes of the arts,—we shall be prepared to comprehend the significance of the discovery. It has given us a new chemistry and a new physiology, and it probably carries the mind of man deeper into the order of nature than any other scientific revelation ever made." Dr. John W. Draper estimates its importance in no less glowing terms. "It was found," says he, "not alone to affect chemistry, properly speaking. It threw a light on every allied science. The chemistry of that day was overthrown. Without any exaggeration, I characterize it as the capital discovery of the last age, rivalling in its importance and in its results the great discovery of the preceding century,—universal gravitation by Newton." Three years before, Priestley had made the same discovery by another process, but failed to apprehend its significance. It was also made independently by Scheele, in 1775. Lavoisier, who gave

to oxygen gas its name, laid claim to the discovery; but the credit of it is generally awarded to Priestley.

It is exceedingly difficult for even extraordinary minds to liberate themselves from the trammels of theories which they have been accustomed to implicitly hold, although, in the light of the latest knowledge, those theories are shown to be no longer tenable. Priestley was no exception to this. A hundred years before, Stahl, a German chemist, to whom this science is much indebted, while he was the author of some very great errors in respect to it that long survived him, propounded a theory of combustion which, up to the time of Priestley's great discovery, was of general acceptance. It maintained that all bodies which burn contain an invisible substance, which he called *phlogiston*, that is set free and transmitted to the air, when combustion takes place. The discovery of Priestley disclosed at once, when clearly understood, the fallacy of this theory. It was made plain that, instead of a body parting with something in burning, it actually added something to itself. But Priestley still held to the *phlogiston* hypothesis, even after it had been abandoned by the leading chemists of his day. He accordingly gave to his discovery the name of *dephlogisticated air*,—air from which *phlogiston* had been expelled. But, important as was the splendid achievement just considered, it did not conclude his researches in science, not even in this department. They continued to his latest years. In addition to the discovery of oxygen gas, he is recognized as the discoverer of nitrous oxide gas, or what is known as laughing gas, and a number of other gases sufficient, it has been remarked, to establish the fame of half a dozen ordinary workers. Pushing forward his investigations in the line which he had pursued with so much success, he was led into a series of important experiments in respect to the diffusion of gases,—the operation of those of different densities when mixed with each other,—and has the credit of having thus given the impulse to some of the most brilliant discoveries in this direction of those who succeeded him. Indeed, so important and numerous were his discoveries that he has been called the father of pneumatic chemistry. Without attempting to enumerate all of his contributions to science or its indebtedness to his unwearying assiduity, I may mention, before concluding this cursory survey of his scientific labors, that among his researches are to be included the discoveries in respect to the influence of oxygen on the color of the blood, and the preservation of animals from putrefaction after they are dead, which he showed to be possible,—a fact, however, which has not been utilized until comparatively recently, in the transportation of this kind of food supply from the great abattoirs of the West. Photography credits, also, to one of his experiments the first germ of its art. These discoveries were all the more remarkable when it is remembered that his science was not an acquirement of the schools. Indeed, his preparation for his researches was of the most meagre description. It was almost nothing. He was, in a word, a self-educated devotee of science, with scarcely any of the facilities for such pursuits accessible to men of science to-day. The apparatus with which he conducted his experiments were chiefly made by himself or by those who had no experience in such work, under his direction. But they were so simple and fittingly adapted to their purpose that some of them are still in use in the laboratory of the chemist. "A prophet is not without honor, save in his own country and among his own kindred." Priestley's achieve-

ments now attracted the attention of scientific men everywhere. The universities of Paris and St. Petersburg made him an honorary member of their bodies. And yet, while learned bodies and institutions abroad thus vied with each other to render their tributes to him, the universities of his own country, which were wholly under the control of the defenders of the faith, seemed to consider his heretical offences sufficiently grave to entitle them to cancel to the end all such claims to their awards and recognition.

But we should form a very inadequate comprehension of Priestley or his intellectual activity, if we contemplated him simply as a man of science or took into account only what he accomplished in this sphere. It must not be forgotten that he was by profession a clergyman, engaged for a considerable period of even the most productive portion of his intellectual career in regular pastoral and pulpit ministrations, and affectionately endeared to those toward whom he sustained these relations. There were no other interests, however alluring or captivating, that could lessen his devotion to this vocation. There were no honors or successes more prized than those which came to him in the faithful discharge of its duties and labors. "I continued," he wrote of his life at Leeds, "very happy, with a liberal, harmonious, and friendly congregation, to whom my services, of which I was not sparing, were very acceptable. Here I had no unreasonable prejudices to contend with, so that I had full scope for every kind of exertion; and I can truly say that I considered the office of a Christian minister the most honorable of any on earth, and, in the studies proper to it, always took the greatest pleasure." Amid such cheerful consecration to the cares and responsibilities of the clergyman and teacher, and while his reputation was steadily growing in all directions, he was continually adding books and pamphlets of one description or another to the list of his published writings. The mere reading of the titles of these, as they emanated in rapid succession from his pen, strikingly exhibits the wide and versatile range of his faculties. Besides those already mentioned, the full enumeration of them includes *A History of the Present State of Discoveries relating to Vision, Light, and Color*; *A Chart of Biography*; *The Constitution and Laus of England*; *Letters to a Philosophical Institution*; *An Answer to Gibbon*; *An Examination of the Theories of the Scotch Metaphysicians*, Reid, Beattie, and others, designed to refute what was known as the philosophy of common sense, of which those named were the foremost representatives; *Disquisitions on Matter and Spirit*,—in other words, a defence of theological materialism; *The Doctrine of Necessity*, of which Priestley was a sturdy and uncompromising champion; a *History of the Corruptions of Christianity*, which was so offensive to Orthodox sensibilities, on account of its free handling of the origin and early development of the Christian system and doctrines, that it was officially ordered to be burned by the common hangman in the city of Dort,—the survival of a custom of earlier days of persecution, since certain writings of Milton had been subjected to the same edict, a hundred years before, on the restoration of the Stuarts. The catalogue of Priestley's works embraces also *Familiar Letters to the Inhabitants of Birmingham*, *The Roman Catholic Claim*, *The American War*, a reply to Edmund Burke's *Reflections upon the French Revolution*, twenty volumes of tracts in favor of dissenters and their rights. These and numerous other books and pamphlets upon controversial and various topics, as occasion prompted them, shared in the work of his active brain and tireless hand

up to the last days of his life, constituting a list which numbered in all more than one hundred volumes, and give him the distinction of being pronounced the most voluminous writer of any age or country. Of course, it could hardly be expected that such remarkable fertility would have, in any very large degree, a permanent value. Many of his writings were called forth by the events of the time. It is not strange, therefore, that he should share in the common fate of authors whose productions owe their origin to such influences, and that most of his should now be forgotten.

There was still another sphere of Priestley's labors in which he sustained an important relation to his time. He was even more than a preacher, a schoolmaster, or a man of science or letters. He was an independent thinker in theology, a brave iconoclast, a social and political reformer and philosopher. In a very characteristic degree, it was his mental tendency to look forward rather than backward. Bred and nurtured under the austere and dismal influence of Calvinistic theology, he steadily advanced beyond one tenet after another of its system, until he had reached the more cheerful and rationalistic ground of the Unitarian position, and was enabled to give, through the force of his writings and preaching, an important impetus to that movement both in England and this country. It was but natural that Priestley's repugnance to the union of Church and State should cause him to assume toward the Church of England a hostile attitude. He earnestly and ably pleaded the cause of the dissenters, and pointed out with unanswerable clearness and vigor the injustice of their disabilities.

The Act of Uniformity, dating as far back as the reign of Elizabeth, and the Corporation and Test Act, from that of Charles II., still survived as a part of the law of the land, as they did for for about half a century afterward.

According to these acts, no one could hold any civil office who had not first received the sacrament and subscribed to the Thirty-nine Articles. It was required that the clergyman should give his entire assent to these articles, not only at his ordination, but upon every change of settlement. A dissenter could not teach or preach without the risk of incurring a heavy fine and a long imprisonment. As an aid to a more effectual combat of such flagrant injustice, Priestley began the publication of a periodical called the *Repository*, which he continued for a number of years. In it, he maintained the equal rights of all irrespective of their religious opinions, and affirmed that he desired nothing for the Protestant that he was not willing to concede to the Roman Catholic. He addressed a series of letters to the students of Oxford, who were compelled to subscribe to the articles of the Church in order to enter that institution. These letters were replied to by the president of the college under an assumed name, who, instead of attempting to answer Priestley's argument, sought to slur his character and depreciate his abilities. But such a mode of argument must have proved, with all but those of inveterate ignorance and prejudice, more damaging to the assailant than the assailed. When Blackstone's great work entitled *Commentaries on the Laus of England* appeared, it was found to include an approval of the statutes imposing penalties and confiscations upon those who spoke derogatorily of the Book of Common Prayer. Dr. Priestley at once attacked the position and showed the benighted character of such laws, and at the same time convicted the famous author of errors in his statements. The eminent author magnanimously acknowledged the force of the criticism, and promised to cancel the objectionable passages

in future editions of his works. The conspicuous attitude which Dr. Priestley thus took as an ecclesiastical reformer, and especially as an opponent of the English Church, aroused the bitter animosity of that establishment against him. This was so intense that the clergymen of that Church who won the credit of successfully answering him, whether they had done so in fact or not, thereby attained an encouraging prospect of access to the highest ecclesiastical preferments,—a circumstance which gave currency to the saying that Priestley appointed the bishops of England.

The connection between Dr. Priestley and Lord Shelburne, hitherto referred to, continued for seven years, when it was dissolved for reasons which have not been clearly explained. It was at the close of this period that was produced what has been pronounced the most powerful of his philosophical treatises,—indeed, one of the ablest of its kind in the English language,—*Disquisitions relating to Matter and Spirit*. Its conclusions Priestley acknowledges himself to be "materialistic." A single specimen passage, like the following, confirms it: "Man, according to this system, is no more than we now see of him. His being commences at the time of his conception or, perhaps, at an earlier period. The corporeal and mental faculties, in being in the same substance, grow, ripen, and decay together; and, whenever the system is dissolved, it continues in a state of dissolution till it shall please that Almighty Being who called it into existence to restore it to life again." It has been conjectured that the publication of this work may have had some influence upon the termination of the relation which subsisted between Priestley and his patron. This is strengthened by this passage in his Autobiography: "It being probable that this publication would be unpopular, and might be the means of bringing odium on my patron, several attempts were made by his friends, though none by himself, to dissuade me from printing it. But being, as I thought, engaged in the cause of important truth, I proceeded without regard to any consequences."

It is but a reasonable presumption, therefore, that his lordship did not find it altogether a comfortable alliance, nor advantageous to his political interests to continue so intimate a fellowship with one toward whom prejudice and hostile feeling set so strongly. To Lord Shelburne, however, it should be said, belongs the credit of faithfully carrying out on the separation all the terms of the contract.

Priestley now resumed his former occupation, and accepted an invitation to take charge of a large and flourishing congregation at Birmingham. This settlement was a very gratifying event to him. It considerably improved his pecuniary condition, and afforded him certain other special advantages. Birmingham appears to have been at this time a centre of remarkable intelligence. It was the home of Watt, the immortal inventor of the steam-engine, and of Boulton, his partner; of Wedgwood, whose name acquired a world-wide reputation as a maker of pottery; of Darwin, the distinguished father of an even more distinguished son, and others of note. With these and the best social life of the place, he enjoyed a friendly and cordial fellowship. But the serenity and pleasant sunshine of those days were destined to but a short duration. He was, as we have seen, a warrior who slept upon his arms and was ever ready for battle. He became involved in sturdy and spirited controversies, not alone with representatives of the Established Church, but with those of almost every sect.

The French Revolution broke forth and spread like the flames of a mighty conflagration, not alone

in the streets of Paris, but all over Europe; setting in action intensely excited feeling, sharp discussions, clashing opinions and sympathies, before which everything else, for a time, was forgotten. Priestley had already made it clear by his writings as well as by the general cast of his characteristics that he was at heart as well as in theory a republican. In the great contest of the American colonies, he unhesitatingly announced that his sympathies were on their side. According to the doctrines of his political philosophy, "All people live in society for mutual advantage, so that the good and happiness of the members—that is, the majority of the members—of any State is the great standard by which everything relating to that State must finally be determined,"—a passage from which Bentham is said to have acknowledged that he derived his famous expression, "the greatest good of the greatest number."

In his essay on "The First Principles of Government," Priestley maintained that "kings, senators, and nobles" are "the servants of the public," and thus, under certain conditions, he justified revolution. But, while Priestley was a revolutionist, it was not of a blood-thirsty type. He shrank from violence, and contended that all such changes should be brought about by peaceful means. Similar views were entertained by him in respect to transition from existing religious systems. He thought ecclesiastical authority necessary in an infant state of society, and should continue in some degree until society is prepared for larger freedom. "If, therefore, I were asked," said he, "whether I should approve of the immediate dissolution of all ecclesiastical establishments in Europe, I should answer, No. Let experiment be first made of alterations, or, which is the same thing, of better establishments at present. Let them be reformed in many essential articles, and then not thrown aside entirely till it be found by experience that no good can be made of them." He proposed, to adopt a familiar industrial phrase of our day, "a big cut down" in the articles of faith, and thought that thirty-eight out of the thirty-nine could be dispensed with.

Sentiments like these, coupled with his answer to the brilliant and vituperative tirade of Edmund Burke, under the title of *Reflections on the French Revolution*, while they enhanced the popularity of Priestley in France, produced quite the opposite effect among his countrymen. The revolutionists of Paris showed their appreciation of his sympathy for their cause by the compliment of his election as a citizen of France and a member of its Assembly, which served to add fuel to this flame of adverse feeling. The most malicious and defamatory charges were put in circulation against him. It was currently reported that he had entered into a league with the dissenters and French revolutionists to overthrow the government. Passages from his writings were seized upon and grossly perverted. "Down with Presbyterianism and Priestley!" became the popular toast of the day. The children in the street took up the cry. The most atrocious libels on his character were published, and tracts and caricatures scattered profusely to imbitter the public mind against him. In one of these prints, entitled "Sedition and Atheism," Silas Deane, an imaginary person, is represented on his death-bed. A clergyman stands by him, holding up his hands, and exclaiming: "No God! Who taught you that doctrine?" The dying man replies, "Dr. Priestley." There was, of course, not a shadow of truth in the imputation, as the whole work and spirit of his life bore unequivocal evidence.

This hostility to him reached its climax on the anniversary of the storming of the Bastille at Birmingham, in 1791. The event was commemo-

rated with a dinner at a tavern, by some sympathizers with the French Revolution. Such a celebration was naturally calculated, in the excited state of feeling prevailing, to provoke an outbreak of the pent-up rage and hatred cherished toward persons of this class by those of conservative sentiments and feelings. A furious mob took possession of the town, and for three days reigned with unrestrained violence. The chapels and houses of dissenters were burned and demolished. Priestley, fearless of danger, was quietly passing the evening over a game of backgammon, when intelligence came to him that the infuriated mob were in pursuit of him; and he and his family were compelled to flee for their lives. His house was set on fire; and his library and apparatus, with many valuable manuscripts and literary accumulations, the fruits of years of studious industry, perished in the devouring flames. Priestley secretly watched at a distance the ruthless destruction. He escaped to London in a state coach, under an assumed name; and the members of his family were saved from death through the concealment secured them by friends, who believed him in such peril that they would not permit him for weeks to appear in the streets. After a while, he was invited to take charge of a congregation at Hackney, a suburban village; but so great was his unpopularity that it was impossible for him to hire a house in his own name, and he was obliged to get a friend to lease one for him. Servants could not be induced to live in the house which he occupied. Even his learned friends turned the cold shoulder toward him. The members of the Royal Society would not associate with him, and he was compelled to withdraw his name from that body. The persecution extended to his family. His son, forced to relinquish a profitable business partnership on this account, emigrated to America. At a dinner of clergymen, on one of those present declaring that, if Dr. Priestley were mounted on a pile of his works, he would be ready to set fire to it and burn him alive, all applauded the speaker, and expressed their willingness to lend a hand, in such a case, to this gentle and brilliant process of extinguishing the troublesome disbeliever.

The animosity which Priestley had aroused followed him to Hackney, and rendered his settlement there uncomfortable. He was accordingly induced at last, with much reluctance and great sadness of heart, to sever the endearments which bound him to his native land, and seek a refuge beyond the sea. His farewell sermon to those who crowded to hear him on the occasion is full of tender regret at the parting.

After a voyage of two months, he landed in New York, in June, 1794. Numerous learned societies and distinguished individuals extended him a cordial greeting, though some of the clergy took occasion to preach against him and his doctrines. A professorship of chemistry in the University of Pennsylvania was tendered to him, which, however, he declined. After preaching a short time in Philadelphia, where many persons of eminence were attracted to hear him, he rejoined his two sons at Northumberland, on the Susquehanna, to which I referred in the beginning, and where they had purchased a large tract of land which they were subduing to cultivation. Here, in this wild and almost uninhabited retreat, secluded from the strifes of the world in which he had participated so long, he passed in quiet thought and study the last ten years of his life. But his nature was too busy a one for even these years to pass without some outward signs of his surviving interest in the world of letters and men, from which he had so cruelly been forced to withdraw. He contributed to scientific journals and societies, from time

to time, reports of his continued investigations, and also gave vent to his opinions, through the press in this country, upon questions of the day. Some of the latter communications were exceedingly distasteful to the conservative elements of society, and caused him to be fiercely assailed. He was accused of being an enemy of the country, and a call was made for the sedition law to be put in force against him. Here is a specimen of the virulence which this antipathy sometimes assumed. "I hope I shall see the malignant old Tartruff of Northumberland," wrote one in a newspaper of the day, "begging his bread through the streets, and ending his days in the poor-house, without a friend to close his eyes." But his cheerful resignation and philosophic calmness of spirit could not be subdued, and never forsook him to the end. He was full of great literary projects to the last, and told his physician, when failing health began to indicate the final event was near, that he would like to have him "patch him up for six months," that he might finish some work which he wished to accomplish.

Among his friends and correspondents in this country were many eminent persons. Jefferson showed a special interest in him, and, when President, invited him to Washington; but he seems to have shown little inclination to leave his exile, and hence the invitation was never accepted. Though seemingly an angry polemic, Priestley was, in fact, one of the most amiable and gentle of men, and almost invariably conciliated the prejudice of those who came in contact with him. Many illustrations of this might be given. I will give but a single one. "He happened to visit a friend whose husband was absent, and feared to mention his name to a Calvinistic divine who was present. But, by chance, the secret came out, when he of the Genevan school drew back, saying, 'Dr. Priestley, I cannot be cordial.' Whereupon, the Doctor, with his usual placid demeanor, said that he and the lady might be allowed to converse until their host returned. By degrees, the conversation became general; and the repudiator was won over by curiosity at first, then by gratification. He remained until a late hour, hanging on Priestley's lips. He took his departure at length, and told the host as he left the house that never had he passed so delightful an evening, though he admitted that he began it like a fool and a brute."

Though the predominant tendency of his mind was radical and rationalistic, as we have seen, he was also decidedly religious, and set apart a portion of each day to prayer and private devotion. It is not strange that he should have been bewildered, as were many of the noblest and best intellects of his time, by the religious ideas in which he had been bred. He was a strong believer in the second coming of Christ as near at hand, and wrote to a friend that, since he came to this country, his chief interest in European affairs had been in connection with Old Testament prophecy. He was also a believer in what is known in philosophy as the doctrine of necessity. He was a materialist in a theological sense; in other words, he considered the soul so involved in the body that it could not exist apart from it. According to his view, the soul slumbered in the grave until the resurrection, when it would again assume its body, and enter upon an immortal existence.

Thus closed the life of this remarkable man amid the quiet scenes of his Pennsylvanian retreat on the 6th of February, 1804. His wife had passed away two years before. The custom of his grandchildren to kneel for their prayers and repeat their hymns at his side, when on his death-bed, lent a soothing influence to his gentle and

religious spirit at the last. He dictated clearly and audibly alterations in one of his manuscripts. "That is right," he said. "I have now done," and shortly expired.

The house where he lived, a comely and substantial structure, though of old-time suggestiveness, with the aperture in the roof where he was accustomed to adjust his telescope to watch the stars, and the laboratory, where many an hour was passed in patient experiment and research, still stands as an interesting memento of its once illustrious occupant. There is also to be seen the little church, with the marble tablet upon the wall to his memory, where he was accustomed to preach to the congregation which he gathered about him.

The University of Oxford, which steadily withheld its honors from Priestley while living, did the work meet for repentance, in 1880, of erecting, within its precincts, a statue to his memory. On the 1st of August, 1874, the chemists of this country, including a large number of its most distinguished representatives, met at Northumberland to celebrate a centennial of chemistry,—the hundredth anniversary of his great discovery of oxygen gas.

The leading newspapers of New York and other cities sent their reporters, and eagerly gave up their columns to extended accounts of the proceedings. The same day there was another assembly in honor of Priestley at Birmingham, Eng., where, less than a hundred years before, he made his escape from the mob that threatened his life. An address appropriate to the occasion was delivered by Prof. Huxley, while telegrams of congratulatory greeting passed across the water between the two commemorative assemblies of Birmingham and Northumberland; thus adding another illustration to the long succession of such of the strange inconsistency of mankind in its treatment of its benefactors,—those whose lives have been consecrated to truth and humanity,—the tardy honors which at last come to the hero and the martyr, as, in the words of our poet,—

"The hooting mob of yesterday in silent awe return,
To glean up the scattered ashes into History's golden urn."

[I inadvertently left out of the manuscript of that part of this essay which was printed last week some words of sufficient importance, I think, to call for a reference to them here. It occurred to me as quite remarkable that three of the most eminent theologians of modern times should all have been distinguished in youth for their observation and love of nature, going to show that early surroundings may be sometimes as potent as innate predilections in determining one's future. On page 335 and in the third part of the third column, I cite Jonathan Edwards as one of the instances just referred to. The second example I intended to give was Theodore Parker. But in the sentence which reads, "Similar testimony is on record relative," etc., these words "to Theodore Parker as," that should have followed here, are dropped, thus confounding Parker and Edwards,—a singularly incongruous union, as is at once apparent.—D. H. C.]

CORRESPONDENCE.

THE MECHANICAL FALLACY.

Editors of The Index:—

It was with pleasure I read Mr. Montgomery's essay and Mr. Chappellsmith's additional.

The latest biological researches in Germany show Montgomery to be correct in assisting to banish mechanical views from biology.

Dr. Gaule (in Report before Der Versammlung der Naturforscher und Aerzte zu Strassburg) has proved, beyond the shadow of a doubt, that "the mysterious entity, which, beyond consciousness, carries on with unremitting faithfulness the functions of life" (Montgomery), is a colony of amoeboid and protoplasmoid individuals; that the human system is a clear case of symbolisms, and not a cell aggregation combined by a special mechanism.

Gaule's are the most momentous discoveries since Mr. Darwin's *Origin of Species*, for they furnish a

true knowledge how the changes are brought about. They are the death-blow to the cosmogenetic evolutionary wheel-work, and destroy the last hopes of the mystics.

Some one competent ought to furnish *The Index* with a paper on it, as I think it would be of the greatest interest to its readers and a feast for Mr. Chappellsmith.

Those who are acquainted with Metchnikoff's investigation (Virchow's *Annalen der Pathologischen Anatomie*)—the only scientist, as Carl Vogt declares, who solved the problem of the germ diseases—will know that those amoeboid individuals known as the white blood cells destroy the germs in the blood, as their prototypes destroy them in the water. Vogt calls them, humorously, microbe-eaters.

KARL CROLEY.

PLEASANTVILLE STATION, N.Y.

THE CHURCH OF THE UNITED STATES.

Editors of The Index:—

If the House shall pass the Edmunds bill (which provides that the government shall administer the property of the Mormon Church by means of trustees appointed by the President), the United States will then have an established religion like other people; and that religion will be the Mormon!

This point is not original; for I have, I think, seen it somewhere before. There is no harm in calling attention to it.

The Constitution says (Art. 1, Amend.), "Congress shall make no law respecting an establishment of religion."

J. S. PEART.

BOOK NOTICES.

CREATION vs. EVOLUTION. By Mrs. H. V. Reed, author of "Earnest Words" and "The Bible Triumphant." Boston: H. L. Hastings. Chicago: Knight & Leonard. 1885. pp. 32. Price 25 cents.

We do not remember to have read a more unsatisfactory work than this on the subject treated. The author knows too little about evolution to write intelligently in regard to it; and her acquaintance with the literature of evolution is so extremely meagre that her quotations and references—generally without mention of page or volume even, and taken, in most cases, from newspapers or other second-hand sources—often convey entirely erroneous impression as to the views of the authors cited. The work aims to show—after giving "a history of the theory," and such a history! that "the best authorities in the scientific world" condemn evolution. Thus, Agassiz declared that "the theory of [evolution] is a scientific blunder, untrue in its facts, unscientific in its methods, and ruinous in its tendency." It is a little surprising that, in the following chapters, our author attempts to show that "the ablest and best advocates" of this "scientific blunder," so "ruinous in its tendency," are those who "reverently believe in God, and believe also that the process of development is in perfect harmony with divine law," etc. If Mrs. Reed had compiled this little pamphlet with any knowledge of the writings of authors she names, nothing could save her from the charge of intentional misrepresentation. We will mention only one instance. On page 18, a passage is given from "Lyell, the well-known geologist," as the result of careful inquiry, "that each species was endowed at the time of its creation with the attributes and organs by which it is distinguished." Whether the quotation is correct we cannot say, for there is no reference to any of Lyell's works. But, assuming that the words are correctly quoted from some of Lyell's earlier writings, the unfairness of giving them without comment is sufficiently evident, when we consider that, in his later writings, Lyell accepted Darwin's theory, and wrote with great ability and effectiveness in refutation of the view expressed in the words quoted above. The spirit of the work is extremely dogmatic, as the treatment is superficial; and, as a contribution to the discussion of a great subject which requires scientific knowledge and a philosophic spirit, it is worthless.

E. F. U.

BIOGRAPHIES OF ANCIENT AND MODERN CELEBRATED FREE THINKERS. Reprinted from an English work entitled *Half-hours with the Free Thinkers*. By "Iconoclast," Collins, and Watts. Boston: J. P. Mendum. 1885. pp. 344.

While these biographies, first published some thirty years ago, created more of a sensation than their

republication can possibly make in any religious circles of to-day, they yet form an interesting volume of readable sketches of the life and works of a number of talented men and one remarkable woman, of different phases of genius and varied degrees of fame. The one woman thus honored is Frances Wright, of whom a charming sketch is given, with pertinent quotations from her writings. Epicurus, Zeno, Hobbes, Matthew Tindal, John Toland, Spinoza, Descartes, Dr. Thomas Burnet, Charles Blount, Bolingbroke, Mirabaud, D'Holbach, Voltaire, Condorcet, Volney, Helvetius, Hume, Paine, Shelley, Robert Taylor, Anthony Collins, and Joseph Barker are the other free thinkers whose lives and work find record in this compact and nicely bound volume. It was the aim of the editors and compilers, as stated in the preface, to present "free and manly thoughts to our readers, hoping to induce like thinking in them, and trusting that noble work may follow noble thoughts." An additional reason for their publication is that they wished "all men to know that great minds and good men have sought truth, apart from faith, for many ages."

We do not think that the name of the smart but superficial, vacillating, and vituperative Joseph Barker, who was "everything by turns, and nothing long," and who, on leaving them, coarsely abused the adherents of every sect, party, and class with whom he was associated, is entitled to a place in this list; but, if it is retained in the next edition, we hope the sketch will give some account of the last twenty-five years of Barker's life, including his return to Methodism.

The Century for January promises well for the instruction and entertainment of its army of readers for 1886. The second and concluding paper descriptive of "The City of Teherán," by ex-Minister S. G. W. Benjamin, is the opening article, and is profusely illustrated with characteristic scenes from Persian every-day life. Dr. R. Shufeldt has an interesting scientific article on "The Feathered Forms of Other Days," which is accompanied by illustrations of the fossil remains of a feathered reptile, or reptile-like bird, with teeth, and several restorations of extinct forms of other curious birds of an earlier age. Three articles of interest to artists are: "A French Painter and his Pupils," which gives a series of short talks given by the French painter, Carolus Duran, to his pupils; "The Lesson of Greek Art," by Charles Waldstein; and "A Broad View of Art," in "Topics." Frederick A. Schwab gives an anecdotal sketch of Verdi, the composer, whose portrait is given in the frontispiece. "Pointers" are the typical dogs considered in this number. The War Series contains an account of the "Second Battle of Bull Run," by Gen. Pope, which is also the subject of the "Recollections of a Private." The serial stories by James and Mrs. Foote have long instalments, and Frank Stockton and Joel Chandler Harris are the writers of the two short stories. W. J. Linton's paper on "Some European Republicans," whom he has personally known, is accompanied by portraits of Mazzini, Lamennais, Herzen, and others. The best poems of this number are "Canada," by Charles G. D. Roberts, and a posthumous poem by Helen Hunt Jackson. Cupples, Upham & Co.

The Atlantic for February opens with Henry James' story, entitled "Princess Casamassima," some of the developments of which are quite interesting. This is followed by a poem called "The Homestead," by Mr. Whittier, which describes exquisitely a deserted New England farm-house. "Ministerial Responsibility and the Constitution" is the title of a paper by Abbott Lawrence Lowell, contrasting the differences of the United States Government and one which, as in England, depends on the individual responsibility of the ministers in power. "An American Soldier in China" gives a graphic account of the manner in which Gen. Frederic T. Ward's achievements in China smoothed the way for "Chinese" Gordon's military successes, and renders Gen. Ward tardy justice. Miss Murfree's serial, "In the Clouds," is full of life, and leaves the hero in the most exciting of situations. Eleanor Putnam, whose sketches of old Salem life have attracted so much attention, has a paper on "Salem Cupboards" and their contents; and Mrs. Oliphant's "Country Gentleman" is brought to a conclusion. "A Rhapsody of Clouds," poems by Paul Hermes and Andrew Hedbrook, critical papers, the Contributors' Club, and Books of the Month finish an agreeable issue of

this standard monthly. Houghton, Mifflin & Co., Boston.

"OUR LITTLE ONES AND THE NURSERY" for January is rich in timely holiday articles, in addition to its usual stock of instructive stories and verse. Five contributors pay tribute to the Christmas Spirit, besides the pretty illustrated calendar for January, with its appropriate lines. Emily Huntington Miller, L. A. France, Florence B. Hallowell, and Lavinia E. Goodwin are among the contributors to this number, which contains nearly forty charming illustrations.

The Schiller Calendar for 1886, published by H. B. Nims & Co., Troy, N.Y., comes in the form of a palm-leaf fan, with a variety of beautiful designs on its face; the central one being a lovely lake view, encircled by ideal heads of the poet and of the principal heroes and heroines of some of his best poems, — Wallenstein, Joan d'Arc, Mary, Queen of Scots, and William Tell. The calendar proper rests near the fan handle; and its selections are inspiring and pertinent, so far as seen.

Dr. BELLOWS' SERMONS.

A New Volume, Selected and Edited by his Son,
Rev. RUSSELL N. BELLOWS.

"For sincerity, originality, sound reason, and deep reflection, as well as pious and humane feeling, this book matches, if it does not surpass, any of like kind lately issued from the press.

"Persons of every sect and no sect at all, Conservative, Radical, Romish, or Free Religious, may taste immaterial elements, bread and wine of substantial communion, at the board of the spirit he spreads."—Rev. Dr. C. A. Bartol, in *Christian Register*.

"Those who heard Dr. Bellows when he was on his conservative tack will be surprised by his radicalism when he 'went in stays,' beating up for the port of truth, and stood out bravely on the other tack. He saw the truth on both sides, and wasn't afraid or ashamed to 'tack ship,' when it seemed necessary to keep in the deep channel."—Rev. Wm. P. Tilden.

"There is many a sentence here that would startle the proprietors of some of our fossil Unitarians out of their habitual slumber with a lively shock."—Rev. John W. Chadwick.

8vo, 400 pp. Price \$2.00. Sent, postpaid, on receipt of price by the Publisher,

B. N. BELLOWS, 109 East 15th St., New York, N.Y.

Dr. PAUL CARUS

Has arranged the following courses of instruction in the German Language at 4 BOYLSTON PLACE.

Lessons for Beginners on Mondays, Wednesdays, and Fridays, at 2.30 P.M. Twenty Lessons, \$10.00. After one course, any one is expected to be able to join the

Readings and Conversations for advanced Scholars (German Ballads, etc.), on Tuesdays and Fridays, at 11 A.M. Ten Readings, \$6.00.

A Repetition (by request) of the Readings of Faust, on Tuesdays and Thursdays, at 4 P.M. Ten Readings, \$6.00.

Other Classes arranged for the afternoons or evenings, if desired.

The Contemporary Evolution of Religious Thought in England, America, and India.

By Count GOBLET D'ALVIELLA. Translated by J. MODEN. Price \$3.00. For sale at *The Index* office.

SCIENTIFIC ATHEISM.

BY FRANCIS ELLINGWOOD ARBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart." 1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Although this work has been eulogized by the secular press, it has been bitterly attacked by the greater part of the religious press, because the author, from the highest intellectual and moral grounds, denounces some of the superstitions which have crept into Christianity as essentially irreligious, and the men who, knowing better, teach those superstitions, as essentially dishonest.

The Religion of Philosophy;

OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERRIN, New York: G. P. Putnam's Sons, 27 and 29 West 23d Street. London: Williams & Norgate. 1885.

"A work which aims to teach a true conception of God, of life, and of morality."

"Mr. Perrin's able work offers a deep interest. . . . It is a remarkable book."—*Morning Post, London, Eng.*

"There has not for a long time appeared any book in the English language which, from the purely intellectual and philosophic side of it, is deserving of a more careful study."—*Times, Philadelphia.*

"It is a work which appeals to the scholarship of the country."—*Prof. Youmans, in the Popular Science Monthly.*

"The author makes a masterly analysis of Herbert Spencer's philosophy, and subjects his theory of the *Unknowable* to a most close and searching criticism. It is an extraordinary work, one of the most important contributions from the press of recent times."—*F. S., in The Index, Boston.*

"Mr. Perrin writes with habitual good taste and unvarying decorum of the beliefs which he holds false in basis and spurious in sentiment. . . . His sympathy is so frank and so thorough with the true sentiments of Christianity, his aim so high and his argument so modest and earnest, that even those who will repudiate his conclusions will find satisfaction and enjoyment in reading his pages."—*Sunday Herald, Chicago.*

*Large octavo, extra cloth, 566 pages. Clear type. For sale by all booksellers. Price \$3.50. Also sent, postpaid, on receipt of price by

THE INDEX, 44 Boylston St., Boston.

THE RISE OF INTELLECTUAL LIBERTY FROM THALES TO COPERNICUS.

By FREDERICK MAY HOLLAND,

Author of *The Reign of the Stoics*. Price \$3.50.

For sale at THE INDEX office, 44 Boylston Street, Boston, Mass.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 30 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

THE PATRONAGE of the liberal advertising public is respectfully solicited for THE INDEX. Though the paper must not be held responsible for any statements made by advertisers, the attempt will be honestly made to keep the advertising pages in entire harmony with its general character and principles. To this end, all improper or "blind" advertisements, all quack advertisements, and all advertisements believed to be fraudulent or unjust to any one, will be excluded from these columns.

ADVERTISING RATES.

For 1 to 12 Insertions, . . . 10c. per line.
" 13 " 25 " . . . 8c. " "
" 26 " 51 " . . . 6c. " "
" 52 " " " . . . 5c. " "

On half-column advertisements, a discount of 5 per cent. will be made; on full-column advertisements, a discount of 10 per cent.

STANDARD PUBLICATIONS

FROM THE PRESS OF

Charles H. Kerr & Co.

THE UNIVERSITY. A LITERARY WEEKLY. Popular, but not sensational; scholarly, but not pedantic; conservative, but not old foggy; progressive, but not iconoclastic. It numbers among its contributors many of the brightest writers of the day. Its matter is wholly original and is edited with discrimination. \$2.50 per year; three months on trial for 50 cents.

UNITY. A LIBERAL RELIGIOUS WEEKLY FOR THE HOME. Seeks to adjust religion and culture; to make thought worshipful and worship thoughtful; to find a unity beneath conflicting dogmas; a community in all denominations; a sympathy between all religions. It seeks to emphasize the abiding elements of religion—love, justice, truth—practically applied among all men. \$1.50 per year; six months, trial subscription, 50 cents.

THE UNITARIAN. A MAGAZINE OF LITERATURE. Aims to popularize and carry far and wide the best thought of rational Christianity. Its writers are the ablest; its matter fresh, varied, practical; its price, 50 cents a year.

SPECIAL COMBINATION OFFER.—For \$1.00 we will send THE UNIVERSITY, UNITY, and THE UNITARIAN to any address four months on trial.

VALUABLE BOOKS OF INTEREST TO INTELLIGENT READERS.

The Consolations of Science. By Jacob Straub \$2.00
The Morals of Christ. By Austin Bierbower50
Unity Songs Resung. Original poems by various noted writers 1.25
Synonyms and Antonyms. By the Right Reverend Samuel Fallows . . . 1.00
Foiled. By a Lawyer: A Story of Chicago 1.25
Seed Thoughts for the Growing Life. From Robert Browning and others . .20
Bardo: A Study in George Eliot. By Mary E. Burt. In preparation.

* * * Any of the above mailed postpaid on receipt of price, or may be ordered through booksellers. Descriptive circulars sent upon application. Address

CHARLES H. KERR & CO.,

175 Dearborn Street, Chicago.

TRACTS.

No. 1.—**Truths for the Times**, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 10 cents; 12 copies, \$1.00.

No. 2.—**Fear of the Living God**, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 5 cents; 12 copies, 50 cents.

No. 3.—**Lecture on the Bible**, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 10 cents; 12 copies, \$1.00.

No. 4.—**Christian Propagandism**, by F. E. Abbot, is an exposure of the weak costliness, and inefficiency of the System of Foreign Missions. Full of Facts, and interesting Extracts. Price 10 cents; 12 copies, \$1.00.

No. 5.—**"God in the Constitution,"** by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 10 cents; 12 copies, \$1.00.

No. 6.—**"The Sabbath,"** by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 10 cents; 12 copies, \$1.00.

No. 7.—**"Compulsory Education,"** by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 5 cents; 12 copies, 50 cents.

No. 15.—**The Battle of Syracuse.** Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 10 cents; 12 copies for \$1.00.

No. 8.—**The Present Heaven**, by O. B. Frothingham, treats of a subject that interests everybody. New Edition. Price 5 cents; 12 copies, 50 cents.

THE "FREIDENKER."

Freedom, Culture, and Prosperity for all!

(Organ of the Freethinkers of North America, of the Union of Radicals, and the North American Turnerbund.)

Editor, C. Hermann Beppe.

TERMS, PER ANNUM, IN ADVANCE:

UNITED STATES AND CANADA:

Freidenker. \$2.50
Turnerische Ausgabe des Freidenker (Amerikanische Turnzeitung). 3.00

EUROPE:

Freidenker. \$3.00
Turnerische Ausgabe des Freidenker (Amerikanische Turnzeitung). 3.50

Sample copies sent, on application, free of charge.

In this weekly, which is now in the thirteenth year of its existence, political, social, and religious matters are discussed with a view to general enlightenment and progress. The *Amerikanische Turnzeitung* is especially devoted to the discussion of topics pertaining to physical culture and matters of interest to lovers of the gymnastical art.

Since Jan. 1, 1885, the *Freidenker* has been enlarged, thus furnishing considerably more reading matter, while the PRICE REMAINS THE SAME AS BEFORE.

For the convenience of those of our readers who are chiefly interested in matters relating to gymnastics, the *Freidenker* and its former supplement, the *Turnzeitung*, have been consolidated into one paper, called *Amerikanische Turnzeitung*, with the sub-heading "Turnerische Ausgabe des Freidenker."

This paper contains more reading matter than furnished by both the *Freidenker* and *Turnzeitung* heretofore. In making these changes, the publishers have incurred great expense; and we therefore solicit the hearty co-operation of all friends of the cause in securing for the *Freidenker* and the *Amerikanische Turnzeitung* a wider circulation.

We also publish

"Erziehungsblaetter,"

fuer Schule und Haus.

A Liberal German Educational Monthly.
(Organ of the German-American Teachers' Association.)

Editor:

MAXIMILIAN GROSSMANN, Milwaukee, Wis.

Associate Editors:

H. H. FICK, Chicago, Ill.

H. SCHURICHT, Chicago, Ill.

16 large quarto pages, with four-page cover.
Terms: \$2.12 per annum, in advance.

"Freidenker-Almanach"

FOR THE YEAR 1885.

The almanac, which is now in the eighth year of its existence, is devoted to the propagation of free-thought principles. Price 25 cents.

"Amerikanischer Turnerkalender"

FOR THE YEAR 1885.

This annual, which is now published for the sixth time, is principally intended to promote the culture of gymnastics, and is pervaded by a thoroughly liberal spirit. Price 25 cents.

CURRENT TOPICS.

BY B. F. U.

DR. HAMMOND says that in another thousand years we shall all be bald.

THE *Freidenker* for January 17 gives an account of an address in Sauk City, Wis., on Emerson, by Mr. George Schumm, who said: "Never has the world-saving spirit attained a more beautiful, bold, and complete expression than in an outgrowth of practical America,—the Concord sage."

SAYS London *Light*: "That Spiritualism is spreading in Catholic countries is shown by the number of journals devoted to its philosophy in those countries. In Italy, within the very shadow of the Vatican, there are four; in France, nineteen; in Spain, sixteen; seven in Mexico; four in Austria; three in Brazil; and two in Cuba."

OUR friends, Messrs. Mendum and Seaver, of the *Investigator*, are determined that, so long as they live, no anniversary of Thomas Paine's birthday shall pass unobserved in this city. Last Friday evening there was at Paine Hall a festival and ball for the young people; and on Sunday there were three meetings, all well attended, at which were given addresses reciting the story of Paine's life, and honoring him for his great services as a political and religious reformer.

AN intelligent correspondent of the *Pittsburg Dispatch*, writes: "If Mr. Bradlaugh take any part in the proceedings of Commons, he can be severely punished, because, under the law, he is clearly not qualified to act as a member. The situation is interesting. If he be permitted to perform all the duties of a commoner, the religious test in the oath is virtually rendered obsolete. If he act and be proceeded against, he will be crushed officially and financially (as the pecuniary penalty would be more than he could pay), and he would pose as a genuine martyr, slain for a principle. In that event there would undoubtedly occur violent demonstration in Westminster, as Mr. Bradlaugh has more than once intimated that, in case he were thrust out of his seat another time, he would per-

mit his supporters to testify their disapproval in a lively manner. It is not improbable that rioting would occur, unless he himself should put a check on movements in that direction."

BISMARCK's scheme for the expatriation of the Prussian Poles reveals the inhumanity of the man, and his threat to carry out his purpose in defiance of the opposition of the Reichstag illustrates his despotic disposition. The partition of Poland was one of the greatest crimes of history. It is but natural that the Poles should desire a restoration of their nationality; and their reward for the patriotism and courage they have shown is the treatment they have received from Russia, Austria, and Prussia. Will the Reichstag yield to Bismarck? If it does, it will thereby be reduced to the ignominious position of those assemblies whose functions, under the Bourbon kings, were limited to registering the edicts of the crown. The Germans are supposed to be a constitutionally governed people. Will they allow Bismarck to drive the Prussian Poles from their country?

THE Parker Memorial Science Class made an excursion to the Museum of Comparative Anatomy, Cambridge, on a recent Sunday,—a day on which it is the custom to keep the museum closed at this season of the year. Prof. Agassiz, before he sailed for Europe lately, paid the class the high compliment of assuring it that the museum would be opened in this instance any Sunday it would be most convenient for the members to attend. The class was greatly indebted to Prof. Garman, of the Reptile and Fish Department, who gave a very instructive lecture before the class three or four Sundays since. Of course, little more than a hurried and superficial survey of the prominent objects amid such a world of wonder and interest could be taken in so short a time; but, under the direction of Prof. Garman, more could be learned and comprehended than in many ordinary visits. Some slight appreciation, at least, could be obtained of the innumerable variety of the animal kingdom, and the profound intelligence, unwearied labor, and splendid munificence which have combined to present, in such vast systematic array, this enlightening representative spectacle in a sphere of knowledge too largely neglected and but vaguely understood by people generally.

MR. M. ANAGNOS, Principal of the Boston Asylum for the Blind, and son-in-law of Samuel G. Howe, the founder of that institution, has, in a pamphlet entitled "Kindergarten and Primary School for the Blind," made a beautiful and glowing appeal for the sightless little ones for whose benefit a kindergarten is projected. The sum of \$20,000 has already been subscribed, which, however, pays only two-thirds of the cost of the site purchased for the future school,—a school which appeals strongly to the large-hearted and wealthy philanthropists of this country. Mr. Anagnos well says that "a system of broad and liberal education, based upon sound scientific principles, and taking cognizance of the physical peculiarities and psychological phenomena arising from the loss of

sight, is the only means which can counteract the influences of the privation to which the blind are subject for life, reduce its consequences to the minimum, and enable its victims to rise superior to fortune and win victory from adversity itself." After showing that the Asylum for the Blind, while doing its own great work in the education of the older sightless children, is yet unfitted for the reception of children under a certain age, and is therefore obliged to reject younger pupils,—many of whom are obliged to remain in poverty-stricken homes, devoid of possible means of education and of recreation,—Mr. Anagnos says that, in order to supply a "fundamental and indispensable step in the ladder of the education of the blind, a kindergarten school, where all the little sightless waifs can be at once removed from their dismal abodes and injurious surroundings and placed under suitable care and home-like influence, is absolutely needed and imperatively demanded." "Annual subscriptions for current expenses, and contributions for an endowment fund large enough to place the establishment on a permanent basis, are solicited" by the treasurer, Edward Jackson, 178 Devonshire Street, Boston. A portrait of Friedrich Froebel, the originator of the kindergarten method, accompanies this interesting pamphlet; also a fac-simile of a letter written by Laura Bridgman (the blind, deaf, and dumb pupil of Dr. Howe), in behalf of the kindergarten for the blind.

THE clergy and the religious press are persistent and severe in their denunciation of the violation of "the Lord's day"; but, if any of them have had a word to say against the violation of justice involved in the decision of the Supreme Court of this State in the case of Samuel Read, of Springfield, it has escaped our attention. In October, 1882, while performing his duty as engineer on the Boston & Albany Railroad, he had a leg broken. He sued the company for damages,—for which he was discharged,—and Judge Rockwell ordered a verdict for the railroad. The engineer appealed, and the Supreme Court sustained the decision; and the plaintiff had to bear the costs. One of the principal grounds for the decision was that "the work in which the plaintiff was engaged on the Lord's day contributed to his injury, and was not a work of necessity or charity." "This," says the *Philadelphia Press*, "is very beautiful. The Boston & Albany Road is still running its trains on Sunday, Mr. Read is meditating on the folly of having confessed himself a law-breaker in open court, and the Supreme Court is still lading out inequitable equity at the old stand. The only thing left to do is to have Mr. Read indicted for violating the Sunday laws, and lock him up to repent of his sins." At the same time, it should be said that the Supreme Court could not help itself. There was the law, and it had to be enforced. Since Mr. Read's accident, it has been changed somewhat (in 1884); and now, if he breaks his leg again in Sunday labor in Massachusetts, he can recover for the personal injury, but not for fraud practised on him or for the value of his services.

MR. ABBOT'S "SCIENTIFIC THEISM."

When Mr. Abbot left the editorial chair of *The Index*, and a commemorative supper was given in his honor at Young's Hotel, we said to the friends there assembled that there was one compensation, and we knew of but one, for which the readers of *The Index* might hope as an offset against their great loss; and this was that the released editor might have more leisure for that philosophical work which we all knew was dear to his heart, and for which he had shown a rare intellectual aptitude. This hope, expressed nearly six years ago, is now beginning to be realized. Within these years, Mr. Abbot has published but little. But some of us have known that his pen has not been idle, as all knew that his brain could not be. And now comes this finely named book, *Scientific Theism*, as the first-fruits of his toil. It is not a large book. It has only two hundred and nineteen pages, of clear and open type. It speaks of itself as a somewhat accidental precursor of a more elaborate philosophical work which the author hopes yet to give to the public. But though the book is not large, and though a summer lecture at Concord seems to have made the occasion of its appearing, it is no hastily prepared work. It bears evidence throughout of wide reading and close thinking: every page throbs with brain-force. And the time for this reading and thinking has had to be snatched in the midst of the laborious and distracting vocation of drilling boys for college and in the intervals of the vacation weeks, when the brain really needed rest. That, in spite of this distracting and fatiguing labor of a different sort, Mr. Abbot should have been able to produce such a book as this, adds new emphasis to the wish of his friends that he might find the place for which mental temperament and culture have so generously qualified him, a college professorship of philosophy. When will some American college honor itself by calling him to such a position?

Scientific Theism has already been noticed in the book-review department of *The Index*, and it is not our purpose here to speak of the work in detail. We propose simply to call attention to its significance and general bearings as related to religious progress. With Mr. Abbot,—our lips still say Mr. Abbot most easily, not yet accustoming themselves to the more formal Doctor-of-Philosophy title which he has deservedly won from Harvard University,—a logically elaborated philosophical system is but a means to an end. He has no special delight in philosophy merely as an intellectual pastime, or as an exercise in mental gymnastics to see what wonderful feats may be performed. He does not belong to the school of dilettanti speculative thinkers who have no further interest in their thoughts than to exhibit them in the garb of ingeniously wrought syllogisms. But all his philosophical thinking and writing are dominated, in a rare degree, by an intense passion for discovering and revealing truth,—and truth that shall bear directly on human conduct and life. This is the end to which his systematic thinking is the means.

And truth, with Mr. Abbot, rises at once to its highest aspects,—to religion. Religion, for him, is practically synonymous with the love, pursuit, and embodiment of truth. The goal of his thinking, therefore, is the justification of religion. He has a fervent faith that right thinking is necessary to right feeling and right action; and that religion, in order to be redeemed from the effeminate sentimentalism and empty ceremony into which it has in modern times so largely fallen,

must come again under the sway, as in previous epochs of the world, of a robust system of thought. This necessary system of thought, he believes, is furnished by science and the scientific method; and to prove this position is, in general, the theme and motive of his book. The key-note of it is struck in this sentence: "The sciences as a whole, above all, the universal scientific method which has produced them, constitute the only foundation on which the philosophy of the future can be reared; and if, as I profoundly believe, human thought is the architect of all things human, then what the philosophy of the future shall prove to be, that also will be its religion" (p. 111). This profound conviction of the necessity of a sounder system of thought for the preservation of religion and for the highest welfare of mankind makes itself felt on every page of the volume, and saturates the chapters with a religious fervor,—until, at the end, the hard logical propositions, which have been gradually rising and broadening in the sweep of their thought, burst almost into a religious rhapsody and literally into rhythm and song.

In connection with the Free Religious movement in this country, and in the membership of the Free Religious Association, Mr. Abbot has been pre-eminently the philosophical thinker. We may say that he has been specially the apostle of the claims of *thought* in the movement. A good many persons, probably, still remember with what thrilling effect, in one of his speeches at a Free Religious convention a good many years ago, he uttered the simple sentence, "What thought cannot win is lost forever." This idea was always central with him, whether on the Free Religious platform or in his work on *The Index* or in the organization of the Liberal League. He was already known, when the Free Religious Association began, as a profound and subtle thinker and as a writer on philosophical themes of remarkable logical precision and rare power. And these gifts of his intellectual nature, in which he has few peers, he gave with lavish generosity to the Free Religious movement. As time went on and he became better acquainted with the various phases of Liberalism, his conviction grew the stronger that what Liberalism most of all needed was a clear system of philosophy,—not a creed, of course, but a common and deeper comprehension of its own spirit and purpose; a clearer understanding of its own reason for being and of its mission to the world. His eager intellect, perhaps, grew too impatient at the few signs among Liberals of such a common system of thought, and at the restiveness observed among many of them when the need of it was hinted. Yet, in his comparative retirement for several years from public work, he has lost no whit of his faith in the principles of the Free Religious movement; and now, as pledge of that faith, he brings this book as the best service he can render to the cause which he still has at heart. *Scientific Theism*, as here thought out and sketched, he offers as "the Philosophy of Free Religion." And, whatever may be the view which its different readers may hold of its qualifications for supplying "Free Religion's need," there can be few to question that, in its earnest, keen, and well-sustained argument, it is a noble offering,—one of the very best contributions of the age to the philosophy of religion.

The present writer agrees with Mr. Abbot that the Free Religious movement, before it can fully accomplish its mission, must concentrate itself upon and feel the impulse of a clearer system of thought. This will doubtless come in time as the movement develops, whether present organizations remain or not. Supernaturalism

with its various creeds is destined to fall; and, if religion is to abide, its existence must be justified in the court of free reason,—it must be shown to be a part of the natural system of things. It must not have to apologize for itself, nor be passed over in silence as something that exists emotionally, but not to be rationally accounted for; but it must boldly claim a right to existence on the ground that it expresses one of the fundamental and ineradicable relations of man to the universe, of which science itself must needs take account; and, from this starting-point, a body of correlated truths will, in the course of time, be developed, which can properly be called the science of religion, and will be generally recognized as having scientific validity. It is on this basis that Mr. Abbot's book places religion. We cannot say that we are prepared to adopt all his conclusions; but his main propositions,—that the universe is an infinite organism, that evolution is organic and not mechanical, that the life-principle of the universe is an infinite immanent Power in which also inhere the attributes of intelligence and moral right,—these we regard as amply substantiated. Whether these propositions can be legitimately pushed to the affirmation of infinite Personality and infinite personal Consciousness we hesitate to admit. Infinitude and Personality are two ideas which we have never been able entirely to reconcile. We prefer, therefore, to say that the immanent and infinite Power, the universal Life-principle, must have attributes corresponding to personality and consciousness, since it has produced them, but infinitely above what man knows under those names. So, too, there is need of care in the use of the term "organism" as pertaining to the world as a whole. No finite organism, however perfect, can be regarded as a sample of the infinite organism. All our words, formed for and from finite things, can be used of infinite Being only as suggestions, not as definitions.

But, whatever might be said on some of the special points of Mr. Abbot's argument, his book starts from the right ground and proceeds by the right method and reaches essentially the right end. It is a masterful treatment of its high theme, and can but have great weight toward the establishing of the religious philosophy that is to come as the product of science,—of science in its large sense, as applied to the whole universe of matter and mind. It is a bold challenge, not only of the systems of revealed religion, but of the most commonly accepted philosophical systems of the day; but it has science at its back, and, with that support, its leading ideas will, we believe, eventually win the battle. It were to be wished that the author had in some places restrained the fervor of his argument to a more "sweet reasonableness" when he was treating opposing systems, and also, at one or two points, with a somewhat more modest confidence, left the book to tell its own great merits. Sometimes the very eagerness of his valor in urging his propositions creates a spirit of antagonism, when the thought itself might not. We missed, too, here and there due consideration of antagonistic arguments,—especially of the doctrine of natural selection in the otherwise strong section on teleology. But not everything could be brought into one small book. The larger book, of which the preface to this hints, we earnestly hope may yet come. But, even if it does not, this one just as it is, notwithstanding these minor defects, deserves not only a kind, but a proud welcome from all lovers of high and free thinking on great themes.

WM. J. POTTER.

THE BAR, PRESS, AND PULPIT.

The fashion of this world changeth; and we are helpless against the course of things, or against the Eternal, as the primitive Hebrews phrased it. That the two venerable professions of law and divinity are not the powerful social factors which they used to be is a fact patent to all, and that their influence is being diminished by the lapse of every new year is also evident. Like a man after he has reached forty-five, they are on the diminuendo. The pulpit, dealing as it does in the crude ideas, beliefs, and myths of primitive tribes living in primitive, barbaric times, and talking as it does about the men and things of old, pastoral communities in Western Asia, and about states of society outgrown and outworn thousands of years ago, in these days finds itself obsolescent and wielding less and less control. Whereupon, some of its more passionate and impatient occupants wax wrathful and denunciatory; and knowing that, in this age and country of popular literacy, or ability to read, the daily newspaper and periodical press which are the great diffusive organs of current thought and opinion on all subjects, the great beacon lights of publicity and intelligence, they proceed to denounce the newspaper, magazine, and review in round terms. As if, forsooth, the press, whether daily, weekly, monthly, or quarterly, dealt solely in daily news and the happenings and occurrences of each day, and not at all in principles, convictions, and truths; as if it did not abound in elaborate and able discussions of every social, political, theological, moral, intellectual, and æsthetic topic which demands such discussion from day to day, and week to week, and month to month; and as if the leading writers of the day, or "them d——d literary fellers," as the late Hon. Zachary Chandler phrased it, did not form a new and distinct profession in the world of to-day,—a profession who make of knowledge and science in all its branches, and of reflective thought, life pursuits and studies for their own sakes as well as for mere bread-and-butter considerations! In France, the literary "fellers," or writers for the press, daily and periodical, furnish the leading politicians and statesmen, and have long done so. Thiers, Guizot, Chateaubriand, Lamartine in the past, and the leading French statesmen of to-day, were and are literary "fellers," or periodical writers and writers in the daily press; and, through that mighty organ of publicity and opinion-moulding potency, they have rayed out light over the whole civilized world. What a brilliant intellectual cohort do the current periodical writers of Great Britain form, such as Huxley, Tyndall, Gladstone, Matthew Arnold, and others almost too numerous to mention of that calibre, to say nothing of the Macaulays, Carlyles, Stuart Mills, Leweses, George Eliots of the just vanished past! These great European periodical writers made and make of the pursuit of knowledge and ideas a distinct profession by itself. Their minds did not and do not move in old legal and theological ruts, confined solely to precedents and the beliefs of the past. In this country also, of late years, hosts of men of highly cultivated and disciplined intellects, following the example of the great leaders of thought and science in Great Britain, France, and Germany, have found in the business of writing for the press, daily, weekly, and periodical, their profession and congenial life-work, when coupled with the oral business of lecturing. The doctrine of to-day is that the world is not finished, but that it is still in process of creation; and that the same forces, physical and moral, which were operated one, two, three, and four thousand years ago, are still operative and in undiminished vigor; that men have

gone on increasing in knowledge from age to age, so that a Humboldt's or Huxley's, a Lyell's or Darwin's, opinions of the world and of the *modus operandi* of creative power are far more correct and sublime than the opinions of Moses or any other primitive Oriental theologian. "Now," exclaims the Rev. Mr. Paxton, "the press is over the pulpit: the newspaper and the periodical have swept us [theologians] aside." Why? Because the world of to-day cannot be adequately reached by the pulpit, even if the pulpit dealt in current ideas, and not in the obsolete notions and myths of a remote Oriental past.

After all, even in this age of materialism and money-making, it is ideas and idealisms upon which the human mind feeds and sustains itself. It is a period of change and revolution in the organization of society and in men's beliefs and opinions. Hence, a constant discussion of social, political, and religious matters is required,—a discussion which shall reach the innumerable host of intelligent people who are seeking a rational settlement of the vexed questions of the day, a rational solution of long-standing social problems,—problems which concern the present life,—and, without a satisfactory solution of which, society, here and everywhere, will continue in a state of turbulence, discontent, and disorder from the collision of the interests of its different classes. Through the ability to read, which will soon be universal throughout the domain of civilization, the press can diffuse its light to every nook and cranny of society. Of course, the *daily* press in particular is not without its faults. In order to fill its columns, it magnifies daily occurrences and popular men and things to undue importance. Its discussions of the questions of the hour are often hasty and crude. It is in hundreds of instances rather partisan than catholic and disingenuous. It wire-draws and spins out to undue length trivial incidents. It gives publicity to purely sensational subjects, and spreads before its readers narratives of things and events a knowledge of which is *contra bonos mores*. But, with all its grave faults, even the daily press is a genuine light-diffuser, knowledge-spreader, and mental and moral pharos of the world. Of course, the monthly and quarterly press is not obnoxious to such objections as are urged against the daily and weekly press. But it is the part of folly and unwisdom for theologians and sore politicians to declaim against the press. It is like butting against a locomotive. The pulpit and the bar for centuries had everything their own way, and were leading social factors in less developed eras. The leading minds of the world once were found wearing their uniforms and in their ranks. But it is no longer so. The professional scientist, thinker, and writer, and the student technically trained to utilize the forces of nature, and thus to develop the natural resources of a country, are more influential than theologians and lawyers. It is the age of light, if not altogether of sweetness. The world wants to know its exact soundings and situation from day to day. It wants truth, reality, the exact state of things. Conjectures, myths, and articles of faith, which are utterly unsusceptible of verification and which lack actuality, are out of date. It was in the order of events that the press should partially supersede the bar and pulpit, and throw them more or less into eclipse. Meantime, the Paxtons should possess their souls in patience.

As for the legal profession, it is still powerful and influential; and so, for that matter, is the clerical. But it is well known that the spread of intelligence diminishes litigation, for an intelligent population is self-reliant and shrewd in the man-

agement of its affairs. It is noticeable that the lawyer element is not nearly so predominant in our legislative bodies as it was formerly, though it is still large, from the very nature of the case. The lawyer formerly, in his character of stump-speaker, was the political oracle and popular leader in times of contested elections. But the newspaper has relieved him of that function. The laity are as well instructed in politics now as the members of the bar. In the popular branch of Congress, lawyers are as numerous as ever; but, in the Senate, millionnaires and monopolists are most noticeable, while there are no successors to the Websters, Clays, and Calhouns of other days. Meantime, social questions are now in the foreground for discussion. These questions are new, and cannot be settled by precedents; for they mean the reconstruction of society on a new base.

B. W. BALL.

THE AUTHORITY OF MORALITY.

II.

None of us would wish to be like the man who went into his neighbor's smoke-house to steal a ham. He had it in his hand, when he happened according to his own account, to remember that the Bible says,—

"The dog will bite
The thief at night."

So he hung up the ham, and went home. For the moment, it is safer to have people do right ignorantly than wrong knowingly; but the permanent welfare of society requires that we do right intelligently. Virtue has work for us which we cannot finish in the dark.

Much light may be gained by considering what the words "right," "just," "moral," etc., originally meant. "Moral" and "ethical" are derived from the Latin and Greek words for "customary." The Germans still use "*Sitten*" for both "manners" and "morals." Their word "*Recht*" may mean either "right" or "law." So does the Latin term "*jus*," from which comes "justice," as signifying not only the virtue, but the judge. "Jurist" and "jurisprudence" are also derived from "*jus*," which again comes from a Sanskrit verb, "*yu*," "to bind." From the same root have grown "join," "yoke," and "zeuglodon." The word translated "just" and "righteous" in the New Testament comes, like the name of the Athenian judge, or rather juryman, "dicast," from a word which in the time of the apostles meant either "law" or "justice," but which may still be found in Homer in its original signification, "usage." "Right," "rule," "rectitude," "righteousness," etc., have the same root as "regal," "regent," "reign," "rich," "rake," "rank," and "rack." They all come from the Aryan verb, "*rag*" or "*rak*," meaning to "stretch out" or "make straight." So does the German word for "right" or "law," "*Recht*." "Honest" originally meant "honorable," and "virtuous" meant "manly." "Wrong" and "vicious" signified that which is "wrung" or "crooked," or out of line with the recognized standard. "Wicked" meant what was thought characteristic of a witch. So the word "conscience" is formed out of "*cum*," "with," and "*scientia*," "knowledge," so as to mean that which each of us knows in company with his fellow-men.

These facts prove that the principal authority which has been recognized in morality from time immemorial is that of public opinion. But how has public opinion become a moral authority? Because it has insisted on observance of the conditions of social existence. Men and women cannot exist except in society. Even Robinson Cru-

soe owed his existence partly to the clothes, tools, seeds, weapons, etc., which were furnished him by civilization, and partly to the skill which he had learned from other men. Adam and Eve could scarcely have lived long enough, as an isolated pair, to leave any offspring. A man or woman entirely without any help from other human beings, or any benefit from their present or past activity, would be like a fish out of water. No life but the social one is possible for us. In all probability, we were social animals from the beginning. Otherwise, the first men and women would have been inferior to monkeys and baboons. Men and women cannot exist without society, and society cannot exist without observance of moral laws. A community must be made up of people who respect each other's rights, minister to each other's needs, and in various ways serve the common good. As Leslie Stephen says (*Science of Ethics*, chapter viii., sec. 39, pp. 349-351): "The moral law being, in brief, conformity to the conditions of social welfare, conscience is the name of the intrinsic motives to such conformity. So far as we feel ourselves to be members of any social organization and identify ourselves with it, we are, in virtue of that sentiment, prompted to this conformity and feel a sense of obligation. . . . Through our affections for our friends and our brothers, our feelings are stamped and moulded, and prepared to be developed under the action of all the other relations into which we are brought, as our intellects and sympathies expand and our passions come into play. In this way, the primary instincts undergo modifications, causing them to act in certain ways and to obey certain rules which have necessarily a moral quality, or, in other words, a definite relation to the conditions of social welfare. The perception that this rule is formed by something outside us, that we imbibe it from the medium in which we live, gives the sense of obligation, though we may become conscious of it as the expression of instincts which have grown up before distinct reflection, and are involved in all our modes of thought and feeling. And, as the process of working it into our character is always more or less imperfect, we have, as a rule, plenty of opportunities for finding that obedience costs an effort, though disobedience may bring with it a pang. The conscience is the public spirit of the race, ordering us to obey the primary conditions of its welfare; and it acts not the less forcibly, though we may not understand the source of its authority or the end at which it is aiming."

Another fact has not, I think, had sufficient notice. Government has had a strong tendency to enforce respect for the rights of person and property, and to promote regard for common interests. This, of course, was not its original purpose. Its creation is not due to any theory, but simply to the pressure of the struggle for existence. Suppose a tribe of savages, broken up into families that are always quarrelling with each other, and destitute of any common head, gets into a war with another tribe all whose members have been brought, by the head of one of its families, into such subjection to his authority that they have ceased to interfere with each other's property, and have learned to act in concert under his orders. His motives may be wholly selfish and his rule despotic; but his warriors would have such confidence in each other and such experience in co-operating for the common good that the disorderly hordes would, in all probability, go down before them, as the grass before the scythe. Strong governments have always conquered weak ones. Rome trod down her lawless neighbors, until she passed through tyranny into anarchy. The family survived where isolated

individuals perished. The tribe subjugated the unorganized families. The nation proved itself more fit to exist than the independent tribes. Thus, the advantages of government became fully recognized, and, in fact, were dangerously overrated. Kings and chiefs were honored, as if their dominion was an end to be worked for in itself, independent of the way in which they ruled. Nowadays, we see that all the good a ruler can do is to protect the lives and possessions of the ruled, and in other ways promote public interests. We know that government has no right to exist, except in so far as it is for the good of the governed. If this is continually and wilfully neglected, revolution is just. Government is not an end in itself, but a means to secure the observance of moral laws. If this end is not attained, the means must be reformed. The maintenance of justice is the true object of government, the higher law to which all legislation should conform. Laws which deprive the individual of any part of his liberty or property, except in so far as is necessary for preserving the rest, are oppressions against which we should appeal to that higher law, established by the fact that respect for others' rights is the fundamental condition of human existence. Public opinion owes its authority to its general conformity with this law. Persecution was once practised by all the rulers, and advocated by almost all the authors in Europe; but this unanimity only increased the obligation of the friend of Liberty to insist upon her rights. The union of public opinion and legal statutes in support of negro slavery made it a sacred duty to agitate boldly for emancipation. Usually, however, substantially the same conduct is dictated by the laws of the land, by public opinion, by the conditions of social existence, and by the moral law.

The relation between the best interest of each individual and that of the whole community is not so close. It depends, to some extent, on constant pressure, exerted not only through praise and blame, but through the dread of legal penalties. We need not go so far as those shipwrecked sailors who had not the remotest idea where they were, until they came in sight of a gallows with a man hanging from it, on which they fell on their knees, and thanked God for bringing them to a Christian country. Still, the general effect on individual conduct of having the laws strictly enforced is extremely salutary. And society has not only the power to do this, but also the right. We could not exist, if society were not kept up; and it would dissolve as soon as its members ceased to respect each other's lives and possessions. The moral law is the fundamental condition of individual existence. Our desire to exist gives society the right to make our existence possible by requiring us to be virtuous. Not only my own existence, but that of all those who are dear to me, is involved in what Emerson calls "the sovereignty of ethics." Prudence and disinterestedness, family affection, patriotism, and universal philanthropy, aspiration after holiness, and desire for self-culture,—all these work together in making us feel the authority of morality. Loyalty to kings and faith in religious sacraments and creeds have powerfully promoted that development of our reverence for morality which we call conscience. Its formation in each individual is the result, partly of capacities and tendencies which he inherits, and partly of the influences exerted over him by other people in early life. Of course, we are not conscious of this, any more than we are of the shining of the stars at noon or of the earth's moving at the rate of about a thousand miles an hour. What we do know is that

conscience speaks with authority, and commands us to act, not only for our own best interest, but for that of others. Conscience usually moves on the line of prudence; but, often, it goes farther, and demands self-sacrifice. This demand we feel to be just; for conscience is the embodiment of those obligations which are imposed upon us by the fact that we must conform to the necessary conditions of social existence, or cease to live. Such conformity produces happiness, and most surely for those who conform disinterestedly, loving Virtue for her own sake rather than for the gifts she brings. The moral standard is not that of individual happiness, but rather that of social prosperity. Those actions by which the community flourishes are morally right, and those intentionally at variance with its conditions of life and growth are morally wrong. Conscience, public opinion, and government unite in requiring us to observe those conditions of social prosperity which constitute the moral law. Our self-interest is in its favor, and so are our disinterested affections. Whatever force religion has is largely in this direction. In short, morality has all the authority that exists anywhere.

F. M. HOLLAND.

RADICALISM.

The essence of Radicalism is dissatisfaction, founded upon the perception of error or wrong, and a desire to remove it. "Where liberty is, there is my country," said one of the founders of the Republic, repeating an old expression. "Where liberty is not, there is my country; and thither I hasten, that I may help to establish it," said the bold and radical Paine. Heaven—regarded as it is by many as a place of perfection and rest—would not be a fit place for the active and progressive Radical, even if rigid Orthodoxy would consent to his admission. There would be nothing for him to do,—no field in which he could exercise his reformatory powers, in which he could work for the abolition of evils and the introduction of better views and methods.

Many there are who have the spirit of Radicalism, who are filled with enthusiasm for reform, but lack the judgment to steady their conduct and the knowledge to work wisely for the desired results. The people of France, in 1789, wanted liberty, and were ready to make sacrifices for it, but lacked the knowledge and stability to embody it permanently in republican institutions. The love of liberty among the ancient Greeks, who were in many respects like the French, amounted to a passion; but there was lack of knowledge of the principles of government, and lack of sobriety of judgment necessary to prevent turbulence, insurrection, and bloodshed. In like manner, the zeal of Radicals now sometimes outstrips their knowledge; and passion gets the better of their judgment.

Radicalism is not always marked by breadth of thought and a charitable spirit. Indeed, those who are exclusively devoted to any one reform are liable to be narrow. They are people of "one idea." Some men, like some rivers, are both broad and deep. Such a man was John Stuart Mill,—a man of colossal mind and the most catholic spirit. But some men are clear and deep, yet circumscribed in their range, and, from their inability to consider a subject in all its bearings and to grasp the relations between it and other matters, are constantly taking narrow views of questions, and frequently doing injustice to those who differ from them. There are others who are superficial, who see only the surface of things, who are incapable of profound and accurate reasoning, yet who are broad and bright, full

of animal spirit, of emotion, poetry, and sentiment, and whose influence, like that of the stream, which lacks depth, but spreads over a wide area, is to enrich and to bless.

Many of the men who have stamped themselves upon their age and influenced succeeding ages have been men lacking breadth, but possessing concentration, persistence, and the enthusiasm of humanity. Such men are usually courageous, often fanatical, frequently violent in language, and unjust and uncharitable to opponents; but, among a people ignorant and indiscriminating, they make the most successful party and religious leaders. The masses, when their interests and passions are aroused, have no appreciation of the man who, with discriminating fairness, is just and generous to all, who treats his subjects with comprehensiveness, and views everything in the unimpassioned light of the understanding.

There is an impatient Radicalism, so called, that comes perhaps, generally, from a sanguine temperament and lack of careful reflection. It wants always to adopt measures for the immediate realization of a reform, without regard to the practicability of the measures. One ever feels kindly toward this class of Radicals on account of their sincerity and earnestness. Many such become less extreme in their views and more reasonable in their methods with increasing years. The Utopian visions of youth give way to the calmer reflections of manhood; and changes once believed to be near at hand are seen to be very remote, if to come at all. The reformer realizes that he cannot change public sentiment in a day, nor secure effective reforms without a public sentiment back of them; and thus he learns to moderate his expectations, and labors more patiently and with more steadiness. Unfortunately, some men in their disappointment become indifferent and even cynical.

There is also a sham Radicalism, which shows itself in "mouthfuls of spoken wind." Speakers and writers are sometimes, by a perversion of language, said to be radical, when they are simply rabid, when they are abusive. Rant is not Radicalism. There are, too, many superficial minds clamoring for change, with no well-defined ideas of what they want, who regard themselves as the most radical of Radicals; and, if you venture to oppose their wild, ill-digested notions and impracticable theories, they exclaim, "Oh, you are too conservative for me!" This class exhibits its ignorance and crudeness on the free platform of radical meetings, affords the press a theme for meriment, and puts into the hands of enemies weapons with which to prejudice the public mind against movements that are unpopular and need the most favorable presentation to the public.

Yet, in spite of all the erraticisms and follies incident to radical movements, it is to Radicalism that the world is indebted for every improvement. Discoverers, inventors, reformers, are necessarily Radicals. Socrates, Jesus, and Mohammed were all Radicals. Luther, with the spirit of Radicalism in his heart, protested against the authority of the pope, and enunciated a grand principle, which, by implication, gives every one the right to protest, as long as he sees anything wrong to protest against. Jefferson was a Radical. He was but a young man when, in 1774, he wrote the celebrated *Summary View*, and when, in 1776, he penned that immortal paper, that "charter of public right," as Edward Everett said, "destined or, rather let me say, already elevated to an importance, in the estimation of men, equal to anything human ever borne on parchment or expressed in the visible signs of thought,—this is the glory of Thomas Jefferson." Radicalism carried the Protestant Reformation to success in

Germany and England, gave us the discovery of America, the art of printing, the discoveries of Copernicus and Galileo. It lessened persecution, it destroyed witchcraft and removed slavery. It abolished rotten boroughs in England, secured Catholic emancipation, extended the franchise, and disestablished the English Church in Ireland. Through the ministry of Gladstone, it is trying to do justice to-day to unhappy Ireland, where Conservatism has seen strong men die amid abundance, and babes even perish on the milkless breasts of their starving mothers, and a whole people in wretchedness, without making any efforts to save or to help. Radicalism gave a republic to France, wrested Rome from the temporal power of the pope, and gave to Italy the services of Garibaldi and Cavour. In this country, it is promoting temperance, elevating women, and modifying theology, improving religious literature, advancing science, giving the world a multitude of inventions, adding to the comforts and luxuries of life, and in thousands of ways benefiting and blessing the race.

Conservatism is not without its use. It affords us a guarantee of the permanence, when once accepted, of what Radicalism secures. The majority will act from habit, custom, usage, and adhere to the established order. Changes must come by evolution or revolution. Revolutions, indeed, are a part of the process of evolution, and sometimes desirable; but they are valuable in what they achieve in proportion as evolution has prepared the people for the condition they aim to secure. Observe the difference between the people of France in 1789, unprepared for a Republic, and the American colonies in 1776, easily adjusting themselves to changes. It is important that a large amount of Conservatism exist in the social organization. It is right that the people abandon cautiously what has become associated with their habits, their institutions, their life, and that they accept cautiously new theories, policies, and principles. But for this Conservatism, society would be characterized by so much instability, by such frequent changes, that commercial and industrial interests, and with them the interests of science and morals, would suffer. But, with this Conservatism, transitions are necessarily gradual and slow; and thus society is kept together, while the march of progress continues. A happy balance of Radicalism and Conservatism, the centrifugal and centripetal forces of progress, can be secured only by a continued diffusion of knowledge.

B. F. UNDERWOOD.

EDITORIAL NOTES.

BY B. F. U.

THE advertising rates of *The Index*, considering the circulation of the paper and its class of readers, are low; and substantial business men begin to realize that it pays to advertise in these columns.

TO ANY person who will the present month obtain for us a new subscriber for a year, we will mail a copy of any book or books advertised in *The Index* this week by John B. Alden, or any other published by him the price of which does not exceed one dollar.

THE Unitarian Review's words in favor of compulsory prayers at Harvard are quoted by the *Independent* with approval, as "too much to the point to be omitted."

IS IT not a justifiable hope that, by applying the Method of Science to all questions, England may some day possess a philosophy, the absence of which during the last two hundred years has been a serious defect in her culture? Science she

has had, and Poetry and Literature, rivalling, when not surpassing, those of other nations. But a Philosophy she has not had, in spite of philosophic thinkers of epoch-making power. Hobbes, Locke, Berkeley, Hume, have produced essays, not systems. There has been no noteworthy attempt to give a conception of the World, of Man, and of Society, wrought out with systematic harmonizing of principles. There has not been an effort to systematize the scattered labors of isolated thinkers. Mr. Herbert Spencer is now, for the first time, deliberately making the attempt to found a philosophy.—G. H. Lewes.

A DOCTRINALLY inclined correspondent of *Unity* says: "Trinitarianism teaches that there are three distinct Persons in the Godhead. . . . Unitarianism teaches that there is but one Person in the Godhead." If this universe is run by "persons," considering its extent and complexity, the more the better perhaps, for the reason, popularly expressed, that "two heads are better than one." Each "person" may be supposed to have control of a department, for instance, the weather, which in New England alone might afford scope for the ingenuity and resources of one "person," while Western blizzards, tornadoes, and floods might keep another "person" so constantly occupied that he (or she) would have no chance for a vacation summer or winter, and none too much time for sleep. But it may be that both Unitarianism and Trinitarianism, as defined by the words quoted above, are in error in ascribing the operations of Nature to one or more "persons." "Divine personality," says Emerson, "is a theologic cramp." We decline to confound the Universal Power which manifests itself in the world of mind and matter, and the contemplation of which fills every thoughtful and serious thinker with wonder and awe, with the petty notions, the narrow anthropomorphisms, of those who invest the source of all phenomena with their own personal qualities, and then discuss whether all these qualities are comprised in "one person," or "three persons" in the "Godhead."

IL PENSEROSO.

How are they faded,—all the morning glows
That changed the landscape to a fairy scene,
The sun-bright mists of amber, blue, and rose,
That prophesied a joy that ne'er hath been!

The hills that, like Jerusalem the blest,
Seemed made of precious gems too dazzling bright
For aught but angel feet thereon to rest,—
How have they lost their evanescent light!

The rapture of the morning hours, the fire
Of heaven's own tears within the rose's heart,
The wind notes swelling like a seraph's lyre,—
Where have they gone, when did they all depart?

The radiant hopes, pure as the unblown bud
Of June's own lily, that once rose so high
With every flood-tide of the pulsing blood,—
How are they perished,—perished in a sigh!

For it is noon,—yes, only noon: the way
Spreads dull and dry beneath the clouded sun,
Sore are the heat and burden of the day,
And we must bear until the day is done.

The poetry of life is o'er: the prose
Alone remains. Our flowers lie dead around.
Footsore and weary, longing for repose,
We tread with bleeding feet the thorny ground.

We lag and grovel. We no longer soar,—
Too tired are we, the skies too far away;
And, if we search them, we can see no more
The radiant angels of the dawning day.

Allegro.

Courage, O fainting heart! Tired of the road,
There are green pastures, waters still and bright,
By whose fair banks we may lay down our load;
For, lo! at eventide it shall be light.

Courage, O time-worn heart! Bear bravely on
A little longer, till the day is o'er.
At eventide, your burden shall be gone;
At eventide, it shall be light once more.

WALTER CRANE.

The Index.

BOSTON, FEBRUARY 4, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }

NO WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in his columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

Evolution and the Higher Sentiments.

BY CELIA P. WOOLLEY.

A new mental attitude toward all the great final problems of thought is necessitated by the changing beliefs of the day, which seems to many minds equivalent to a complete denial of the worth and significance of such problems, remanding them to the realm of poetry and romance and reducing life to its most prosaic level. Despite the unprecedented progress of the new doctrines of evolution, this system of thought is still regarded with great popular distrust and apprehension. One reason for this doubtless lies in the prominence given to the study of mere method as distinguished from the eschatological pursuits of the metaphysicians,—the old alluring search for final causes. Another reason of similar nature springs from the new importance bestowed by science upon the physical side of life,—the biological and physiological aspects of man's nature,—to the apparent exclusion of those more ideal possibilities attaching to him as a self-acting, spiritual being. The fact, also, that, to the average understanding, evolution seems chiefly occupied in the study of the small, obscure beginnings of things, confirms belief in its tendency to seek only the ends of a crude materialism, and to inculcate an ignoble view of life and human destiny. The discovery of intelligent motion in a speck of protoplasm has the singular effect in some minds to cheapen and degrade the conception of a living universe,—as if such a discovery lessened man's importance somehow, who would like to usurp to himself and the higher animals the entire realm of conscious existence. The vision of the ancestral ape obscures remembrance of all that has come after, the long line of growth and achievement which marks man's progress from his early condition of ignorance and barbarism to his present state; and Darwinism, in its popular interpretation, stands for a theory which, placing the emphasis of scientific

approval upon the monkey, stops there, lost in admiration of this initial discovery. It is a common mistake, shared by many of those who accept as well as by those who reject the main inductions of science, to believe that the value of certain human sentiments and affections is wholly determined by their origin. With the proverb, "A stream can rise no higher than its source," the opponents of evolution attempt to show that all the higher motives and impulses in man—as those of mercy and pity in the philanthropist, the sense of obligation, the religious instinct, the sentiments of love and domestic affection even—will lose in moral weight and significance as soon as the purely natural conditions of their origin and growth are demonstrated. Another kind of criticism is condensed in a single term of reproach,—“agnosticism,”—a word supposed to mark the final halting-place of all religious belief, and to stand as the last expression of the world's intellectual despair; a condition which exists chiefly by the critics' implication, and is by no means the necessary result of that intellectual honesty which the term agnosticism more correctly defines. The true spirit of agnosticism was set forth some time ago in two essays, entitled "Religion, Retrospect, and Prospect," and "Retrospective Religion," contributed to the famous Spencer-Harrison debate by the first writer. Perhaps the future conception of religion is to be supplied in the combined ideas of these representative leaders of the two most prominent schools of the day. Religion, being of two-fold nature, and existing in man's heart both as sentiment and impulse to duty, having its speculative and ethical aspects, it may devolve upon the scientific and positive philosophies to supply the two needful elements of rational belief and moral enthusiasm. The agnostic theory, as developed in Part I. of Spencer's *Synthetic Philosophy*, is raised to the height of an infinite mental abstraction; while the *Religion of Humanity*, reduced to its practical analysis, is found consonant with many of the principles underlying the work of our Ethical Culture Societies. Strictly speaking, the agnostic theory defines only a philosophical relation and experience rather than any state of religious belief, which last exists simply as implication of the first. Belief in the Unknowable is reached, not by an act of faith, but by strict logical induction, and in the form, as Spencer explains, of "a necessary datum of consciousness"; and the basis thus afforded scientific philosophy is, in this constant assertion of a real though unknown force in the universe, not negative, but broadly affirmative and constructive in its main nature and influence. Doubtless, agnosticism, in its refusal to dogmatize upon the character and intent of this force, offers room for the conclusions of both pessimist and optimist, each of whom, however, is impelled to his peculiar views chiefly by circumstance and inherited tendency, and easily finds excuse for the same in the existing condition of things.

To those who believe that science, so far from aiming at the overthrow of religion, is continually supplying new material on which the wonder-loving mind of man can employ itself, it follows that all the other higher sentiments which spring from, or are closely allied to, the religious, and find expression in the varied forms of art and an improved social state, will also be preserved. We are often told that scientific thought furnishes no adequate motive to either artist or poet; that not only the sanctions of faith and duty, but the ideals of beauty also, must be destroyed, along with belief in their supernatural origin. This is not the place to enter upon a

discussion of the principles of art, or to follow Sir Philip Sidney and Shelley in a new "defence of poetry"; but, admitting that the office of each is the spiritual interpretation of the facts of life, this office is found to have been best fulfilled in the past by those in whom the gift of genius was united to a strong moral sense, and who did not hesitate to assume the burdens, material or spiritual, of their age. There were conditions uprooting to faith and mental peace in Dante's and Angelo's time as in our own, and which bore as marked effect upon belief and moral progress; and the entire period of the Renaissance was marked by awakening doubt and scepticism as plainly as by a rebirth of hope and higher belief. Always, the two go hand in hand,—doubt of old and worn-out error with strong and unflinching faith in the new truth of to-day. It is Lowell who justly condemns those as "nerveless poets" who can find no motive for glad utterance or inspiring fancy in the thought of their own age, and who are continually mourning the past as "the lost opportunity of song." The poor, weak sentiment uttered by one of the pre-Raphaelite school, when he says,—

"I was not born to set the crooked straight,"

and who describes himself as

"The idle singer of an empty day,"

finds no echo in the manful verse of Hosea Biglow, nor any of his honored compatriots in song. What a noble definition of the poet's aim and mission we find in the works of our own Emerson, Longfellow, Whittier, and Holmes, each of whom, in the hour of peril, gladly employed his high talents in the service of justice and national honor! Whittier describes his own work in this respect as that of one

"A dreamer born,
Who, with a mission to fulfill,
Had left the Muses' haunts to turn
The crank of an opinion-mill,
Making his rustic reed of song
A weapon in the war with wrong;
Yoking his fancy to the breaking plough,
That beam-deep turned the soil for truth to spring and grow."

It is natural that the art ideals of the present day should betray the signs of that spirit of intense activity and practical wisdom which rules the age. The artist of to-day is nothing, if not realistic,—a word of very destructive import to many people, who believe that truth is to be found anywhere but in every-day experience. For them, the Madonnas of Raphael and the floating angels of Fra Angelico make up the lasting ideals of the painter's art, beside which the works of the modern artist, who has abandoned belief in both Madonna and angels, and can no longer honestly paint them, appear dull and commonplace. But I find in many of the art productions of our own age abundant prophecy of the worthy results to be attained by art under the lead of a rational philosophy. Such are LePage's "Joan of Arc," the lion-pieces of Riviere, Millet's delineations of the peasant life of France, and the numerous works of our noted landscape painters.

And not only between, but in the lines of much of to-day's poetry, notably that of Tennyson, Browning, and Lowell, we find earnest and thrilling utterance of those truths which are agitating the thought of the day, and shaping it into new forms;—

"As I count our poet him
Whose insight makes all others dim,"

says Browning, while Tennyson stands pre-eminent as the poet who owns

"The faith, the vigor, bold to dwell
On doubts that drive the coward back,
And keen through wordy snares to track
Suggestion to her inmost cell."

The feeling of distrust toward the new philosophy is strongly directed against the supposed evil effect to follow in its practical application to the general conduct and affairs of life. A friend with whom I was once discussing this subject gave a singular illustration of what he deemed the encroaching spirit of modern unbelief, as he fancied he had found it in the changed use and character of children's toys.

With the utmost gravity he pointed out how the present sceptical tendencies of the age had penetrated even to the nursery and toy-shop, where a sentiment of practical utility and common sense now reigns in place of those pleasing fancies and illusions which once constituted the intellectual domain of childhood. Boxes of tools and miniature housekeeping sets replace the sugar hearts and tinsel ornaments of a generation ago, while books of animals and birds and easy travel description crowd the stories of Andersen and Grimm on the shelves of our juvenile libraries. Noah's ark is still retained as a favorite plaything, but manifestly less as an object of religious instruction than as a convenient means of imparting an elementary knowledge of natural history. These signs of growing self-reliance, and a disposition to original research, point to the most dangerous consequences in the mind of my gloomy philosopher, the rapid disappearance of all childlike happiness and sentiment; but there are more hopeful observers of the times, who are interested in the other side of the question, and who welcome the release of the child's mind, along with that of adult manhood, from the reign of credulous fancy and superstition. The superstitions of childhood are as painful to experience and as difficult to remove as those which afflict the world's older intelligence. Thoughtful parents and teachers are beginning to take note of that vast realm of the marvellous which lies within the boundaries of the actual, and to learn that a safer stimulant to the child's imagination is found in the writings of a Lubbock or Grant Allen than in our popular works of romance and adventure. The improved methods in education attest that the new era of mental breadth and freedom brings a peculiar boon to the young; and, though many of the new theories are overlaid with error and extravagance, they cannot but prove widely beneficial in their general result.

The sociological doctrines involved in evolution deter many thoughtful people from a full acceptance of its teachings. The theories of natural selection and the survival of the fittest seem, to the popular mind, to antagonize and set at naught those precepts of mercy and good will laid down in the accepted system of Christian ethics, and to sanction the principle that, in the struggle for existence, as for political preferment, "to the victor belong the spoils." False sentiment has so long usurped the place of reason in the conduct of charitable affairs that any attempt to introduce the more rigorous measures of social science would naturally be regarded at first with considerable distrust. Evolution deals with social problems in the same rational and impartial spirit as with intellectual, its office being not only to devise new and improved methods of work, but to gather up and apply to present uses whatever of truth or good result has been attained in preceding systems. For it is no part of rational philosophy, as many seem to think, to reject and count of little worth the accomplishments of the past. The point of view held by the consistent evolutionist is that of the widest historical survey, where past and present lie mapped before him in one continuous line of progressive achievement. He is a shallow reasoner who does not recognize that the labors and opinions of former ages had as legitimate a part

to play in the world's development as those on which we pride ourselves to-day. The fact that, according to the evolution hypothesis, life is seen to be a competitive struggle, where strength and ability win the day against weakness and inefficiency, gives rise to another grave misconception respecting the nature of scientific philanthropy, one fostered by the intemperate speech of some of its advocates as much as by the prejudice of its opponents, and which warrants to rash conclusion in such minds that among men, as in nature, only the elements of a bold and masterful success should be employed, and that it is man's part to assist nature in crowding the weak to the wall. A more just and careful use of the term nature will save us much needless confusion in this matter. To the evolutionist, the realm of the natural is not confined to the action of those rude, elemental forces which have given shape and being to the universe. Nature includes human nature, that vast range of feeling, knowledge, and aspiration conveyed in the thought of a progressive humanity. The impulses of pity and benevolence are utilized, not rejected, in a true social science. A product of the natural universe, man is also its chief helper, alike the promoter and recipient of those benefits which inhere in a continually unfolding order of nature and society; for

"Nature is made better by no mean
But nature makes that mean: so, over that art
Which you say adds to nature, is an art
That nature makes."

The fact that, after ages of moral strife and conquest, man has attained his present degree of righteous and enlightened will power is proof that he is bound, by the very laws of his being, to an active participation in the onward movements of his time. The triumphs achieved through industry, patience, and growing skill are the best rewards life offers to man; and the race has its share of such triumphs in every noble impulse and pure affection wrested from selfish appetite, in those graces of mind and character which, springing from low, animal instincts, have now their part to play in the evolution of a still higher and ever-advancing social ideal.

The new thought of the age is as yet an unfinished structure, resembling Giotto's tower, full of rich promise and suggestion, but destined, in the critic's opinion, to remain forever bereft of the final touch of ideal beauty and perfection which should attest the fulfilment of the artist's dream.

"A vision, a delight, and a desire,
The builder's perfect and centennial flower
That in the night of ages bloomed alone,
But wanting still the glory of the spire."

That is the way Longfellow describes it. But turn we now to that most modern of poets, Robert Browning, and note in "Old Pictures in Florence" the use he has made of this same theme, sketching a picture of the unfinished bell-tower as it stands complete and perfect in his poet's vision, and crowned at the top, not with any of the symbols of that mediæval faith for whose use it was first built, but with a very different emblem, the national flag, sign of a resurrected and emancipated Italy.

"Pure Art's birth being still the Republic's."

But here also it is quite likely that the critics will find cause for complaint, drawing only the most melancholy conclusion from the lesson of the past, and protesting against the conversion of the lovely campanile into a flag-staff; but other minds, more open to receive what light of truth and prophecy springs from the world's present thought, will find here a most inspiring suggestion, and the true relation of use and beauty, opposite phases of the same truth, will be taught anew.

One age finishes the work of another. Giotto lays the foundation of a monument of national pride and greatness, which waits for a Garibaldi and Victor Emanuel, with Browning for interpreter, to complete. Thus, the thought of our own age waits for the broader interpretation of an age to come; and, meantime, conviction strengthens that the belief resting on the broad foundations of nature and experience is fitted, above all others, to fulfil man's highest needs, to serve as the pedestal of his strongest hopes and most reasonable desires.

CORRESPONDENCE.

AN OPEN LETTER TO MR. B. F. UNDERWOOD.

Dear Sir,—The following appeared in the *Sunday Herald* of Dec. 27, 1885:—

"Dr. F. E. Abbot's new book, the *Science of Theism*, confirms the opinion of the few best able to judge that he is the ablest philosophical thinker in America, and that his work seems to be the foundation of that deeper religion of the future, sure to come, which will satisfy both the head and the heart of man."

I think there are many readers of *The Index* who appreciate Dr. Abbot's reasoning in a similar way, and are desirous to know why a "consensus of the competent" cannot "sustain the fundamental positions of the philosophy he defends" (1), and how "his repugnance to certain theories betrays him into a most unjudicial spirit and misleading statements" (2). Why is it that "his main position must prove unsatisfactory to theistic thinkers generally"? (3)

G. H. Lewes (*Problems of Life and Mind*, Vol. I., Preface, p. ix) says: "I cannot agree that philosophy gains any refuge from difficulties by invoking the Unknowable: though it may admit the existence of the Unknowable, this admission is transcendental, and leaves all the purposes of philosophy unaffected. Deeply as we may feel the mystery of the universe and limitations of our faculties, the *Foundations of a Creed* can only rest upon the Known and Knowable." (4)

Frederic Harrison says, in the *Nineteenth Century*, "Mr. Spencer must remember that, in his religion of the Unknowable, he stands almost alone." (5)

There are, certainly, a number of such competent men who sustain the fundamental principles of Abbot's *Scientific Theism*, and will aid in the noble effort to harmonize science and religion, and to create a philosophy which must be comprehended by all rational beings. (6)

Yours truly,

CARL H. HORSCH.

DOVER, N.H., Jan. 20, 1886.

(1) The fundamental position of Mr. Abbot is that we cognize not only our own conscious states, but also the external world; that we actually perceive objective relations and know the universe *per se*. In this position, his disciples ought at least to know that he is not supported by what he would call the "consensus of the competent." There is a general concurrence among modern psychologists and philosophers that our knowledge is limited to our states of consciousness, whether its changing states be due to causes external or internal. Huxley, in stating Descartes' position, also defines his own, when he says that, "whatever the universe may be, all we can know of it is the picture presented by consciousness. This picture may be a true likeness, though how this can be is inconceivable; or it may have no more resemblance to its cause than one of Bach's fugues has to the person that is playing it, or than a piece of poetry has to the mouth and lips of the reciter." Lewes says, "The world is the sum total of phenomena; and phenomena are affections of consciousness, with external signs." John Fiske says that we know only states of consciousness in their relations of coexistence and sequence, likeness and unlikeness; and he adds that this is "one of the best established conclusions of modern psychology." "The consensus of the competent" is not our phrase, nor do we attach the importance to it that Mr. Abbot does. We simply say that it does not support him in his fundamental philosophical position. It has long since pronounced its verdict against this position, and this verdict is not likely to be reversed by Mr. Abbot's restatement of theories and doctrines with which

philosophic minds have long been familiar. His views as to the "consensus of the competent" may be seen in an article on "The Individual at the Bar," in reply to Mr. W. D. Le Sueur, in *The Index* of April 17, 1879.

(2) Our statement in regard to the "unjudicial spirit," etc., of some passages of the work,—a defect which often mars far greater works than this,—can be abundantly sustained by a reference to Mr. Abbot's treatment of the relativity of knowledge, in which he ignores the philosophic distinction, as held by thinkers, between the Knowable and that which, in consequence of incurable limitations, transcends the capacity of the knowing faculties; his treatment of Spencer's philosophy as a "mechanical" theory; his confounding of ancient realism and modern realism, or omission to state their most important difference; and his allusion to agnosticism,—not to speak of other points. We intend ere long, as we stated, to subject some of Mr. Abbot's positions and reasonings to criticism, when the justice of our remark regarding his work will, if we mistake not, be evident enough.

(3) Theistic thinkers, generally, dissent from the fundamental positions that we know the universe *per se*, that the universe is the noumenon, that the universe is an organism (without an environment),—which, however, was the almost universal opinion of antiquity,—and that the intelligibility, real or alleged, of the universe implies that the universe itself is intelligent.

(4) This is substantially the position of Spencer, with whom philosophy is the unification of knowledge, not speculations regarding the "Unknowable." At the same time, while our knowledge is of the relative, because we can only think in relations, it is, Spencer holds, impossible to get rid of the consciousness of an actuality behind appearances that is and must ever be unknown. Spencer's powerful reasonings on this point have not been met by Mr. Abbot.

(5) It is not Spencer's postulation of the Unknowable that Mr. Harrison finds fault with; for he says: "I habitually speak of him [Spencer] as the only living Englishman who can fairly lay claim to the name of philosopher,—nay, he is, I believe, the only man in Europe now living who has constructed a real system of philosophy. Very much in that philosophy I willingly adopt. As a philosophical theory, I accept his idea of the Unknowable." The phrase, "the religion of the Unknowable," has come to convey a false idea of Spencer's position. His clear correction of Mr. Harrison's statements ought not to be disregarded. Spencer has never proposed any object of religion, never suggested that men should worship the Unknowable. In reply to Mr. Harrison's idea that Humanity should be the object of religion, Mr. Spencer points out what has been the object of the religious sentiment in the past, and shows that religious evolution must be along the same line as hitherto. Here, far from standing alone, he has the concurrence of thinkers generally.

(6) A philosophy that can "be comprehended by all rational beings" must be so extremely simple as not to be entitled to the name of philosophy at all. Philosophy is the algebra of thought. It is, as Spencer says, "knowledge of the highest generality." "Knowledge of the lowest kind is ununified knowledge; science is partially unified knowledge; philosophy is completely unified knowledge." Mr. Abbot accepts Spencer's definition of philosophy, when he says that its function "is simply to systemize science as a whole,—that is, to gather up all the special facts and verified truths of the several sciences and rearrange them in one complete, comprehensive, and self-harmonious system" (*Index*, May 6, 1880). Such a philosophy can be "comprehended" only by clear-headed and profound thinkers.

B. F. U.

THE LABOR QUESTION.

Editors of The Index :—

Our continued welfare as a nation and as individuals depends upon the vigilance exercised in looking out for dangers ahead, and by keeping ourselves in harmony with such demands of the times as the best interests of society point out to us. The greatest demand of the times is that the labor question should be settled. This problem, in its different phases, is becoming more and more prominent, as a subject for serious consideration, in the minds of intelligent men and women. It is impossible to overestimate its national importance; for it has assumed a gravity which

every patriotic citizen must view with fear and alarm for the future. Even those who are indifferent to the question, so far as principles of justice and right are involved, should consider it from the stand-point of personal interest; for the law of reflex action arising from social conditions must show them that their welfare is as much at stake as those whom the question more directly concerns. Much has been written and said regarding the respective rights of capital and labor. The latest views of those who have made sociological laws a study, are, that for either to remain on a basis of enduring prosperity, a subserviency to the best interests of the other must be mutually observed. But, every day, their mutual relations grow more strained and antagonistic. Every day, we are confronted with an increasing class of facts which go to show that their difficulties contain no inherent tendency to right themselves. From Maine to California, the newspapers, in their record of daily events, have a large share of their columns monopolized by the reported details of strikes, of lock-outs, and of wages being reduced to starvation prices. We learn of thousands of working men and women who, living under a high degree of civilization never before attained, are utterly unable in any adequate measure to procure for themselves the common necessities of life. There is no need for me to dwell on these things, for it seems to me that they must stand forth with a startling significance before the minds of every intelligent reader of the daily news. And, certainly, he must be a supremely selfish man, who, with a knowledge of these every-day facts, is so wrapped up in what he considers his own individual interests as to refuse to throw the weight of his influence on the side of the cause which toiling millions represent.

Without bringing to our aid any false sentiment to magnify the distressed position which so large a number of the most useful elements in society are forcibly placed in, is it not enough to make that dispassionate philosophy which soars above the clouds of human passion and prejudice despair over humanity's prospective future?

In order to solve the labor problem, we shall have to discover, if possible, what dominant traits there are in man's nature which, if unchecked in their action, will produce the results from which the labor problem has sprung. It seems to me that we must, if we have not done so already, coincide with the views so fully elaborated by Volney in his work, *Les Ruines, ou Méditation sur les Révolutions des Empires*, that cupidity and self-love, unrestrained by the feeling of social obligation, are the motive forces which have given birth to all the varied manifestations of social wrongs and injustices, and which, to-day, we should look up to as being responsible for the vast extent of our labor troubles. Their voices are as potent with the laboring classes as with those who represent financial greatness. These principles were fully exemplified to me several years ago, while being employed as an operative in a pistol shop. The work was let out to contractors, who, in order to do the work assigned them, would hire the necessary number of men and boys. Though they made from two to three hundred dollars per month, the pay of the operatives rarely exceeded one dollar and a quarter per day, and in very many instances ran down as low as fifty and seventy-five cents. As might be expected, this unequal distribution of wages gave rise to many complaints, which were loudest from those who received the lowest pay. But, if by some lucky chance one of the operatives got a sub-contract, making it necessary for him to hire men and boys on his own account, he was sure to immediately put into practice the method of giving the lowest possible pay, which, as a principle, he was so loud to condemn before his position was bettered. The coming struggle must be between the State and this active principle of selfishness. A permanent basis of settlement of the pressing question of labor can never be reached until all individuals in society practically recognize their moral obligation to consider the progressive demands of the body politic as being paramount to their own selfish ones. Educated self-love will alone point out the expediency of pursuing this course. Not until then can we escape an extension of the evils which comparatively few individuals have brought upon the nation, by reaping for their own benefit the harvest which many hands have raised, but have not been allowed to share.

GEORGE H. HADLEY.

CHURCH INFLUENCE.

Editors of The Index :—

In the *Boston Herald* of December 10, among the reminiscences of William H. Vanderbilt, a statement was made that the great millionaire, in conversation about his railroad enterprises with a reporter who had incautiously assumed that they were intended, more or less, for the public benefit, had emphatically replied, "The public be d—d!" and had proceeded elaborately to affirm that his interest was solely in No. 1, and that regard for the public welfare had no share in it.

The *Herald* of the day following stated that "Vanderbilt's uncle was very much exercised when the familiar phrase, 'The public be d—d,' was ascribed to his nephew. 'I don't believe he ever uttered it,' said the old man, indignantly. 'Everybody who knew Will knew he never swore. Perhaps they meant that it was I who said it. It might have been. I do swear sometimes.'"

What strikes me as noteworthy in this affair is that the uncle, while shocked at the particular form of expression attributed to his nephew, seemed neither shocked nor in any degree surprised at the supreme selfishness which was avowed as the sole rule and motive of the nephew's business transactions. The profaneness must be promptly and emphatically repudiated, in vindication of the nephew's character; but the assumption of absolute selfishness as the right rule for business transactions, irrespective of the honesty of the transaction and of the suffering or loss experienced by the other party,—this seems not to have been thought of as needing either repudiation or apology. This was a matter of course; and, when the uncle admitted that the phrase in question might have been his own, since he did sometimes swear, the unscrupulousness therein avowed as the right rule of business seems not even to have been thought of. That was a matter of course for the uncle as for the nephew: how else could men accumulate millions? With both these men, according to the story, No. 1 seemed as thoroughly the sole consideration as it did to Mr. Squeers in his last conversation with Ralph Nickleby.

The view of the comparative objectionableness of the two matters above alluded to is a result of clerical teaching and church influence. The church to which the Vanderbilts belonged is no worse than others in this respect; for it may safely be asserted that nine out of ten members of every orthodox church in the country would receive, from the phrase above quoted, precisely the same impression as the uncle did. The *dashed* word they would immediately recognize as something *sinful*. The principle included in it, as elaborately expressed by the nephew and implicitly adopted by the uncle, would not of itself strike their attention. If their attention were called to it, they would admit it to be objectionable, out of harmony with the sermon on the mount and the golden rule,—not the right thing for a church member; but really, you know, the shocking thing is that a church member should allow himself to use profane language!

C. K. W.

TRAMPS.

Editors of The Index :—

The honest agriculturist asks, in despair, if he is always to be harassed by tramps; and there is only one answer: Until civilization advances to such a condition of refinement that all are influenced by their own intelligence to do exact justice by their fellow-man, tramps will exist; and the more terrible the penalty, the more audacious and reckless they will become. Cain was the first tramp in our record, and the curse inflicted upon him has been a greater evil to every organized community than to his species. Ishmaelites hover on the outskirts of society; and, to every evidence that the hand of man is upon them as a class, they make cruel reprisal. The modern practice of meeting them with shot-gun in hand and a savage mastiff to tear them to pieces only makes them more cunning, more in the spirit to depredate, and therefore more dangerous. The early settlers of New England suffered by tramps far more numerous and dangerous than those of the present time.

The savage Indian, smarting under the sense that his home had been wrested from him by an arrogant race who despised him and viewed him with satis-

faction only when his lifeless carcass rendered him harmless, and classed him with the wild beasts of the forest as *varmint*, to be destroyed at sight, and, in return, the savage cultivated his cruel instincts to return vengeance in kind,—and this was the tramp with whom our New England fore-fathers had to contend; and, so long as hate intensified hatred, the evils aggregated.

But these wild men were susceptible to the influences of practical humanity. There resided on the banks of the Connecticut River, in New Hampshire, near the present locality of Charlestown, a large landed proprietor, who spurned the belief that the land of the pagan was given to his race for an heritage, after the destruction of the inhabitants. He despised the doctrine as high-handed robbery and cruel murder. He scorned its source, and refused to take an agency under the system; but his domain was large, and he wished for neighbors. Wherefore, he constructed a meeting-house open to all. No lock nor latch was upon the door, only a wooden button, which could be turned at will; and he was as much edified by an Indian pow-wow as by Puritan worship, venerating sincerity, regardless of creed. His wood-pile was high and long, and a stone oven was as free to the Indian to cook his game as to the new settler or emigrant to bake bread. This brotherly treatment of the Indian softened his savage nature, and Moses Willard could leave his stock to roam or his farming utensils unhoused, with no fear that Indian tramps would commit a depredation in any form; and his family were as secure as any that resorted to the fort each night for protection.

Would not the dreaded professional tramp be less formidable for evil, if treated more in the spirit of humanity which influenced the good Quaker, Moses Willard, even though not practicable to be as broad in its scope? But there are honest tramps, into whose ranks all may fall, if visited by fire, flood, famine, or fickle fortune in any form, and compelled to leave a scene of thrift and the accumulation of a generation; and, to these, a gentle word or glass of water given in kindness may keep hope alive, and save them from sinking into the ranks of the degraded professional tramp. Then we are all tramps, marching up the incline with an impetuous rush in the din of turmoil and struggle, until the summit is reached, when the decline is made with constantly lessening bustle, and the forward ranks send back no sound to indicate their existence, and the front platoon sinks into silence, soon to be forgotten.

Let no perturbed spirit meet you there with upbraids that your ungenerous reception with shot-gun, savage dogs, and laws of extermination, drowned hope and created a professional tramp, lost to progressive intelligence.

J. F. WETMORE.

ALBANY, N. Y., Jan. 11, 1886.

DETECTIVES' DEMANDS ON EXECUTORS OF WILLS.

Editors of The Index:—

In your issue of April 24, 1884, there was an article relating to the evil of the autocratic powers of the District Attorneys in this State, Massachusetts. Since that time, much public interest and action against this evil have been aroused, and some decisive steps taken to relieve it. I wish to call attention in like manner now to another evil which calls for vigorous measures, to the end that individuals, under the cloak of law, may not injure the living and the names of the dead, and get rich so doing.

To demonstrate clearly, I will cite one case, omitting names simply because it was requested. A respected and respectable old gentleman of Boston died some time since, and his only son was named and appointed as executor in the will. To him appeared, early in his labors, a man who presented a bill against the estate for mysterious services rendered by a firm of "licensed private detectives." Inquiry brought the statement that this man was one of this firm claiming pay of the estate. No details were given in the bill, none would be given on request of executor, but threats only of exposure, etc. The son, well knowing the character and life of his dead father, refused wholly to credit that any service had been requested even, much less rendered, and denied the claim, giving the claimant permission speedily to withdraw.

Although it is now some two or three years since

that date, no suit to compel payment of the bill, no further claim by that firm, has been made on the estate. Hence it is clear that no honest claim existed.

This case is one of several known to me; and it seems a particularly mean form of stealing, since, in a large number of cases, it would be likely to succeed in gaining the desired moneys, in making the minds of the friends of the dead uneasy, and in casting suspicion on the lives of those since dead.

It is difficult to see wherein is the demand for such a supply, if the paid police throughout the States do their full duty; and, if any one desires to discover any fact in regard to another which is right and proper for him to inquire into, there is no need of consulting detectives, whether "licensed" or not. Ordinary discretion and patience are enough to gain any ends, as above described. History shows, beyond all question, the evil of systems of espionage in cities, or large bodies of men, since it leads invariably to dishonesty on the part of the spies employed.

JOHN DIXWELL.

BOSTON, MASS.

WHAT JESUS MEANT.

Editors of The Index:—

In your last issue, I noticed, in "A Catholic's Reply to Rabbi Schindler," a quotation from the Douay version of the New Testament, part of which is as follows: "Jesus said to them, Amen, amen, I say to you, before Abraham was made, I am." This is made use of to show the divinity of Jesus or that he claimed to be equal with God.

Now, it seems to me that this view is, to say the least, very superficial, although it is doubtless held by many Protestants as well as Catholics.

When we consider that the name Abraham was often used to designate a particular line of descent, and that, in this case, if understood in any other way, the whole passage referred to would be an absurdity; when, too, we understand that the Jewish nation had long looked for a Messiah who would be a temporal king and leader, and that Jesus never claimed to be such, but evidently believed himself to be the exponent and representative of humanity in its grandest moral and spiritual aspects,—i.e., the Son of Man,—then it is not obvious that the lesson he wished to teach the Jews was simply this: that humanity was older than their particular race or people?

O. L. SPAULDING.

LUNENBURG, Jan. 18, 1886.

MRS. DALL'S "SHAKSPERE."

Editors of The Index:—

Will you allow me to thank Mrs. Underwood, through your columns, for her friendly notice of my "Shakspere" in *The Index* of January 7? No one ought to print a book who is not willing to stand the test of the severest criticism,—nay, who is not grateful for any honest rebuke. But some of the sharp criticisms of the New York press are far from honest. For instance, when Mr. Appleton Morgan, at the beginning of this month, accuses me in the *New York Tribune* of preserving traditions and not adding to the facts, easily accessible, he either had or had not read my book. If he had not read it, he had no right to notice it; if he had, he knew he was not writing the truth, but was misleading his readers. I have not preserved a doubtful tradition, with one exception; and that is not my exception, but Mr. Halliwell-Phillips', as no one knew better than Mr. Morgan. As soon as I discovered that the third edition of the *Outlines* had led me into one serious and several unimportant errors, I submitted my book for correction to two of the best Shaksperean experts in this country, that I might prepare the plates for a second edition. Neither of them pointed out the forged letter of Southampton to Ellsmere. I asked them why. "That is not your error," was the reply. "You had a perfect right to extract it from Halliwell-Phillips, so long as you gave every reader the proper reference." So writes Dr. Ingleby, quoted against me by Mr. Morgan. "You naturally relied upon Halliwell-Phillips," he says, and goes on to tell me of his residence under Halliwell-Phillips' roof, while his own criticisms of the "enclosing of Welcombe" were going on. Mr. Halliwell-Phillips himself laughs at my criticisms of his clumsiness, and invites me warmly to make him a visit. Mr. Dykes Campbell, the secretary of the Browning Club, thinks a large edition of the book can be sold in England.

How different these kindly greetings, from strangers who do not know me, from the sharp injustices of many critics here! It is certainly a very grave carelessness that I could not in my first edition spell Mr. Halliwell-Phillips' name right.

I had excellent proof-readers, who did not discover the error; but nearly every critic who commented on this dire mistake misspelled my own name, though he had my title-page before him! If I live, this little book shall be made so accurate that none of my country women shall be ashamed of it. If I die, I shall still have given to the English student the means of reference to all the facts in Shakspere's life and to their full discussion.

CAROLINE H. DALL.

WASHINGTON, D. C., Jan. 23, 1886.

DATE OF THE OLDEST BOOKS.

Editors of The Index:—

Will you kindly answer through the columns of *The Index* the following queries. They are asked with a view of settling some points raised in a friendly discussion.

What is the supposed date of the oldest book in the Scriptures? (1)

Are the Scriptures the oldest and most complete literature extant? (2)

If they are not, please name the oldest writings and their date. (3)

A READER.

[(1) The oldest book of the Bible is probably Amos, 800 B.C. (2) The Hebrew Scriptures are not the oldest and most complete literature extant. (3) The oldest, or among the oldest writings, are the Chinese Book of Changes, 1150 B.C., and Book of Rites, of about the same antiquity; the Egyptian Book of the Dead, about 1500 B.C.; and the Indian Rig-Veda (hymns), 1400 B.C. Our authority is *Encyclopædia Britannica*.—B. F. U.]

BOOK NOTICES.

JAPANESE HOMES AND THEIR SURROUNDINGS. By Edward S. Morse. With Illustrations by the Author. Boston: Ticknor & Co. 1886. Price \$5.00.

Prof. Morse's work is an original monograph,—the first of its kind,—permanent in value, extremely interesting, admitting us to the interior domestic life of the middle classes of the Flowery Empire people in a very curious way. It is a rich and heavy volume of four hundred pages, and its three hundred illustrations are its chief attraction. The scientific precision of the descriptions is such that the book might actually be used by architects as a text-book; and yet the interest of the subjects treated is such, and they are presented in so bright a way, that popular interest is not lessened. The women of England and America can learn much from a study of the Japanese interiors sketched by Prof. Morse. Works like this change the tastes and art-habits of a nation.

The houses of the middle-class Japanese (we learn from Prof. Morse) are mostly one-story structures, unpainted within and without, yet with the stamp of extreme neatness and taste everywhere visible. They are mere frameworks, with their sides composed of sliding screens of white paper to admit the light. The universal verandah has also sliding wooden screens,—or storm-doors, as we should call them,—which are closed at night and during rain. Country houses are almost all thatched; city houses shingled with mere shavings of shingles, attached by bamboo pegs, like our shingle-nails. It follows from the use of all this paper and light combustible material that conflagrations are almost uncontrollable. The most valuable articles are by each family always done up and carried to another part of the town, when a fire breaks out in their neighborhood. Separate fire-proof buildings, called *kura*, heavily coated with mud, are usually in the yards of the well-to-do. During a fire, the streams of water are directed upon the firemen themselves, as they are engaged in tearing down buildings to stop the flames! It is amusing to see Japanese firemen at night on the roofs of burning buildings, with lanterns in their hands.

As there are no windows and doors like ours, so (except in country inns and some country houses) there are no fireplaces. Charcoal is the universal fuel, and the *hibachi* the omnipresent portable charcoal hearth, or box, over which hands and bedding are warmed in winter. The kitchens contain other

kinds of hearths and ranges. A peculiar feature of Japanese homes is their apparent emptiness, as if they were to let. They will have no truck or litter around: coal and wood are kept under the floor (you raising a board when you want them). There are no chairs or tables or beds in a house. The floors are always covered with cool, clean straw mats; and, on these mats, people eat, sleep, and die. They both receive guests and eat their food in a kneeling posture, resting the body on the knees and the haunches on the heels,—a painful position to foreigners. Food is served on lacquered trays. No clogs are worn in the house: it would ruin the mats. For bedding, padded comforters are laid on the floor, and others like them serve for covering: they are rolled up in the morning, and laid in closets. The Japanese interior decorations are exquisite in quiet reserve of tone. They keep their paintings and bric-à-brac, not on the walls or on tables, but in closets and drawers, hanging one or two at a time on the walls. For flower decorations, they will place in a vase a single spray of wild cherry blossom rather than a huge clump of murdered flowers. They will work into their room wood-work bits of wreck, burls, natural posts, etc., and are free in invention, endless in original designs,—the first requisite of great art, as Ruskin shows in the Gothic workmen. They observe another rule of great art,—avoidance of base bilateral symmetry (p. 135).

The old-gold screens, used in the rooms to obtain privacy when the *shōji*, or sliding screens, are rolled back, are well known to be marvels of decorative painting. "The six-panelled gold screen," says Prof. Morse, "is, beyond all question, the richest object of household use for decorative purposes ever devised. . . . On certain festival days, it is customary for the people, bordering the wider thoroughfares, to throw open their houses and display their screens." Prof. Morse, in speaking of a house where he was often received as a guest, mentions the perfect harmony of the tinted walls; the screens with their curious, free-hand ink-drawings, "or conventional designs on the paper of so subdued and intangible a character that special attention must be directed to them to perceive their nature"; the clean and comfortable mats; and the natural woods composing the ceiling. And then he draws a contrast between this exquisite taste and the taste that leads us to stuff our parlors with everything under the sun, disposed in the crudest and most barbaric fashion,—dusty carpets, suffocating wall-paper, and labyrinth of close-smelling varnished furniture. He prefers the Japanese taste, and with justice; though, in general, we think his enthusiasm for things Japanese a little biased and undiscriminating. Why certain of the Daimios of Tokio have built houses in the foreign style, for the transaction of their business with foreigners, was a puzzle to Prof. Morse, until he saw the manner in which a foreigner was likely to behave on entering one of their own dwellings: "If he did not walk into it with his boots on, he was sure to be seen stalking about in his stockinged feet, bumping his head at intervals against the *kamoi* [lintel], or burning holes in the mats in his clumsy attempts to pick up coals from the *hibachi* [charcoal-hearth], with which to light his cigar. Not being able to sit on the mats properly, he sprawls about in attitudes confessedly as rude as if a Japanese in our apartments were to perch his legs on the table," etc.

In nearly every house are either Shinto or Buddhist shrines, containing image, lamp, and offerings. "In front of these shrines, one may often see the inmates of the house bow their heads, clap their hands, and then, rubbing the palms together in an imploring gesture, pray with much earnestness. . . . Among the intelligent classes, the household shrine seems to be provided for the female members of the family only, the men having outgrown these superstitions. And it was interesting to observe that, in Japan, as elsewhere, the women—being as a rule less informed—made up the majority of those attending public worship."

"A household shrine to which the children pay voluntary and natural devotion is the birds' nests built within the house," generally in the most frequented room or portion of the shop. A little shelf is placed beneath the nest to protect the mats, and the gentle Japanese children watch the processes of nest-building and rearing of the young with curious eyes.

The elaborate tea-ceremonies, and tea-houses especially built for these occasions, are very odd features

of Japanese social life. "Many books are devoted to the exposition of the different schools of tea-ceremonies." But it would be an injustice to Prof. Morse, were we to pilfer any more of his honey. We have nefariously come away with bucket filled, it is true; yet have scarcely given a hint of what is left. And the general impression remaining with us is that the author, with characteristic alertness and energy, has used the two years of his university professorship at Tokio, and his three trips to Japan, to as much advantage as many others would have taken half a dozen years to utilize. W. S. K.

THE CONFESSORIAL EXPOSED, as it exists in the Church of Rome and the Church of England. By Saladin, editor of the *Secular Review*. London: W. Stewart & Co., 41 Farrington Street, E.C. pp. 92.

The *Pall Mall Gazette*, having shown "how procuresses, pimps, panderers, and policemen, according to their different vocations and capacities for evil, had entered into an only too successful conspiracy to offer our womankind for sale on the shambles of lust, and generally to debauch the tone and temper of our times," the author of the pamphlet endeavors to prove that those who, in the wilderness of social blight, turn to the Church as to the shadow of a great rock in a weary land, trust only to be deceived. The work is based in part upon "The Priest in Absolution," issued in 1866, under the auspices of the Holy Cross. It is much to the credit of Saladin that several pages of his evidences are printed in Latin. Such filth can hardly fail to corrupt the imagination of the average reader.

MY GIRLS. By Lida A. Churchill. No. 2 of D. Lothrop & Co.'s Household Library. Paper covers. Price 50 cts.

This is a pleasantly told story of the friendships, loves, misfortunes, and independent pluck of four exceptionally bright girl telegraph operators out of employment, who formed themselves into a co-operative housekeeping association, and some of whom achieved success. There is evidence of crudity of thought and of youthful inexperience of the real world in these pages, but they are never dull; and, though some optimistic readers may object to the death of two of the most interesting and unselfish characters of the book, yet the remarkable successes attained by the other members of this group of "my girls" partly atone for the hard fate dealt out to the other characters.

PARLOR VARIETIES. Part II. Being the Second Series of Plays, Pantomimes, and Charades. By Emma E. Brewster and Lizzie B. Scribner. Boston: Lee & Shepard. 1886. Paper. Price 30 cts.

This will be found a useful help in village lyceum and dramatic associations as well as in private theatricals. The following plays, etc., are given: "The Lover's Stratagem," parlor play; "Zekiel's Courtship," pantomime; "Bouquet of Rare Spirits," musical; "Cinderella," burlesque pantomime; "Dialogue for Five Little Girls"; "Beresford Benevolent Society," a short play; "The Rumseller's Exhibit," tableaux, with descriptive lecture and songs; "The Bachelor who lived by himself," pantomime; "That Boy Tom," parlor play; "Who Wins?" a one-act play; "Carboline," a one-act play.

"MIND" for January commences its eleventh volume, to which is appended a copious index to the ten completed volumes. These constitute a most complete record of the best recent thought by the foremost thinkers in the wide range of the various departments of mental science, and contain essays from some of the ablest writers in this country as well as in Europe. In the present number, the first essay is by John Dewey, giving a very clear and rational view of "The Psychological Stand-point" in mental inquiry. Prof. Karl Pearson contributes an interesting account of the peculiar philosophic views of Eckhart, the celebrated German mystic. William Mitchell treats upon "Moral Obligation." Joseph Jacobs argues for "The Need of a Society for Experimental Psychology." Prof. G. Stanley Hall and Joseph Gastrow, of Johns Hopkins University, contribute some "Studies of Rhythm." James McKeen Cattell treats of "The Time it takes to see and name objects." H. M. Stanley discusses "Feeling and Emotion." Carneth Read reviews Mr. Mercier's "Classification of Feelings." The other essays are one "On the Analysis of Comparison," by F. H. Bradley; and "Notes on Aristotle's Psychology." Among the reviews are one

on *The Guide of the Perplexed* of Maimonides by I. Abrahams; and of Ribot's *Les Maladies de la Personnalité*, by James Sully. The list of new books noticed is very full. Williams & Norgate, London, are the publishers.

In the *Andover Review* for January, Prof. Ladd, of Yale College, continues the discussion of the Harvard method of education opened by Prof. Palmer. Prof. Asa Gray, in connection with the memoir of Prof. Agassiz, recently published, presents a delightful sketch of the earlier or European portion of his life. Rev. F. H. Johnson considers "Revelation as a Factor in Evolution." Prof. Stearns furnishes a summary of the conceptions involved in the doctrine of atonement. A new department in the *Review* is opened by Prof. Churchill, under the title "Expositions of Contemporary Church Architecture." It is proposed to review several modern churches as books are reviewed. The first editorial is concerning the need which exists for the enlargement of the agencies and activities of local churches. An abstract of the recent Encyclical of Leo XIII. is given in a second editorial, with some comments. A third editorial replies to a communication to the *Review*, from Dr. Todd, of New Haven, commenting upon the last article on "Progressive Orthodoxy." Houghton, Mifflin & Co., Boston.

Dr. BELLOWS' SERMONS.

A New Volume, Selected and Edited by his Son,
Rev. RUSSELL N. BELLOWS.

"For sincerity, originality, sound reason, and deep reflection, as well as pious and humane feeling, this book matches, if it does not surpass, any of like kind lately issued from the press.

"Persons of every sect and no sect at all, Conservative, Radical, Romish, or Free Religious, may taste immaterial elements, bread and wine of substantial communion, at the board of the spirit he spreads."—Rev. Dr. C. A. Bartol, in *Christian Register*.

"Those who heard Dr. Bellows when he was on his conservative tack will be surprised by his radicalism when he 'went in stays,' beating up for the port of truth, and stood out bravely on the other tack. He saw the truth on both sides, and wasn't afraid or ashamed to 'tack ship,' when it seemed necessary to keep in the deep channel."—Rev. Wm. P. Tilden.

"There is many a sentence here that would startle the proprietries of some of our fossil Unitarians out of their habitual slumber with a lively shock."—Rev. John W. Chadwick.

8vo, 400 pp. Price \$2.00. Sent, postpaid, on receipt of price by the Publisher,

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOCOSMIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAH: THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 30 copies for \$1.00.

BREATHES there a man with soul so dead
Who never to his wife hath said,
"I will a flower garden make,
Both for my own and thy dear sake,
And sow with seeds to come up quick,
Which you, of course, will buy of Vick?"
If such there be, I pray repent,
And have an order quickly sent.
Then sweet thy rest, I'm sure, will be,
And thy dear wife will smile on thee.

The GUIDE is a work of 150 pages, Colored Plates, 1000 illustrations, with descriptions of the best Flowers and Vegetables, prices of Seeds and plants, and how to grow them. It tells you what you want for the garden, and how to get it. Printed in English and German. Price only 10 cents, which may be deducted from first order. BUY ONLY VICK'S SEEDS AT HEADQUARTERS. By RICHARD B. WESTBROOK, D.D., LL.B.

Price \$1.00.

For sale at THE INDEX office.

Pirates, Authors, and CHEAP BOOKS.

The "Pirate" and "Copyright" questions fully discussed, the controversy with Mr. Hamerton, the attack of *The London Saturday Review*, and the "return fire," all printed in full in a neat broadside, sent free to any applicant.

ECHOES of the BATTLE.

"If the receiver of stolen goods is as bad as the thief, hundreds of poor students will gladly accompany you to a pirate's doom."—ANNA M. JACKSON, Sauburg, Penn.

"Your reply to Hamerton is simply magnificent, and all who want good and cheap books ought to thank you both for it and your work."—E. E. LEWIS, Sioux City, Iowa.

"I am entirely pleased—nay, delighted—with your books which have come to hand."—T. H. ATTRIDGE, Cork, Ireland.

"John B. Alden deserves the recognition of all good men for his service to society in the inauguration of his Literary Revolution. Works beyond the reach of the middle classes, owing to the great cost, are now obtainable by the industrious at prices possible to be paid out of the mechanic's wages. Money could not buy this advertisement, which merit gets for nothing."—*Protestant Pillar*, Montreal, Canada.

HISTORY of RUSSIA. By ALFRED RAMBAUD. 2 volumes, large 12mo., fine cloth, gilt tops. Library style, finely illustrated, \$1.75.

"It is beyond question the best complete History of Russia which has appeared in the West. In the author's power of seizing salient points of character and selecting picturesque incidents, the book reminds us very much of Green's English History. We will venture to prophesy that it will become the work on the subject for readers in our part of the world."—*Athenaeum*, second notice.

QUIZOT. History of FRANCE. New and cheaper edition, in 8 volumes, large 12mo., 427 fine illustrations, bound in fine cloth, gilt tops. Library style, \$6.00.

"There is only one drawback. . . it seems more like getting a present than making a purchase. Quizot is the most brilliant of French historians, as well as the most to be relied upon. He is the Macaulay of the History of France."—*Churchman*, Toronto.

QUIZOT. History of CIVILIZATION 50 cents.

GREEN. Larger HISTORY of the English People. Illustrated Aldus edition, 5 vols., half Morocco, marbled edges, \$3.75.

The same, Elzevir edition, 5 vols., cloth, \$2.50.

CARLYLE. FRENCH REVOLUTION. Elzevir edition, 2 volumes, \$1.00.

CREASY. Fifteen DECISIVE Battles of the World. Elzevir edition, 50 cents.

SCHILLER. HISTORY of the Thirty Years' War in Germany. Elzevir edition, 50c.

HISTORICAL WONDER-BOOK, containing Green, Schiller, Creasy, and Carlyle, as above, in one imperial octavo volume, fine cloth binding, profusely illustrated, \$2.50.

The same, without illust., half Russia, \$1.75.

"A wonder-book in more senses than one. The idea of putting a work like this at only \$2.50 per copy, seems preposterous; and yet there is wisdom in it, for everybody will want it, and it will thus be the means of advertising the numerous other valuable books which the publisher is putting forward."—*Christian at Work*, New York.

RAWLINSON. Seven Great MONARCHIES. Complete in 3 vols., with over 700 illustrations and maps. Fine cloth, gilt tops. Price reduced from \$18.00 to \$3.50.

"It is one of the greatest historical works of this age. It covers the ground, as that ground is covered by no other publication in the English language, and shows splendid critical ability, as well as profound scholarship and laborious research. Marvelously cheap as it is, this classic work should now find its way into every library in the land."—*Journal of Education*, Boston.

PRESCOTT'S GREAT WORK, the History of the Reign of Ferdinand and Isabella. Library edition, 2 volumes, small octavo, fine cloth, gilt tops, illustrated, \$2.25.

The same, popular edition, in one vol., \$1.25.

"One of the very finest histories of modern times, written by an author of rare felicity of diction, fervor of imagination, accuracy of statement, and exquisite beauty of style. Every one who reads at all should read Prescott."—*Presbyterian*, Philadelphia Penn.

ALDEN'S CYCLOPEDIA of Universal Literature. Parts I. to IV. ready; paper, each 15 cents. Volume I. ready, 480 pages, fine cloth, gilt top, 60 cents.

"I am strongly impressed with the great intrinsic value of the work as a popular educator in a high department of learning. The plan is admirable. Combining as it does a personal knowledge of an author with specimens of his or her best literary productions, gives it an inestimable power for good among the people."—BENSON J. LOSSING, LL.D.

HUME. History of ENGLAND, 6 vols., bound in 3, large octavo, Pica type, fine cloth, gilt tops. Harper's price for the edition printed from plates almost identical, is \$12.00. My price is \$5.00.

KENRICK. History of Ancient EGYPT under the Pharaohs. 2 volumes bound in one. The English price is \$15.00. My price is \$1.00.

BARING-GOULD. CURIOUS MYTHS of the Middle Ages, 40 cents.

BARING-GOULD. LEGENDS of the Patriarchs and Prophets. 50 cents.

"S. Baring-Gould has made the literature and legend of the ecclesiastical past a province peculiarly his own. His works are widely read both in this country and his own."—*Daily Eagle*, Brooklyn.

SCOTT. Beautiful HOMES. The Art of Beautifying Suburban Home Grounds. Very finely illustrated and bound. Price reduced from \$8.00 to \$3.00.

"Ought to be in the hands of every household. There is no other book that can compare with it for the wants of common people, with small ground, and smaller means, and who, with a desire to do something, do not know what to do, nor what to do it with! But such a book, if only two or three were in a neighborhood, might soon revolutionize the region."—HENRY WARD BEECHER.

AMERICAN PATRIOTISM. Famous Orations and Patriotic Papers of celebrated patriots, from Washington to Lincoln. 75 cts.

FROUDE. Historical ESSAYS, the best of his "Short Studies on Great Subjects." Fine cloth, gilt top, 50 cents.

CLASSIC COMEDIES. The masterpieces of Goldsmith, Sheridan, and Jonson. Fine cloth, gilt top, 60 cents.

"The School for Scandal' is perhaps the most finished and faultless comedy we have."—WM. HAZLITT.

"The Stoops to Conquer' Wit without licentiousness; humor without extravagance; brilliant and elegant dialogue."—HENRY NEKLE.

"Every Man in His Humor' will endure reading so long as either ingenuity or learning are fashionable in our nation."—THOMAS FULLER.

OBITER DICTA. By AUGUSTINE BIRRELL. Fine cloth, gilt top, 50 cents.

"A most attractive little book, and it proves to be what Lamb would call 'really a book,' something pleasant to read and delightful to own."—*The Critic*, New York.

BURKE on the SUBLIME and Beautiful. 60 cents.

"A charming edition of one of the most famous of books."—*Dominion Churchman*, Toronto.

HAMERTON. The Intellectual LIFE. Elzevir edition, 60 cents.

The same, full Russia, gilt edges, \$1.20.

"Hamerton's delightful essays are here put in form that will engage the eye of him who loves to see his favorite in pretty dress, becoming to its excellence."—*Journal*, Indianapolis.

LAMB. ESSAYS of ELIA. Fine cloth, heavy paper, gilt top, 50 cents.

"There is an undying charm about the Essays of Elia. Charles Lamb saw things from an odd angle, and the oddness was so blent with humor, pathos, and geniality that it never offended, but only surprised and charmed."—*The Critic*, New York.

WHAT TOMMY DID. By EMILY HUNTINGTON MILLER. Finely illustrated, elegantly bound, 50 cents.

"Fun, jollity, and mirth-provoking incident run riot through the story. Wrinkles vanish in its reading, and care fades away before the cheery influence of the recital."—*San Francisco Post*.

HANDY-VOLUME Edition of the POETS By far the handsomest editions published in America at any price:

BURNS, complete in 3 volumes, cloth, \$1.50; full Russia, gilt edges, \$2.75.

SCOTT, complete in 4 volumes, cloth, \$1.90; full Russia, gilt edges, \$3.25.

MOORE, complete in 3 volumes, cloth, \$1.50; full Russia, gilt edges, \$2.75.

MILTON, complete in 2 volumes, cloth, 90c.; full Russia, gilt edges, \$1.75.

DE QUINCEY. CONFESSIONS of an English Opium-Eater. Cornell Univ Lib

"It is not Opium in I

POETICAL CONCORDANCE

CHAR. A. DUFFEE, being an index to every character, first line, and popular quotation in 49 of the principal poets of the world, including Browning, Byron, Chaucer, Goethe, O. W. Holmes, Homer, Longfellow, Schiller, Shakespeare, Tennyson, and Whittier. Fine cloth, gilt edges, \$1.25.

"An extremely convenient and rather remarkable work. The value of such a work is evident upon its face."—*Christian Union*, New York.

GEIKIE. Life of CHRIST. 60 cents.

"A work of gigantic industry, and what is the chief point, it breathes the spirit of true faith in Christ. I rejoice at such a magnificent creation, and wonder at the extent of reading it shows."—DR. DELTZSCH.

GEIKIE. HOURS with the BIBLE: From the Creation to the Patriarchs. 60 cts.

An Eminent American author writes: "I'm a little bit fond of adventure and am enjoying my cruise with a pirate! Some nervous literary friends have expostulated with me in vain, representing the literary perdition to which you are leading me; but I've a head of my own and have answered all with the words: 'Wait and see!' I have read with much amusement your answer to the *London Saturday Review*. I don't blame you for hitting back. I sent an English publisher, on order, a MS. worth in our market \$300.00, and trusted to his own liberality for remuneration; he sent me nine dollars!"

"Your books are largely in use out here among our English reading native friends, as well as among ourselves."—J. H. DE FOREST, Osaka, Japan.

"The name of John B. Alden will soon become as famous, if it is not already so, as any of the great philanthropists who make the world better. He has not given millions to the poor, nor endowed some fashionable hospital, but he has done even better than any of these things. He has given us choice works at prices that place them within the reach of all at prices that have stirred to their utmost depths greedy souls of monopolizing publishers."—*Connecticut Catholic*, Hartford.

MAURICE THOMPSON. By-Ways and Bird Notes. Cloth, gilt top, 75 cents.

"Its chapters are as crisp and refreshing as a breeze upon a mountain's brow laden with the resinous aroma of piney groves and forests of fir. There is nothing in the literature of natural history more delightful than Mr. Thompson's chapter entitled 'A Red Headed Family.'"—*Record-Union*, Sacramento.

CLASSIC POEMS. A charming Elzevir volume, containing the most celebrated poems of the following authors: Goldsmith, Burns, George Eliot, Jean Ingelow, Schiller, Tennyson, Campbell, Byron, Coleridge, Macaulay, Aytoun, Poe, and Goethe. Fine cloth, 50c.

LUTHER. TABLE-TALK and Luther Anecdotes. Elzevir edition, 30 cents.

CANON FARRAR. Seekers After God. 45 cents.

CONFESSIONS of ST. AUGUSTINE. 50 cents.

"No one mind has ever made such an impression on Christian thought. No one can hesitate to acknowledge the depth of his spiritual conviction, and the strength, solidity, and penetration with which he handled the most difficult questions."—JOHN TULLOCH, Principal of St. Andrew's Univ.

HISTORY of ALL RELIGIONS. By SCHMUCKER. Reduced from \$2.00 to 60 cents.

BACON. ESSAYS, Complete. Elzevir edition, 30 cents.

"The Essays of Bacon are still peerless. One never fails to wonder, as he reads them, that in so busy a life, Lord Bacon should find time, and have a taste for the sober and impressive meditations found in these remarkable pages."—*Zion's Herald*.

LOCKE on the UNDERSTANDING. 30 cents.

"The work that has eclipsed every other, and given to such inquiries whatever popularity they ever possessed."—HALLAM.

BACON'S ESSAYS and LOCKE on the Understanding. Complete in one volume, half Russia, 50 cents.

BRICKS from BABEL. By JULIA MCNAM WRIGHT. Cloth, gilt top, 60 cents.

GRACE GREENWOOD. Home Stories for Young and Old, as follows:

Stories for Home Folks, 60 cents.

Stories for Folks Home, Stories and Legends of France and Italy, 75 cents.

Stories from famous Ballads, History of my Pets, and Recollections of my Childhood, in one vol., 75 cents.

Stories and Legends of Travel and History, and Stories of Many Lands, 75 cents.

Merrie England, and Bonnie Scotland, 75c.

"Stories charmingly told. There is an old-fashioned religious quality, a reverence for all the best and holiest impulses of life, which has almost become a lost art in the construction of stories of the present day."—*Free Press*, Detroit.

CHAMBERS. CYCLOPEDIA of English Literature. 8 volumes bound in 4. \$2.40.

DICKENS. CRICKET on the HEARTH. Illustrated. 30 cents.

"The most delightful inspiration of the great literary genius of the Nineteenth Century."

EMERSON. ESSAYS. 12mo., cloth, red top, 50 cents.

The same, small octavo, half Morocco, marbled edges, 80 cents.

JOHN STUART MILL on LIBERTY. Price reduced from \$1.00 to 30 cents.

HERBERT SPENCER on Education 50 cents.

A LITERARY CURIOSITY. The Glass of Time, Divinely handled by THOMAS FRYOT. A reprint of the famous and extremely rare poem which is supposed to have inspired Milton's *Paradise Lost*. Gilt top, 50 cents.

POETICAL "WONDER-BOOK," containing Burns, Scott, and Moore, as above, complete in one volume, imperial octavo, bound in fine cloth, ornamented, \$2.25.

CHINESE CLASSICS. The famous writings of Confucius and Mencius, translated into English by LEOX. Fine cloth. Price, \$3.50, reduced to \$1.00.

GREAT Thoughts from GREEK Authors. 60 cents.

GREAT Thoughts from LATIN Authors. 60 cents.

CLASSIC PROSE WONDER-BOOK, including, complete: Hamerton's *The Intellectual Life*, Mill on *Liberty*, Spencer on *Education*, Bacon's *Essays*, Letters of Junius, Macaulay's *Life of Frederick the Great* and *Essay on Milton*, Great Thoughts from Latin Authors, and Great Thoughts from Greek Authors, in one large imperial octavo vol., fine cloth, ornamented, \$2.

EMINENT AMERICANS. By BENSON J. LOSSING. Brief Biographical Sketches, with over 100 portraits. 80 cents.

DORE BIBLE GALLERY. Price reduced from \$6.00 to \$2.25.

DORE PARADISE LOST. Price reduced from \$6.00 to \$2.25.

"There seems to be no end to Mr. Alden's enterprise. Not content with gleaming the choicest gems in the mine of literature and giving them to the public at prices within the reach of the slender purse, he now boldly enters the field of illustrated books. The binding is rich and handsome. It is not too much to say that so choice a gift book was never before offered to the public at anything like so low a price."—*Homestead*, Springfield.

RUSKIN'S CHOICE WORKS: Crown of Wild Olive, 30 cents.

Ethics of the Dust, 30 cents.

Sesame and Lilies, 30 cents.

The above three bound in one volume, 60 cents.

WASHINGTON IRVING'S WORKS, complete, except the *Life of Washington*. Caution edition, 6 volumes, fine cloth, \$4.75.

Library ed., 9 vols., fine cloth, gilt tops, \$7.00.

ANCIENT CLASSICS for ENGLISH Readers. 27 vols., bound in 9 vols., half Russia reduced from \$37.00 to \$6.00.

HOLYOAKE. Manual of CO-OPERATION. 35 cents.

"We are on the eve of a revolution; we can make it a peaceful one; books of this kind help along the peaceful solution of the great socialistic problems."—*Southern Churchman*, Richmond.

ALDEN, ELLEN TRACY, Stories and Ballads for Young People. Finely illus'd, 60 cents.

"One of the pleasantest child books we have seen for many a day. Everything in it is good. It is more than good."—*Inter-Ocean*, Chicago.

MILTON. PROSE WORKS. 60 cts.

BOOK-LOVER'S ROSARY. 40 cents.

ARGYLL. Reign of LAW. 70 cents.

Argyll's Unity of Nature. 70 cents

Argyll's Primeval Man. 50 cents

The above three bound in one volume, \$1.25.

TAYLOR. Self-Cure of HERNIA 90 cents.

Health for Women, 40 cents.

Health by Exercise, 60 cents.

Alden's wonder Books.

BY B. F. U.

COMPLAINT comes from the Hindus that the idols sent them from Birmingham, Eng., are of poor quality; that the wood of which they are made is cross-grained, and covered with a cheap mineral paint, which comes off when the devotees kisses them. Besides, they say the designs are ugly.

REFERRING to the recent discussion at the Nineteenth Century Club between Presidents McCosh and Eliot, a contemporary says, "It will be time enough to insist upon teaching religion in the schools and colleges when the religionists agree among themselves as to what the truths of religion are."

THE Worthington Company, 28 Lafayette Place, New York, announce that they will soon issue Mr. Swinburne's study of Victor Hugo. Swinburne was an ardent admirer, almost a worshipper, of the French poet; and this wreath to his memory, woven by a personal friend and fellow-poet, is a masterpiece of eulogy.

A FEW days ago, in a town near New Haven, a man in a state of religious frenzy attempted, to use his own language, "to cut across lots to heaven" by hanging himself; but the rope broke, and instead of arriving at the celestial regions for which he started, as he imagined, this impatient fellow came more closely in contact with the earth than he was before he made the experiment of trying to "cut across lots to heaven."

THE Philadelphia Record thinks that professional educators and the public are more and more coming to believe that theological dogmas are out of place in a college, that this change, in the absence of some reaction arising out of unknown conditions, is likely to go on increasing in a geometrical progression; and "that colleges which used to have compulsory prayers twice a day will have no compulsory service at all is predictable for this reason."

PROF. AUSTIN PHELPS, in the *Congregationalist*, endeavors to answer a question as to the duty of a Christian stockholder in a railroad whose directors run trains on Sunday. The question is, "If it is wrong for me to take my dividends, is it right for me, by selling out, to tempt my neighbor to take them?" Prof. Phelps does not think the stockholder should decline to accept his dividends. "What is that," he asks, "but giving his property outright to the support of a Sabbath-breaking community?" As the *Springfield Republican* remarks, "The professor sees the point, and fights shy of it."

THE cabinet Mr. Gladstone has succeeded in forming is composed of men of intellectual strength and vigor. John Morley, secretary for Ireland, and Charles Russell, the new attorney-general, will undoubtedly, with the premier, favor Irish home rule. The dominant spirit of the cabinet is radical. The omission of the Marquis of Hartington, Lord Derby, and Sir Charles Dilke is noticeable. The first two cannot for the present indorse the new administration's proposed policy on the Irish question; and the name of the last rests under a cloud, which, it is hoped, however, will be dispelled by evidence to be brought forward in the divorce court, in which case Sir Charles will probably receive the appointment of foreign secretary.

THE Boston Herald, referring to the decision of Judge Shepard of Chicago as to the competency of people to testify in court who believe neither in a personal God nor in future rewards and punishments, remarks that such men—conscientious atheists and agnostics—have "had to stand aside and see miserable whiskey-drinking, fighting, swindling scoundrels devoutly kiss the book, and then lie away the fortunes and good name of honorable men. At last, thank heaven, the day has come when the more intelligent public, with sound judges to back them, declare outright they will not stand this sort of thing any longer. And now that honest men who devoutly respect the pure tribunal of conscience are, in many of our States, beginning to be put on the same high level of privilege with habitual liars and thieves, who must be terrified into telling the truth piecemeal with superstitious fears, is it too much to hope that the same even-handed justice may in due time be extended even to the brute creation?"

WHY do the orthodox clergy as a class oppose the opening of museums, picture galleries, and libraries on Sunday? Their Master never said that all places of instruction and amusement should be closed on that day, and that the churches only should be attended. The Bible does not contain a passage to the effect that Sunday should be observed as an exceptionally sacred day. Even in regard to the Jewish Sabbath, Jesus said, "The Sabbath was made for man, not man for the Sabbath." But the orthodox clergy and press are, to all appearances, as much opposed to open museums, art galleries, etc., as to open whiskey and beer saloons on Sunday. Nothing will satisfy them but church attendance; and anything in their

opinion tending to lessen this they persistently oppose in the name of religion and morality, and invoke the civil authority to aid them whenever possible, whether they can cite the words of Jesus on their side or not. How much shall be credited to disinterested devotion to truth and morality, and how much to devotion to their personal and professional interests?

DR. P. W. MOSHLECH, scientist and the master of ten languages, died last week at the Erie (Pa.) County almshouse, in his seventy-ninth year. He was a Prussian by birth. He graduated with high honors from the University of Bonn, made medicine a specialty, and practised several years in Paris; turned his attention to science, and afterwards to the languages. He numbered among his friends many illustrious men, and among them Darwin and Victor Hugo. At the beginning of our war, he visited this country, and accepted a position as professor of Greek and Hebrew in Bethany College, West Virginia, which he held but a short time, owing to the war excitement. He subsequently practised medicine in Ohio and Pennsylvania, and wrote for scientific publications. He was so much interested in his work that he neglected to make provision for his old age; and, when he could no longer pursue his profession, this man, who had associated with the most learned men of Europe, was compelled to apply to a poor-house for shelter and bread. Even after he entered the almshouse, he prepared a number of young men for college, and lectured occasionally before the Erie Historical Society. Although he died a pauper, he was more worthy of honor than Vanderbilt.

JOSEPH ARCH was recently dined at the National Liberal Club in London, by five hundred gentlemen. The host sat in broadcloth and evening dress, but the laborer's champion and representative adhered to his homely suit of gray. The home of the Prince of Wales, Sandringham Palace, is in Mr. Arch's constituency. This fact led Mr. Chamberlain at the banquet to say: "If anything could add to the cordiality with which you will receive that toast, it may be the fact that the Prince is one of the constituents of my friend on the right," adding, when the laughter and cheers had subsided, "The royal family has, however, higher claims upon our consideration." The *Ottawa Free Press* remarks: "Time brings its revenges. Not many years ago, a bishop of the State Church proposed that Mr. Joseph Arch should be ducked in a horse pond as an agitator; and the London Times, with characteristic short-sightedness, held the farm laborers' movement up to public ridicule. To-day, the same Joseph Arch sits in Parliament, by virtue of having defeated a lord as the Tory candidate, and the farm laborers, through their capture of the country constituencies, have turned a Tory government out of office. To those who take stock in the ravings of the London Times upon the Irish question, we commend a study of the result of its opposition to the farm laborers' movement."

THE NEW MORMON BILL.

The Index, through its editorial notes, has condemned more than once the iniquity of Senator Edmunds' new measure for suppressing polygamy, which has already passed the Senate, and now awaits the action of the Congressional House of Representatives. This measure should never become a law; at least, it should not unless the radical and central principle of it, its heart, be first cut out of it. There may be some features of the bill that would aid in enforcing existing acts, and to which no sound objection can be urged; but the important part of it, the proposition that would place the property and business management of the Mormon Church in the hands of trustees appointed by the President of the United States, annulling all power of that Church as a corporate body, if we rightly understand the measure, is an amazing piece of legislation to be seriously offered in this country. No attempt, probably, will be made to find any precedent for it. As Liberals, however, this fact of novelty does not trouble us. The amazing fact is the cool way in which the bill proposes that the United States shall go into the business of running a church. And how the United States government is going to do this without running counter to that clause of the Constitution which says, "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof," is a problem that greatly perplexes us.

We have looked in vain to see how this point was met in the senatorial discussion of the matter. It must necessarily be assumed that such able and experienced lawyers as Edmunds, Evarts, Sherman, Hoar (the latter only voting in the negative because of the reactionary clause abolishing woman suffrage), must have considered this question, and also that to their minds there is no constitutional obstacle in the way of the law. Their opinions are certainly entitled to great weight; but it were to be wished that they had elucidated this difficulty more clearly. Senator Morgan, of Alabama, has offered a resolution in the Senate setting forth the unconstitutionality of the proposed legislation; and, if this comes up for passage, some of the prominent constitutional lawyers who voted for the bill will have an opportunity for enlightening the public in this particular, which, we hope, they will not let slip.

Doubtless, the Senators who voted for the bill—and they made a large majority of the Senate, without distinction of party—intended to discriminate between the Mormon Church as a religious body, holding property for purposes of worship and other objects ordinarily regarded as strictly religious, and the Mormon Church as violating United States laws in the practice of polygamy; but the proposed bill does not clearly indicate this line of distinction. Its motive and basis, as we gather them from a careful reading of the bill, seem to be rather to discipline and punish the Mormon Church as a church, because it teaches polygamy and because some of its members practise polygamy, and a portion of its revenues may go to uphold this illegal practice. It may be that the Senators have positive information that the Territorial laws which this Congressional Act is intended to annul were passed with the direct purpose of sustaining polygamy. If so, Congress would have clear authority to annul the laws, and should do it, since they are in conflict with United States laws. But nowhere have we seen this reason stated. And, if this were the case (and no other supposition ought to be possible), all that would follow would be that the laws in question should be annulled, and the corporate business of

the Church as legalized by them should be closed up, and not at all that the business affairs of the Church should be managed by the national government.

We have always taken the ground, in these columns, that United States laws for the suppression of polygamy in Utah are entirely legitimate; and we sustained the previous Edmunds bill, which is now in operation in that and other Territories, as clearly within national jurisdiction. This we have done not only in the interest of morality, but in the interest of liberty and human progress. The Mormon Church has as clear a right as any other to hold such doctrines and institute such forms of worship as the convictions of its members demand. Equal religious freedom is fundamentally guaranteed in the United States Constitution, and should be guarded throughout the country as a sacred right. But this principle must be interpreted in terms that are not opposed to the civilization and humanity of the age. There are certain things that have been practised as religious rites in past ages and among barbarous peoples who have not been much affected by modern enlightenment, which no highly civilized nation can allow within its domain, under shelter of the plea of religious liberty. Widow-burning, the sacrifice of children, the cruel flagellations practised upon each other by the fanatical sect of the *Penitentes*,—these are acts which every civilized government should abolish as crimes, no matter what claims may be made for them in the name of religious creeds. Polygamy, in this country, has been made a crime of this class, though less immediately cruel than others of its kindred; and to permit it under the plea of religious conviction is to step backward toward barbarism. What the national government, pledged to religious freedom, has to do in respect to all such acts is not to yield any point which civilization has gained, but, in the name of liberty, to emancipate the victims from the thralldom of such superstitions as take the form of practical violence to human rights.

But, because the government is bound by a moral obligation, which the highest civilization imposes, to prevent Mormon polygamy, even though it claim the protection of a religious creed, it is also bound to be specially careful to respect all those religious rights and privileges which the Mormon Church has in common with all other churches and sects in the country. Mormonism, in its general creed, is not unlike the popular forms of evangelical Christian belief; and, aside from polygamy,—and it draws warrant for that from the Old Testament,—it is entitled to the same protection through the laws which is accorded to these sister faiths. The United States may possibly find that the practice of polygamy, though not originally a part of the Mormon creed, has become such a pronounced and central object of the existence of the Mormon Church that Congress would be justified in taking away from that Church the charter it has received from the Territorial legislature. But nothing could justify so anomalous and monstrous a step as that of the United States government taking possession of the property and revenues of the Church, and managing them for the Church. If this can be done under any pretext for the Mormon Church, it might be done under some pretext for the Catholic Church, or for the Methodists, or any of the Protestant denominations, in the Territories and the District of Columbia; and the State legislatures might follow the example in the several States. Indeed, the government might have such success in managing church revenues and doing ecclesiastical business that all the de-

nominations would be petitioning to have their financial affairs taken under governmental control. And, as a matter of equal justice, the rule should be all or none. As the national Constitution now stands, the rule is none. When the Constitution says that "Congress shall make no law respecting an establishment of religion," we submit that it says pretty plainly that it shall not make a law giving the President the right to appoint trustees to conduct the business of any church. In time, a church thus distinguished might come to have a special prestige. In fact, the Senate has taken a step toward having an established religion in this country; and it is Mormonism!

WM. J. POTTER.

THE SOUTHERN PROBLEM.

I.

First Stage.

In considering the Southern Problem, an error of time is apt to lead to an imperfect understanding of its real nature. The common opinion is that it originated after the abolition of slavery and the close of the War. But this is a grave misapprehension. The War and the abolition of slavery were shoots from a common stock or source. This common stock or source was the union under one government of two contrary social systems. The problem is as old, therefore, as the Constitution of 1787. This instrument united free institutions and free labor to their opposites. The jealousies, irritations, and fears which sprang from this unnatural alliance gave rise to sectionalism, the slavery question, and to what in our day is called the Southern Problem. Difference of name is of no consequence. Fundamental opposition between the two parts of which the Republic was formed constituted then, and constitutes now, the root of the evil. It is this social antithesis with which we must interest ourselves, if we would obtain any clear insight into the present phase of an old trouble. Under the operation of economic laws, it became the foment of dissension, a principle of division. The problem from the adoption of the Constitution was how to mediate between counter impulses of opposing systems. Thus endowed, each must necessarily develop according to its own laws, and bring forth fruit after its own kind. But, with every accretion of the one or expansion of the other, the difficulty of averting collision would grow graver and more grave. No one believed at the formation of the Constitution that permanent peace could follow such an ill-starred conjunction. The fathers looked confidently for the solution of the problem to the ultimate extinction of the weaker or Southern system. To the grand divorce court of time they appealed. But Death, the stern judge in that court, suddenly relented toward the South; and the day of final settlement was indefinitely postponed.

Arkwright's invention of the spinning machine, which increased the demand for raw cotton, and Whitney's of the cotton gin, which multiplied the supply, breathed fresh life into the Southern system. Slave labor rapidly appreciated in value, and African slavery awoke as from the dead. As the tide of agricultural prosperity flowed in upon the South, the frontier posts of freedom were pushed steadily back upon the North. The boundary lines between the two civilizations became clearer and more clear. The hopes of the founders were dashed; and the problem, which had seemed to them in a natural and advanced stage of solution, grew dark and baffling.

The purchase of Louisiana is an instance of the inclination of misfortunes to flock together. Slav-

ery must needs have plenty of room. Otherwise, it will decline. Free labor is able to flourish upon a small fraction of the ground-space which is required for the maintenance of slave labor. To the Southern system, therefore, the acquisition of Louisiana was of the highest moment. New and vast regions thus made its extension and expansion possible, and confirmed its new lease of life. The wings of a great social reaction brooded over the Republic. The Southern idea, which the fathers believed to be in the way of early extinction, had rallied, contrary to the expectations of the doctors, and rushed with the hot blood of new hopes and passions into aggressive and tumultuous activity.

It was not long before the jealousies and irritations consequent upon this reaction appeared in national politics. The South was in possession of the government and the shaper of its policy. The embargo and the restrictive measures of Jefferson's administration, which had fallen with disastrous effect upon New England, were not calculated to allay the ill-will which was rising against the slave representation clause of the Constitution. The South, through it, enjoyed undue benefits and exercised undue power in the Union. It should, therefore, be shorn of them, and a new balance struck between the sections,—a balance that should correspond in reality to the political equities of the North. So New England reasoned. The Hartford Convention was the first encounter of the skirmish lines of the two systems. The fierce conflict over the admission of Missouri came five years later. If the contest on the part of the South at this juncture was migratory, that of the North was a struggle for self-preservation. The southern hive was swarming. Wherever a swarm alighted, a slave State would begin to grow. With its admission, new perils would arise to the free States and their institutions. With this danger impending, the injustice of the slave representation clause of the Constitution grew intolerable. Free men, and no others, should now be counted in the apportionment of representatives to new States. The free States invoked the original policy of the Republic to resist the reactionary movement. There must be no more slave States. On this ground, the North gave battle to the South. It was the first of our hundred years' war.

The combatants were so equally matched, and the consequences of the contest seemed so alarming, that both sides agreed to end it by mutual concessions and covenants. The Missouri Compromise restored peace and pledged the sections to harmony. Behind the 36° 30' boundary wall which the Compromise erected, the North rejoiced in its security against all future invasions of the slave power. At last, the problem was solved. A simple division line had vanquished the Sphinx. And the dear fathers,—how singular!—why did they not think of this wonderful device? Ah! why did they not?

The whole country turned now from this battlefield to other pursuits and interests,—to the consideration of purely economic and non-sectional questions, internal improvement, encouragement of manufactures, construction of national highways, completion of national systems of defence and finance,—to the doing, in short, with might and main whatever tended to increase the material and political greatness of the Republic.

But the enemy was sowing amid all these grand co-operative efforts the germs of contention. The new friends were to discover, at the end of their generous rivalry, old antagonisms ready to renew the ancient feud. The old grudge lurked in bank and tariff. The bright apples of a deceitful

peace turned to dust and ashes. The fiscal action of the Union threw the industrial machinery of the South into confusion. Public distress sprang up in crops everywhere, and a general explosion and collapse seemed imminent. Certainly, the ability of a common government to legislate for contrary social systems looked dubious enough. The tariff which nourished the North poisoned the South. The difference between the sections was positive, fundamental, and of kind. They were not "hurt with the same weapons, subject to the same diseases, healed by the same means." How, then, could they be ruled by the same laws? This was the Sphinx's riddle.

No marvel that the South demanded that the fires of this great fiscal engine be raked out, and that the tariff policy of the nation be reversed! But, if the continued operations of the machine, at its then speed, involved wide-spread ruin to the South, its sudden stoppage could mean no less to the North. And so it was a matter of life and death, whichever side prevailed. Awful, indeed, is the crashing together of two civilizations in the battle for survivorship. Neither could prevail and the Union, also; and, as this must be maintained at any cost, there were mutual surrenders again, and a fresh compromise. The fiscal fires were banked, and the breaks called into use.

At the conclusion of this second contest, the South was left in an extremely precarious condition,—its agricultural and commercial interests prostrated and its political ascendancy imperilled. Exhausted and anxious, there was no longer any doubt that, in the race of life, it was lagging behind its rival. Self-confessed, it was the weaker system. Its ultimate existence demanded of its sons fresh safeguards,—some weapon of defence that, in the darkening future, would enable it to protect its peculiar institutions, and preserve its federal position from that strong undertow of freedom which was wasting both. The leader who, more than any other, understood its needs, who was the incarnation of its spirit, invented the weapon. Nullification and State sovereignty Calhoun placed within reach of the slave power. There, for twenty years, he kept them,—the bow bent and the arrow ready for flight.

But this was not enough. The supremacy of the South within the Union must be newly fortified. There must be some additional offset to the superiority of the North in wealth and numbers. By the simple action of natural laws, that section had attained a majority in the lower House,—the slave representative clause of the Constitution, notwithstanding.

Texas, struggling for independence at this juncture, offered to the South an opportunity to repair this balance. Texas, with its vast areas and vaster pretensions, was, indeed, no ordinary object. Its acquisition was so absolutely necessary to the ultimate security of the slave system that it is no marvel that the existence of the Union was staked upon the issue. Texas was admitted. But the South, drunk with its success, and imagining that the iron of a still greater opportunity was hot, struck for more territory. The sparks kindled the Mexican war, and fired the free States to uncompromising resistance to any further aggrandizement of the slave power. The combatants grappled in a long and bitter conflict for mastery.

The result evinced the superior strength of the North. Oregon, California, and New Mexico were held as by a giant's grip, which no menace or assault or fury on the part of the South was able to break for an instant.

Upon the dying vision of Calhoun, the impossibility of preserving the union of two irreconcilable systems under the government established by the

fathers broke with a sort of despairing light. The wisest leaders of the North began to foresee that the conflict was irrepressible.

The party who loses is always ready to dissolve the copartnership. Not so, however, with him who gathers the profits. He is content to let well enough alone. "The Union,—it must, it shall be preserved," became the watchword of the North. "The Union,—it must, it shall be destroyed," became in like manner the watchword of the South. Blinded by passion, it pressed forward over every concession interposed by the North to the final plunge into the gulf of disunion. Vain were the magic of a fresh compromise and the repeal of an old one to avert the catastrophe. Escape there was none. And the two irreconcilable social systems crashed together in the storm of Civil War.

A. H. GRIMKE.

COMIC THEOLOGY.

As in the theatrical profession, so in the theological profession, there are various kinds of performers. There are those who do the high tragedy and the low comedy, some the singing, others the pantomime, and others, again, the *bouffe*. The pay varies, too, according to the talent and the drawing power. The performer who fills the house gets the most money. As there are Beechers, Pattons, Crosbys, and men like them, to play the higher parts, so there are Moodys, Talmages, and Sam Joneses to tumble in the saw-dust. Mr. Moody has just been playing a couple of weeks' engagement in Chicago, and his comic religion drew enormous crowds. To prevent people being crushed to death in the struggle to get into the tabernacle to hear this travelling expounder, the admission was by ticket only; and even the ticket-holders were required to be in their seats fifteen minutes before the beginning of the service, under pain of losing them. Persons who called at noon on Saturday to get tickets for Sunday morning's meeting found a string of disappointed men and women ahead, who were already too late. Every ticket was gone, although the tabernacle will hold nearly three thousand people. This will give an idea of Mr. Moody's popularity,—a popularity which is a great humiliation to learned and intellectual ministers of the gospel, whose dignified and eloquent discourses are treated with contempt by their congregations, who flock to hear the egotistical comedy of a popular "evangelist." More bitter still, those ministers are compelled outwardly to approve a performance which they inwardly dislike and condemn. The fun begins with Mr. Moody's rambling comments on the different sentences in the text, as he reads it; and he mixes up the text and comment in such a bewildering way that it is not easy to tell without the aid of a Bible which is Moody and which is Moses. On the first Sunday of his engagement, the text was from the twenty-fifth chapter of Exodus; and here's the way he read it:—

"And the Lord spake unto Moses, saying: Speak unto the children of Israel, that they bring me an offering; of every man that giveth it willingly with his heart ye shall take my offering. And this is the offering which ye shall take of them,—gold and silver, and brass. If you have not gold to give, why, you are to give silver; and, if you have neither, then brass will be just as good in the sight of the Lord, if it is given willingly. What God wants is heart service. And blue and purple and scarlet and fine linen and goat's hair. I have always been glad that goat's hair has been put in there. Any one can get goat's hair. That baby in its mother's arms can bring a few goat's hairs. You can go out on some of the back streets and

get two or three or a dozen goat's hairs from the people who have the goats. And rams' skins dyed red, and badgers' skins and shittim wood, oil for the light, spices for anointing oil and for sweet incense, onyx stones, and stones to be set in the ephod and in the breast-plate, and let them make me a sanctuary, that I may dwell among them. And the result was God came and dwelt with them."

This curious text, as it reads here, is not half so ravelled up as it actually was by Mr. Moody. This is the way it reads in the *Chicago Times*, of Monday, after it had been put into grammar shape by the reporter for the paper. When it has been carefully separated, and we have rendered unto Moses the parts of it that belong to him, and to Moody the parts that belong to Moody, it will be noticed that there is not much difference in the quality of the ingredients, and that one is as valuable as the other.

The sermon began with a complaint, probably well founded, that the majority of Christians are what we used to call in the army "malingerers," fellows who were always on hand for rations, but never on hand for duty; who rode in the wagons on the march, and scented the battle afar off, but never got there. "There is a false idea abroad," said Mr. Moody, "that a few in the church must do all the work. The others say they have not the talent, and are continually asking the Lord not to send them." This is curiously like the malingerers; and we agree with Mr. Moody that they might at least offer a few goat's hairs, and even a whole goat occasionally, or a few stones to set in the "ephod." The ephods are sadly out of repair.

In the opinion of sane people, ignorance and weakness of mind are infirmities fraught with evil; and, to-day, the genius of all virtue is at work trying to cure them. Yet evangelists assure us that those defects are necessary, in order to understand God, and that without them preaching is all in vain. "For six thousand years," said Mr. Moody, "God has been using weak things that were despised of men to help his work along. One drop of God's strength is worth a ton of intellectual power. What is needed to preach successfully is supernatural power." Of the scores of intellectual ministers of the gospel in Chicago, where this was said, there is probably not one who will dare to contradict it publicly; and, therefore, they must all be considered as approving it. What a commentary is this upon their religion! It cannot be advanced by intellectual power. It must have supernatural aid or perish. It will not avail them to say that this is only the extravagant boasting of an ignorant man jealous of preachers who were educated in the colleges, and who have trained their minds by study. They indorse it by their silence, and by it their preaching and their doctrine must be judged. They concede the implied claim of Mr. Moody that he has been touched by the Holy Spirit, and that a tongue of fire has fallen upon him as it fell upon the other apostles on the day of Pentecost.

Wisdom can never be a disadvantage in the propagation of any truth,—religious, moral, or physical. Yet Mr. Moody said that "God took up the foolish, the weak, and the despised to do his work with." Why? Why should the "foolish" be better advocates of religion than the wise? In all the rest of his government, God uses wisdom and the wise as his most efficient agents. Why should he make an exception in the matter of religion and use "the foolish" there? Does Mr. Moody mean to say that his religion is itself foolishness, and that, therefore, the preaching of "the foolish" is most in harmony with it? If not, why does he

exalt folly as a missionary agent, and sneer at "intellectual power"?

Mr. Moody has a playful way of changing Scripture, and making revised versions as he goes along. He informed the vast congregation that, when Moses "was sent down into Egypt to free his brethren, he did not plead his inability to cope with the king, but he relied upon the power of God. He went out into the wood and cut the first stick he found. He did not look about for the finest one to be had; and it was an ugly-shaped stick, old and dry. When he was going down into Egypt, to bring his countrymen into the promised land, he was asked how he expected to free them from the bonds of slavery, and replied, 'With this stick.' And away he went, leaving the impression that he was clean mad."

There is nothing of all this in the Bible, neither in the old version nor the new. That makes no difference to Mr. Moody. It will probably be in the next version, which is just as well. "Old and ugly" as that stick was, it could be changed into a serpent at a moment's notice; and it became a scourge to the king of Egypt. "It was not Moses," said Mr. Moody, "but the God of Moses, and the God of that rod which he had with him, which caused the frogs to overrun the country. What we want to-day is the same power; and we can have it, if we look to God for it. God's way was not our way. He knew the walls of Jericho could be taken by the blowing of rams' horns. We would want horns of silver or gold,—something to look fashionable,—but the blowing of a crooked ram's horn was God's way." If what Mr. Moody says is true, that God chooses the foolish and the weak as tools to do his work with, surely the above specimen of preaching is "foolish" enough to convert a whole tabernacle full of sinners, although, as in the present case, they numbered three thousand souls. Delinquents who require anything more foolish than that to convert them must be hardened in iniquity.

People who believe in Mr. Moody's theology will easily see blemishes in this sermon, bits of wisdom and humanity here and there for which perhaps he will make apology at some future time. He said, "Every man could have a hand in God's work, if he would use what he had at hand." Though awkwardly expressed, this is good religion, if Mr. Moody means by God's work every good deed done, every act of justice, love, and charity, every prayer that includes within it the good of all the world. No doubt, in this "God's work" there is something for every man to do. There was also some very reprehensible wisdom in the statement that "people had an idea the world was to be redeemed by sermons, but the fact was rather that the people were preached to death." If Brother Moody continues to talk as wisely as that, he will soon be invited by the churches to cease preaching himself. There was dangerous wisdom, too, in the opinion that "there were many who could be saved by little acts of kindness upon whom an elaborate sermon would have no effect." This is not only wisdom, but genuine religion and rank heresy. O missionary of many words, how many of those three thousand in the tabernacle, do you suppose, thought you meant what you said when you told them that "thousands of nice garments might be made and taken to the needy, and kind words might be spoken in the home of the drunkard"? Probably, not one. How many of the three thousand went from the tabernacle to put the doctrine into practice? Certainly, not one. Do you have time to practise it yourself? A short time ago, a band of Indians passed through Chicago from the West on their way to Washington; and the name of

one of them was "Walk around and Talk." How many preachers there are whose parents ought to have given them that name!

"Christian life," said Mr. Moody, "ought to be crowded with little acts of kindness." This is true religion, no matter under what form of worship it may come. It might be made stronger by leaving out "little"; for acts of kindness ought to be of dimensions equal to our ability to perform them, and the admonition applies to every life, whether Christian, Mohammedan, Pagan, Jew, or any other in the world. The Christian does not need it more than the rest, nor less. So it was well said that, in practical charity, we should all do what we can; and, if we are not able to do much, we should do something. "The widow's mite," said Mr. Moody, "had brought more money to the work of Christ than any other offering ever did." This is notably true; and yet, in that case, the principle of charity was strained until it ceased to be a virtue. That "mite" was more than the widow could afford to give. She ought not to have given it, and the Church ought not to have accepted it.

Mr. Moody praises the woman who brought the ointment and anointed the Lord's feet with it, and he said that she had "created for herself the greatest and most enduring of monuments, and the story of her deed of love had been translated into three hundred and fifty different languages." This is fame, indeed; but the fly in that ointment was the unpleasant question of Judas Iscariot, "Why was not this ointment sold for three hundred pence, and given to the poor?" This is a question that has never been answered yet; and, while the act of Mary may be credited to her as worship, yet there was great force in the criticism of Judas. To-day, millions of dollars are being squandered for ointment to anoint the Lord's feet; while squalor and vice fester in the shadow of the costly temples. On the very steps of the church sits Lazarus. Mr. Moody is not responsible for that, perhaps; and, while there was in his sermon much orthodox foolishness, there was also in it a good deal of heretical wisdom and mercy, too.

M. M. TRUMBULL.

MOTION THE ULTIMATE PRINCIPLE.

Perrin's "Religion of Philosophy."

One opens this book with a certain misgiving, born partly of its size and partly of its title, expecting another of those obscure and prolix treatises which begin anywhere and end nowhere, and of which the times are prolific. But the reader, closing the book with a certain wonder and delight, "looks round him with a wild surprise," as had "a planet newly swum upon his ken." He rubs his eyes, and inquires of himself if it can be indeed true that the "open sesame" of the universe has at last been pronounced, among the many shouters of "open barley," "open wheat," of this and of that, and the real key-word of thought and fact has been spoken. On this, it may be indeed rash to hazard a dogmatic opinion, seeing that there are many experts in metaphysical reasoning whose criticism must first be successfully endured. Nevertheless, one may at least venture the conclusion that a notable step forward has been made in the most perplexing realm of thought, and many mists are cleared which have hung about the ultimates of speculation for centuries.

The first thing in the book which strikes the

* *The Religion of Philosophy, or The Unification of Knowledge.* By Raymond S. Perrin. New York: G. P. Putnam's Sons, 1885.

reader is the unusual lucidity and directness of its style. There is no evasion of difficulties, no going "about it and about" with many words to no purpose. What the writer has to say is said quickly and simply. His theory is stated early, and is then rapidly applied to the solution of the various difficulties of philosophers, beginning with the ancient Greeks and coming down, through Germans, French, and Englishmen, to the present day. In this review, Mr. Perrin is able to present us with one of the most connected, interesting, and intelligible *resumes* of philosophic thought with which we are acquainted. His own theory furnishes him with a natural clew to the various systems, which enables him easily to unfold their merits and their shortcomings, and to point out the causes of their failure to reach the end for which they set out. Were this the only merit of the book, it were well worth both the writing and the reading; but it is much more than that. It pretends, actually, to furnish us with the true key to the so-called problem of the universe; in other words, to give us the ultimate principle of fact and thought,—the one unity from which all things can be derived without assumption and without labor. The magic word is "Motion." Given "Motion" as the first principle and reality, and "all other things shall be added unto you." It is motion, external, objective, from one point to another, which gives us the idea of space. It is motion, internal, subjective, from one event to another, which gives us the idea of time. It is motion arrested, as when the moving hand is stopped by a table, that gives us the idea of matter. It is motion unarrested, as in the flow of ideas, which gives us the idea of mind. Matter itself is but a form of motion, as the physicists have proved that internal molecular vibration is the absolute condition of all matter; and, if Sir William Thompson's conjecture be adopted, that the ultimate atoms of matter itself are merely whorls of motion, which seems the logical conclusion of all the analogies, the chain is complete. The atom, the body, the material universe,—all is a development of motion; and all together form an interlocked and interacting organism of different motions.

And the mental universe is the same. Consciousness is a motion of the human organism. It begins in the sense of a relation (that is, a motion) between myself and some other object. If there were no other object and no motion, it could not arise. In a vast blank, it is not even possible to conceive of consciousness as awaking. This relation may be through a beam of light to the eye, or a wave of sound to the ear, or the stir of a nerve with pain, or the shudder of the body in arousing from sleep. It may be anyhow or to anything; but, to be conscious at all, one must be conscious of something besides himself.

Here, then, we have at the outset with Mr. Perrin a most encouraging augury of success. He gives us a key: he proceeds to show us how it turns in the rusty wards of the most troublesome riddles of thought and fact. There is no logomachy. There is no forcing the meaning of words. There is no rearrangement of materials. He gives us clearly his ideas of the genesis of the primal generalizations of the mind in plain terms, which anybody can verify by thinking about the subject, whether learned according to the schools or not. In other words, he appeals to common experience and the facts of the case. If these do not support him, he is quite ready to fall; for, of all men, he is as little concerned as was Socrates to make out a case. He is simply trying to see the thing as it is, and to state it as he sees it in nature. And, when he says that in the one fact of

motion are found the meeting points of all the fundamental conceptions, that matter and mind are but two general forms of motion, that space and time are but different aspects of motion, according as it is looked at as external (objective) or internal (subjective), he does not offer any proof. He would as soon think of trying to prove the existence of light. If a man does not see light, how can it be proved? It is a mere matter of fact, open to common apprehension,—that is all there is in it. So is this ultimate of "motion." As a fact, it does give a visible starting-point for all the other generalizations, as nothing else can. Try space or time or matter or mind in the place of Motion as the ultimate, and see what confusion immediately arises. You cannot get the idea of matter from that of time. You cannot get the idea of time from that of matter. Everything falls apart, remains discrete, separate, and remains so even when one endeavors to posit the common ultimate of "mind," as Anaxagoras did, and as popular thought does at the present day. From the idea or existence of mind, one cannot get the idea of space by any natural process or perception. "Mind" is obliged to create space to get it into existence,—as we see in the usual phrase, "a great creative mind," where mind is found to be deficient as an ultimate of thought, and one must add to it the ideas of "creative" and "great" to complete the conception of the requirements of a final cause, feeling dimly that a mind might chance to be too small or too idle to "create" space or motion.

Equally, indeed, from the idea of a "great creative Mind," the idea of matter does not logically follow. This Mind might or might not "create" matter; and, in fact, those who hold this view believe, generally, that there were eternal ages of Divine Mind alone "before the worlds were," and from everlasting to everlasting. This shows that mind cannot be the ultimate of thought and fact; for the ultimate must be the logical source and fountain of all the rest, the necessary spring of their being. Now, what Mind fails to do,—namely, involve all the others, and furnish in itself the necessity of their existence,—motion does with perfect success and ease. It borrows nothing elsewhere, it requires no additions. Let "motion" be, and all the rest are. It appears at once as the mother of space and time, the cause of matter and mind, an infinitely simple containing the infinitely complex. It unfolds to our view a perfectly homogeneous universe,—a universe of co-ordinated motions, limiting and diversifying each other, where there is no break between matter and mind, since both are forms of motion, and therefore mutually interactive. In other words, it shows us a universe perfectly simple, all of one piece, freed from mystery and delightful to study. Certainly, if "God is Light, and in him is no darkness at all," this would seem to be light enough to be God.

This is what Mr. Perrin claims, indeed; and, herein, he seems to agree with the apostle whom we quote.

To readers curious about these most weighty matters, in whose bosoms hide all the philosophies, religions, civilizations of the past, present, and future, we deeply commend Mr. Perrin's book. They will see how quickly and easily his "motion" unlocks the problems of the schools, what short work it makes of all the muddy mystics, Kant and Hegel and Schopenhauer, of the clear sceptics, Hume and Hobbes, of Positivist and Agnostic alike; how it transfers to the wonderful Greeks the crown of laurel in philosophic speculation also, as to those who have deserved best of the human race.

The author's criticism of Herbert Spencer and George Henry Lewes is made to carry with it the evidence for his own theory and the explanations of it. And no reader can possibly follow the writer's simple and straightforward elucidation of their complex sentences and cumbrous modes of thought without the greatest pleasure and satisfaction. When he sees how easily all that those sincere and comprehensive men have tried to say in scholastic and obscure phrase can be turned into the language of the street and the newspaper, "understood of all the people," he feels as if a new Columbus had sighted, by the substitution of the one magic word "motion" for their words, a new land beyond the mists of Agnosticism and metaphysics, whose continent should be the field of new and greater evolutions than the world has before seen. Mr. Arnold gives Americans the credit of "seeing clear and thinking straight," and this book seems to be the most signal example of these qualities yet produced by us. We may well be proud that so comprehensive and far-reaching a generalization has been made by one of our citizens.

It does not detract from the lustre of Mr. Perrin's generalization that all the philosophers of eminence have just been on the edge of saying exactly what he now says, but rather increases the force of it and the argument for its truth. Not to mention the Greeks, who had his idea, but not the physical knowledge necessary to establish the fact, we readily see that Kant's "Pure Reason" *a priori*, stripped of its verbiage and obscurity, is motion, pure and simple; that Hegel's "Becoming," where nothing is, but something is about to be, is again motion; in a word, that Spinoza's "Substance" is but one form of motion, and, therefore, inferior to motion as an ultimate of thought, much more of fact; that Descartes' "Immateriality of God and the Soul" brings us to a divine energy simply, which is motion and naught besides; that Hume's "Universal Scepticism" is simply a bewilderment from failure to name the actual, ever-changing motion which the universe is; that Spencer's "Unknowable Energy and Persistence of Force" shows the same failure to put his finger on the ultimate fact, which is as knowable and clear as the sun in the sky, needing only to be seen to be known,—namely, Motion, always and everywhere, the essence of the universe and of all its phenomena and laws. Mr. Perrin freely acknowledges that many have thought it, some said it, all held it, and only himself endeavors to give to it proper place and setting in thought. He simply would complete what Darwin began to show, that evolution is the one primal law and form of the universe, and there is no other anywhere.

I dwell the more upon the philosophical part of the book, because the Religion of Philosophy, which gives the book its title, is less complete and far less important than the philosophy itself. One may or may not go with him in this last part. His religious reviewers treat him as if that were his main intention, which it is not. He seems to us to have thought out his views there much less thoroughly than in the rest, and has descended more to the common line of reasons *pro* and *con*. Yet there, also, many things are well said, and sound learning is evinced. But it is needful for no one to receive that, if he prefers something else. But, meanwhile, Mr. Perrin has given us enough before, and a germinal idea, which may prove not less valuable and not less powerful in philosophy than Mr. Darwin's evolution has proved in science. One can only receive the book with gratitude and praise.

STARR H. NICHOLS.

THE UNIVERSE NEITHER ORGANISM NOR MACHINE.

Mr. Abbot, in his recently published work, opposes effectively, we think, the theory that the universe is a machine, and defends the conception that the universe is an organism. "Now, modern science," he says, "is reaching, nay, has almost reached, this sublime conception of the universe as a living and growing organism."

But, when carefully examined, this conception of a "cosmical organism" proves to be no conception of an organism at all. We have never seen any valid evidence or argument that the universe is an organism or that it is a machine. In our opinion, it is neither the one nor the other.

Organisms manifest the phenomena of growth, assimilation, reproduction, and decay. In other words, they live and die. They have an environment to which they are fundamentally related and from which they derive sustenance. They are sustained by the introduction of new material from without, which is assimilated and incorporated into the structure. "An organism lives only in relation to its medium." Such are a few of the main characteristics of all organisms, from monad to man.

What reason is there for the claim that the universe in its entirety has that mode of activity which is manifested by organisms, and which we call life? Has the universe grown by the assimilation of material from without? Has it existed from eternity, and yet been evolved, adjusting itself to external conditions? Does it reproduce its kind, and is it subject to decay and disintegration? Has the universe an environment upon which it acts and which acts upon it? Do its movements indicate that it possesses sensibility?

If it be true, as to us it seems to be, that what is the most fundamental in the conception of an organism forms no part of any conception of the universe which is warranted by science, then it is evidently unscientific rather than scientific to regard the universe as an organism.

George Henry Lewes, in 1877, wrote touching this point: "A definition, however abstract, should not exclude essential characters. The general consent of Mankind has made Life synonymous with Mode of Existence. . . . The universe assuredly exists, but it does not live: its existence can only be identified with life, such as we observe in organisms, by a complete obliteration of the speciality which the term Life is meant to designate. Yet many have not only pleased themselves with such a conception, but have conceived the universe to be an organism fashioned, directed, and sustained by a soul like that of man,—the *anima mundi*. This is to violate all scientific canons."

It is only as a metaphor or a simile that the word "organism" can be used in reference to the universe, as, for instance, when Strauss speaks of the cosmos as resembling "one of those tropical trees on which, simultaneously, here a blossom bursts into a flower, there a ripe fruit drops from the bough," to illustrate that worlds and solar systems have a limit in space and a beginning and end in time, while the universe, in its totality, is infinite and eternal; that "the cosmos itself, the sum total of infinite worlds in all stages of growth and decay, abode eternally unchanged, in the constancy of its absolute energy, amid the everlasting revolution and mutation of things."

More unscientific even, if possible, than the conception that the universe is an organism is the old theological idea that the universe is a machine. A machine is a structure in which the parts unrelated primarily have been put together in a certain juxtaposition, designed to accomplish, by

the concentration and direction of force through an artificial arrangement, some specific external end. It is not necessary here to point out the utter inadequacy of this conception to explain the universe. It implies the existence of some power outside the universe that created or formed the universe, and bears to it the relation of a mechanic to his workmanship. It is strange that so intelligent a writer as our friend Mr. Abbot should persist in connecting the name of a thinker like Spencer with a crude "mechanical" view of the universe, when, some years ago, in reply to a criticism by Mr. Abbot, Mr. Spencer distinctly wrote: "If his statement . . . has any meaning at all, it means that there exists some 'force operating *ab extra*,' some 'external power,' distinguished by him as 'mechanical,' which is not included in that immanent force of which the universe is a manifestation, though whence it comes he does not tell us. This conception he speaks of as though it were mine, making it seem that I ascribe the moulding of organisms to the action of this 'mechanical,' 'external power,' which is distinct from the Inscrutable Cause of things. Yet he either knows, or has ample means of knowing, that I deny every such second cause. Indeed, he has himself classed me as an opponent of dualism. I recognize no forces within the organism or without the organism but the variously conditioned modes of the universal, immanent force; and the whole process of organic evolution is everywhere attributed by me to the co-operation of its variously conditioned modes, internal and external."

We will conclude this article with an extract from a letter, which we have permission to quote, from a scientist whose name is known to all English and German thinkers: "Cosmical organism sounds like an atavistic relapse. It used to be the almost universal opinion of antiquity. But, after Descartes, it was thought a great improvement to look upon the universe as a machine instead of an organism (Voltaire, Paley, Hume, etc.). The incompetence of both notions has become palpable enough. The only data for establishing an analogy between the cosmos and an organism lie close at hand. They are to be found first in the evident unity of both, a unity due to the interdependence of all their parts; and then in the unitary purpose seemingly manifest in the interaction of these parts. Thus, all the speculations indulged in, in order to explain the organism and its purposive actions, were likewise applied to the cosmos. A formative soul and a directing mind were attributed to it (*πῦρ τεχνικόν, πῦρ νοερόν, anima mundi*, etc.). Schelling and his followers were also inclined to look upon the universe as a kind of organism. Drawing their inspiration from neo-Platonism, or, nearer at home, from Spinoza and Jacob Boehme, they assumed a creative principle deeper than consciousness, making it at the same time aim-fulfilling in analogy to the working of instinct. Hence, the philosophy of the unconscious (Schopenhauer, Carus, Hartmann). Granting the cosmos were really an organism, the same arguments against design in the formation of special organisms would also be valid with regard to the universe. But an organism exists and lives through interaction with its medium. The cosmos has no medium. *Ergo*, it is no organism, and is not alive. This is quite enough to extinguish this *ignis fatuus* of a notion, though it admits of being put out piecemeal."

B. F. UNDERWOOD.

AN, strive again no human heart to wring:
Let no one feel thine anger burn or sting:
Wouldst thou be lapt in long-enduring joy,
Know how to suffer: cause no suffering.

—Omar Khayyam.

EDITORIAL NOTES.

BY B. F. U.

THE University of the Science of Spirit of Boston was incorporated last week. Dr. E. J. Arena, "Old Theology" healer, is the President.

DOUBT, if not an *end unto itself*, is the very life almost of truth. It is the anvil on which the steel of knowledge is hammered. The doubt of our time is of that kind of which the poet claims it holds more honest faith than all the creeds combined.—*Jewish Reformer*.

SOME who are weary of the confusion of religious belief, which is so prominent a feature of our age, will be glad to learn of a work which aims to simplify the whole question of religion by demonstrating that "God is a principle, not a person"; a "universal fact, not a mystery." We refer to the *Religion of Philosophy*, by Raymond C. Perrin, the general merits of which are set forth in this number of *The Index* by an intelligent contributor. Copies of the book are for sale at this office, at \$3 per copy.

THE reconciliation of physics and metaphysics lies in the acknowledgment of faults upon both sides; in the confession by physics that all the phenomena of nature are, in their ultimate analysis, known to us only as facts of consciousness; in the admission by metaphysics that the facts of consciousness are, practically, interpretable only by the methods and the formulae of physics; and, finally, in the observance, by both metaphysical and physical thinkers, of Descartes' maxim, Assent to no proposition the matter of which is not so clear and distinct that it cannot be doubted.—*Huxley*.

THE London *Inquirer* gives this extract from a letter received from George Anthony Denison, Archdeacon of Brent:—

For the matter of my being able and ready to meet in all the courtesy of the Christian life those with whom I have little in common in respect of what that life is, I have this to say,—that I make one exception only to this my habit of life, and that exception is this: I refuse to receive into my house, "bid God speed," or hold any intercourse with man or woman who denies the eternal Godhead of the Son, lest I be "partaker of their evil deeds." To all other, I hold out the right hand, however impossible it be for me to admit either their manner of belief or their reasoning or their action.

MR. W. C. GANNETT, always broad and generous, writes in *Unity*: "It is time to take at last the absolute position that Unitarianism in its essence stands for its principles alone, and that they alone furnish the test of its fellowship. What makes a Unitarian? Emphasis hearty and complete on freedom, fellowship, and character as the supreme things in religion,—this and not our theism, however grand,—this and not our Christianity, however dear. In the light of our history, we pronounce it 'ethical' to be logical. And more,—it is growing unethical to be longer illogical. The issue has become too plain. We cannot much longer plead unconsciousness. Unconsciousness has saved our ethics hitherto; but, before long, ethics will glue our lips together before we ask one, true to our principles, but unable to say *God* with us, that door-pointing question, 'Can there be any doubt, sir, as to what you ought to do?' To us, that question has non-Unitarianism in it."

REV. OSCAR CLUTE, of Iowa City, is of the opinion that a preacher who comes to think that Unitarianism means only "ethics" is not, properly speaking, a Unitarian. We quote from an article by him in *Unity*:—

He holds, indeed, to ethics, and is in so far a Unitarian; for Unitarianism has always put great stress

The Index.

BOSTON, FEBRUARY 11, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

IF PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

The Banks of the Wye, and the Ethics of Wordsworthianism.

BY W. L. SHELDON.

An excursion to the Wye is also a pilgrimage. We like to visit a locality which has been associated in our minds with the composition of great poetry. Sometimes, it may be a scene of surpassing beauty and grandeur. In that case, nothing is gained for it by associations of this kind. We go to the locality for its own sake. We do not visit the Alps for the sake of Coleridge. The "Hymn in the Vale of Chamouni" adds nothing to Mont Blanc. The sublimity of the scene would naturally put the hymn out of mind. Sometimes, on the contrary, the locality of these associations may be very tame and uninteresting in itself. I recollect my surprise when travelling through the districts of Scotland associated with the life and poetry of Burns. The landscape was positively dreary. Mauchline, Ayr, and the banks of the Doon would not attract the eye of the stranger. And yet they have become consecrated in our minds through Burns and his poetry. And so, too, we are drawn to the English lake regions through the influence of Wordsworth. Grasmere, Rydal Mount, Loughrigg Fell, and Lake Windermere have a charm for us which all the romanticism of Scott has not been able to give to the much grander scenery of Loch Lomond, Ben Nevis, and Ben Venue. We think of the English lake region as the true birthplace of the poetry of nature.

We may not always be able to associate great poems with specific localities, and we may not wish to do so. We attach great interest to the place of composition only when it has been the theme and inspiration of the poem. English literature has given us several great hymns which are conspicuous for their depth of feeling and grandeur of conception. One of them comes from Milton, a hymn to the deity, as the poet summons all creation to bow in adoration. It is the "Morn-

ing Hymn of Adam and Eve in Paradise." Another comes to us from George Eliot, a hymn to humanity, in the lines of "The Choir Invisible." We have a third from Wordsworth, as a hymn to nature. It is the well-known "Lines composed a few Miles above Tintern Abbey, on the Banks of the Wye." These are typical poems. They have for their subjects the three great themes of poetic inspiration,—Deity, Humanity, and Nature. And yet to only one of them can we give a "local habitation." There is surely none for the "Morning Hymn to Jehovah." The mental vision of the blind poet Milton was its only locality. The temporary environment of the poet had nothing to do with the poem. The environment was not his theme. And so, too, with the lines of "The Choir Invisible." We do not know where this poem was written, and we do not care. We know that humanity was its theme, and the aspirations in the soul of George Eliot its real source and environment. And that is enough for us. But, with the "Hymn to Nature," it is different. We can associate a specific locality to this poem. It was in a single day, on an excursion along the banks of the "sylvan Wye," that Wordsworth conceived this exalted ode to Nature. Its theme and inspiration were the banks of the Wye.

It was this that drew me to the valley of the Wye. To the lover of the poetry of nature, this river and valley become idealized through the poetry of Wordsworth. The poem written on its banks has well been called the *modus classicus* of Wordsworthianism. It is more. It has become the *modus classicus* of the poetry of nature. The lover of nature goes to it for an expression of the feelings which he cannot put into speech, just as the devout mind may go to the Psalmist for the language of religious emotion. And so for him "Tintern Abbey" and the "banks of the Wye" acquire a hallowed significance. He early conceives a desire to visit a scene which has been so deeply woven into his visions of the beautiful in nature and so consecrated in his thought. It was to gratify an earlier longing of this kind that led me now to make this pilgrimage.

I have found the Wye in the west of England. I have come away from the lake region of the north, and outside the common route of travel. The stranger from other countries seldom comes here, though the beauty of the spot is well known to the English tourist. I am among the hills of Monmouthshire, close on to Wales and the Severn. This is the region of the "Wye." Here it nestles and pursues its course. It seems like a secluded spot all by itself; just the place to come and be with nature, and write its poetry. The river is a narrow, winding stream, moving in great, beautiful curves in its passage through the hills. The valley is scarcely wider than the stream, though here and there it stretches out into a sloping plain, but closes in again with the next bend in its course. A little railway runs up through the valley, moving along the banks of the stream, tunnelling through the hills or cutting along their sides. But it does not seem to interfere with the harmony of the scene. In rural England, the railway is like a natural feature of the landscape. The course of the river is not long. The "Wye Valley," as I refer to it, is this secluded region between Monmouth and Chepstow, a distance of perhaps thirty miles as the river winds, though I should say scarcely more than half that distance as the crow flies. The scenery is varied and beautiful. Sometimes it is quite soft and serene, then again it is rugged and wild; but it nowhere rises into sublimity. It was surely a chosen temple of nature for the poet.

The centre of interest to the traveller is in the

on ethics. But, inasmuch as he has eliminated from his teaching all the other characteristic thoughts of Unitarianism, he is no more a Unitarian than a Catholic or a Calvinist or a Jew is a Unitarian; for all these hold also to ethics. My questions of ethics are simply these: How far is it ethical for this preacher of ethics only to call himself a Unitarian, and so misrepresent his own position by giving it a name which has always included a great deal more than he includes in it? How far is it ethical for him to call himself a Unitarian, and so to misrepresent Unitarianism by conspicuously affirming that it means only ethics? How far is it ethical for him to use churches and Sunday-schools to teach only the thought of ethics, when he knows quite well that those churches and Sunday-schools were established for the purpose of teaching Unitarian thoughts of God and Christ and prayer and immortality in addition to the thought of ethics?

"A MATERIALIST" writes, in the *Westerly Call*, very sensibly in regard to the taxation of church property: "Any church or society have the privilege to erect as costly buildings as they please, and this government is bound to protect them in that right; but this government has no right to tax non-religionists to support them, or indirectly tax them by exempting the churches. We would defend with our lives and property, if need be, the right of any denomination to worship as they choose, claiming for ourselves the same right; but we protest against paying, or contributing in any way, for what we do not have and for what to us is absurd. Would not the churches consider it very unjust to exempt Paine Memorial Hall from taxation and at the same time tax them? And is it not equally unjust to the Liberals of Boston for them to pay an annual tax of \$1,000 on the Paine Memorial, while the churches are exempt? If there is any just cause for exempting church property from taxation, we should be glad to be informed of it. We know no reason why Trinity Church, of New York, or Grace Church, of Providence, or any other church, should not be taxed in the same proportion as the poor man's cow or the widow's mite. 'Hew to the line, let the chips fall where they may.'"

For The Index.

CREDO.

In tiny sand, in seed, in bud, in leaf,
In fairest flower,
In lowest life, howe'er it spends its brief
And passing hour,
In the dull clod's deep heart enshrined is God,
Or wondrous Power.

O Spirit of the stream, the wood, the cloud,
In all, through all,
I wis not if, in secret or aloud,
Thou knowest my call,
Nor if, in happy ways or darkest maze,
I stand or fall.

To all the elements I am related,
Earth, fire, and air,
To myriads of living forms created,
Or low or rare:
Our kin in regal state, our kin who lowly wait,
Are everywhere.

To all the noblest, brightest minds of earth
Akin am I;
To all who, favored ill, in woe have birth
Under the sky:
With ruth for those who sin, heights fairest may I win
Ere I shall die.

Yes, higher still: 'tis all we know of heaven
To live aright;
To feel, though dearest hopes and joys are riven,
Nearer the light,
Whether to us may come, when human lips are dumb,
Or life or night.

But if, awaiting us, at death's dark portal,
No faces shine,
Fairer than fairest dream of life immortal,
With light divine,
When soul and body rend, then may forever end
This life of mine!

ANNA OLOOTT COMMELIN.

neighborhood of Tintern Abbey, a few miles up and down the stream. The Abbey itself is a beautiful ruin. It rests in the valley on the banks of the river, with the village of Tintern in the background. The outer walls are still standing, though the blue sky overhead is now its only roof and canopy, and the smooth greensward under foot its only pavement. The beautiful stone-work of the great west window stands out against the sky. Many of the pillars remain in their old position, and cast their dark shadows upon the ruined walls as the sunlight streams in through the archways and shattered windows. Some of the walls of the monastery adjoining the Abbey also remain standing. The ivy and creeper have made themselves at home everywhere, climbing the walls, trailing around the pillars and up along the sides of the windows. Nowhere in England or Scotland have I seen a more beautiful ruin. The history of the Abbey dates back into the twelfth and thirteenth centuries. But the time of its lapse into a ruin I do not know.

Below the Abbey, as we descend the river, the scenery becomes rugged and wild. The waters of the stream grow turbid from the ebb and flow of the surging tide as it sweeps up in violence from the Severn, and raises the waters of the Wye to a great height along its banks. The valley becomes narrow, the hills grow steep and woody. The road no longer winds along the river, but ascends the hills. We look with awe and delight upon the mass of color as it continues to spread itself out anew with every change in the landscape, while we watch below and follow the course of the winding stream. Everywhere, we see the patches of dark and sombre green from the mournful yew-tree, resting like shadows upon the pale and delicate tints of autumn which make up the background of this mass of color. As strangers, we grow fascinated with the "gloom profound" of this solemn and mournful tree. A few miles down stream, the valley widens out again suddenly; and the river winds in a great sweeping arc beneath a line of precipitous cliffs, where the wild game has defied the English huntsman for centuries. We can ascend these cliffs eight hundred feet above the valley. The view from their summits is supremely beautiful. In a single glance, we can take in the winding stream, the rolling hills, the precipitous cliffs, and, in the distance, the broad estuary of the Severn. It is the "Valley of the Wye." At the next angle of the river, we come out upon the picturesque ruins of Chepstow Castle and the old town of Chepstow. The castle rests upon a commanding height, where it has gone through many a siege. Its ivy-clad walls and towers carry us back to the mediæval ages, to the time of William the Conqueror. Within, it is now only a mass of ruins. Below Chepstow, the Wye passes out into the plain, and so on to its confluence with the Severn.

Above the Abbey, on the other hand, as we ascend the river, the scenery is altogether different. The tides of the Severn no longer affect the stream, and the waters begin to have their "sweet, inland murmur." It is now "the sylvan Wye." Nature is no longer rugged and wild. All is now soft and serene, a fair and beautiful landscape. The winding stream, the sloping hills, and the blue sky, all blend into a harmonious whole. The river continues true to its name as it winds in sweeping curves along its narrow valley between the hills. We can wander along its banks for miles, catching with every turn a new and varied scene of beauty. Here and there, we shall come upon a cluster of hamlets; and wherever there is a cluster of hamlets there is sure to be the little parish church, its stone walls overgrown with ivy.

Sometimes, the little church rests upon the hillside; and, then, it is all the more picturesque. The sloping hills are cultivated sometimes even to the very top. The pretty hedgerows in their lines of darker green wind all over their sides, and rest like a beautiful network upon the cultivated slopes. And, above the hill-tops, the clouds float in the azure overhead. The serenity of the hills blends with the serenity of the sky, and the stream reflects the serenity of both. Here it was that Wordsworth composed his "Hymn to Nature."

And so these banks of the Wye have a peculiar significance to the traveller. We are attracted by their beauty, it is true; but we come to them rather for the sake of Wordsworth. We would see what he saw and feel what he felt. We come to the Wye. We wander up and down the stream, along the hillsides, beneath the beautiful sky; and we enjoy it deeply. But this is not all. What is the spirit of the scene? What new revelation of herself did Nature make to this poet through these banks of the Wye? What new conception was it that led Wordsworth to pay this exalted tribute to Nature? This is what we come here to learn.

Nature can appeal to us in three very different ways. It can be the "brute nature." All this mighty maze of things is only so many material substances,—earth, sky, water, and air, atoms, molecules, crystals, and cells, all moving in one stupendous plan at the will of a deity outside of nature. Nature is nothing, deity everything. This vast universe appeals to us not by itself and for its own sake, but as indicating the hand of an omnipotent agency outside of the universe. Nature is but the handiwork of deity. Its poetry is its summons to the worship of the Creator. It would lift us from nature up to nature's God. A hymn to nature becomes a hymn to deity. It is this conception which inspires the poet Thomson, in the "Ode to the Seasons," as he exclaims in the fulness of his devotion,—

"These as they change, Almighty Father, these
Are but the varied God. The rolling year
Is full of thee."

Another aspect of the poetry of nature appeals to us in a tenderer way. It touches not our minds, but our hearts. It is the personification of all the various objects of nature. We can mourn with Burns over the fate of the "Daisy," as though it, too, had a consciousness of its baffled and defeated life, as though we saw in it the reflection of our own earthly destiny. In the fancy of Shelley, we can exult with the "Cloud" and soar with the "Sky-lark." We can weave our whole environment into a beautiful tissue of poetic fancies and speculations. We can put life and thought into everything, and see the reflection of our own life everywhere. It is all very beautiful, but it is not true. The daisy does not feel as we feel, the cloud does not exult as we exult, the lark does not soar as we soar. This is poetry, but not the truest poetry. Neither is the other aspect of nature altogether satisfactory. It is scarcely a true definition of the universe of existence to classify it into "matter and deity." As though matter were only the crude world-stuff for spirit to play upon! As though we knew what matter was! As though we could explain the law of gravity or the origin of a crystal! It is not for us to deify a lump of clay more than we would deify a soul.

And so there is a third aspect in which Nature may appeal to us. She may appeal to us for her own sake and through her own majesty,—not as deity, not as personification, but as in herself an infinite order of existence and an infinite reality. Nature is not simply an unreal shadow

and reflection of an Unknowable. Nature is real. Nature is actual. In contact with Nature, we are in contact with infinitude itself. The great organ of the universe is playing for us, and we bend low to catch the strains of the solemn music. We are in contact with reality, and the voice of the infinite is speaking to us. We have a right to worship, and we ought to worship. It is the mood of the poet, in the presence of Nature,—

"That blessed mood,
In which the burden of the mystery,
In which the heavy and the weary weight
Of all this unintelligible world,
Is lightened, . . . we are laid asleep
In body and become a living soul;
While, with an eye made quiet by the power
Of harmony and the deep power of joy,
We see into the life of things."

This is what I understand by "Wordsworthianism." It is this new conception which gives to us all a poetry of nature. There is for us a sense of spirituality everywhere. And it is this, as I understand it, which makes the poetry of Wordsworth so attractive to minds of almost every shade of religious conviction. Agnostic, theist, and Christian,—they all can go to this poet for an expression of their feelings toward nature.

Viewed in this light, my pilgrimage to the Wye has been a pilgrimage to nature. As I wander on the banks of the stream, all these varied scenes have a new meaning to me. It is no longer "as a landscape to a blind man's eye." These hedgerows winding over the hillsides, the cattle grazing on the banks, these mournful yew-trees, the stream itself, and its reflection of the sky, the ivy growing on the ruins of the Abbey, these hills and cliffs rising above the river,—I cannot look upon them all simply as "mute, insensate things," as automatic activities of matter, as evanescent reflections of an unknowable reality. No: I must feel that they have a worth of their own. They may not think as I think and feel as I feel. They may not have a life like mine. But they belong to an infinite totality. They are genuine links in the chain of the universe of existence. They are "their own excuse for being." On these banks of the Wye, I am in contact with the totality of nature.

And, now, I fancy I can enter into the mood of Wordsworth on that memorable day, July 13, 1798. I can trace all his steps along the Wye. All the varied scenery of the river is reflected in the poem. I think of him setting out from Chepstow, accompanied by his sister. They pause a moment, to view the beautiful ruins of Chepstow Castle. Then they follow the stream as it winds in its great arc beneath the jutting cliffs, and so on up the narrow valley, as it bends and sweeps between the rugged hills. They stop again at Tintern. They go into the old Abbey, and lose themselves for an hour in contemplation of its ruins. As they look up at the canopy of the blue sky and look down at the greensward under foot, as they see the ivy and creeper winding around the pillars and trailing over the walls, they feel that nature has taken possession of the Abbey at last. It is for them to feel the exquisite blending of the warm tones of nature with the "frozen music" of the crumbling architecture. Again, they go on up the river. Their mood is softening with the pure serenity of the changing scene. The "wild, green landscape," the sloping hills and the winding stream, the "woods and copses," "the pretty hedgerows," the "pastoral farms," the "wreaths of smoke sent up in silence from among the trees,"—they see and feel it all. They are on the banks of the "sylvan Wye." I can fancy the very spot where at length they paused "under the dark sycamore." The valley

has widened, the range of hills has broken its outline, and their sloping sides stretch out in various directions. It is the culmination of the beauty of the Wye valley. The joy and the beauty of the day come over the poet like a flood. The recollections of a lifelong communion with nature revive in his thought. Under the spell of it all, he composes his poem. Nature, too, has now her hymn.

And yet there is in this commemorative ode to Nature one line of sentiment which these banks of the Wye might not seem to suggest. It is the well-known allusion to the "still, sad music of humanity." This, too, in a sense, is a new feature in the poetry of nature. What was there in this Wye valley to stir so new and strange a sentiment? What has nature to do with humanity? Do we not, on the contrary, sometimes fly for relief from humanity to nature? And did not the poet do so himself? And why did the thought follow him there, as though it were of Nature herself and a part of her poetry? We must go to Nature herself for the answer.

We come from London to the Wye. It is thus that we feel the contrast. Nature suggests to us what humanity lacks. London is typical to us of colossal power. The stranger in that city will only feel an awe at the thought of the human race. But London, alas! is also typical to us of colossal discord. The energy is enormous, but so is the waste. The wealth seems boundless, but so does the poverty. We feel that humanity is not working together. There is a sense of a "disconnection, dull and spiritless," which prevails in human things. We awake to a consciousness that the grandeur of our race lies chiefly in its colossal possibilities. And then we go to nature. We come down to these banks of the Wye. Here everything is reversed. We become conscious, somehow, of an order, a unity, a harmony in nature. This is what we mean by a sense of "nature's peace." Nature is typical to us of a colossal harmony. And yet we ourselves carry in our hearts the burden of our race. And the contemplation of this harmony in nature stirs within us the "still, sad music" of the harmony which might be and ought to be in humanity, but which does not exist. And so we fly to Nature for relief in the sense that we fly to her for inspiration. We would mingle with this universal order and unity. We would not stay alone forever with Nature. We would not lose ourselves in her music. We go to her that we may be stirred into activity again, as we would be stirred into renewed activity by a symphony of Beethoven. The sense of an infinite order outside of us in nature awakens in us an aspiration for a like order in humanity. We feel ourselves anew impelled to grapple with the possibilities of our race and to create out of them a religious reality. The poetry of nature leads us back to the poetry of humanity. We renew again our consecration to duty. This, as near as I can understand it, was the message of nature to Wordsworth on these banks of the Wye.

And so Wordsworthianism is a revelation for the future. Nature opens wide her arms to the poet. I look upon this valley of the Wye, and then I feel what new regions have been opened for the poetry of the future. I think of Ruskin mourning over the waning beauty of the world, as he pictures to his mind the geological changes which may efface the grandeur of the earth and reduce it to the level of monotony. And I think of Wordsworth, and his assurance,—

"Nature never did betray the heart that loved her."

And I have faith that she never will. The "light of setting suns," the "round ocean," the "living air," the "blue sky," and the "mind of man,"—

these will continue. The stars will swing in their spheres, the grass will grow at our feet, the Daisy will have its Burns, the Cloud its Shelley, the Rivulet its Bryant, and the whole wide universe of nature its Goethe, its Emerson, and its Wordsworth. One lesson, however, a pilgrimage to the Wye can teach to the traveller, like the "Morning Hymn to Jehovah" and the lines of the "Choir Invisible." This "Hymn to Nature" has no local habitation. The valley of the Wye was its occasion, but nature altogether was its inspiration. We cannot localize the poetry of nature. We can feel this poetry anywhere. There are rivers as beautiful as the Wye all over the world. Every breeze, every flower, every blade of grass, every drop of dew, and every star can tell us the same story. Nature can speak to us at home. We can list to her voice. We can sue for her peace. We can aspire for her all-pervading harmony. And so the same pure message of nature can come to us at home that came to Wordsworth on the banks of the Wye.

CORRESPONDENCE.

MR. ABBOT'S "SCIENTIFIC THEISM."

Editors of The Index:—

The public owes a debt of thanks to every man who, in these days, has the intellectual courage and zeal to attempt what promises no money, no popular fame, but only to instruct in the region of pure intelligence, in which very few people have any interest, though it is really of supreme moment and the ultimate ruler of the world. To this class of works belongs Mr. Abbot's *Scientific Theism*; and it is written with an unwonted animation of style, and is of marked power.

It deserves high regard from all religious people for its pure and lofty sentiments and conceptions. No one can read its descriptions of Deity without some stirring of religious fervor. The book is thus one of the many writings, now multiplying, which seem to show that human thought as well as human feeling must have a Person for a God. But its avowed pantheism will be an objection to the more rigid theists.

But for two faults, this book would be, what we all wish it were, a perfect specimen of Scientific Philosophy and a proof of Scientific Theism, which it claims to be. These faults are false premises and an illicit conclusion.

His first and preliminary premise is that, in all the sensible forms, we have an immediate perception of the external world as *non-ego*, and that this is the implicated affirmation of all modern science.

The appeal to material sciences, such as astronomy, physics, chemistry, physiology, in proof of a principle so purely psychological and metaphysical, is a proceeding singularly irrelevant. These sciences have no voice on this question, because they have not investigated it, it being entirely beyond their sphere. It is very true that, whether scientists or not, men do generally assume that the extra-organic objects of sense are *non-ego*. But that is not the assumption or implication of the several sciences as such. These only affirm that the objects of sense are of such or such sensible quality and quantity and form and relations. The deeper question of their egoistic or non-egoistic nature belongs not to them, but wholly to the science of psychology and to metaphysics, which is philosophy proper, and should be scientific.

The one "modern science" which has a right to speak, and which has spoken as a science proper, is very clear and quite unanimous in asserting that the objects of sense are subjective states or modes of the *ego*. This our author admits and affirms, and tries first to refute it, and then to ridicule it toward the end of the book. He refutes it by showing the transcendental difficulties of some of its advocates. But that is an illicit process. Because philosophy cannot weave all the discoveries of science into a grand ultimate unity, that does not prove that all its supposed discoveries are false. That it cannot as yet thus co-ordinate the doctrine of the subjectivity of sensible phenomena is no proof of the falsity of that doctrine.

Mr. Abbot imagines that he intrenches himself in

a position beyond successful assault by identifying phenomena and noumena. But the idealist may also do that, as Hegel did long ago; and, perhaps, I may be allowed to mention myself as always thinking in that line. We have, then, subjective noumena instead of non-egoistic noumena. How to construct these into a total ultimate philosophy is what remains to be done, and it will doubtless so remain for some time to come.

The next premise of scientific theism—the first that is intrinsic to the argument, the other being necessary as a preliminary—is that the universe is infinitely intelligible, whence he infers its infinite intelligence. His argument, fully expressed, stands thus: The intelligible is (always) intelligent. The universe is intelligible. Therefore, the universe is intelligent. The argument is perfect so far, but the major premise is false. The intelligible effect may reveal an intelligent cause, but that it itself is intelligent is another thing. All human mechanism is intelligible, but it gives no sign or proof of being intelligent. So, though the world is to some extent intelligible, it is not therefore intelligent. Besides, all intelligence directly known to us has feeling; and we have no evidence that the external world has any feeling, which as an organism it ought to have. The novel interpretation of intelligible as "immanently relational" does not make it intelligent; for everything is immanently relational, and we have no evidence that everything is intelligent, but very much proof to the contrary.

It is also a serious error to say that we know nothing but relations, for these presuppose things which must be known as a condition of knowing their relations. Perhaps both are designed to be included under the one term. This would make it intelligible so far, but not so far as to convince many people that all the relations of the sensible universe constitute an organism infinitely perfect, animated, eternal, self-conscious, intelligent, purposeful, and self-directive.

While *Scientific Theism* is not satisfactory as a philosophy, nor always conclusive in its reasoning, it is here like all other metaphysical treatises, and among such works it ranks high. It is an honor to its author and his country, and ought to be well studied by the trained minds of the world as one of the great forms of human thought necessary to be thoroughly understood and intelligently rejected before the true form of thought can come. W. I. GILL.

WHO ARE THE AGNOSTICS?

They are those who claim that, beyond the region of phenomena, we do and, so far as we can judge, can have no knowledge, and that, consequently, of the first cause of all things and of an unseen world of spiritual beings, we know and can know nothing. But this is only a negative description, and there is a positive as well. As a moral and religious principle, Agnosticism is the opposite of "that deficient human sympathy, that impiety toward the present and the visible, which flies for its motives, its sanctities, and its religion to the remote, the vague, and the unknown."* It is an expression of "that generous love which cherishes things in proportion to their nearness."† God, if there be a God, it says, exists for us incarnate in the habitual order of the world, so that, for any helps we may desire, we must look to this, and not for anything beyond; we must look to one another and ourselves, to

"the fidelity

Of fellow-wanderers in a barren place
Who share the same dire thirst, and therefore share
The scanty water: the fidelity . . .
Of fellow-heirs of the small island, Life,
Where we must dig and sow and reap like brothers."

A favorite joke with those to whom Agnosticism is abominable is the defining of its confessors as know-nothings. But one has only to consider who some of the Agnostics are, to see that such a definition has to them no very striking application. Prof. Huxley is an Agnostic, Prof. Tyndall is another, Herbert Spencer is another, George Eliot was another. And these are not exactly know-nothings. They were and are persons of marvellous intelligence, the sum of whose knowledge is appalling to the most of us who, over against their mountains, see our mole-hills infinitesimally small. But what

* George Eliot's *Essays*. † Ibid.

they know concerns the visible and the near, or what is gained by slowly reaching outward, step by step, from these; by the patient watching of external facts and the silencing of preconceived opinions. There is no charge that is brought more frequently against the agnostic principle than that it disdains the super-sensible, that it confines itself to things that it can touch and taste and see and hear and smell. But Prof. Tyndall says, "The domain of the senses is almost infinitely small in comparison with the vast region accessible to thought that lies beyond them." "By means of data furnished in the world of the senses, we make ourselves at home in other and wider worlds traversed by the intellect alone." Agnosticism is not then exactly knowing nothing, for all the vast result of science is within its scope,—all that the astronomers, the geologists, the biologists, the chemists, the historians, the archaeologists, have amassed for our instruction; all that the novelists have written; all that the artists have created; all that the poets have sung. He would be very diligent who should exhaust a hundredth part of all which the Agnostic's treasury of knowledge obviously contains.—*John W. Chadwick.*

BOOK NOTICES.

CITY BALLADS. By Will Carleton, author of *Farm Ballads*, *Farm Legends*, etc. Illustrated. New York: Harper & Brothers. 1886.

It is not strange that the generous reception accorded to one after another of Mr. Carleton's books has incited him to further composition. But, as his *Farm Festivals* was distinctly a falling off from his *Farm Legends*, and that from his *Farm Ballads*, so here we have the lowest deep of all, at least so far. It is greatly to be hoped that hereafter he will not feel obliged to publish a new volume every year. It is entirely possible that, if he should suffer himself to lie fallow for a time, and not expect a regular annual crop of some two hundred pages, something might ultimately spring up as good as "Betsy and I are Out," or the precious story of the unwelcome baby that grew to be so precious in the father's eyes. The scheme of his latest volume is extremely artificial. The different poems are put forth as respectively the journals of a young student and an old farmer for the first time visiting the city. The book is still further divided into sections, such as Wealth, Want, Fire, Water, Vice, Virtue, Travel, Home. The only poems that rise above the level of sheer wilfulness are "Yes, it's straight and true, good Preacher," and the burlesque, "How we fought the Fire," which, by a pardonable device, is not a city ballad, but a country reminiscence. The four best lines are these:—

"The Deacon lay on his first wife's bed,
His second wife's pillow beneath his head,
His third wife's coverlet o'er him wide,
His fourth wife slumbering by his side."

On the whole, it is not a little surprising that Mr. Carleton, having set out to write a volume of city ballads, should not have got more of the city vastness, noise, and wonder into them. If he couldn't get these things directly from the city, he might have got them from a few hours' reading of Walt Whitman. It is sometimes complained that the text of articles and poems is written for the illustrations. If Mr. Carleton's had been, his work would have been better; and they would have been for him something "to live up to."

J. W. C.

THE Art Amateur for February contains an abundance of pleasant art gossip about New York exhibitions and studios, including a detailed account of the Japanese collection of ceramic ware now on exhibition and sale in the gallery of Mr. Edward Greey, of New York. It is said to contain fine specimens of Imari, Hirado, Naheshima, and Satsuma porcelains, which are eagerly sought by connoisseurs to fill up gaps in their collections. Music and the drama have their share of attention, Stephen Fiske giving us an account of Mrs. Thurber's new American Opera Company and of Modjeska's personation of Camille at the Fifth Avenue. Theodore Childs' sketch of the career of Walter Gay is very interesting and encouraging, showing the recognition which good work receives, even in the midst of the strife and emulation of art in Paris. The art hints and notes contain a mixture of shrewd, practical wisdom and technical direction, with high ideal thought. They must be very help-

ful to young artists. Photography is not neglected, and an interesting paragraph gives an account of M. Lesseps' use of it to report exactly to him every day the appearance of the work done on the canal. Home decoration and embroidery are not forgotten. The most pleasing picture in the number is Edith Scannell's illustration for her sister's book, *Sylvia's Daughter*. A charming little maiden sits on a stone-wall, gazing off into the distance. The action is natural and free, and the picture full of thought and pleasing.

"ST. NICHOLAS" for February is more than usually interesting and readable. We have space only to mention a few of its articles. "Fish-spearing through the Ice," by J. O. Roorbach, with two illustrations of winter scenes in New Jersey and Wisconsin; "Around the Bay of Naples," by Frank B. Stockton, with seven pictures illustrative of Neapolitan life; three chapters in the life of George Washington, by Horace E. Scudder, with four illustrations and a map; "Among the Law-makers," by Edmund Alton, with pictures of the English Houses of Parliament, exterior and interior; "An Electrical Engineer," by George J. Manson; "The Firm of Big Brain, Little Brain & Co.," by Frank Bellow; and "The Real King," by John R. Coryell, are each one worth the price of this single number for the information given. There are also stories and poems in profusion; and, among these, Mrs. F. H. Burnett's delightful "Little Lord Fauntleroy" carries off the palm. Cupples, Upham & Co.

AMONG the many attractions offered by the February *Wide Awake* are the short stories by Sally E. Young, F. E. Fryatt, Edmund Collins, and Elbridge S. Brooks, and the serial stories of Charles Remington Talbot, Harriet Prescott Spofford, and Margaret Sidney. Amanda B. Harris writes of "Nathaniel Hawthorne"; Mrs. Mary Treat, of "Spiders"; Nora Perry, of "Autograph Hunting and Autographs"; Mrs. Sherwood, of the late King Alfonso of Spain and a sister of his; Mrs. Fremont, of Louis Napoleon; and Agnes Watson, of "Some Florida Chameleons." Three full page and over forty smaller illustrations elucidate the poems, stories, and graver articles of this superb number. D. Lothrop & Co.

THE popular rage for bicycling has broken out in a new direction; and, in consequence, we have the Columbia Bicycle Calendar for 1886, a very artistic and handsome calendar for those who are interested in this mode of locomotion. On the slips devoted to each day of the year, the notable cycling events, opinions of the highest medical authorities in regard to the healthfulness of this form of exercise, the benefits of tricycling for ladies, etc., are noted. The face of the calendar gives a charming combination of cycling scenes, in which both ladies and gentlemen are actors.

FOUR pretty valentine poems, each prettily illustrated, mark the February number of *Our Little Ones*. There are stories of a "Cat Hospital" and a "Doll Hospital," of a monkey's ride on an elevator all by himself, of a squirrel's visit to a school-room, and of a little boy and some swans. Emily Huntington Miller, Florence B. Hallowell, Sydney Dayre, Rev. Edward A. Rand, and Mary N. Prescott are among the contributors to this number. There are beautiful pictures on every page.

EDUCATION IN DORCHESTER.

The Dorchester Art and Grammar School, Clara M. Bisbee, Principal, entered its second term of the year, on Monday, February 1. This school offers peculiar attractions to those who would secure the conditions of good health and morals, with a thorough education in music (vocal and instrumental), oil painting, and the English branches. Pupils are specifically trained for the Latin and High Schools or prepared for an advanced course in the school itself. Number limited to thirty. A few pupils will now be received on the very low terms of *twenty-five dollars* for the remaining half year.

The Contemporary Evolution of Religious Thought in England, America, and India.

By Count GOBLET D'ALVIELLA. Translated by J. MODEN.
Price \$3.00. For sale at *The Index* office.

Dr. BELLOWS' SERMONS.

A New Volume, Selected and Edited by his Son,
Rev. RUSSELL N. BELLOWS.

"For sincerity, originality, sound reason, and deep reflection, as well as pious and humane feeling, this book matches, if it does not surpass, any of like kind lately issued from the press.

"Persons of every sect and no sect at all, Conservative, Radical, Romish, or Free Religious, may taste immaterial elements, bread and wine of substantial communion, at the board of the spirit he spreads."—*Rev. Dr. C. A. Bartol, in Christian Register.*

"Those who heard Dr. Bellows when he was on his conservative tack will be surprised by his radicalism when he 'went in stays,' beating up for the port of truth, and stood out bravely on the other tack. He saw the truth on both sides, and wasn't afraid or ashamed to 'tack ship,' when it seemed necessary to keep in the deep channel."—*Rev. Wm. P. Tilden.*

"There is many a sentence here that would startle the proprietors of some of our fossil Unitarians out of their habitual slumber with a lively shock."—*Rev. John W. Chadwick.*

8vo, 400 pp. Price \$2.00. Sent, postpaid, on receipt of price by the Publisher,

R. N. BELLOWS, 109 East 15th St., New York, N.Y.

The Religion of Philosophy;

OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERKINS. New York: G. P. Putnam's Sons, 27 and 29 West 23d Street. London: Williams & Norgate. 1885.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, Ph.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 30 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

BREATHES there a man with soul so dead
Who never to his wife hath said,
"I will a flower garden make,
Both for my own and thy dear sake,
And sow with seeds to come up quick,
Which you, of course, will buy of Vick?"
If such there be, I pray repent,
And have an order quickly sent.
Then sweet thy rest, I'm sure, will be,
And thy dear wife will smile on thee.

The GUIDE is a work of 150 pages, Colored Plates, 1000 illustrations, with descriptions of the best Flowers and Vegetables, prices of Seeds and plants, and how to grow them. It tells you what you want for the garden, and how to get it. Printed in English and German. Price only 10 cents, which may be deducted from first order.

THE PRESENT DAY.

A JOURNAL DISCUSSING THE PRINCIPLES AND METHODS OF MOVEMENTS.
Edited by GEORGE JACOB HOLYOAKE.

"Crown Publishing Co.,"

267 Strand, London W.C., England.

THE "FREIDENKER."

Freedom, Culture, and Prosperity for all!

(Organ of the Freethinkers of North America, of the Union of Radicals, and the North American Turnerbund.)

Editor, C. Hermann Beppe.

TERMS, PER ANNUM, IN ADVANCE:
UNITED STATES AND CANADA:

Freidenker..... \$3.50
Turnerische Ausgabe des *Freidenker*
(*Amerikanische Turnzeitung*)..... 3.00

EUROPE:
Freidenker..... \$3.00
Turnerische Ausgabe des *Freidenker*
(*Amerikanische Turnzeitung*)..... 3.50

Sample copies sent, on application, free of charge.

In this weekly, which is now in the thirteenth year of its existence, political, social, and religious matters are discussed with a view to general enlightenment and progress. The *Amerikanische Turnzeitung* is especially devoted to the discussion of topics pertaining to physical culture and matters of interest to lovers of the gymnastical art.

Since Jan. 1, 1885, the *Freidenker* has been enlarged, thus furnishing CONSIDERABLY MORE READING MATTER, while the PRICE REMAINS THE SAME AS BEFORE.

For the convenience of those of our readers who are chiefly interested in matters relating to gymnastics, the *Freidenker* and its former supplement, the *Turnzeitung*, have been consolidated into one paper, called *Amerikanische Turnzeitung*, with the sub-heading "Turnerische Ausgabe des *Freidenker*."

This paper contains more reading matter than furnished by both the *Freidenker* and *Turnzeitung* heretofore. In making these changes, the publishers have incurred great expense; and we therefore solicit the hearty co-operation of all friends of the cause in securing for the *Freidenker* and the *Amerikanische Turnzeitung* a wider circulation.

We also publish

"Erziehungsblaetter,"

fuer Schule und Haus.

A Liberal German Educational Monthly.
(Organ of the German-American Teachers' Association.)

Editor:
MAXIMILIAN GROSSMANN, Milwaukee, Wis.
Associate Editors:
H. H. FICK, Chicago, Ill.
H. SCHUBERT, Chicago, Ill.

16 large quarto pages, with four-page cover.
Terms: \$2.12 per annum, in advance.

"Freidenker-Almanach"

FOR THE YEAR 1885.

The almanac, which is now in the eighth year of its existence, is devoted to the propagation of free-thought principles. Price 25 cents.

"Amerikanischer Turnerkalender"

FOR THE YEAR 1885.

This annual, which is now published for the sixth time, is principally intended to promote the culture of gymnastics, and is pervaded by a thoroughly liberal spirit. Price 25 cents.

Orders for all kinds of books promptly filled. Radical and Freethought Publications a specialty.

CURRENT TOPICS.

BY B. F. U.

GEN. HANCOCK leaves behind him what is better even than his well-deserved military fame,—the memory of an unblemished manhood.

THE death of Horatio Seymour, following swiftly that of Gen. Hancock, removes another prominent citizen of this country, a Presidential candidate cordially supported by his party, and a man whose ability and integrity commanded for him the respect of all his countrymen.

FRENCH friends who heard Prof. P. W. Chastanier, of Paris, on Tuesday evening, last week, at Chickering Hall, on the history of the *mise en scène* of the French theatre, inform us that the lecturer has that charming accent which marks the speech of Parisians who belong to the cream of society.

DR. CYRUS HAMLIN's lecture before the Parker Memorial Science Class last Sunday was the most lucid and comprehensive statement of the Eastern Question we have heard or read. The remarks by Mr. Anagnos in criticism of some of the lecturer's views, adverse to Gladstone's foreign policy, although rather brusque, were instructive, and added much to the interest of the occasion.

THE Springfield *Republican* observes: "The vote of the French Chamber of Deputies to sell the crown jewels, and to devote the proceeds to the establishment of homes for aged workmen, is good poetic justice and fair enough democracy. The hard hands of the people earned the money that bought these treasures, and they can well be turned to account now that crowns are no longer the fashion in France. The vote is a particularly characteristic declaration of confidence also in the republic."

THE London *Inquirer*, referring to an extremely lenient sentence passed, simultaneously with Mr. Stead's release, on one of the scoundrels belonging to the class he attempted to expose, says: "On the merits of the late trial and the justice of the sen-

tences passed in connection with the abduction case, we are not now expressing any opinion. But the revolting inadequacy of the system under which offences such as we allude to are expiated by one month's imprisonment calls for protest, and the contrast inevitably set up by the synchronism of the two events forms a painful commentary on the state of opinion on matters of deepest social interest."

A FRIEND inquires as to the purpose of the University of the Science of Spirit in this city, of which Dr. E. J. Arens is chancellor. The doctor informs us that the institution is "for the purpose of imparting knowledge of the science of spirit, and of the creation of the spiritual universe, and of the origin and phenomena of matter, and thus to make manifest the relation between God and the soul and between the soul and the body, and thereby promote man's moral and physical health." Dr. Arens does not believe in spending time on the small questions, such as occupy the minds of our scientists. He tackles only the biggest problems; and, if he gets floored every time that he grapples with the infinite, it makes no difference with him. He renews the struggle with that good nature and confidence which show he is wholly unconscious of defeat.

IN an editorial showing how sectarian colleges are hampered in their efforts to secure first-class teachers, the Boston Sunday *Herald* observes: "Let us, for a moment, imagine a high endowment for the foundation of a college of science, in which each department should have its special professor, with the requirement that each incumbent should not only be an original investigator, having the reputation that accompanies good work, but should possess the added grace of being a member of some evangelical church; and we hazard the conjecture that the chairs could not be filled, or, if filled, would not only exhaust the field, but leave sad gaps in other colleges. A lucrative field is here open for aspiring graduates who can cling to dogma and yet make a record in silence. Such a man would find the arms of a hundred crippled chairs widely outstretched to receive him. The reason why Catholic colleges are usually reduced to atrophy, as regards a scientific department, is not that they would not like to add this vital feature to their curriculum; but it comes from the very grave difficulty of finding men of science who are at the same time well grounded in the dogmas of the Church. Thus it is that a non-sectarian college—other things being equal—will possess a vigor and freshness, an elasticity and vitality, which stand in bright contrast to the usual character of the sectarian college."

A WRITER in the *Church Review* (London) thus comments on Bradlaugh's taking his seat in the House of Commons: "The 'irony of fate' never received a more noteworthy illustration than in the House of Commons on the 13th of last month. A Conservative government, in place, but not in power, looked helplessly on when, after five years'

struggle against one man's right to his seat in Parliament, that man took the oath and his seat; and the Conservative 'leader of the House,' attempting to interfere, was promptly suppressed by the speaker in whose re-election his party had just—because they couldn't help it—acquiesced. We hope and believe that the same circumstances which thus enabled Mr. Bradlaugh to enter upon the performance of those duties which he owes to his constituents will hold back the government from any fresh attack upon him in the law courts. Two things only remain now to be done,—the passing of an Affirmation Bill of wide scope, and the expunging from the records of the House of Commons of the unconstitutional resolutions with which the sessions of 1880–84 have disgraced them. Mr. Bradlaugh and the people of Northampton have apparently triumphed at last. We congratulate them. Of all those who have taken part in the 'Bradlaugh Question,' Mr. Bradlaugh himself is the only one whose record is perfectly clean. The fact that his personality is detestable to them should not prevent honest men from acknowledging this."

THE *Independent* says that "any college is justified in making it a bar against the election of a professor of ethics, or history, or political economy, or Greek, or geology, that he is an atheist. If that is narrowness or bigotry, then make the most of it. We are not ashamed of such bigotry. . . . The abler and brighter and more specious an atheist is, the more we do not want him in a Christian college as the pattern and instructor of our children. He can do all the more hurt. It makes no difference if he is the best geologist living. We may then, perhaps, call him in for an occasional lecture; but we do not select him, and pay him to do work against the faith we believe." Although, in the words quoted, the "atheist" only is mentioned as unfit to be a professor in a college,—the word "atheist" being an opprobrious term, used apparently to conceal partially the actual exclusiveness and bigotry of the writer,—it is evident from the editorial from which the extract is taken that its author would exclude equally all "who disbelieve in the Christian religion." The *Independent* would not have a college limit its appointments "by denominational lines." Oh, no! but it would, nevertheless, have the limits established by "lines" that would make impossible the appointment to college professorships, not only of Huxley, Tyndall, Haeckel, Vogt, and scores of other distinguished scientists, but of all those "disbelievers in the Christian religion" who now teach at Harvard, Yale, Johns Hopkins University, the Michigan State University, the Iowa State University, and at all other first-class educational institutions. The pious editor's declaration that he is "not ashamed of such bigotry" would only make it appear more offensive, but for the indication the article contains that the real human nature in the author is actually ashamed of the unbrotherly and exclusive position his theology—the fossilized thought of half-civilized ages—compels him to take.

ANOTHER UNITARIAN BATTLE.

For a year or two, the Unitarian denomination has been congratulating itself on the establishment, within its borders, of an era of harmony and peace. Its National Conference, though retaining the long-fought-over Preamble, had distinctly declared that it was not to be regarded as an "authoritative test of Unitarianism." The "Year-book controversy" had been decided on the principle of home rule; that is, of enrolling in the list of ministers the name of any person whom a Unitarian Society had chosen as its minister. The good suppers of the new club at the Hotel Vendome were evidently stimulating to good fellowship. And, meantime, the solid walls of the denominational building in Boston have been growing upward, alike satisfying the denomination's pride and betokening its prosperity. More recently, it has been announced that a portrait of Theodore Parker, an excellent likeness, has been specially painted for this Channing memorial edifice, and will have conspicuous place within it; and, to crown all, the American Unitarian Association has just published with its imprint, as one of its missionary books, a volume of Theodore Parker's selected writings. No more significant sign could be given that the old controversy over Parker is meant to be considered as denominationally settled, and the very bitterness of it, if possible, buried.

But, in the midst of this "era of good feeling," suddenly sounds forth the tocsin of war. And this time, for a novelty, the battle has broken out in the West. Hitherto there have been conflicts between Eastern and Western Unitarianism; but, in the West, Unitarianism, though weak in numbers, has been, at least in late years, so predominantly radical in its tendencies that there has been little room for open war. The conservatives, seeing no chance for carrying their points, have contented themselves for the most part with a silent protest; and the radicals had been led to believe that they were going to win their victory by the peaceful processes of evolution. Now, all is changed; and the parties are preparing for battle. *Unity*, which represents the radical tendencies, but has been conducted on the policy of admitting no controversies in its columns, has been compelled, in spite of its name, to show that it can defend its positions and principles, if attacked. And the attack has come in a way which cannot be ignored. The conservatives are the challenging party. They have questioned the right of *Unity* and its editorial writers to be regarded as working for Unitarianism or even (in the case of some of the writers) as having a moral legitimacy within the Unitarian ranks. In fact, the conservatives have attempted the old problem of defining Unitarianism; and their definition embraces certain theological doctrines, which, they frankly say, ought to exclude from them some of their brethren.

This conflict becomes more important and inevitable from the fact that the conservatives are led by the Secretary of the Western Unitarian Conference, Mr. J. T. Sunderland, who holds a good deal of official power in his hands. He was, until a few months ago, one of the editors of *Unity*, but retired from that position because of the difference of view between himself and his co-workers; and now, with the editorial help of Mr. Herford, minister of the Arlington Street Church, Boston, he has an organ of his own, the recently established *Unitarian*, whose special mission it is to make Unitarianism stand for Christian theism and worship. This is published in Chicago, and is a near neighbor of *Unity*. Another weapon on the conservative side is a little paper called *Our Best Words*, published and edited by Mr. Douthit, the

zealous minister of a small Unitarian society in Shelbyville, Ill. But Mr. Sunderland, both by his ability and his office, is the more important opponent; and he is a frank and honest one. He plainly told his brethren of the Western Conference, before they re-elected him secretary last May, that he conscientiously believed that Unitarianism, in its Western churches and organizations particularly, needed these restrictions, and, if elected, that he should work with a view to secure them as far as possible. And, very soon after his election, he recommended, "as secretary," that the churches of the Western Conference should adopt as basis of church organization the following form: "In the love of truth and in the spirit of Jesus Christ, we join for the worship of God and the service of man." He also recommended a statement of similar tenor, but more elaborate phraseology, for all Western Unitarian conferences. And this he did for the reason he had given in his annual report, that such a basis as that which the Western Conference and some churches had adopted—namely, "Freedom, Fellowship, and Character in Religion"—was not sufficient to exclude from positions of active influence in churches "Agnostics, Spiritualists, and Materialists."

It seemed to us at the time that, after Mr. Sunderland had given fair warning of the course he should pursue, the radicals of the Conference, who had a large majority, stultified themselves by re-electing him. We know that they wanted to show that Mr. Sunderland's theological views did not operate as a bar to his receiving their full fellowship and confidence. Were they not contending for the principle of fellowship and co-operation in religious work, in spite of difference of religious opinions? and was not this very vote for secretary to test their own faithfulness to this principle? But it is one thing to be ready to fellowship and work with another person of different religious views on entirely free and equal terms, each doing what he individually can to advance his own views as well as promote common aims; and it is another and quite different thing for a body of persons, who have announced their faith in certain principles and a corresponding policy of action, to put into a position where he is to do their work to a considerable extent for them a person who has announced that he holds and will endeavor to execute a contrary policy and principles. This latter thing is what the radical majority of the Western Conference did. It was magnanimous and fraternal; but it was not rational, nor did fellowship in freedom require it. If they thought thereby to preserve peace, the hope has been disappointed. Their action has probably precipitated the conflict.

It is not natural for Unitarian societies to receive from an official hand beyond their own borders, even as a recommendation, any kind of formal statement, especially a theological one, to which they are to subscribe. The traditional spirit of individual mental liberty and congregational independence starts up in protest. This has doubtless been the result of Mr. Sunderland's policy as secretary. And when, in a correspondence with Mr. Connor, minister of the Unitarian church at East Saginaw, Mich., he plainly intimated that, unless that gentleman held certain theological views, he (Mr. Sunderland) did not think that he had any right to the name Unitarian or to be preaching in a Unitarian church, we do not wonder that Mr. Connor should have burst out in an indignant letter against the assumption of any other Unitarian minister to define Unitarianism for him. The spirit of Mr. Connor's letter was not so good as his cause; but this defect could not prevent fair-minded readers from seeing that he

was defending a principle which has been professedly dear to the Unitarian heart, however great and frequent may have been its violation in deed. And so the Western Unitarians are taking their positions for the battle. Unitarianism in the East has not yet been much affected. Our amiable neighbor, the *Christian Register*, is still serene in its visions of harmony; the denominational building on Beacon Street is going on toward completion, undisturbed by the cry of war; and the Unitarian Club still smokes the pipe of peace in the Vendome's elegant supper-rooms.

The principle, however, which is at stake in this new Unitarian battle, is a large one. It is nothing less than this: Shall all dogmatic tests of whatever kind be laid aside in religious organization and fellowship, and the ethical test alone remain? Shall the two fundamental principles of Unitarianism, reason in religion and supremacy of character, be followed squarely through to their ultimate conclusions without fear or favor of any theological beliefs, or shall the denomination now intrench itself on some kind of beliefs concerning God, immortality, and worship, and the spiritual authority of Jesus? We understand the Western conservative Unitarians to take the latter of these alternatives, and the radicals to take the former. The radicals are really contending for the principles of the Free Religious Association, and for their right honestly to stand on that ground and give to Unitarianism so broad a meaning as to cover them. Their ethical honesty in doing this is called in question by their opponents, and such an impeachment of their honor inevitably incites them to self-defence. But they assume no apologetic attitude, but boldly claim their right to take Unitarianism forward to new meanings. Mr. Gannett—the last man against whom any charge of ethical dishonesty can hold—makes clear, by an able and uncompromising article in *Unity*, his own position and that, probably, of his colleagues. He sees and states the issue plainly, and is ready to meet it. Averse by nature to controversy, he yet knows there are some things better than peace. Coming from a man of such acknowledged devoutness, his statement should open the eyes of the conservatives to the narrowness and untenableness of their position. Says Mr. Gannett: "Reason and doctrine, say these friends, fix Unitarian fellowship; reason and *not* doctrine, say we. Character and a creed, say they; character and *not* creed, we." *The Index* can but hope that those who are battling for reason rather than doctrine, and for character and *not* creed, will win.

WM. J. POTTER.

WEBER'S "HISTORY OF EUROPEAN PHILOSOPHY."

The University of Strassburg had long been a centre of culture and science, when it was reorganized under the German empire in the year 1871, after the cession of Alsace-Lorraine. Goethe, Herder, and other heroes of German thought are well remembered having been students in the wonderful city on the Ill, where Erwin von Steinbach's cathedral grandly towers into the sky. It was a great change, though; but many professors who had been teaching in the time of the French government remained in their positions, and perhaps the most prominent among them was the philosopher Prof. Alfred Weber, a man as much acquainted with the drift of French culture as with German philosophy.

Weber is a native Alsatian, and has been educated in French colleges and universities at Strassburg and Paris. Yet his love for the kindred race

on the other bank of the Rhine, his acquaintance with and appreciation of German thought, induced him to visit German universities also. His patriotic attachment to Germany is the more noteworthy, as during his younger years there was no hope for a reunion or closer connection with the old Fatherland. So much the more he aspired, with all the sincerity of his fervid enthusiasm, to keep his country in close connection with the growth of scientific and humanitarian ideas in Germany. Naturally, a man like Weber became the interpreter of German thought to his French countrymen. Without mentioning national prejudice, it is, indeed, or at least it appears to be, very difficult to the French mind to grasp and understand German thought; and it is remarkable how often French scientists, for this very reason, either ignored or misinterpreted the works of their German colleagues. I refer to such facts as the miscomprehension of Kant's philosophy by Comte and Laplace's* being ignorant of Kant's nebular hypothesis.

Weber has done more than any other Alsatian or Frenchman in bridging over the gap between the two nationalities. His work, *Histoire de la Philosophie Européenne*, will be an everlasting monument of his merits with special reference to this fact; for his chapters on Kant, Fichte, Schelling, Hegel, etc., are most brilliant, and at the same time clear and exhaustive. Thus, he introduces the philosophic ideas of his Teutonic brothers to his French countrymen. It is a book which unites the elegance of diction, for which the French are famous, with the German depth and thoroughness.

The beautiful Alsace has been a country of thinkers and authors as much as any other German province. It was, in the Middle Ages, a stronghold of German civilization and thought. From Eticho, the first Alsatian duke, down to the seizure of Strassburg by the French under Louis XIV., in the end of the seventeenth century, many Alsations were among the foremost champions of progress, liberty, science, and art. One of the very first German poets mentioned in the history of literature is Otfried von Weissenburg, an Alsatian, who translated the gospel into German. Reimar von Hagenau and Gottfried von Strassburg are bright stars in the galaxy of the German Minnesang. It was in Strassburg that Gutenberg, of Mayence, established the first printing-press; and here Schoengauer lived, who was famous for his engravings in copper. Master Eckard, although no native Alsatian, preached in Strassburg. He and his disciples, Johannes Tauler and Rulman Merswin, were most effective harbingers of the Reformation. Then, in the great spiritual contest of the Reformation, the most prominent literary men on either side (perhaps with the single exception of Hans Sachs, the mastersinger of Nürnberg) were Alsations. I refer to Sebastian Brant, the author of *The Ship of Fools*, Geiler von Keisersberg, Wimpfeling, Thomas Murner, who so effectually satirized Luther, and Johann Fischart. In the Napoleonic wars, no fewer than three Alsations

were famous generals; namely, Kleber, Kellermann, and Rapp.

These are facts which prove the value of this beautiful country. Certainly, the French lost much, when they were obliged to surrender it to Germany. And the profit which they might have derived from the Alsations would have been greater still, if they had been more appreciative of their virtues. No doubt, Weber's book is one of the most benign services ever rendered to France by Alsations. It will contribute much to reconcile the old hostility, for all works of art and science are peace-makers. I gladly take occasion to mention that recently (during the last month) the fourth edition of this History of Philosophy has been published; and, as I glance through its pages, I find that the book has increased in size as well as with regard to its contents. I have shown elsewhere that Weber belongs to that class of philosophers who must be regarded as the most sound and healthy in our days, breaking a path for a better view of life than is given in either optimism or pessimism. Weber accepts the doctrine of monism, and traces, like Schopenhauer, matter and spirit back to the same source; namely, the will. But he differs from the pessimistic philosophers. According to Weber, it is not the mere will,—that rude desire for existence,—but the will as the aspiration to something higher,—the will of doing the good and of realizing the ideal. ("La volonté, non la volonté qui tend à l'être et rien qu'à l'être comme chez Schopenhauer, mais la volonté qui tend à la réalisation du bien, de l'idéal.") I call such view of life meliorism;* and also Weber, in his latest edition, has accepted the term. In the preface, after defining his position with regard to optimism and pessimism, he says: "S'il nous était permis de désigner notre point de vue par une néologisme, nous dirions que ce n'est ni l'optimisme satisfait, ni le pessimisme désespéré, mais bien le meliorisme, fondé tout à la fois sur les faits évidents que l'optimisme ignore et sur les aspirations imprescriptibles que le pessimisme étouffe."

I conclude with the statement that Weber's book, as it is the best work of its kind in French, has not its equal in the English literature. In this country, a translation of Schwegler's History of Philosophy, a German work, is generally used as a text-book. Let me add that Weber's work is in every respect its superior, and will be a welcome source of information to any scholar of philosophy who is acquainted with the French language.

PAUL CARUS.

"THE IDEA OF GOD."

Mr. John Fiske's book on this subject is quite popular as the avowed creed of an evolutionist, and in this light chiefly has it been noticed. It is creeds which are still things of chief interest to the majority. If the creed is satisfactory, it is of small consequence whether his proofs and defences are sound and just. Philosophy exactly reverses this order of interest. It cares nothing for creeds, but only for sound rational methods and logical processes with their results. In this light let the book be once reviewed in perhaps the only weekly in the world that has a constituency able to appreciate such a process.

We shall not stay to consider his exposition of the genesis of the idea of God, because the idea itself will demand all our time.

As a lofty mountain spreads its base afar, so Mr. Fiske begins his approach to his own idea far off, by contrasting it with the action and influence of another idea opposed to his own. This

favors rhetorical exhibition, if not elucidation of thought. He represents all modern atheism and all the conflicts of modern science and religion as the effect of the notion of God as transcending the world, and the world as being a mechanism of his creation, instead of being considered as the working and manifestation of his power and presence. This view, he argues, shuts out God from the world and from all agency in it, unless he interfere with its laws, and so confound science and dishonor his own work. God is no longer necessary; and, if the world is eternal, he never was necessary.

This conclusion is not necessary from even the false premise of a mechanical universe. The perfection of this mechanism for its ends in a moral economy may consist in requiring the hand of its Maker all along or at intervals, to meet the emergencies arising from the action of the free moral will. This is conceivable; and that is enough, since we are dealing only with thought.

Further, for an extra-natural agent to act on nature and use nature or in any wise modify its course is not necessarily a violation of its order. The human volition does modify nature's course continually. Any superhuman volition may do the same; and, if such agent is invisible, the result will be a miracle, whether its effects appear through the organism of a prophet or human medium or directly in the changed phenomena of nature.

This does not in any wise imperil or impair either science or religion, because science itself observes its own boundaries and nature's fixity, together with the interactions of the higher forces. All that we need here is due proof of superhuman action in relation to nature's action and forms; and this we can know by knowing nature's own regular and necessary action and the difference of its action in all such superhuman interpositions, so that all through it is a scientific observation. It is not the mechanical construction of the world which is here the source of our trouble, but the mechanical notion of human and superhuman action relative to nature as a mechanism, as if that action interfered with the nature, plan, and laws of the mechanism, as Mr. Fiske assumes.

The Church has never been much divided on the question of the immanence and emanence of the divine Being relative to the universe; and very few Christian divines, if any, have held either one, to the exclusion of the other. For all alike hold that the universe is finite, and other than God as well as infinitely less than God. They must therefore all hold that, in every possible meaning, God must transcend the universe. They must also logically allow—as they do, the Greek as well as the Latin—that the created universe is really something, that it constitutes some complex of forces, so that of itself it can and will do something, else what is the wisdom of creating it a thing utterly powerless and useless? They also claim with united voice that this created universe is not to be worshipped, because it is not God, but that it is yet worthy of the creative fiat of the Infinite. They only differ in that some of them more than others vaguely identify or unite the agency of God with the agency of nature; and the Greek Fathers, perhaps, do this more than the Latin. Not always; for the Synoptics and Platonizing Christians—who were, for the most, numerous among the Greeks—made matter an eternal force other than and independent of God (and, indeed, so did Aristotle and some of the Latin Fathers and theologians down to a late date). But, whatever their minor differences, all the Christian Fathers and theologians have equally been at an infinite remove from the cosmic philos-

*This fact is not so much known as it ought to be. I quote from J. B. Stallo's excellent work, *Modern Physics*, p. 280: "The nebular hypothesis, in the form in which it is now generally held, is due to Kant, and differs in several essential particulars from the hypothesis of Laplace. This latter hypothesis is limited in terms to our planetary system; and there is no indication in any of the writings of the French astronomer, certainly none in his *Exposition du Système du Monde*, that he ventured to extend it to the entire universe, as was expressly done by Kant. But there is a difference still more important between the hypothesis of the two thinkers. Kant's assumption was that 'all the materials composing the spheres that belong to our solar world were, in the beginning of all things, resolved into their elementary substance, and filled the whole space of the system in which these spheres now move.' This assumption is common to all recent forms of the nebular hypothesis. . . . The assumption of Laplace, on the contrary, is simply that the atmosphere of the sun, at one time, extended beyond the orbits of the farthest planets; and that the formation of the planets and their satellites, as well as that of the comets, was due to a gradual cooling and contraction of this atmosphere."

*Of the essayist's *Monism and Meliorism*. New York: Christern. 1885.

ophers, who merge God in an eternal universe, conscious or unconscious. No writer should confound these two systems of God and the universe, and attempt to advance the latter view in the name of the former, as coincident with Jesus and Paul.

I claim that this cosmic view, so far from exalting, as its advocates claim, degrades the notion of God. Though it may allow that God is more or less a sort of mentality as adumbrated by our own, yet, as it confines his action to nature and conscious finite beings as the modes of his agency, it limits him, because these are limited. Metaphysicians may affirm the infinity of space, if they choose; but the assertion of the infinity of its contents is a self-contradiction, unless all space is absolutely filled, which no one can affirm.

Further, this notion degrades Deity to the rank of the lowest organic beings, and even inorganic beings, and does not anywhere raise him above the rank of organic beings; for that were to transcend the universe. And, if that were allowed, we could assign no limit to his possible action, whether in accordance with or in counteraction of some natural forms and motions.

This notion furnishes no advantages in relation to science and natural laws. It does indeed secure by necessity regularity of nature's action, but so does the conception of the world as a created unconscious complexus of forces. It has indeed the peculiar distinction of keeping its God constantly occupied, like a blind Samson, grinding in the prison house to keep the mill going,—a form of activity we do not covet for God or man, relative to their creations or inventions. It keeps God always at work, without ever being able to effect an achievement. According to the counter-theory, he is able to achieve some works at once,—to speak and it is done, to command and it stands fast. Cosmic Theism says virtually that God is the universe and no more, since he does not transcend it. Christian Theism says that God is the creator of the universe and infinitely transcends it, and is able to vary it at will, and also to work with infinite variety in many ways transcending our imagination, which is limited by our experience; and we suppose he is always so working, as implied in his infinity.

The doctrine of a cosmic Deity immanent in the universe, if pondered a little more deeply, will disclose a new and more startling aspect. Mr. Fiske holds firmly to the doctrine of modern psychological science, that all phenomena are subjective states, which finds clear expression in this book as follows: "In the deepest sense, all that we know is mind. . . . States of consciousness we call material qualities, and matter is nothing but the sum of such qualities," and much more of the same kind. All the known and knowable universe, then, it is agreed, is *ego*, the known *ego*, states of consciousness, the *ego* in said states. Immanence in the universe, therefore, is immanence in the individual, sensible *ego*.

It is evident that the writer did not think of this in the course of his exposition of the divine immanence in the universe. His thought has slipped down to the old pre-scientific notion, still popular, of the universe as non-egoistic. In unfolding his theology, he has entirely forgotten his psychology. He thinks only of one universe, as all-embracing, vast, boundless, fit area for the infinite presence and affording sufficient scope for the action of his infinite energies. Hence, in close connection with this, he gives at length the common proofs of the unity of the universe, which are utterly needless to one who keeps in mind that all phenomena are modes of one subject: so that the universe is not only a unity, but a conscious unity; and doubt is impossible.

Now, to come to the genuine concepts of science, that the universe is a complex subjective state and that the immanence of God in the universe is only his immanence in me and others like me, it does not take much of a deity to fill the immensity of the sensations of a human being or any number of them. A deity confined to such a domicile will never command much reverence.

If, as it is alleged, this immanent Deity operates all the universe, he operates my sensibility and no more. He is thus made the subjective energy of all my sensitive being and experience, and so identified with me. He and I cannot be discriminated. From psychological science, I learn that I am the immanent subject, active and passive, of all my own conscious states; that is, of all the universe. From theology, with Mr. Fiske and others for teacher, I learn that this immanent subject-agent of all my consciousness, or the universe, is deity. As he says, "The universe is not a machine, but an organism with an indwelling principle of life," which is true; and that principle of life is called by Fiske God, and by psychology it is called man, the individual *ego*, conscious and subconscious. God is thus but another name for self,—certainly a practical truth often exemplified.

It is well said that a liar needs a good memory. The same need belongs to the system-builder and special pleader, unless he happens to have hit upon the truth, which is clearly not the rare luck of our author here. His unconscious transitions from *ego* to *non-ego*, in his conception of the universe, are matched by his unconscious transitions between two opposed conceptions of matter,—as forceful and forceless. He says: "The conception of matter as dead or inert belongs, indeed, to an order of thought which modern knowledge has entirely outgrown. If the study of physics has taught us anything, it is that nowhere in nature is inertness and quiescence to be found. Matter is indestructible, motion is continuous; and beneath both these universal truths lies the fundamental truth that force is persistent." This can be true only of non-egoistic matter and motion, of which it is confessed we know nothing; and it is clearly known matter and motion of which he speaks. And this is only sensation, which often ceases altogether and starts again.

But, to meet him on his own false ground, it is to be observed that this ert living matter, quivering with energy, he elsewhere, and close by, describes as intrinsically inert. Its energy is pronounced to be a foreign element which pervades matter, shapes, animates, and directs it as its "principle of life." In answer to the complaint of Leibnitz, that Newton's law of gravitation had relieved God from duty in the physical world, Mr. Fiske says: "Now, the fallacy of this argument of Leibnitz is easy to detect. It lies in the metaphysical conception of the word 'force.' Force is implicitly regarded as a sort of entity or demon, which has a mode of action distinguishable from that of Deity: otherwise, it is meaningless to speak of substituting one for the other." Thus we are here told that it is a fallacy to suppose there is any force distinguishable from that of Deity. Astronomy, physics, and chemistry, he says, know only forms, impressions, and motions, never any push or pull in changes of places; and all phrases implying force and its action are used only by way of convenience or by mistake. It is not in matter to produce its own motion and changes, and the only explanation is God. Like some old-time preachers, he thus strips his energetic, living matter of all its force and life, that he may ascribe them wholly to God, or rather erect them into an unknown god. The force persistent through all phenomenal changes is the cause of the changes,

the eternal almighty power which pervades and animates and energizes the universe,—that is, my sensations.

Now, this force, this god almighty in the material world, cannot be discriminated from the material world itself. Matter and its force are never known apart, and never can be. If the force is not a sensible phenomenon, it is not immediately known, but only inferred; and the question is whether we are to infer that it is intrinsic or extrinsic to known matter,—that is, whether or not it is one with matter. The simplest inference is that they are one, that matter is intrinsically forceful. Then we have a unity intelligible and competent, for aught we know, to be the sole author of all that the universe unfolds. We then need no other god, so far; and this refutation of atheism is good only for those who are content to split matter into form and force, and call the latter god, and forget that the form in which the god dwells is the conscious sensitive states of the *ego*, and that their animating and animated subject ought to be considered as also *ego*.

WM. I. GILL.

THE SOUTHERN PROBLEM.

II. Second Stage.

Disunion, the answer of the South to the problem, the Sphinx rejected, and, rejecting, devoured its victims. The belligerent systems were forced back under the same general government. The War wrought no miracle. The properties of the two opposing social principles survived untouched. There were the same irreconcilable differences. There would be the old irrepressible conflicts. The pacific co-existence of these contrary systems under one government or under two was simply impossible. Disunion, therefore, had it succeeded, would have failed to cure the disease. The same old feud would have broken out again and again, in that event, between two nations instead of between two sections; and the international quarrel would have lasted until one of the powers had fallen under the dominion of the other. The extinction of one of these forces became then the condition of national unity and greatness. In accomplishing this object, two mistakes may be made: we may rely too passively upon natural causes or too positively upon personal ones. The first was the error of the founders of the Republic; the second, that of its preservers. Nature may be assisted in her labors. It is assistance, however, which should be offered. We must not attempt to supersede her office by any pragmatic action of our own. This personal aid is never wholly useless, and sometimes it is of the highest value.

That there should be but one social system under as there was but one political government over the two sections, the strongest motives now enjoined. National unity demanded it. Justice could not be established, domestic tranquillity insured, the common defence provided for, the general welfare promoted, the blessings of liberty secured, by any possible combination of circumstances in which this master element was wanting. This was the posture of affairs at the close of the War.

The abolition of slavery was, of course, an important step toward extinction and uniformity. By it, a powerful principle disseminated itself through the South. The idea of individual freedom, self-ownership, travelled like light to the remotest spaces and the darkest corners, passed like heat through all conditions and strata of degradation and oppression, and stirred into consciousness the manhood of four million slaves. It was

the seed-corn of a social revolution, whose fruition lay then and now afar off.

The wound which emancipation inflicted upon the Southern system, though deep, was not immedicable. It rallied to repair this hurt to such effect that the slavery of a class formed itself upon the stump of that of the individual. African slavery was metamorphosed into African serfdom. The old fly-wheel which the War had fractured was skilfully replaced by a new one, hardly less powerful or efficient. It was a stroke whose consequences, had it succeeded then, the wisest could not have foreseen. It astounded the North. The instantaneous alarm which ensued disabled the North from being "amazed, temperate and furious, loyal and neutral, in a moment." But that which it is possible to be in a moment, that it certainly was in amazing measure,—loyal and furious. It precipitated itself upon the African serf-power with the fierceness of a tiger. It was in this temper and with this expedition that the gigantic task of reconstructing Southern society was entered upon by the North. To avert this impending danger and fortify its own ascendancy, that section adopted a policy of enforced conformity toward the South, prescribed conditions for its readmission into the Union, demanded security for the future. The condition prescribed and the security required were nothing less than the entire and radical reconstitution of Southern society upon the model of free institutions. This was the Northern fiat method of solving the problem. Congress said: Now we will make the Southern States over after our image. In the image of the free-man of the North, we will form master and slave; and they shall be equal. But it forgot that the soul of time must first move over this mass of aristocratic and servile habits and passions; that the first object of the legislative fiat should be the dispensation of light. The schoolmaster, the common-school system, are the pioneers, the pathfinders to the new earth. All the lower instincts, the whole brute creation of both races, ought to have been considered, in any general scheme of social reconstruction. The extension of the notion of property, free labor, individual responsibility, must necessarily precede the birth of the notion of public relations and responsibilities. These were the conditions to the success of the congressional experiment. They were violated in every particular. Scared at the rise of a serf-power in national politics, the North erected the negroes into citizens; and thus the blacks, without preparation or warning, were launched upon the unknown sea of self-government. Without chart or compass and in thick weather, they sailed upon their voyage of discovery. The fate of eleven States was thrust into the baby grasp of four million political foundlings,—four million foundlings crying in that dark night for light, and literally with no language but a cry. Of such material the North built the breakwater between its supremacy and the South. What followed? That dreadful decade of anarchy and misery. Misrule and a carnival of corruption on the one hand, the darkest atrocities and a saturnalia of blood on the other. The new citizens, without experience or moral leadership, fell easy dupes to gangs of political adventurers and scoundrels,—unresisting victims to organized malignity and violence. At bay and in the last extremity, the South fought with the fury of fiends. We can see now that the issue was never doubtful. The utter helplessness of the new citizens, their appalling poverty and ignorance, could not furnish a foothold for Northern ideas or the social fulcrum necessary to the overthrow of the Southern system. The North needed a place to stand upon. It wanted an ade-

quate prop for its lever. In its alarm and anger, it neglected to provide them. The power was too great. The improvised ground trembled and sank, the artificial fulcrum split and crumbled under the strain and pressure. Failure was a foregone conclusion, and it came at last in the terrific explosion of 1876.

A. H. GRIMKE.

EDITORIAL NOTES.

BY B. F. U.

DR. PAUL CARUS will give a free reading on Tuesday, February 23, at 3 o'clock P.M., at Mrs. Martin's, in the Hall of Otis School, off Brimmer Street. The subject will be poems by Schiller, Heine, and others. German scholars are invited.

THERE will be a lecture at Fraternity Hall, Parker Memorial Building, by Dr. Samuel Kneeland, Sunday evening, February 21, on "Thorwaldsen's Sculptures." The lecture will be illustrated with oxy-hydrogen light. Tickets of admission, 25 cents, which are for sale at *The Index* office and at Oliver Ditson & Co.'s.

TO KNOW things as they are to us is all we need to know, all that is possible to be known. A knowledge of the Supersensible, were it gained, would, by the very fact of coming under the conditions of knowledge, only be knowledge of its relations to us. The knowledge would still be relative, phenomenal.—*Lewes*.

IN a suit for damages against a Brooklyn railroad company for the loss of a leg, the plaintiff's counsel, in summing up in court, said:—

My client, gentlemen of the jury, has lost a leg. Look at him. You can see that he has to use crutches to take the place of that useful limb. So, with only one leg, he is doomed to go through life, with one leg to go down to the grave,—the grave over which the sweet daisies and pretty—er—dandelions will wave their heads in sorrow, and the grass will gracefully grow.

DR. MONROE, in his *Iron-clad Age*, evidently had in mind a certain class—a very small one, we hope—of his subscribers, when he wrote: "Did you ever observe that the man who owes you and doesn't intend to pay, or has robbed you under legal forms or overreached you by betraying your confidence, will never answer a letter calling his attention to the matter? Not one in a thousand of such fellows will vouchsafe a line in reply to a civil letter from the man they have robbed or fraudulently overreached. This is one phase of human nature. It is an infallible mark of inherent scoundrelism."

IN a recent lecture on "A Religion of Morality," reported in the *Philadelphia Times*, Mr. S. B. Weston said: "The signs of the times point out the fact that the religion of theology is dying, and a religion of morality is slowly but surely rising. People are not over-fond of exertion in matters of religion; and the religion of morality demands of us, however perfect we are, to rise still higher, for it requires not only individual rectification, but the rectification of human society. I believe that moral ideas and endeavors are the life and soul and inspiration of all that is best and most essential in religion, and that character and humanitarian deeds are far truer and nobler fruits of religion than any kind of theological creed."

REV. JOSEPH COOK, in his opening lecture in Boston this season, began by saying that he stood upon the platform as with one hand on his father's grave and one on his own grave. His robust appearance impaired somewhat the effect of the latter part of the statement. He thanked all for

their sympathy with him in his loss, and paid a tribute to his father's memory. He then referred to his experience as a traveller around the world. Next, turning to agnostic doubts, he said that "the buzzing of any bee in the West is sure to be heard at the antipodes." He objected to sending any uncertain sounds to the missions, alluding, probably, to the probation after death heresy. Evolution, he said, was being reduced in importance, agnosticism growing less arrogant, and the wave of doubt had passed. Spencer's books would not be bought, except as curiosities, ten years after his death. Cambridge was changing to theism. To those who regard theism as better than Christianity, this was gratifying, since Cambridge has always been Christian. New England universities were changing, and it would not long be safe for individuals to urge their doubts. Whether they would be boycotted or not, he did not say. He opposed the scheme to join the evangelical and unevangelical churches. It would lead to "conglomeration." The unevangelical must abandon their views. The chief peril of the Church was in receiving individuals who call themselves orthodox, but are, in fact, Universalists. The lecturer next referred to and disposed of several heresies. One religious journal had advanced the monstrous idea that a man has "a second chance in probation after death." Mr. Cook's notion is, it will be remembered, that a man has not even one chance "in probation after death," although there is a small chance after *breath*. After prayer by two other ministers, Mr. Cook gave a list of books which he recommended to be read, passed to a consideration of Gladstone's course, discussed Irish troubles, home rule, etc., and bade Gladstone God-speed. All the foregoing was merely a prelude to the lecture proper, which was begun with a quotation from Shakspeare, and was mainly a repetition of the lecturer's views as to "total surrender" and deliverance through Christ "from sin and the love of sin." Mr. Cook's hearers cannot complain that he does not serve them with a *variety* of thought, be its quality what it may.

MR. JOEL LEWIS, of Orwell, Ont., for many years prominent as a free thinker in that part of the Province, died on the 6th inst. at the age of eighty-three. Mr. Lewis was an ingenious and skilful mechanic, a successful farmer, and a public-spirited citizen. He was radical in his religious views, and generous in supporting, by his personal influence and money, the liberal movements of the day. A friend writes of the deceased, as follows: "To the very last, his faculties were unclouded. He called the whole household to his bedside, all by name, and gave a kind word to each, and then passed to that rest which he had longed for. He was questioned just before he died by parties who hoped to elicit something that could be used as evidence of a recantation as to his religious opinions. His answers were in every case unusually clear and to the point. He died as he had lived, a true man and a philosopher. By undue influence in the time of the family's bereavement, the orthodox people obtained the consent of the widow to have a clergyman officiate at the funeral, although this was contrary to his distinctly expressed wish the day before he died. Some of his religious opponents regard it as a great victory." A victory won by performing over the body of a man when dead religious services in which the man when alive did not believe, and which he had asked might be omitted at his funeral, is a "victory" which, while it disturbs not the dead, reflects no credit upon the intelligence, the liberality, or the moral sensibility of those capable of regarding such ceremonies as a sort of triumph over the aged free thinker or his opinions.

The Index.

BOSTON, FEBRUARY 18, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

THE DEAD GODS.

BY HUDSON TUTTLE.

The dead gods! Can the gods die? Aye, die, and be buried out of sight beneath the wreck thrown from the seething waves on the coast line of the ages. There they lie on that desolate coast, against the black background, deserted, pale, dead, past all resurrection or second coming. About them lie the ruins of the races that bowed to their shrine,—the broken column, the crumbling temple, brooded over by silence profound, impenetrable.

Dead tribes, dead empires, dead races, dead civilizations, and dead gods scattered as sea-waste along the interminable shore line which extends into the night of the past, lost in clouds and mist.

In the lovely age of a new earth, fresh, strong, and exultant in its youth, arose the Persian civilization. Above the lofty walls of Babylon, centre of Magian faith, arose the more ambitious towers devoted to her gods,—proud gods, lording it over their abject subjects.

They forgot their lineage. They ignored their ancestors; for beyond them, the terror of a savage race, were the fetiches, of which they were the union and concentration. Innumerable minor fetiches became in them one, blended in the sun, most glorious object of worship in the heavens. Light and darkness, Ormuzd and Arimanes, good and evil,—how naturally the antagonism falls! The vast empire, stretching from Indus to the Mediterranean, received with unquestioning devotion the religion of light. The Magians were the priestly order,—more powerful than kings or nobles, whom they created and cast down at a word; for they were directly endowed by the gods. The king might rule the people, but they ruled the king. Theirs was the court of final appeal. When the oracle was consulted, the deity spoke; and disobedience called down divine wrath.

How honored were these gods! The finest marble, the hardest granite carved into exquisite forms and polished with incredible labor, formed the

walls of their temples which, within, were encrusted with silver, gold, and precious stones. On their altars burned the perpetual fire, consuming the first and best of the flocks; for grateful was the odor of roasting flesh to the nostrils of these deities. In the very shadows of these vast towers, the people dwelt in hovels, uncomfortable for beasts, and were content with innutritious pulse and sodden cake. Oh, then was the paradise of the priests and the high tide of godhood! The people were all believing, and doubt was unknown.

It was a grand belief,—this worship of light and flame as the emblem of the Creator. Nature wrote in her symbolism the profoundest distinctions of the analyzing mind. What is more glorious than the sun bursting out of the eastern darkness, flooding the world with dazzling light? Life awakes at the coming of the lord of day. He is the creator of the life he evokes. How sad is his setting in the mists of evening, and terrible the darkness!—more terrible to the uncultured, as their fancy peoples it with invisible beings. The beast of prey lurks in the shadows, and the enemy takes advantage of it to approach. It was opposed to light; it was the antagonist to good; it was the symbol of evil. Here was founded the religion of which the Magians held the key, and swayed the destinies of the Chaldean and Persian civilizations. When Babylon had reached the zenith of her glory, resting on the lovely Euphrates, could send her orders to remotest tribes by a single messenger and have them obeyed; when the summits of her broad walls gave ample field for the manoeuvre of armies, and she could throw wide her hundred gates, allowing a host to march from each,—then with the splendor of war came the splendor of the priesthood; and the gods were supreme. There was the divine Father Ormuzd, "The King of Light," god of the Firmament, of "Goodness" and Truth; addressed as "Eternal Source of Sunshine and Light," "The Centre of all that exists," "The First-born of the Eternal One," "The Creator," "The Sovereign Intelligence," "The All-seeing," "The Just Judge." He rested on a white throne in the regions of pure light, and was the "Eternal One."

So far removed was he from the paths of men to heed their cries or minister to their cares, Mithras, the Mediator, came between the father god and the children of men. He was the sun-god, and they kept the twenty-fifth of December as his birthday. Then it is the sun from its southern journey perceptibly begins to return northward, or is born again; and they celebrated the event with far greater ceremonies than we now do our Christmas tide. And again, on the vernal equinox, or easter day, they held festivities which for splendor never were excelled. The "annual salutation of Mithras," the "Mediator" and "Savior," was an event in which the whole people participated; and neither time nor expense was spared to make the pageant attractive. It lasted forty days, which were devoted to thanksgiving and sacrifice.

On the appointed day, long before the light of morning, the great city Babylon, the centre of the fire-worship, was astir; and her myriad population swarmed the streets, washed and dressed in gala attire. The vast brazen gates looking to the east were wide swung; and the procession began its march to the holy Mount Orontes, there to salute the rising sun. First was the high priest, bare-headed, his tiara borne by a page; and behind him followed a long train of Magi, in robes of spotless white linen, chanting hymns, and swinging over their heads silver censers, in which the sacred fire was burning. Behind them, in single file, came three hundred and sixty-five noble youths, representing the days of the year, clad in scarlet to represent flame. Then came the chariot of

the sun, empty, but decorated with garlands, drawn by white horses harnessed with burnished gold; and led behind this the most superb white horse to be obtained, his forehead blazing with a diadem of gems. Then came the king in a chariot of ivory and gold, and an endless train of courtiers and nobles riding on camels, followed by the people. Slowly, they ascended the mountain; and, gaining its summit, the vast host faced the east, overlooking the purple plain, where on the remote horizon the first red blush of Aurora, goddess of morning, heralded the coming of her lord. The stone altar was prepared in front of the breathless ranks, and piled with odoriferous woods and frankincense, on which the beautiful white horse, devoted to the god, was placed. The high priest assumed his tiara, wreathed now with myrtle, and, taking the silver censer from which streamed the sacred fire, held it aloft while he watched for the coming of the sun. When its rim first appeared, he lighted the offering; and, as the fragrant smoke arose in the clear, still air, the Magi sang a hymn of praise to Ormuzd, source of all blessings, who had sent the radiant Mithras as a savior to mankind. Then the high priest offered prayers, and all the vast multitude joined in a chorus of praise; and beggar, priest, and king prostrated themselves before the orb of day.

Wonderful pageant, yet not so tender as that given in honor of Mylitta, virgin mother of Tam-muz, the incarnation of Mithras, the holy son of Ormuzd. She was represented as bearing in her arms her infant son, and the mothers of Tyre and Babylon bowed at her shrine. To them, she was the affectionate, all-loving mother, whose tender heart would be touched by their appeals, and intercede for them with her son. She was exceedingly beautiful, and the erring sinner could appeal to her with more chance of success than to the stern father. She had incarnated the divine nature without sin, and her son had suffered death for the salvation of men: hence, she had a right to plead. She was the "Celestial Virgin," "the Mother of God," "the Great Mother," "the Immaculate One."

Glorious age, when the gods were nigh unto the children of men, and daily conversed with them, daily told them that their followers should possess the earth, and force the heathen nations, who knew not Ormuzd or Mithras, to bow at their shrine! Arimanes, the Evil One, the Darkness, should be bound at length, and the garden of Paradise be regained.

What a beautiful dream of these gods! The sands drift in waves like the sea over their morning empire, and stagnant pools breed miasm, where the walls of Babylon swarmed with armed myriads and the towers of Babel provoked the deity by its cloud-piercing ambition. The mighty kings whose frown or smile was like a decree of fate, the leaders of armies and of States, the hero clad in brazen armor guiding the neighing war-horses in the thundering chariot, the countless swarms of warriors, gone—all gone; and the sands drift and the slimy pools fester in the sun. The bright orb rises as of old; but no Magi await his coming with swinging censer, no altar on the mountain tops, no sacred groves, no priests with flaming sacrifice. The empire is dead, the priests are dead. Ormuzd, the Father, Mithras, the Mediator, Mylitta, the Holy Mother, her beloved son, Arimanes, the Evil One, all dead—dead; and the desert sands drift, and the slimy pools fester in the sun.

By the side of the Persians lies another people, as remote in time, and occupying a wide extent of coast,—for they are hundreds of millions strong and of countless generations,—the Hindus, whose religion still exists, though its vitality is gone.

Over all that fruitful India, religion came to blight and blast with its doctrine of caste and childish whims, which destroyed the pleasures of living. The Brahmins encouraged beliefs entirely to their advantage, and ruled by inherited prejudice they had thus established. There was a host of gods, of whom Brahm was the eternal one, the unthinkable and infinite. Brahma came as his emanation, a lower degree, yet too far removed to require honors, festivals, or temples. Vishnu and Siva are the gods of good and evil. Siva is the destroyer; and his companion, Doorga, is the chief of the female deities, and her altar often streamed with blood, even of human victims.

Vishnu incarnated himself in Buddha, and Krishna was another incarnation. Their mothers were "Celestial Virgins" and were "Saviors." Of Buddha, it is said in the sacred books, "he gave his life like grass for the good of others." He was called the "great physician," "Saviour of the world," "the Blessed One," "the Anointed," the "Messiah," the "Only Begotten."

The theology taught by these gods was as gloomy as the shadows of the Indian jungle or its rock-hewn temples. Life was a struggle to free the spirit from the sin of having entered the flesh. The physical world and everything connected therewith were evil. It was the earliest form of primitive Christianity. The welfare of the spirit could only be gained by crucifixion of the flesh. The devotees sought the caverns in the densest forests. They abode with wild beasts, and sustained themselves on roots and herbs; they wore garments that chafed the flesh, whipped themselves with thongs, or wore crowns of thorns piercing the brow, submitted to the extremes of hunger and thirst, heat and cold, to overcome and subdue the flesh. From all parts of the vast empire, streams of pilgrims came to wash away their sins in the sacred waters of the Ganges. Vast numbers gathered to celebrate the days sacred to their gods. The temple car was drawn at the head of the imposing procession; and, as it passed through the living lines of prostrate people, some in their infatuation threw themselves beneath the crushing wheels, and by their zeal gain the approbation of their gods. The people are there still; but other gods are jostling these sad old deities, who die supine and paralyzed, while the tide of thought sets by them.

As a daughter to a mother, so was Egypt to India. At a time history speaks not of, the former was a colony of the latter; and then the people carried their gods with them. There on the banks of the Nile, mysterious river, flourished a civilization unlike any other furnished by the ancient world. The labor of a dense population easily fed was used by the priesthood for their own purposes. The gods wanted temples; and the bodies of the dead must be carefully preserved against the time the soul returned again to occupy them. Egypt became a land of temples and of tombs. The gods gave the priests absolute authority, and they made the people slaves. Into the rocky cliffs, they hewed enormous galleries, faced and columned from the flinty stone, and written over all the walls with hieroglyphics recording pious thoughts and godly deeds. To the banks of the sacred stream, on vast foundations, they brought the titanic columns and blocks, and erected temples as colossal and gloomy as the mountain caverns. The gods had said that the body would be demanded by the spirit; and, unless preserved, the lone spirit would be compelled to wander forever without one. Hence, the care of the bodies as well as of the souls fell to the priests; and they embalmed the dead and wrapped carefully, awaiting the resurrection.

When Egypt was at her prime, the Nile flowed through the most fertile and best-cared for country on the globe, bringing the waters of Central Africa to 'nourish the gardens and palm-groves; and in its little valley, hemmed in by deserts, the population was crowded in villages, and teeming cities along its banks. It mirrored a thousand temples; and between were the towering Pyramids, fresh from the hands of their builders. Colossal images of stone guarded the temples, of which the Sphinx is a remaining example. All was alive, active, breathing the intense zeal and superstition which prevailed.

Osiris was the active creator, and the sun was his emblem. He was the "oldest Son of Time, and courser of the day."

With Amon dwelt the exalted goddess Neith, in the sphere of pure ether. Her temple at Sais exceeded in colossal grandeur any before seen, and her power was written on their walls in characters deciphered by Champollion:—

"I am all that has been, all that is, and all that will be. No mortal has ever raised the veil that conceals me. My offspring is the sun."

The Holy Family of Egypt presented a beautiful and charming picture. As Osiris was the active principle of creation, Isis was the passive. She was the prolific mother; and, between them, they are represented as bearing the cross, mysterious emblem of life, which, in a later age, the Christians adopted as the symbol of life immortal gained thereby. In her arms, she bears her beautiful infant Horus, the incarnation of the All Father. In the hieroglyphics, she is styled "Our Lady," "Queen of Heaven," "Mother of God," "Immaculate Virgin," all of which were afterward applied to the Virgin Mary. She is represented as standing on the crescent moon, with twelve stars over her head, and holding her son in her arms.

The twenty-fifth of December was his birthday, and the occasion of national rejoicing. It was realized, in order the more forcibly to impress its significance on the minds of the people. The high priest, followed by the priesthood, the king, and nobles, marched in procession to the village where Horus was said to be born; and there found the infant, in a manger, awaiting them. The mother, thus exalted for a time to act the part of the mother goddess, with her infant, was borne to the temple, crowned with flowers, and followed by crowds chanting sacred hymns of joy. When they came to the Nile, the high priest launched a miniature ship freighted with the choicest fruits of the land, as an offering to the "Immaculate Mother." Over the rejoicing multitudes, the Pyramids arose like miniature mountains, the temples cast gloomy shadows, and the sphinxes gazed with stony eyes.

O beautiful gods, remorseless gods! not content with ruling this world, who sat over the Stygian river, in your cavern temple, and at midnight's awful hour judged the dead! Fearful judgment! for, if adverse, the body, of beggar in his rags or Pharaoh in his purple robes, was cast to the crocodiles, and thus the soul forever and forever doomed to walk in Stygian darkness.

A thousand years have gone by, when the wandering souls, it was said, would return and claim their bituminized dust. A thousand years have three times past, and decay has made the dust its own. A few of these god-commanded mummies are preserved, curiously gazed on with rising gorge, dreadful preservations of ghastliness; but the ashes of the Pharaohs, the Thothmes, and a score of dynasties, have fertilized their native soil.

That grand civilization, at which the world gazed with charmed wonder, is dead. The Pyramids, useless efforts of labor, the crumbling

columns of colossal temples, gnawed by the sharp sands in which they are half-buried, are all that remains. Egypt, once able from her bursting granaries to feed the world,—now none so weak as to do her homage. The race that tent beneath the ruined arches of her former greatness know not of that famous time, and are an alien race. The pageantry of the gods is no more. They are dead,—Osiris and Isis and Horus, Amon and Neith, with all their train of dependent deities,—dead, and nothing remains. Ay, their mummies! Did they embalm the gods as well? Surely, and a museum boasts of having the only perfectly preserved mummy of the god Apis. That god is a curious sight, lying down with head erect, wound in every direction with linen bands. By his side are ranged the embalmed remains of sacred cats, storks, and the ibis. Poor dead gods! Was it not enough to die, that these remains should be preserved, to mock your godship and awaken the laughter of the unborn ages?

You cannot preserve the perishable. Time will crumble adamant to dust; and, although the mummy outlasts the god-idea it represented, it shall vanish. The sharp tooth of the desert wind shall level the last block of the Pyramids, and not even the Sphinx shall remain a monument to the history it will not reveal.

The gods of Greece! How fascinating the mythology of the classic race! Its gods were so human, and approached so near the ways of men, their devotees unconsciously felt for them the love they fully returned. What a flood-tide of intelligence in that age when Plato and Socrates searched for spiritual truth, Aristotle philosophized, Æschylus and Sappho sang, and Phidias made the white marble breathe! The gods were not the terror of their worshippers: they were their fellows. They evoked the loveliest conceptions of beauty in the imaginative Greeks. The temples erected for them have been models of architecture since their time, and admit of no improvement. Their sculptured images, freed from the coarse symbolism which forced itself forward in other races, were perfectly human, and hence divinely beautiful.

Jupiter ruled over the firmament, Pluto over the nether world, and Neptune over the sea; and there were Bacchus, Adonis, Mars, and a host of inferior deities. They were all susceptible to the softening influences of love; and what an array of goddesses shone in the Pantheon,—Juno, Minerva, Venus, Proserpina, Ceres, and countless lesser goddesses and nymphs, perfected in every grace!

Ceres was the mother goddess, affectionate, tender, and true, the perfect type of womanly loveliness. What a wonderful festival was hers, when the autumn brought its harvest! It was the Mysteries as celebrated by women. They gathered on the seashore, and for several days performed prescribed rites. She was the goddess of humanity, and hers was the shrine of Compassion and Peace.

There were the greater Mysteries, wherein the secrets revealed by the gods were taught. The Mysteries were the church of Greece. If the initiated revealed the secrets, he met the vengeance of the gods; and the stigma of non-observance was far greater than that attending infidelity at the present time. Socrates was given the hemlock because he neglected the worship of the gods.

Every five years, all Greece assembled at Eleusis in Attica, to celebrate these solemnities. The vast concourse tented on the plains around a splendid temple erected over a cavern, in which, at an earlier time, the rites were first held. This temple was of divine architecture, its endless colonnades chiselled from purest marble, without spot or stain.

It stood on a swell of ground, and could be seen rising in snowy beauty by the vast multitude. Over its front was a colossal statue of Jupiter, calm, beneficent, all-powerful; and, on either side, a statue of Ceres smiled on the passers-by. The novitiate was led to the door, crowned with myrtle. There he was washed in a fount of holy water. Then he was asked: "Are you pure and spotless from the world? Are you free from crime?" Then, as the door opened, an impressive voice chanted: "He who enters must be pure, or the gods will destroy him. He who passes this portal goes into a shadow, from which only the just return. O weak, thoughtless, and improvident mortal, daring to penetrate the realm of the gods: aspire to truth and perfection, and strive to discard the flesh and the world!"

The Mysteries were celebrated for nine days, during which all distinction of rank was abolished. The first day was for social gathering. They bathed in the sea, offered sacrifice to the gods, marched in processions. Every ceremony had a meaning which was fresh in their minds. What a delightful episode in their lives must these ceremonies have been! and how they bound the people together! The gods were in every respect human, and their favor was gained by homage and tribute. They were regaled with the fragrance of the altar; and, the more sumptuous the offering, the better were they pleased. When angry, the sacrifice must be greater; when exceedingly wroth, human victims were required to appease them. The husbandman offered to Ceres cakes made from the grain she had given him; he poured out wine to the god of the vineyard. The sailor threw an offering to Neptune into the sea. There was a goddess presiding over birth, over marriage, and over death. Every river and lake and stream had its presiding divinities; every grove and mountain. The passions and the thoughts were guided and controlled by them. A delightful world, when such exquisite gods and goddesses rule the affairs of men, with whom they form such close communion! Poetry grew on such celestial food, and art attained unparalleled perfection. Such gods, surely, are immortal. Their temples are indestructible, their altars will retain the constant flame.

The temples are in ruins; the marble shafts, the finely wrought architrave, win the admiration of a race unknown to their builders; and the sculptured images are treasured as priceless specimens of art. History records the daring deeds of heroism,—the march of the ten thousand, the defence of Thermopylae, the devotion at Marathon, the brighter pages of the achievements of orators, statesmen, philosophers, and poets. The old race is dead. The shrines are deserted. No gathering of wives on the seashore in honor of Ceres; no hosts camping on the plains of Eleusis; no waiting for the death of Adonis; no festivities at the Christmas-tide; Jupiter no more the god of thunder. He is dead. Ceres, the immaculate mother, Venus, Isis, Pluto, Neptune,—oh, the endless line of dead gods and goddesses, whose departure seems to take the poetry out of nature and existence! With the Greek and Roman civilizations which they led to the flood-tide of glory, they passed away, and now linger on as sweet and beautiful interpretations of the phenomena of the world. We now meet the hard facts of experience, behind which we expect no hidden god. The Greek might say that Aurora blushed when the sun kissed her pale brow; but, with us, it is simply the revolution of the earth. He could fancy a saucy nymph in echo: we can find nothing but reflection of the waves of sound. He could picture Neptune lashing the sea: we only the effects of the

wind. He was affrighted at the thunder, as the voice of Jove in anger: we know it is nothing but an overcharged cloud. Oh, what a matter-of-fact, unpoetic world, with the gods dead, and reality and certainty everywhere!

Most influential on the strong tide which set past historic headlands, entering into and forming a part of the civilization of the present, is Jehovah of the Jews. He was at first a vagabond god, imprisoned in a chest or ark, slung on poles, and carried on the shoulders of his priests, as they fled to the desert from a people they had robbed. Moses, chief of the priesthood, an initiate in the mysteries of Egypt, bestowed on his patron god the character ascribed to Osiris, and called him, in language he had learned, the All-powerful, the Great I Am, propitiated him by the burnt offerings he had learned were acceptable to the Egyptian gods. The movable ark or shrine, having Jehovah boxed up, ready at all times for transportation, was a brilliant forethought of a leader of a wandering band of barbarians. Having their god always with them assured success; and, to preserve the box, the priesthood formed a body guard. When the Jews roamed the desert, their god, beside his box, had a tent or tabernacle, the curtains of which he had ordered exactly how to be made, even to the rings thereon. It was a tent, but much larger, better, and cleaner than the foul coverings of his followers. When they had conquered the land he had promised them, then Solomon built him a temple,—not so large or beautiful as those other nations had erected for their gods, but sumptuous for such a poor and weak nation as the Jews. The temple was better than a tent, and large enough for the Jewish people. They had one god, and wanted but one temple; and other nations were forbidden, in their selfish exclusiveness, to join in their worship.

But whether in his box, in a tent in the desert, amid the lowing cattle, bleating sheep, and the shouting herdsmen, the dirt and squalor of nomadic life, or behind the purple curtains of the Holy of holies in the temple of Solomon, with attendants in fine linen burning frankincense or offering up the smoking blood of the firstlings of the flocks, what a terrible god he was! He had neither friendship nor love. He was a shrewd, cunning, conniving Jew, bargaining, trafficking, envious and jealous of other gods, and sanctioning unmentionable atrocities. He would at times, on the slightest provocation, smite his chosen people as remorselessly as he would their enemies. He led them up from the desert, a horde of covetous Bedouins, and showed them the promised land, flowing with milk and honey. It was a fruitful land; for it had been long occupied by a race of agriculturists, who had by labor conquered the desert, and made it bloom like the rose. They had built cities and villages, planted orchards and vineyards and fields of grain; and when that horde appeared, following the priests carrying their god-box, over all that bright land were peace and plenty, and the happiness these insure. Then Jehovah spoke, and gave this land to his followers. They must take it by the sword, and he would go with them. He would even lengthen the day by causing the sun to stand still in the heavens, that they might have more time to murder. Spare no man, was the bloodthirsty order. Kill men, women, and children, except the virgins, whom they had better have killed. The white hairs of age, the prattling babe, the strong man, and the pleading woman,—all the people of a province, the most lovely and happy the sun ever shone upon, consigned to butchery, that this chosen people of Jehovah might despoil them of their homes!

History is just; for the Jehovah who urged this deed, when his people became possessed, and had erected a gorgeous temple for his dwelling, submitted to the ignominy of their captivity, and heard their vain cries from the slavery of Babylon.

In the age of his glory, he could say that he trod the winepress of the gory nations alone, and his garments were red with the blood of the slain. "I will dash them one against another, even the fathers and the sons together, saith the Lord: I will not pity, nor spare, nor have mercy, but destroy them." With mighty boast constantly repeated, he called his Jewish people his chosen ones, who were to own the earth and to whom all nations were to bow. The temple they had built would become the world's shrine, and into their laps the products of all climes would be poured as a peace offering.

Great promises, egotistic boasting of proud rascality, abject selfishness, and shameless crimes,—all gone. The Jewish tribe receives justice at the hands of time, and the slaughtered warriors and innocent babes of Canaan are avenged. Scattered from their country, as chaff before a strong wind, is that people who, ejected from the land of the Nile, came over the desert, with that god-box slung on poles, to the promised land. They have received, instead of homage and titles, the scorn of the world and the buffets of all people, aliens and foreigners, wherever they go. Their country is little better than a desert; the city of their pride is half in ruins, and of no consequence except as a relic; the boasted temple vanished in dust; and Jehovah,—dead, and not even the box, borne over the desert by the sweating priests, remains for decent sepulchre!

Are the gods all dead? Nay: they may die, but they reappear in other forms and under new names. The monotheism of the Jews was modified into the trinity of Christianity. The Father God was supplemented by the Son Jesus Christ; and the third person was established in the Holy Ghost, a sort of second emanation from the Father. It was a strange conception, at which human reason revolted. How God could be his own son or Jesus his own father, how one could be three or three one, was a mystery, which to attempt to solve was a sin. The difficulty was overcome by the church Fathers teaching that belief should come without examination,—in the words of Celsus, neither giving nor receiving any reason for their faith. Julian, the last of the philosophers, says that "the sum of all their wisdom was comprised in the single precept *believe*."

That belief was considered praiseworthy which received the most incredible statements. As Tertullian says: "I maintain that God died. Well, that is wholly credible, because it is monstrously absurd. I maintain that, after having been buried, he rose again; and that I take to be absolutely true, because it was manifestly impossible." Founded on such an all-receiving credulity, the new doctrines grew. The Godhead became strong, and for nearly two thousand years tyrannized over the minds of men. It stripped the dead gods of their garments, with which it clothed itself, and paraded before the world.

The Emperor Constantine,—Constantine the Great, as the early Church delighted to call him,—after a life of most atrocious crimes, assassinations, perjury, and murders, with the blood of his wife and son on his hands, called on the pagan priests for absolution. They told him that for such crimes they could not save him from the vengeance of the gods. Then it was he turned to a priest of the new Christian faith, and was assured that, however great his villainy, if he professed belief, he would become pure and spot-

less. From that moment, he declared himself the protector of the new sect. With him began persecution for free thought. In vain, says Renan, to search the Roman laws before his time for enactments against abstract doctrine. He brought persecution and the sword.

Then came the carnival of theology. The night of ignorance rapidly gathered over the world. The philosophers, sages, poets, orators, statesmen, perished; and none arose to take their places. Men stopped in greater pursuits to wrangle over the most indifferent distinction of creeds. The fantastic speculations of Asia were grafted on the growing stem; and it bore as fruitage a complicated system of theology, the despair of reason. This theology taught that man was created perfect, and fell. Having committed an infinite sin, only an infinite sacrifice could atone therefor. God himself must suffer, did suffer on the cross, that sinners might be saved thereby.

The Hindu Siva was transformed into Satan, the Greek hades into hell, and the priesthood, not content with ruling this life, claimed possession of the keys of the next. They decided who should be saved, who lost. This life was at best a vale of tears, and the horizon of its brief day was lurid by the reflection of the gulf of hell. Only a chosen few were to be saved. The great current of humanity swept onward, broad and deep as a mighty Amazon, and poured over the edge of the gulf of death into the abyss of hell. There was no respite, no forgiveness, but eternal torture. And God—who, in his all wisdom and power, might by a thought change all to Eden—smiled at the suffering he had created! I need not enlarge on this awful picture, nor mention the minor doctrines which sprang from the fundamental belief in the fall of man. For a thousand years or more, the nations calling themselves Christians suffered the chronic spasms of theological nightmare, and cast aside the real world for dreams. It was enough if God commanded through the most ignorant priest. To hear was to obey. Europe became a battlefield where the contending armies decided the whims of doctrine by the sword. The dungeon, the rack, the fagot, were the chosen means for conversion of heretics. If belief was the one thing required, and simple belief saved the soul from hell, it were better received at the hands of the inquisitor than not at all! Beautiful theory, the culmination of this system of theology!

Here is a little instrument, into which, like the ends of the fingers of a glove, you place your fingers. There is a screw on top pressing down on the sensitive nails. You can bear one or two turns of the screw. "Do you believe now that three times one are one, and that Jesus Christ was his own father?" "No." Another turn, that starts the blood. You wince, but say, "No." Then the priest says he must save you, and turns down until the nails start. "Now do you believe?" "Yes," you cry through the white lips of pain,— "yes." Then you are saved, you are a Christian.

Saved from what? Hell and the devil; for, mark you, now the devil is first in the Godhead. He captures nine souls out of ten, and the other narrowly escapes. Not only was Europe a battlefield, her hillsides whitened with the bones of the slain and the air darkened with the smoke of burning cities: she precipitated her hosts against Asia, in a useless effort to gain the sepulchre of God, and wasted a million lives in the vain effort.

What a stifling night was that when the Church with its theology reigned supreme, and lorded over the minds of men! To think became a crime, and the all-believing fool the type of Christian grace. At the time Giordano Bruno was burned at the

stake because he thought, the darkness seemed impenetrable, and poor humanity without effort to free itself from the fetters of darkness. What was there to save in this ever downward course of bigotry and superstition? What power could free the mind from its fear of God, the devil, and the priests?

Knowledge came. One thing had been left out of count, when the God-appointed hierarchy bound mankind. They forgot that thinking was man's heritage. Set him to counting his beads and praying over dead saints, he will weary after a time, and begin a new order of thought for himself. Then have a care; for, when he begins to think, the old boundaries will not confine him.

Knowledge came. Knowledge, calm of brow, clear of eye, the earth beneath her feet, the stars for a diadem, bowing before no shrine, offering prayers to no superior power, uncompromising with ignorance, pitying credulity, scorning unsupported belief, came like the dawning sun; and darkness, bigotry, and superstition vanished as wreaths of fog in the light of morning.

Knowledge came, asking no favors of king or priest, in the proud consciousness of invincible strength; and the fetters which bound the nations broke like bands of straw. Knowledge came; and Theology, which had grasped the throat of humanity and held it in the dust, loosened its hold. Mankind awoke from the stupor of ages. Against the black background of the past, it saw innumerable gibbets from which its thinkers swung, the scaffold still gory with its best blood, the smoke of the dying fagots; and hailed with shouts of joy the advent of knowledge as their savior. The hordes of superstition are pushed back, snarling with thirst of hate's slanderous tongue; and their gods are incapable of arresting the flood of light which overthrows the teachings of fifty generations of their devotees.

Ahrimanes, Siva, Satan, poor devil, was first to die. Robbed of his horns, his cloven foot restored; resolved into a human being, with some excellent qualities; resolved into a myth, the impersonation of a principle,—he disappears, leaving not even a shadow. Jesus, the Christ, the Son, the Saviour, the central embodiment of the legends of Adonis, of Horus, of Christna, of Prometheus, of Mithras, of Hermes,—freed from which, he becomes a self-sacrificing, true, and noble man, giving his life for the good of others, in the same manner that they have done.

The God who created all things in six days, and sat a personal ruler, like an Asiatic tyrant, on the throne of the universe, could not endure the presence of Knowledge. The Infinite cannot be circumscribed, nor calculate and plan. The Infinite must know without thought, and think without reason. The terrible beliefs which have wrung the soul; the creeds against which the heart has rebelled, amid torture; doctrines on which eternal welfare, it was taught, depended,—long since dead, are galvanized for the last time into mimicry of life. Poor dead beliefs,—the fall of man and his redemption through the blood of another, and all that pertains thereto! Dead, and, dragged after the ignorant, tortured into the grimace of life! It would be a dreadful spectacle for a man to have the corse of his dearest friend bound to him. Still more dreadful to be fettered to a dead creed, a dead belief, and obliged to drag it after him.

The power has departed; and the anathema, "Believe or be damned," is the threat of impotency. The fiery tongue of flame cannot be used to compel faith; but the old hate is retained by the old ignorance, not yet quite driven out of the world.

In the Churches of to-day, the preachers hold

the corpses on their feet, dried into mummies, and make believe they are alive. They grin with the horrid contortion which shows the pangs felt in the olden time by many a martyr. The audiences make believe they enjoy the spectacle, and that the preachers are honest. It appears well, but is all a sham and a farce. A spectacle at which we may laugh or weep,—a preacher, with dead ideas, preaching to a dead church.

Shall we weep at the fleeting glory of gods, and turn aside, saying, Life is a cold reality: there is no warmth in this certainty? Of all impotent cries of weakness, this of want of warmth is the most impotent. What has it to do with the matter? The truth comes: we have no question whether it pulsates with love or the cold certainty of fact. A Saviour's all-absorbing love may kindle the heart: what of it? That makes it not true. There are better ways of kindling the heart than contemplating selfishly the sacrifices others have made for us. They who are best pleased to hug a delusion, even though they know it to be such, must retain their fond idol. Knowledge has no dungeon or gibbet: she abhors persecution, and her savior is the growth which is the birthright of the soul.

Slumber on, dead gods, in your eternal sleep! Were you gods, you had not perished! You were created from the minds of men, and bear the impress of the finite. Creeds, dogmas, beliefs, doctrines, moulder in decay along the shore, like seaweed and salt sea spume,—beautiful imagings or grotesque and horrible as the misshapen forms and devil-fish which are concealed in the drift. Sacred books,—Zend-Avesta, Vedas, Shastas, King, Koran,—gather dust on your most holy pages! for, as ye were written by men, when men were filled with the superstition of ignorance, better can now be written, if bibles are required.

Free soul, emancipated from the bonds of darkness, breathe full breath and think without fear! The god of to-day scorns the cringing slave, the narrow bigot, the weakness of ignorance. He demands a brave and fearless mind, which accepts not defeat, and conquers the forces of nature and binds them to its will.

When we look down this long vista, the road over which mankind has travelled, wearily and with pain, through the countless centuries, the tortures of body, the more refined and excruciating agony of spirit, all this suffering borne for the gods, imposed by the gods, and for the sake of religion, to save souls never lost, come up before us in one black mass of world-pervading woe, and we say, Just is the doom of such gods and such religions! Our temple of worship is the universe, our savior is knowledge, our religion to embody perfection in our lives by ordering our conduct in accord with the laws of the world, and our prayers for the perfect strength and trust which come from understanding.

CORRESPONDENCE.

EGO UPON ABBOT.

Editors of The Index:—

Mr. Gill informs your readers that Dr. Abbot's recently published work would be valuable but for two faults, which are that "the premises are false and the conclusions illicit." This language is brusque; and if not so sustained by argument and exposition that it must be taken for the necessary verdict of all sound critical judgment, rather than the dictum of an individual, it is arrogant. Mr. Gill makes a show of sustaining it: first, by a string of assertions; and, secondly, by setting up a man of straw and knocking it down again. This could not seem sufficient; and I was about saying to myself that he should be either less assuming in manner or more convincing in matter, when it luckily occurred to me that he is the

author of the universe he inhabits; that all which appears to him as *non-ego* is the product of his *ego*; and that, accordingly, Dr. Abbot's book and Dr. Abbot himself, so far as known to him, are creations of the same prolific *ego*. This timely reflection at once rebuked and checked my incipient objection to his style. Of course, he has a right to take liberties at pleasure with his own productions, as he has a right to call himself a goose, if so inclined, though it would be highly indecorous in another to bestow upon him that title.

D. A. W.

For The Index.

THE WANDERING JEW.*

He passed across the twilight waste,
A spectral shadow, dimly traced,
And vanished far, as one in haste.

And ne'er, through night or weary day,
He may his endless wandering stay,
Though generations pass away.

And fading, as the fading grass,
The fleeting generations pass,—
Or visions in a magic glass.

And seeking evermore, in vain,
A respite from his inly pain,
He comes again, and yet again.

Once, as he sat beside his tent,
A stranger came, with wandering spent
And 'neath his heavy burden bent.

An hungered and with travel sore,
Deep sorrow in his face he wore,
And sought to rest beside the door.

Upon the stranger sad he turned,—
His heart with sudden anger burned,—
And from his threshold fiercely spurned.

Whereat, a deadly shudder went
Through all the earth and firmament,
As of the heart of nature rent.

And straightway, on his burdened breast,
A hand of iron, stifling, pressed,
And drove him forth in wild unrest.

Through that inexpiable crime,
To goad him on, from clime to clime,
Throughout the flight of coming time.

And evermore, from waste to waste,
A spectral shadow, dimly traced,
He swiftly flees, as one in haste.

Threading the city's crowded street,
With none his stranger-form to greet,
He passes on with hurrying feet.

And where Palmyra, ruined, stands,
Alone amid the desert sands,
Who ruled, a queen, o'er antique lands.

He finds no rest where wearily
He ploughs, unknown, the weltering sea
That moans in lone immensity,

Nor where, through waxing, waning moons,
The billows chant their mystic runes
Along the wide and windy dunes.

He treads the barren desert drear,
Where pyramids their shadows rear
O'er kings, through fear who ruled, in fear;

While stars, deep in the solemn night,
A glorious company of light,
Gaze silent on his evil plight.

He pierces far, with venturous prore,
Through boreal regions, white and frore,
'Mid whirling snows and wintry bore.

And longing aye his soul to steep
In soothing slumber, sweet and deep,—
A dreamless, everlasting sleep,—

Still his inexpiable crime
Shall goad him on from clime to clime,
Throughout the flight of coming time.

And evermore, from waste to waste,
A spectral shadow, dimly traced,
He flees afar, as one in haste.

HOWARD WORCESTER GILBERT.

BOOK NOTICES.

SOCIAL WEALTH, the Sole Factors and Exact Ratios in its Acquisition and Apportionment. By J. K. Ingalls. New York: The Truth-seeker Co., 33 Clinton Place. 1885.

Mr. Ingalls thinks we are now living under a system of "capitalistic aggrandizement or commercial

*The weird legend of the Wandering Jew has furnished a theme for many writers, notably Eugène Sue, in his famous and powerful novel of that name. When freed from the narrow, theological bias which the monkish superstition of the Middle Ages gave to it and endowed with a wider application, it possesses an obvious humane significance.

monarchism" unparalleled in the world's history; that the impoverishment of the many for the enrichment of the few is openly or tacitly held to be a part of the social evolutionary order, and demanded by the laws of trade; that our political savants give us nothing but contradictory theories, while obsequiously bowing to the dominant plutocracy; that, on the other hand, we have imported from Europe a great variety of proposed panaceas, all the way from the extreme of anarchism to that of a socialism or communism which would have all social industry controlled by the State. Mr. Ingalls believes that in this conflict of thought there is a natural relation between the worker and the soil, and "a principle of law which will give an equitable share of the products of industry to each who shares the labor, and a just principle of agreement and consent in regard to such production and division." He holds that natural capital is land and labor, and "artificial or institutional capital, certain private rights created by custom, statute law, or by the arbitrary will of some conqueror or ruler, which enable one to force exchange or command labor without equitable return, through usurped dominion of the land, ownership of the person, or other civil services." On this basis, he develops his thought, criticising freely Henry George and other writers on industrial and economic subjects, and presenting his own views generally with clearness and strength. Some of the author's "isonomic definitions," such as Interest is "a fraudulent claim of one party to an exchange, by which a charge is made for the 'flight of time' between the inception and completion of an exchange," or Profit is "a false entry in the business ledger, in which a dealer charges time for the same thing," or Rent is "an immoral tax," will be unhesitatingly rejected by most readers of *Social Wealth*, who will appreciate the real merits of the volume and the intelligence, earnestness, and independence of its author, while dissenting from some of his conclusions.

B. F. U.

THE RAGE OF THE AGE. A Story by Alice Huntly Payne. New York: Oscar Dryer, 228 Eighth Avenue. pp. 260.

In this interestingly told story, which is intended mainly to show the inequalities of woman's position in the world as contrasted with that of man, but which deals incidentally with the various other social questions which are being discussed to-day from differing stand-points, we find depicted in detail the characteristics of many small villages, both East and West. The "little leaven" of liberal and reformatory thought, "the rage of the age," set to working through the efforts of one family in the village of Byfield, is traced in its influence and effects on the lives and characters of half a dozen or so of the inhabitants in a very thorough and analytical manner. The major part of the people thus influenced migrate, as is natural, from their native village and early surroundings, and encounter a series of varied experiences and success, which the last chapters summarize in briefly told stories, narrated by the chief actors in them. The author deals scathingly with free-love theories and sophisms, against which she seems to have a particular enmity. The book, though a little crude in style, is pure in tone, inspired by a high moral purpose, and will be found interesting reading by those who have a lively interest in the social problems of the age, such as woman's place and possibilities in society, liberality in religion, marriage, divorce, etc. We quote specimen passages from the more didactic portion of the story: "It is a noticeable fact that the majority of the men who rise to eminence in a metropolitan life are these same restless, dissatisfied country youths. They rise over the city born and bred, not so much from their superior ability as by the steadfast determination which they bring to their work. Their bodies are strong to endure unusual strain; and they are willing and able to labor sixteen and eighteen hours a day, to insure themselves success." "Next to not knowing the whole personal history of a new-comer to a small village is the sin of growing up under their eyes and going out into the world where wealth is earned, and perhaps a name. That others should recognize talent, ability, or genius, it is not incumbent on them to forget how he used to wear patched trousers when a boy, or went by the name of 'bull-head' or some other fanciful name to commemorate some act of stupidity, to which all people are sometimes liable."

S. A. U.

HAPHAZARD PERSONALITIES: Chiefly of Noted Americans. By Charles Lanman. Boston: Lee & Shepard. 1886. pp. 387.

In his preface, Mr. Lanman explains that, in his "protracted experiences as a merchant's clerk in New York, a newspaper man, an author and artist, and an official in Washington, it has been" his "fortune to make many good friends among the noted men of the time"; and of a few of these he makes these pen pictures. Among the most interesting of the forty notable persons of whom personal reminiscences are given in this volume are Longfellow, Irving, Bryant, Clay, Edward Everett, Horace Greeley, John Howard Payne, the explorer Kane, Dickens, Alexander H. Stephens, Gen. McClellan, and Martin F. Tupper. Mr. Lanman, in these memorials, has kept true to his expressed intention, to give only "such interesting revelations of character as have come under my own personal observation"; and there is, in consequence, only original matter, new to the public, in these *Personalities*. Many letters from the distinguished men of whom he writes, addressed to Mr. Lanman, are given in this volume.

Bound Volumes of The Index
For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes (of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

Dr. BELLOWS' SERMONS.

A New Volume, Selected and Edited by his Son,
Rev. RUSSELL N. BELLOWS.

"For sincerity, originality, sound reason, and deep reflection, as well as pious and humane feeling, this book matches, if it does not surpass, any of like kind lately issued from the press.

"Persons of every sect and no sect at all, Conservative, Radical, Romish, or Free Religious, may taste immaterial elements, bread and wine of substantial communion, at the board of the spirit he spreads."—Rev. Dr. C. A. Bartol, in *Christian Register*.

"Those who heard Dr. Bellows when he was on his conservative tack will be surprised by his radicalism when he 'went in stays,' beating up for the port of truth, and stood out bravely on the other tack. He saw the truth on both sides, and wasn't afraid or ashamed to 'tack ship,' when it seemed necessary to keep in the deep channel."—Rev. Wm. P. Tilden.

"There is many a sentence here that would startle the proprietries of some of our fossil Unitarians out of their habitual slumber with a lively shock."—Rev. John W. Chadwick.

8vo, 400 pp. Price \$2.00. Sent, postpaid, on receipt of price by the Publisher,

R. N. BELLOWS, 109 East 15th St., New York, N.Y.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, Ph.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOOSMIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 30 copies for \$1.00.

Address: THE INDEX, 44 Boylston Street, Boston, Mass.

STANDARD PUBLICATIONS
 FROM THE PRESS OF
Charles H. Kerr & Co.

THE UNIVERSITY. A LITERARY WEEKLY. Popular, but not sensational; scholarly, but not pedantic; conservative, but not old foggyish; progressive, but not iconoclastic. It numbers among its contributors many of the brightest writers of the day. Its matter is wholly original and is edited with discrimination. \$2.50 per year; three months on trial for 50 cents.

UNITY. A LIBERAL RELIGIOUS WEEKLY FOR THE HOME. Seeks to adjust religion and culture; to make thought worshipful and worship thoughtful; to find a unity beneath conflicting dogmas; a community in all denominations; a sympathy between all religions. It seeks to emphasize the abiding elements of religion—love, justice, truth—practically applied among all men. \$1.50 per year; six months, trial subscription, 50 cents.

THE UNITARIAN. A MAGAZINE OF LIBERAL CHRISTIANITY. Aims to popularize and carry far and wide the best thought of rational Christianity. Its writers are the ablest; its matter fresh, varied, practical; its price, 50 cents a year.

SPECIAL COMBINATION OFFER.—For \$1.00 we will send THE UNIVERSITY, UNITY, and THE UNITARIAN to any address four months on trial.

BY B. F. U.

THE *Independent* asks, "Why does not the Church reach the masses?" Says the *Catholic Review* in reply: "The answer is very plain and simple. Because they have not the Mass, to begin with."

DR. OSCAR SCHMIDT, Professor of Zoölogy in the University of Strassburg and author of *The Doctrine of Descent and Darwinism*, one of the ablest volumes of the "International Scientific Series," died last week, at the age of sixty-two. He had belonged to the University since its reorganization by the Prussians.

ALTHOUGH not a man of large intellectual calibre nor of much literary culture, yet in his talent for effective story-telling and mimicry, and in his power of moving the sympathies of his audience and holding his hearers spell-bound, John B. Gough was unsurpassed, perhaps unequalled, by any orator of this generation. In his death, the Total Abstinence and Prohibition Movement has lost its most eloquent and most famous advocate.

SAYS Mr. George J. Holyoake's *Present Day*: "At a trial, over which Mr. Justice Maule presided, great doubt was expressed as to whether a little girl who had been called as a witness knew the nature of an oath. To silence controversy, the judge asked the child if she knew where she would go to if she told a lie. The witness meekly replied, 'No, sir.' To which the judge added: 'A very sensible answer. Neither do I know where you will go to. You may swear the witness.'"

THE *Modern Crematist* is the name of a monthly journal started at Lancaster, Penn., where the first crematorium for general use was built in this country. This journal "is published in the interests of reform in funeral methods and a more enlightened scientific sanitary mode of disposing of the dead than by burial in the earth and mixture with the mould." The *Modern Crematist* will contain information in regard to this reform, arguments for it, the testimony of science, the results of experiments, and facts in regard to its growth.

SOME of the evangelical people of Chicago are doing their best to "get up" a revival in that city. A Committee recently issued tickets reading: "Rev. Sam Jones and Sam Small. Special services at Chicago Avenue Church." In fine type below was, "Address by Mr. Sam Small." There was nothing on the ticket to indicate that Sam Jones would not be present. Is a religion that will not prevent its believers from resorting to petty deception like this, which has hitherto been confined mostly to ten-cent shows, worth reviving or worth having even?

THE Chicago *Inter-Ocean*, in reply to a statement which it published from Bishop Merrill, that there "is no necessity for work on Sunday in order to the production of the Monday paper, unless there are seven papers in the week," says: "No Methodist of spirit would buy a paper that did not have the news of Sunday night, and all that news must be put in type that night. All the preparation in the way of writing and filing despatches, editing them and putting them in type, would be as much in the nature of Sabbath-breaking as the mere printing and distributing. It is a fact that more work for Monday's paper is done on the Sabbath than is done for Sunday's paper."

WRITING on "The Employment of Informers," in the *Week*, Goldwin Smith says that to put down the unlicensed sale of liquor is quite right; "but the employment of professional informers is almost as objectionable as the sale of unlicensed liquor. A drunkard may be not a bad man in heart, though addicted to one fatal indulgence: a professional informer must be utterly vile. Morality is the main object; and you miss it, if, in suppressing intemperance, you create villany. There can be no doubt that much useful evidence might be obtained by torture, but society has rightly determined that no evidence can be worth that price. Let the police and the regular detectives do their duty; and, if their number is not sufficient, let them be re-enforced."

RALPH S. TARR writes in *Science*: "Many a fish in the sea instinctively avoids the deadly power hidden behind the brilliantly phosphorescent jelly-fishes. This protective light has saved the jelly-fish much trouble, and is a great aid to its struggle for existence among the multitudes of surface animals. Through some curious freak in evolution, an entirely inoffensive cluster of animals, devoid of any protective power, has gained the use of this phosphorescent light, and, by imitating the dangerous jelly-fishes in this respect, sails about the surface, inspiring terror among surface animals that could easily devour them. This cluster of animals is *Pyrosoma*. In the clusters of floating seaweed in the Gulf Stream there are vast numbers of tiny fishes attired in the color of the floating weed, and that certainly gain protection thereby."

THE Milwaukee *Sentinel* has these words of common sense in regard to Sabbatarian laws: "If it is the aim of the Sabbatarians in Philadelphia

and other places, where efforts are being made to enforce dead-letter Sunday laws, to make people hate Sunday and religion, and everything in any way connected with the Church, they are taking the right way about it. Even if it were possible to close up the barber shops, to prevent the delivery of milk, to stop the production and sale of newspapers, to close the cigar stores and stop the running of street-cars on Sunday; even if it were possible to enforce an outward observance of the day,—which, of course, it is not,—neither religion nor morality would be advanced by it. The Church is bound to get the worst of it in any contest of this kind. Good can come only from the correction of the inward spirit, which is the source of conduct; and the revival of old laws which have been put into the dust heaps by the verdict of society, and which serve only to make men uncomfortable, will never work anything in this direction. Every man of common sense knows the inevitable consequence of an attempt to restore the puritanical Sabbath in this country, and religious people cannot afford to ignore the common sense in their struggles against irreligion and immorality."

THE *Catholic Review* uses as an argument against our public schools the fact that they are cordially sustained by "infidels." "One peculiar feature of the dispute concerning the public school system," it says, "is that our infidel friends have never found fault with that system. Catholics have always opposed it on principle, and Protestants of a candid and inquiring disposition have been compelled at times to add their dissent to ours; but the infidel has been either desirably silent or has opened his mouth only to declare that, with the fall of our school system, our government also shall fall. He has found no words too strong to express his regard for it, no praise too fulsome to heap upon it and its Christian promoters. . . . With the exception, perhaps, of the pulpit of the Anthon Memorial Church, there is not a place in the country where infidelity has a stronger footing than in the public schools. Fifty years ago there were no public schools, as four centuries ago there were no Protestants in the world. The schools were all denominational, controlled by the secretaries paid by the State. Common schools were in existence for those who had no settled religious belief. To our infidel brethren and their misguided friends among the sects, we owe the public school system. In its first days, it was odiously Christian; that is, the new religion called non-sectarianism prevailed in it, and continued to prevail, until Catholic agitation put an end to it. This very agitation, or something similar to it, infidels counted on to wear away the last few shreds of Christianity. The public prayers and the reading of the Protestant Bible, the religious test in selecting teachers, and other Protestant notions were banished. The Protestant lost his contention, the Catholic gained his; but the real victor was the infidel, who might survey the system from foundation-stone to cupola and find not the faintest color of Christianity."

THE ADMINISTRATION AND THE INDIANS.

The friends of the new national policy toward the Indians were much encouraged when the Cleveland administration first came into power by the attitude it took upon Indian affairs. The prompt and vigorous measures adopted in regard to the Crow Creek reservation and the Oklahoma invasion led to the belief that the change of administration would work no detriment to the Indian cause. And it is probable that the President and Secretary Lamar and Commissioner Atkins would still all affirm that there has been no change in their position on this question. Yet it is a matter of fact that those citizens who most interest themselves in the improvement of the Indians' condition are not nearly so hopeful of efficient help from the national government as they were a few months ago. The President and the heads of the Indian department may be as sound in their views as they were then, but the pressure of the office-seekers has been too much for them; and it looks now as if the distribution of offices were to be the rock on which their good intentions toward the Indian are to be badly wrecked.

Unfortunately, the Civil Service Reform Act does not apply to appointments in the Indian service; and, in consequence, a good many changes have been made in the department of Indian inspectors and agents for purely partisan considerations. In no part of the civil service are partisan considerations more out of place; and it should be the aim of the civil service reformers to extend the law at once to this field. In work among the Indians, it should make no difference whether one be a Republican, Democrat, or Mugwump. For a good Indian agent or inspector, not only are integrity and ability required, but that peculiar combination of sympathy, quick perception, and tact which make the practical philanthropist. And this combination of qualities is so rare that the government should welcome and use it when obtainable in any man or woman,—for women like Miss Alice C. Fletcher have been among the most efficient Indian agents,—and ask no questions about the politics of the person who is willing thus to serve. Unfortunately, too, the salaries of Indian agents are so small that persons of these requisite qualifications to fill the places are not easy to find. At present, these offices are temptations to the dishonest and the incompetent, who do not expect to live upon the salaries, but to use the positions for the crooked and dishonest gains they can make out of them. Only a few persons really qualified, morally and intellectually, can afford to make the sacrifices required to accept the office of Indian agent. A few, however, who are every way competent, have a moral drawing to the work, notwithstanding the small pay; and these are the persons whom the government should seek for Indian agents, irrespective of party service.

There is no question that there were inefficient and corrupt agents in the Indian service, left over from Republican administrations, who ought to have been removed; and the special friends of the Indians, though belonging to the Republican party, would have welcomed any new broom at Washington which should have swept the Indian service clean of these bad characters, who have cheated both the Indian and the government, or who may have only failed because not mentally qualified for their peculiar tasks. But, if all reports be true, the broom in the Indian department has not been plied with any such discrimination. The removals and the new appointments have been made, evidently, on the line of political considerations. A man has been appointed Indian inspector against whom most serious charges of

financial dishonesty in his own business affairs have been made and apparently proved; a man of whose appointment a distinguished lawyer of his own city said that it was as bad as any he had ever known in his political experience, and that the only person he had met who thought the appointment fit was one who gave as a reason that he "always did hate the Indians." And the agent who was suspended to make room for this man was removed, so far as has yet been revealed, without any charges being made against him.

Mr. Herbert Welsh, the devoted and efficient secretary of the National Indian Rights Association, has brought this matter of partisan removals and appointments in the Indian service to the attention of the public in the *Civil Service Record*. A particularly flagrant case which he cites is that of the dismissal of Dr. W. V. Coffin from the superintendence of the Forest Grove Indian Training School in Oregon,—a position requiring special qualifications of a high order. Dr. Coffin, an educated young man of great moral earnestness, a member of the Society of Friends, had held the office for two years, and given eminent satisfaction. He had voted the Republican ticket, but not otherwise engaged in politics. Leading citizens of Oregon, including the Governor, Secretary of State, and Treasurer, the Superintendent of Indian Missions of the Presbyterian Church, and other prominent persons, testify to their familiarity with his work, and affirm that, in their judgment, it has been "successful in the truest sense of the word," and will "leave behind a lasting influence for good." Here, certainly, was just the man to keep in the Indian service so long as he would remain and do such work as this. He is a believer in Indian civilization, and ready to give his abilities and life for it. But the administration has removed him, and put in his place a Democratic office-seeker from Indiana, whom it deemed expedient to provide for somewhere, but who has no familiarity whatever with the work to which he is assigned, and, though he may be a moral man, no special aptitude for it. He himself, indeed, confessed, when he arrived at the spot, that he thought the government had made a mistake in sending him to such a post. Yet with the aid of his relatives, whom he has put in the subordinate positions, he has undertaken the responsible and delicate task of teaching an Indian school and training a race for civilization.

We have no partisan feeling whatever in this matter. We did not vote for either Mr. Cleveland or Mr. Blaine; and we believe that, on the whole, in the matter of appointments, President Cleveland has been more consistent with the principles of the civil service reform than Mr. Blaine would have been. Our contention simply is that the Indian department of the government in particular should be lifted above party politics. If the Indians are ever to be civilized, and thus fitted to take their place as a component part of the nation, it is to be done, not by putting their interests in the hands of the best party workers, whether Democrats or Republicans, but by appointing to this responsible service the persons, whatever their politics, who are best qualified to educate and train the Indian, morally, mentally, and industrially, for the duties of citizenship.

WM. J. POTTER.

SUBJECTIVISM.

The powerful and profound work of Dr. Francis E. Abbot on *Scientific Theism* raises anew some of the old philosophical questions, and does not raise them in vain. Subjectivism in philosophy, so long triumphant, has at least been put on the defensive; and that it will be able to main-

tain the defence does not at present appear. And should it not, no one needs mourn; we shall but be quit of a most dreary doctrine. For a dreary doctrine it indeed is that one knows nothing but his own sensations, or nothing but his own states of consciousness. In the churchyard of the ancient Benedictine Abbey, situated in the valley of Engelberg, is a headstone bearing the inscription, "Life is the dream from which death is the awakening." This belief is the root of monasticism, and it is surely a sad belief in reference to the present existence. But subjectivism goes farther and says, Life is a dream from which there is no awakening. The dreamer mistakes subjective vision for objective reality; and, according to the philosophy now chiefly in vogue, all which passes for waking perception is, in truth, no more than such a mistaking, in other words, is of the nature of dream. This philosophy imports, therefore, that the conscious individual is alone in a phantom-world, peopled only with phantoms; that those nearest and dearest to him, those to whom he gives the sacred names of wife or child, father, mother, or friend, are but illusive, projections of the various faces which his consciousness assumes or the masks it puts on; and that all the objects of love, loyalty, duty, and religion, all the objects toward which the noblest sentiments and the holiest affections turn, are simply visionary. No one ever believed this doctrine otherwise than in a distant, merely speculative way; and none would willingly remain in existence for an hour after coming fully and clearly to a realizing belief in it. Nor is it any consolation to hear that beyond the world of illusion with which we are conversant there is a reality of which we can know nothing save that it is forever unknowable. We are comforted by this piece of information only as a hungry man would be upon hearing of food beyond his reach. Meantime, this fine information must remain doubtful, if the doctrine be true. For what is the alleged reality but one more state of consciousness, differing from the others only in being utterly indefinite? That it is not seen, but is reached only by a process of reasoning, is nothing to the purpose. States of consciousness being the only data from which we can reason, it may well be asked how the reasoning should be more valid or its conclusions more real than the data upon which it proceeds. The law of gravitation is, in like manner, not seen, but concluded to by a process of reasoning; but it is phenomenal in the same sense with the objects it affects. And so of the "unknowable" reality; if we know nothing but our own states of consciousness, then we know of this only as a *derivative* state of consciousness, of an extremely vague and undefined sort.

Subjectivism rests upon two propositions: first, that the human mind has no faculty of perception, but only a faculty of mock perception; secondly, that the states of consciousness, into which the universe is resolved, are false. To illustrate: I look forth from a window and see a two-story white house, with green blinds, on the opposite side of the street. I am conscious of perceiving it, though consciousness retires, as it were, into the background out of sight; for I do not think at all of it or of myself, but only of the object perceived. Here, however, is a state of consciousness. In what does this state consist? The question may be put somewhat pointedly, for it does not appear that all who talk fluently of such states think clearly concerning them. What, then, is this state of consciousness? It is simply an affirmation to the effect that a house is perceived by me, the conscious person. What is true in this case is true in all cases; states of consciousness are simply affirmations of fact. To speak more

specifically, consciousness (apart from self-consciousness, strictly so called) is that which refers a man's thoughts and actions to himself as the person thinking and doing. Take an analogous case. A man's property in a farm is itself neither the farm nor the man; it is a relation between the two, a reference of the land to him as the possessor. Well, consciousness gives one a property in his thoughts and deeds by referring them to him as his own. Hence I see not but one might as well say that the farm is only a state of property as that an object perceived—a house, horse, mountain, or river—is only a state of consciousness. And now let us return to the case supposed, where my consciousness affirms that a house is perceived by myself as the percipient person. A philosopher approaches, and assures me that no house, no real object, is perceived, for the sufficient reason that none exists; what appears to be such is but an image within the mind. Well, if no object is perceived, there is no act of perception, but an act of a very different sort; namely, illusive projection. And the same being true in all similar cases, it follows that the human mind has no faculty of perception, but, in place of this, a power to project mental images, and give them the look of objects perceived. It follows, also, that the affirmation of consciousness is doubly untrue: it affirms a mental act which is impossible, and an object which does not exist.

Perception unreal, consciousness untrue,—these are the charges against the human mind which subjectivism must make good, in order to have a standing. Such charges, it is obvious, can be sustained only by strong evidence, evidence no less than demonstration. Upon no light argument shall we form a final conclusion against that which Coleridge called "the faith of reason," the spontaneous, universal, indestructible faith of mind in itself. What, now, is the evidence offered? Three lines of argument occur to me, which I will briefly examine. In the first place, apparitions and the phenomena of dreams are cited as showing that unreal objects may appear to us as real. They show, undoubtedly, that this may happen under certain special conditions; but what of it? No one will pretend that these phenomena furnish a parallel case to that of waking perception. Sense-impression is indispensably requisite to genuine perception; and in dreams this is wholly wanting. I dream of seeing a house, but my eyes are closed, I do not physically see. This radical difference between waking perception and the visions of a dream is by no means the only one; but it suffices to put the two cases in quite different categories, and to make this argument of the subjectivist utterly worthless. Dream-vision is disordered recollection, as Dr. Abbot says; and he that supposes himself to see a ghost, or the like, simply dreams with the eyes open.

Again, it is said that we are conscious of our sensations, and that, as consciousness is reached by nothing else but these, we can, in the nature of the case, have knowledge of nothing beyond them, however we may, with Mr. Mill, infer an "unknown cause of sensations." Here is an extraordinary misapprehension of fact. For the fact is that we are directly conscious of our perceptions with their objects; while we neither are, nor can become, conscious of the sense-motion which serves toward them. For example, when one sees a house, rays of light proceeding from the object impinge upon the retina; but he does not feel them strike. The effect upon the retina is telegraphed to the optic ganglia, and thence, as is supposed, to the gray cortex of the brain; but consciousness knows nothing of this. A mental act follows, and the object is perceived; and here

it is, not sooner, that consciousness enters the field. It is aware of the perception as embracing its object; it is totally unaware of the sense-impression—not properly called sensation—which precedes. I might go on to show that we have the same direct consciousness of perceptions to which a felt sensation serves as condition precedent; but it is necessary to economize space, and enough has been said to render it clear that the attempted resolution of perception into sensation, the attempted shutting up of consciousness within a cloud of sensations, out of which it shall never see, fails utterly.

The Kantian argument remains. The ultimate point of this is that, when thought proceeds as far as it can go, it exhibits two faces looking in opposite directions; in other words, it is found to be in contradiction with itself. In this alleged fact is seen a final confirmation of the conclusion that the universe as known to us is apparitional, not real, or, in Kant's phraseology, phenomenal, not noumenal. The simplest type of the asserted "antinomy," or ultimate self-contradiction of thought, is afforded by our notion of space and time; and we will here take the case of time. It is said that we can neither conceive of time as beginning and ending nor can definitely conceive it as without beginning or end; that is, as infinite. Very true; but let us look at the fact, and see what it precisely is. If one say that time had a beginning and will have an end, we answer at once, The thing is impossible, the assertion cannot be true. If, on the other hand, it be said that time is without beginning or end, somewhat of a quite different sort follows. The mind assents to the proposition, and cannot think the contrary, but acknowledges itself unable to embrace what it must esteem true in a definite conception. What ground, now, for saying that thought is here in contradiction with itself? Obviously, there is none at all. The mind asserts always and unequivocally the infinitude of time. It makes no assertion to the contrary, but only confesses an inability, a limitation, of its own conceptive power. The general truth signified is but the old one, that finite mind can only apprehend, not comprehend, the infinite; and I doubt if much more is signified by any or all of the antinomies which the philosopher of Königsberg wrought out with so much care. Still, holding with Kant that the primary thought-forms—moulds of all mental experience—are native to the mind, I find in this fact no reason to think that there is nothing corresponding to them in the relations of the natural world, while the antinomies simply instruct me that the human mind is finite. Finite it is, and my own mind is very finite indeed. I am daily, deeply, humbly sensible of the fact, but cannot conclude thence that the universe, as to myself known, is the apparitional product of this same extremely finite mind.

D. A. WASSON.

FIRM FOOTING.

As a common centre is the universally attractive point toward which all matter tends, the point from which it springs and round which it revolves, so truth is the universally attractive point toward which all mind tends, from which it acts and round which it thinks.

Reality is man's reliance, his acknowledged teacher and his final arbiter. Fundamental in the constitution of existence is veracity, truthfulness; an unyielding master, yet an unfailing mother; a fatal executioner, but a vital nurse. Whatever is not akin with veracity lacks life, and perishes. Man must be loyal to veracity, if he would live.

Our works may co-work with the exact law or promise of nature, and will then endure. Wherein they would differ from that exact law, that sincere promise, they cease, paralyzed.

Our thoughts may conform with the exact law of sequence, and will then survive, confirmed by the supreme idea; but when they wander from true sequence, which is the guidance of the supreme idea, they come to an end in confusion.

Our morals may live out the indestructible ideal seeded in man, and will then develop felicity. In so far as they fall short of that ideal, dimly seen as yet, we meet disappointment, disgust, at last intolerable distress.

This constitutional veracity, so far as we can see, conditions all being. It is the one reality which no mind ignores: no mind can ignore it, and yet live.

Thoughtful men in all ages have seen in it design, and obedience to its behests they have called duty. Since yesterday, men see in it evolution; and harmony with its requirements they call growth. What's in a name?

Accompanying design, enforcing duty, or accompanying evolution, guaranteeing growth, there exist alike a past and present Idea, a past and present Power, a past and present Tendency. The mind of man, working sanely, is able to entertain a proposition which presents facts in its behalf; but mind cannot accord conviction to that which is inconsistent with the nature found, by comparison of consciousness, to be universal among men. To illustrate, the following proposition would be incredible by mankind: that chimera or error is really superior in kind, more worthy of search to find, and of loyalty and obedience when found, than is truth. Or this: that ill will or indifference toward others is an inclination superior in kind, more worthy of effort to acquire, and more admirable as a rule of conduct, than is good will. There is unanimity in the verdict of mankind as to its relative estimate of Chimera and of Fact as the basis of belief and guide of action. There is a like unanimity in its verdict as to the relative excellence of ill will or indifference and of good will, as a quality of character or as an impulse of conduct. It is seen that any diversity of mental conclusion as to the better worth of truth than error, or as to the higher duty of good will than malevolence, would indicate insanity; and that attempted action in defiance of the verdict of mankind must be self-destructive.

From these considerations may we not deduce this as a certainty, challenging full belief and complete reliance,—that there is that which is truth or fact as distinguished from error or chimera; that there is that which is good will as distinguished from ill will; and that truth and good will are more worthy than error and ill will, as objects of regard, controllers of character, and incentives to conduct? May we not stand on the ground thus securely won, with perfect confidence that any enhancement in our intelligence or betterment in our character will increase rather than diminish the preference which we accord to these supreme ideas?

It is with the idea Veracity, the impulse Good Will, and that present Power which stands behind these supreme facts apparently forevermore, that man must loyally co-work. He surely must, or confusion, disappointment, and death confront him.

For man is the outgrowth, the child, of a cosmos rooted in absolute veracity, and gradually developing excellence. He recognizes in these abiding principles the conditions of his life.

Feeling his kinship with the nature which underlies those principles, man will always regard that

nature with reverence and joy in connection with an absolute trust.

And he will inevitably read his destiny in his kinship with that abiding nature rather than with the transient organism, whose limitations and inadequacy he more and more perceives to fall short of his noblest aims.

SAMUEL C. BLACKWELL.

FOR AND AGAINST SABBATISM.

An English naturalist, in a railway car, was carrying a hedgehog, and was surprised at the demand of transportation for it as if it were a dog. Remonstrating with the official, who insisted on his claim, the naturalist took a small tortoise out of his basket, and asked if he was expected to pay for that also. "No," said the man: "dogs is dogs, cats is dogs, and hedgehogs is dogs; but a turtle's a hinsect."

We consider this English official as a grossly ignorant person; but a reverend clergyman—nay, more, the Right Reverend Bishop of New York—has just committed himself in the same style of classification. At a meeting in Chickering Hall last Sunday evening, called by the New York Sabbath Committee, that dignitary said (according to the report in the *New York Times* of January 25), on the question whether the Museums of Art and of Natural History should be opened to the public on Sunday afternoons, "Museums mean theatres, theatres mean factories; and, then, what is to follow cannot be imagined."

As if to restore the balance of Episcopal intelligence, the same paper reported a sermon preached on the same day, by Rev. R. Heber Newton, at All Souls' Church, in New York City, on "The Superstition of the Sabbath." Mr. Newton wished his hearers to sign the petitions in circulation, asking for the opening on Sunday of the museums, art galleries, and libraries of the city,—a demand which he declared to be the healthy outgrowth of the physical, intellectual, and moral needs of the people. "The Sabbath question has been in order," he continued, "ever since a certain saintly Sabbath-breaker forced it upon the religious public of Judea eighteen centuries ago, and lost his life in the controversy. It is a question which, if it needs still the courageous liberalism of a Jesus against a superstitious religion, needs now, also, the courageous conservatism which he would have been the first to exemplify against a superficial secularism. In such a discussion as is now unavoidable, we need the guidance of a clear-cut principle. Such a principle we find in the classic words of the saintly Sabbath-breaker of Judea. The negative proposition of Jesus is that man was not made for the Sabbath. Man was not created in order to get the Sabbath kept. . . . There must have been valid reasons for the fact—which Luther, with his strong common sense, noted—that Jesus set himself to break the Sabbath deliberately, and even ostentatiously, of a set purpose. Every institution of civilization is a means to an end; and that end is man's own life in health and happiness, in intelligence and virtue. If it stands in the way of higher interests of humanity, it must be pushed aside in the name of humanity. If, in this perversion, it corrupts religion and caricatures God, it must be religiously rejected in the name of God. Therefore, in the name of humanity, whose interests were jeopardized, in the name of the God whose character was grossly caricatured, Jesus set himself to break the Sabbath of ecclesiasticism. Surely, the folly and the sin of a superstitious Sabbath keeping ought to have been to all Christians sufficiently exposed in such a death of their Lord and Master. As

a matter of fact, Sabbatarianism did outlive the controversy of eighteen centuries ago, and transferred itself to the very church which called Jesus 'Lord.' In our own city, every effort rationally to use Sunday for the physical and mental improvement of the people is met still with the sincere and earnest, but none the less superstitious, opposition which similar efforts would have met with from the scribes and Pharisees in the age of Jesus. When it is proposed to open our libraries or our museums on Sunday, the Churches which bear the name of the saintly Sabbath-breaker of Judea interpose, on behalf of that Jesus, to perpetuate the very superstition which he lost his life in combating. There is still need for those who discern the significance of his example, and who believe in the principle which he enunciated, to lift up a calm and earnest protest, in his name, against this lingering superstition.

"It stands in the way of the physical progress of man. There are hosts of our fellows to whom it is the one chance for an outing into the fresh air, the one chance to build up their bodies toward the measure of a perfect manhood. It stands in the way of the intellectual progress of mankind. To these hard-worked classes of our fellow-citizens, our Sunday affords the one day in which they can seriously endeavor to improve themselves. We have a number of libraries in this city. How many of them are open on Sunday? It is the religious sentiment of our city which turns the key of their doors, in the name of Jesus Christ! Our young men and women may not become saints by frequenting libraries; but will they not be more likely to grow into noble manhood and womanhood as they learn to think and read, and thus climb from the life of the animal to the life of the intellectual being?

"This superstition of the Sabbath stands in the way of the moral progress of mankind. Everything that tends to foster among our working people the notion of class privilege is making against the truest morality in our midst. As they look upon the case, it is the wealthy people whose homes are private libraries and galleries of art who, unconscious of the seeming hypocrisy, protest against the opening of our libraries and museums to those who can afford no library and who can buy no pictures. Sabbatarianism is feeding very dangerous fires to-day. This superstition of the Sabbath stands in the way of the religious progress of man. With the rigid Sabbatarian, I believe that our Sunday is an institution that is essential to the future of religion. Just because I so think, I look with dismay upon the superstitious notions of the Sabbath which are imperilling this sacred day itself. This superstition of the Sabbath very largely aids in continuing the undue emphasis which ecclesiasticism has always laid upon secondary elements of religion. To the extent that religion exalts institutions, it endangers that for which institutions are called into being. The best way to promote a revival of religion lies, not through any society for the better observance of the Sabbath, but through the honest efforts for the better observance of those equally divine days from Monday to Saturday in the fear of the Lord. This superstition of the Sabbath, now as of old, endangers religion by caricaturing God, and by drawing above the life of his children the dark clouds from which men shrink back into the sunshine of the world. If I wanted effectually to drive my children away from God, I should teach them on Sunday to sing that dreadful hymn of our forefathers,—

'I must neither work nor play,
Because it is God's holy day.'

"As I want them to love and trust this Father, I

teach them that he has given unto his children a day in which no laughter is wrong, no merriment is sinful, but all joy right, only the more right as it is nobler and purer."

We wait with interest to see the result of the contest now waging between superstition and rational religion in New York City. But it is greatly to be desired that, before waiting for this result, the city of Boston would carry out the excellent suggestions of Heber Newton by opening its public library on Sunday afternoons, as well as the reading-room of that most valuable institution. Let Boston and New York compete with each other in the promotion of intellectual, moral, and spiritual interests, as well as those of commercial or otherwise material character.

C. K. WHIPPLE.

RELATIVITY.

In his able work, *Scientific Theism*, Mr. Abbot says of the doctrine of the "relativity of knowledge": "It simply means that man cannot know everything. It does not at all mean that he does not know what he knows. . . . From the very nature of the case, nothing but relative knowledge is possible. . . . The doctrine of the relativity of knowledge, therefore, is a truism so far as it asserts the co-essentiality of subject and object to the relation of knowledge; it is a falsity and absurdity so far as it asserts the non-knowableness of the object by the subject in that very relation of knowledge."

With due respect for our friend, Mr. Abbot, whose clear-headedness and independence we greatly admire, we must say that, in our opinion, the doctrine of the "relativity of knowledge" as stated by him is deprived of its essential meaning and force. Kant, in maintaining this doctrine showed with masterly ability that, since there is necessarily a co-operation of subject and object in every act of cognition, the pure object can never be known. "Let us therefore," he said, in his *Critique of Pure Reason*, the great outcome of which, Lewes declares, "was a demonstration of the vanity of ontological speculation,"—"let us, therefore, content ourselves with our own kingdom, instead of crossing perilous seas in search of kingdoms inaccessible to man."

We cannot perhaps, within the limits of an editorial article, more clearly show the essential meaning of the indisputable doctrine of the "relativity of knowledge" than by grouping together a few facts in regard to the psychology of the senses.

Aerial vibrations communicated to the acoustic nerve give rise to the sensation known as sound. Without a nerve of hearing there can be no sound; for, whether it be the tempest's roar, or the serpent's hiss, or the voice of human sympathy and love, sound is a sensible phenomenon, and not something external to the hearer. Color is also a subjective affection; and particular colors depend upon the particular velocities of the waves of attenuated matter gathered together by the optical apparatus of the eye, and which impinge upon the retina, affecting the optic nerve and giving rise to what appear objectively as colors,—blue, green, violet, etc.,—but which are known to be sensations, or conscious states. This is as true of the "rosy cheek," the "ruby lip," and the "love-lit eye," as it is of the blue sky above us or the brown earth beneath our feet. In some persons, vibrations as different in velocity as those which commonly cause redness and greenness awaken identical sensations. Luminousness is a sensation produced by the action of waves of ether upon the retina and fibres of the optic nerve. This sensation may also be produced by a blow or by elec

tricity, which, singularly enough, while it causes luminous phenomena in the eye, brought in contact with other parts, gives rise to quite different sensations,—sounds in the ear, taste in the mouth, ticklings in the tactile nerves. That tastes and odors are not intrinsic in things with which we associate them is very evident. The sweetness of sugar and the fragrance of the rose are sensations in us caused by these objects, the one appreciated by the sense of taste, the other by the sense of smell. Heat, too, is a sensation, and is conceivable objectively only as a mode of motion.

Another quality which we ascribe to things is hardness. But hardness cannot be intelligently conceived, except as a feeling. When we say that a stone is hard, we mean that, if we press against it, we experience a sensation of touch, a feeling of resistance, which is designated by the word "hardness." To illustrate that both hardness and form belong to the groups of our consciousness which we call sensations of sight and touch, Huxley observes: "If the surface of the cornea were cylindrical, we should have a very different notion of a round body from that which we possess now; and, if the strength of the fabric and the force of the muscles of the body were increased a hundred fold, our marble would seem to be as soft as a pellet of bread crumbs." What we call penetrability is the consciousness of extension and the consciousness of resistance constantly accompanying one another. What we call extension is a consciousness of a relation between two or more states produced through the sense of sight or the sense of touch. Even the conception of vibrations among particles of matter, mentioned above as objective factors in the production of sound and color, is but inferences from states of consciousness caused in us by vibrations which have been appreciated by the optic or tactile nerves; in other words, by subjective experiences produced in us by some unknown cause.

Thus, what are popularly believed to be qualities and states of matter—sound, color, odor, taste, hardness, extension, and motion—are names for different ways in which our consciousness is affected; and, were we destitute of hearing, sight, smell, taste, and touch, the supposed qualities of matter would not, so far as we can know or conceive, have any existence whatever, for, by psychological analysis, they are reducible to states of consciousness.

As to Space and Time, whether we regard them with Kant as forms of sensibility, belonging to the subject and not to the object, or adopt Spencer's theory, that Space is the abstract of all relations of position among co-existent states of consciousness or the blank form of all these relations, and that Time is the abstract of all relations of position among successive states of consciousness or the blank form in which they are presented and represented, and that both classes of relations are predetermined in the individual, so far as the inherited organization is developed, when it comes into activity, while both have been developed in the race, and are resolvable into relation co-existent and sequent between subject and object as disclosed by the act of touch,—whichever of these theories we adopt or whatever theory be affirmed, still we know Space and Time only as subjective forms or states, not as external realities. Both Space relations and Time relations vary with structural organization, position, vital activity, mental development and condition. How great in childhood seemed the height and mass of buildings which now seem small or of but moderate size! How long the days seemed when we were young; how short now! How rapidly time passes in agreeable company, how slowly in

waiting for a delayed train! That there is equality or likeness between our different estimated lengths of distance or duration,—but so many variations of subjective relations,—and any nexus of external things, there is no reason to believe.

But does not the mind possess a synthetic power by which it can put together the materials furnished by the senses, and thus enable us to realize or understand the objective world as it actually exists? Is there not in the mind a faculty of "intellectual intuition," or a "perceptive understanding," by which we can discover relations as they are beyond consciousness? If we do not know the nature of noumenal existence, how can we know anything about its relations? The great Kant dwelt upon this subject for years; and, although he believed in an existence transcending sense and understanding, the conclusion of his years of laborious thought was that we can only put together the materials furnished by the senses, and that we can know nothing of the world as it exists, unmodified by and independently of consciousness. To the same conclusion, after years of profound thought, came Herbert Spencer.

Although there seems to be almost a complete unanimity among the great thinkers of the world that we can form no conception of the objective world apart from the conditions imposed upon it by our intelligence, and that changes of consciousness are the materials out of which our knowledge is entirely built, let no one hastily conclude that there is anything in this position inimical to, or inconsistent with, what is called "objective science." Prof. Huxley, one of the greatest, if not the greatest, of living scientists, and a philosophic thinker of no mean ability, pursuing the "scientific method" with which he is supposed to be well acquainted, comes to the conclusion "that all the phenomena are, in their ultimate analysis, known to us only as facts of consciousness." George Henry Lewes, eminent as a physiologist and psychologist, as well as a remarkably acute metaphysical thinker, versed in all systems of thought, declares in his *Problems of Life and Mind*: "Whether we affirm the objective existence of something distinct from the affection of consciousness, or affirm that this object is simply a reflection from consciousness, in either case we declare that the objective world is to each man the sum of his visionary experience,—an existence bounded on all sides by what he feels and thinks,—a form shaped by the reaction of his organism. The world is the sum total of phenomena, and phenomena are affections of consciousness with external signs." (Vol. i., p. 183.) Dr. Maudsley, the distinguished physiologist, who is no more than Spencer or Lewes a subjectivist or idealist,—who, indeed, is commonly regarded as a materialist,—says: "After all, the world which we apprehend when we are awake may have as little resemblance or relation to the external world, of which we can have no manner of apprehension through our senses, as the dream world has to the world with which our senses make us acquainted; nay, perhaps less, since there is some resemblance in the latter case, and there may be none whatever in the former. . . . The external world, as it is in itself, may not be in the least what we conceive it through our forms of perception and modes of thought. No prior experience of it has ever been so much as possible; and, therefore, the analogy of the dreamer is altogether defective in that respect." (*Body and Will*, p. 51.)

This is the position of nearly all the great representatives of science, including the original investigators,—Huxley, Tyndall, Montgomery, Lewes, Proctor, Romanes, *et id omne genus*. To a young man who asked him if idealism was not the "very negation of science," one of the most ingenious

and acute thinkers this country has produced—Chauncey Wright—wrote: "By objective science, I understand the science of the objects of knowledge as contradistinguished from the processes and faculties of knowing. Does idealism deny that there are such objects? Is not the doctrine a definition of the nature of the objects rather than a denial of their existence? There is nothing in positive science, or the study of phenomena and their laws, which idealism conflicts with. Astronomy is just as real a science, as true an account of phenomena and their laws,—if phenomena are only mental states,—as on the other theory."

But it is time to inquire whether the fact that what are commonly regarded as qualities of matter or sensible phenomena or states of consciousness carries with it the implication that these states of consciousness, or the individuals who experience them, are the only existences, or that we have no reason to hold that beyond reason is an unknown and Unknowable Reality. Our opinion is that the implication is unwarranted; that, on the contrary, the facts we have stated illustrating the "relativity of knowledge" imply that there is objective existence known and knowable only by the modes in which we are affected by it, and the actual nature of which is inscrutable. A statement of this position must be reserved for another article. Meanwhile, it is enough that, for all practical purposes, we know things as they are in relation to us.

B. F. UNDERWOOD.

You look forth upon nature: you say that you are sure the sky is blue, that the grass is green, that the leaves are yellow in these autumn days, that the rose is red, and that lilies are white. All this brilliant pageant of color delights you, and you say you are certain of its existence. But ask yourselves, What is color? By color, we denote the power which objects have of reflecting certain waves of ether to our eyes; and it is our eye which sees the color in them. And, if there were no eyes like ours, there would be no redness in the rose, no whiteness in the lily, and no greenness in the grass, and no beautiful blue in the sky. The proof of this is color blindness. Nor is it to the eye alone, but to all the senses, that the same argument applies.—*Felix Adler*.

THE *Secular Age*, published at Cleveland, and edited by Mr. George C. Stoll, says, "The Index, of Boston, Mass., is the neatest and ablest edited paper in the liberal field of to-day."

SAYS the Boston Herald: "When Agassiz exclaimed to an astonished audience of solid Boston men 'that he could not afford to waste his time going round making money,' he did more to open their eyes to the idea that there might be other kinds of wealth than those summed up in dollars and cents than could have a year of Sunday sermons."

TO A YOUNG AUTHOR ON HIS BIRTHDAY.

Friend of my later years, whose thoughts are set
To noble ends, despising the pursuit
Of vices which the fierceness of the brute,
Incorporate in man, contends for yet;
Who out of boyhood's slavery and fret
Could issue like a sword-blade from its sheath,
Resolved by high endeavor to bequeath
Some good that future times may not forget,—
Press on, thy better fortune leads the way,
And thine is still the sesame of youth,
To which the door of many a hidden truth
Shall open,—so I dare to prophesy,—
And ancient Error, stubborn and uncouth,
Shall own thy strength and rue thy natal day.

GEORGE MARTIN.

The Index.

BOSTON, FEBRUARY 25, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, BENJAMIN F. UNDERWOOD, : : : : : } Editors.

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

GIORDANO BRUNO.

BY THOMAS DAVIDSON.

Although the subject of Giordano Bruno's life is to be treated by an abler pen than mine, I think it will contribute to the understanding of my lecture, if I preface it with a brief sketch of that life, mainly as related by himself before the inquisitorial court at Venice.

Giordano Bruno, whose proper name was Filippo, was born in 1548, at Nola, an ancient Etruscan town about twenty-two miles from Naples. His father was a soldier. At the age of fourteen, he began the study of Logic and Dialectic. Soon after, he entered the Dominican order, became a priest, and performed priestly functions till 1576, when he reached the age of twenty-eight. Before that, he had twice been in trouble with the ecclesiastical authorities, once because he set aside the images of the saints and told a fellow-monk that he might be better employed than in reading about the seven joys of the Virgin Mary, and once because he uttered certain Arian or Unitarian views. To get out of difficulty, he went to Rome in 1576; but, being called to account there also, he laid aside his monk's attire and escaped to Noli, some forty miles from Genoa, where he remained four months, teaching grammar to boys and astronomy to grown people. He then went, by way of Turin, to Venice, and there printed a tract on the signs of the times, the first of his published works, apparently. Soon after, he went to Padua, resumed his monk's dress, and travelled, as a beggar apparently, by the way of Chambery to Geneva. Here he arrayed himself in hat and sabre, and came out as a secular teacher, calling himself professor of theology. This was in 1579, three years after he had left Naples. How long Bruno remained at Geneva is not altogether certain; but what is certain is that he got into very great difficulties with the Protestants, who treated him with much rigor, but whom he, no doubt, sufficiently provoked by his radical ideas. At all events, he acquired no

love for Protestantism in Geneva, and left it after a few months' stay. It is worth noting that, while there, he made his living by correcting proofs for a printer. From Geneva, he went to Toulouse, where he taught, took a doctor's degree, and held a professorship for two years. At the end of that time, the civil war drove him to Paris. Here he taught for five years, and was introduced to King Henry III., who was so astonished at his wonderful memory as to inquire whether he did not owe it to magic. Here he published several works, one of which I hold in my hand. It was probably held in his hand. At the end of five years, he went to England, bearing a letter from the king to the French ambassador there. In the house of this ambassador, he lived for two years and a half, lecturing in various places and holding communication with all the great men of the time. He was even introduced to Queen Elizabeth, who spoke Italian to him. His account of his doings at Oxford, and his description of English life, as seen in London, are curious and racy, but by no means flattering. Here he printed several of his works,—notably, the comedy, *Il Candelaio*, which added to his reputation. When the French ambassador returned to France, Bruno, not finding himself at home in England, or among Protestants, returned with him; but, finding the country in great disorder, he betook himself to Germany, and, after wandering about for some time, settled in Wittenberg. Here he taught for two years, under the auspices of the Lutherans. Later, he went to Prague, where he taught for six months, thence to Brunswick, where he taught for a year. Here he must have been held in high esteem; for he delivered the funeral oration over his patron, Duke Julius. This seems to have been in 1591. About that time, Bruno went to Frankfort on the Main, to attend to the printing of some works in Latin. Here he lived in the Carmelite monastery, and seems to have been kindly treated by the monks, although the abbot thought him a man with no religion, which, from his point of view, was no wonder.

From Frankfort, through the medium of his publishers, Bruno was induced to return to Venice, being invited thither by a Venetian nobleman, Giovanni Mocenigo, who wished to learn from him his wonderful arts of memory and of originating ideas,—subjects on which Bruno had written several works, one of which I hold here. As might have been expected, the foolish nobleman was disappointed in his desire to learn to be a genius like Bruno; and Bruno, weary of his task, was preparing to return to Frankfort, when Mocenigo seized him, with the aid of some gondoliers bound him, and threatened that, if he did not teach him his art, it would go hard with him. When Bruno asserted that he had done his best, Mocenigo, by the advice of his confessor, denounced him to the Inquisition as a heretic, denying the most sacred dogmas of the Church,—transubstantiation, for example. Bruno was arrested on the 23d of May, 1592, and thrown into prison. On the 29th and 30th of the same month, he was examined; and, on the second of June, he handed in a list of his works, so that these might also be examined. The Venetian inquisitors seem to have treated Bruno with considerable gentleness; and he might possibly have escaped with some slight punishment, as Galilei did, later on, had his extradition not been demanded by the pope. The Venetian government hesitated for some time; but, finally, in the following year, 1593, he was delivered up, carried to Rome, and thrown into the dungeons of the Roman Inquisition. Here he lingered for seven years, subjected to every kind of annoyance and importunity. Finally, as he would not recant,

he was degraded, excommunicated, condemned to death, and handed to the civil authorities with the mocking recommendation that he should be dealt with as gently as possible, and put to death without effusion of blood; that is, at the stake. On the 17th of February, this sentence was carried out; and Bruno perished in the flames, at the age of fifty-two. When the calendar of the Church of the future comes into operation, Saint Felippo Bruno's day will be a great festival. In the Positivist calendar, his name occupies a very modest place beside and below that of poor, timid, sentimental Pascal, in the month of Descartes! Could irony go farther?

Giordano Bruno's Philosophy and Free Thought.

Man is a rational animal. Such is the logical definition of him given in the old times, and still valid. The distinguishing mark of man is his rationality, or, more strictly perhaps, his intelligence. Now, the essence of intelligence is that it places the intelligent being in relation to the entire universe, to the Infinite. Sensation, on the other hand, as such, is essentially a relation to the finite. But intelligence is a passive faculty, when we know it is the universe that acts upon us, and not we that act upon the universe. The universe is not altered by our knowing it. Still, like every other passive faculty, intelligence has an active side,—a side whereby we may, and do, react upon the universe, and modify it. This active side of intelligence we call freedom. Intelligence, man's very essential nature, is essentially correlated with freedom. The two are inseparable. Without intelligence there is no freedom possible; without freedom there is no intelligence possible. Intelligence and freedom begin exactly at the point where sensation and instinct cease. Instinct is unfreedom.

It is a common mistake to speak of the freedom of the will. There is no such thing. Freedom is utterly distinct from will, standing to it in the relation of master to slave. Will is simply instinct, in so far as it obeys the dictates of freedom; and freedom is conformity to intelligence. The free man is simply the man who, in all cases, follows what his intelligence tells him is best. But, although intelligence is distinct from will and its natural master, it is, nevertheless, of no use without will, since it is through will that it is enabled to act upon the outer world and modify it. And not only so, but the will, in order to be effective, requires the physical frame; and this frame, in order to perform its proper functions, must be strong and unfettered.

It appears, then, that, before the rational human being can act rationally and humanly,—that is, before a man can be in actuality a man, and not a slave,—three conditions are necessary: (1) intelligence, involving freedom of choice; (2) a will, obedient to free intelligence; and (3) a strong unfettered body. By interfering with the development or action of any one of these, the path to true manhood can be blocked. If the intelligence be stunted by ignorance or repressed by unintelligible dogma, its freedom is impaired; and the will is left to act simply as instinct, without goal or guidance. If the will be perverted by selfishness, by desire for sensual indulgence, ease, or applause, then its operations are subject to all the uncertainty of these passions, and have no steady direction toward universal good. If the body be fettered or enfeebled, whether in brain, nerves, or muscles, then the impulses of the will are fruitless. In any one of these cases, man is enslaved, and cannot reach true manhood. Still worse is his position, when all the obstacles mentioned are thrown in his way at once, as has generally been the case

throughout his entire history. Ignorance, dogma, selfishness, weakness, and bondage have combined, like evil demons, to block his path, and hold him back from the heights of free manhood. Nay, they have even found a powerful ally in man himself, who, for the most part, has not only preferred ignorance, dogma, selfishness, weakness, and bondage to knowledge, truth, generosity, strength, freedom, but has even decreed, slandered, beaten, bruised, and murdered those individuals of his race who, in all simplicity and manliness, have sought to bring him to a better frame of mind.

Perhaps at no time in the world's history did the demons obstructive to human progress enter into such a nefarious conspiracy as they did in the centuries which we are wont to call the Dark Ages. At that time, dogma banished knowledge and suppressed freedom of thought and inquiry; selfishness, in the forms of competitive worldly and other-worldly ambition, guided the wills of the strong to all forms of political and social oppression; while feudalism bound men's bodies to the soil, and made them drudge out their lives for mere pitiful subsistence. In a word, ignorance left the will to be guided by instinctive selfishness; and this selfishness debauched, enfeebled, and bound the body, until men almost ceased to be men. To say that they became brutes would be to libel those poor things that cannot speak for themselves.

From the triple bonds welded on mankind during the Dark Ages, they have, under the influence of a few great spirits, Messiahs, and martyrs, been slowly freeing themselves. Considerable progress has already been made; but there is still much to make, ere man be truly man. He is still, as Tennyson says, "half akin to beast." Slavery, in the narrow sense of bondage to a single master, and serfdom or attachment to the soil, are at an end, or nearly so. Heresy, or disbelief in dogma, can no longer be punished by imprisonment or burning at the stake. Intelligence is, in the main, free from physical impediments. Now, we may think what we like or can, and in the main say openly what we think, without risk of personal violence. But this is all the progress we have made. How small it is compared with what has yet to be made! Let us look at the other side. If slavery proper and serfdom are at an end, they have found a worthy successor in the form of wage-slavery, due in the main to the supineness of the State in allowing the introduction of machinery, without seeing that its benefits are distributed among those whose labor—that is, whose means of livelihood—it takes away. Men do not cease to be slaves, because they are allowed to change masters, so long as they must have a master or starve. Cold, hunger, wretchedness, forcing to theft, beggary, or prostitution, are sufficiently merciless slave-drivers. Men can never cease to be slaves until they have such a share in the soil and in the products of industry as shall prevent them from being forced to sell their labor as a commodity and themselves as temporary slaves in a labor-and-slave-glutted market. And so long as men are slaves, compelled to spend their entire strength in obtaining a meagre subsistence for the body, so long are they disinherited of well-nigh all that belongs to them as sons of humanity, of all the accumulated capital of art, science, and moral opportunity which humanity has been slowly accumulating. What is this capital to the millions whose lives are spent in toiling for the mere necessities of life, and who have to compete with each other in lowness of wages for every wage-slave's place that is vacant or can be made so? What opportunity have these

millions to press forward to the heights of manhood? Is not their way blocked?

Again, although no Church claiming to be the organ of the supernatural and using the arm of the civil power can any longer condemn us to the pillory or the stake for questioning her unintelligible dogmas, is thought in reality free? Has dogma ceased to hold sway? By no means. The pillory, the stake, and the block, like slavery and serfdom, have found worthy successors in the social ostracism, contempt, and disabilities inflicted upon those whom intellectual piety and earnestness compel to reject and, on occasion, openly to condemn the current popular beliefs. The means whereby the present punishment of heretics is inflicted are the pulpit and the public press, which, for effectiveness, hold about the same relation to the pillory and the block as the spinning-jenny does to the old pendent spindle. Is not honest atheism still a heresy, liable to be punished with social contempt and even political disabilities? Is not Mr. Bradlaugh still excluded from the English Parliament for this heresy? Is not the man who is bold enough to declare that he is not a Christian looked upon as likely to be a bad man, and are not his virtues misconstrued? And what shall we say of the socialist and communist, not to speak of the anarchist and nihilist? Are they not to a large degree political and social outcasts, liable to be hunted from country to country at the will of unjust governments? Is there any unprejudiced consideration and discussion of their views by those who condemn them? I leave you to answer.

It is apparent, then, that, although we have made some progress toward personal and intellectual freedom, we are very far from having attained either. What we have accomplished is simply this: we have broken down those obstacles to personal and intellectual freedom which were set up by law; we have caused personal and intellectual bondage to lose the support which they formerly had in legal enactments. That is all. Personal and intellectual bondage still exists in fact, and will never cease to exist until, on the one hand, the poor cease to be dependent upon the rich for the opportunity to labor and to earn, and until, on the other, ignorance and blind faith have given place to knowledge and insight.

But, if the case stands thus badly with personal and intellectual freedom, it stands still worse with moral freedom. Toward this, it is questionable whether we have made any progress at all since the Dark Ages. Men's wills are still swayed by passion as much as ever. They live and act by instinct, which rules instead of serving their intelligence. Indeed, perhaps at no time since the decay of the Roman Empire were men's actions so little guided by intelligence, and so much by vulgar ambition and other forms of selfishness, as they are now. What men labor and struggle for are the things that enslave,—ease, comfort, place, power, pleasure,—not the things that free,—intelligence, love, moral energy. Read the daily papers which most faithfully represent what the mass of our people care to hear and think about, and then tell me whether I am right or not.

If, now, we ask, Why, while we have made some progress toward personal and intellectual freedom, so far at least as the law is concerned, are our wills still bound in worse than mediæval bondage? the answer will not be hard to find. Freedom, which alone can direct the will to the good and free it from the bondage of instinct, is only the obverse of intelligence; only a choosing of the good, recognized as such by the intelligence. Without a developed intelligence, freedom cannot act; and man must be the slave of instinct. But, at the present day, the intelligence of the great

majority of men and women is stunted by ignorance and repressed by dogma, persistently held up from tens of thousands of pulpits as something superior to knowledge. Dogma is ignorance, and ignorance and freedom are utterly incompatible. Thus, dogma not only deprives men of intellectual freedom, but, as a necessary consequence, it also robs them of moral freedom by leaving their actions to be guided by instinct and prejudice.

Looking back upon what has been said and recapitulating it, we may say that the two great obstacles to human advancement which still remain to be overcome, and which it is our duty and the duty of all good men to labor with all our might to overcome, are wage-slavery and ignorance, including dogma. Universal industrial co-operation and universal education are the battle-cries of the future. It is these that will call forth the heroes and martyrs of the future; it is these that will be borne on the banners with which the coming generations will march across the ruins of capitalist, factories, and dogmatic churches to the serene heights of freedom, whose throne is set upon three pillars,—intelligence, human love, heroism.

But the heroes and martyrs of these two great causes are not all in the future. Some of them loom up as examples to us from the past. Especially numerous and noble have been the martyrs of enlightenment. Of these there are two that stand out above all the rest like great peaks, round whose stainless summits the lightnings of heaven play,—two inspired prophets whose deaths mark epochs in the history of the human race. These two are Sôkratês and Giordano Bruno.

It would be instructive, if we had time, to draw a parallel between these two great men, and to show that they differed just as the needs of their epochs differed, each being just the martyr that his epoch required, in order to transform it. Each was a new force in the world, unlike anything that had ever appeared before. Plato says that Sôkratês was like no other man, past or present; and the same was true of Giordano Bruno. Each was a thorough radical, in the best sense of that word. Each appealed from imagination to reason, from fable to truth, from the authority of ancient tradition to the authority of present fact. Each denied the popular, external gods of his time, in favor of the inner god whose throne is in every human soul, and who is not to be distinguished from that soul. Each was executed for atheism, because he did not conform to fashion in the matter of gods. Sôkratês was the human giant who began the successful struggle against polytheism. Giordano Bruno was the still greater giant who began the struggle against monotheism,—a struggle which is still going on, with no uncertain issue.

But, though there are so many points of resemblance between the ancient and the modern martyr of enlightenment, there are also many points of difference. Sôkratês was a brave citizen of a free State, of the State which laid the foundations of human freedom; while Giordano Bruno was a poor monk in a universal Church, which for hundreds of years tried to stifle human liberty. Sôkratês rarely left his native city. Bruno wandered, homeless, under the ban of the Church, from land to land,—over Italy, Switzerland, France, England, Germany. Sôkratês strove to manifest the divine in man, Bruno to reveal it in all nature. Sôkratês, finding his contemporaries devoted solely to physical nature and neglecting the marvels of spiritual nature much to the detriment of truth and thought, strove to draw their attention to the nature of truth and morality. Bruno, on the other hand, finding his contemporaries wholly

given up to disputes about the spiritual nature and altogether overlooking or even despising physical nature, thereby losing much essential truth, strove to direct them to the study of physical laws. And the fates of the two men were widely different. Both were condemned and executed, but under what diverse circumstances! Sôkratês, as he leaves the judgment hall, calmly says to his judges: "But now it is time for us to depart, me to death, you to life. And which of us goes to the better thing, God alone knows." Bruno, after having spent seven years in the dungeons of the Inquisition, leaves the inquisitorial palace with this fierce remark, which was afterwards a prophecy, "Ye pronounce judgment upon me perhaps with more fear than I shall receive it with." Nothing is more dramatic than the death-scene of Sôkratês, as sketched by the master-hand of Plato. The Greek martyr drank the hemlock quietly in his prison-cell, in the midst of weeping friends, among whom no word was said that could disturb the calm of his departing spirit.

Bruno's death-scene, as described by an eye-witness, is one of the saddest and most barbarous on record. "To-day," says Kaspar Schoppe, "he was led to the stake. When he was on the point of delivering up his spirit, the image of the crucified Saviour was presented to him; but, with an angry and troubled look, he repelled it. And so he died miserably by burning, and went, I suppose, to proclaim in those other worlds which he imagined to exist the way in which blasphemous and impious men are treated by the Romans." Such were the feelings of the bystanders at the death of the lonely martyr, Giordano Bruno. After the death of Sôkratês, his friends buried his body decently and with honor, and so worshipped his memory and continued his work that, in less than a generation, his name was known throughout the civilized world as a synonyme for all that was noblest and wisest. He became the great saint of the Hellenic world, and a bronze statue was erected to him in one of the most public places of Athens. Nay, it is even said that his accusers were punished with exile and death. When Bruno died, nothing was left of him to bury. His noble dust was scattered to the winds of heaven. And then no friends arose to keep his memory green. His very works, published in many lands during his weary wanderings,—works whose contents cost him his life,—were burned, concealed, and forgotten; and his name, whenever it was mentioned, either by Catholic or Protestant, was made a synonyme for all that is godless, blasphemous, arrogant, obstinate, and foolish. Hegel, writing in 1830, says: "Among both Catholics and Protestants, his writings were declared heretical and atheistic, and therefore burned, exterminated, and kept secret. . . His writings are rare, often forbidden. In the Dresden library, they are still among the forbidden books; and, therefore, in Dresden they are not shown." This was in 1830. Eight years later, the English historian Hallam, though he tries in a mild way to defend Bruno from the charge of atheism, talks of his "self-conceit," and declares that "he deviates so often into rhapsodies of vanity and nonsense that it is difficult to pronounce whether he had much knowledge of the [physical] science." No statue has yet been erected to Bruno. But it is to aid in obtaining means for the erection of one on the spot where he was martyred that I am speaking here to-night, and I doubt not that in a few months this tardy token of slow-grown honor will be conferred on his memory. And this honor will, I trust, be like other things of slow growth,—enduring. If there is any name in the history of free thought and enlightenment that ought to call forth all our sym-

pathy and enthusiasm and prompt us to liberality, it is that of Giordano Bruno. As he is the greatest of martyrs to modern science, so he ought to be its greatest saint. If there is any event from which the modern era, which is distinctly the era of man, as the grandest known expression of the divine, dates, it is the martyrdom of Giordano Bruno. Perhaps, too, the day will come when the era of man will be so dated; for, in spite of its long, lethargic negligence, the world is slowly coming to recognize that Giordano Bruno was one of its Messiahs, a man truly inspired, a man of infinite heroism, a martyr and a saint. The whole Christian world melts into compassion and amazement over the sufferings of Jesus of Nazareth. I see no reason to suppose that they were more than a fraction compared with those of Giordano Bruno. Jesus suffered no imprisonment: Bruno passed seven years in the dungeons of the Inquisition, exposed to all insults and threats of Roman inquisitors. Jesus died in the midst of weeping relatives and friends: Bruno died in the midst of a crowd that only jeered at his sufferings. Jesus, ere he died, shrieked out to God, asking why he had forsaken him: Bruno died without a shriek or a groan, knowing, as every great soul knows, that his God was within him, and could not forsake him unless he forsook himself. Which, let me ask, was the greater sufferer? Which was the greater hero? I will not ask which died for the higher and truer principle.

As I have said, the world is slowly coming to accept the truth with regard to Bruno, even in spite of Hallam and other respectable Philistines or Pharisees. He was, perhaps, not altogether forgotten at any time. As we shall see, one of his works, at least,—a play called *Il Candelajo*,—was known to Shakspere (who may very well have known the author), and is several times quoted from in no less a work than "Hamlet," written probably in the very year in which Bruno suffered martyrdom. As we shall further see, his philosophy was known to Spinoza (born in 1632, died 1677), who, in all probability, borrowed his pantheism from it, and to Leibniz (1646–1716), who certainly derived his monadism from it. But, though largely drawn upon during the seventeenth century by some of the greatest minds, Bruno was little mentioned, and his value little appreciated, until the appearance of Brucker's *Critical History of Philosophy*, in 1731. Brucker, being a follower of Leibniz, naturally felt a great deal of interest in Bruno's doctrine of monads, and accordingly devotes considerable attention to him. From that time on, Bruno's name, with some account of his tenets, appears in all the histories of philosophy,—in Fülleborn's, Buhle's, Tennemann's, Ritter's, Hegel's, Erdmann's, Schwegler's, Ueberweg's, etc. But the first person that really made Bruno's name current was Jacobi, who pointed out that he had forestalled the chief ideas of Spinoza. Through Jacobi, apparently, Bruno became known to Hamann, Kant's friend and a great authority in matters of education, as well as to Herder; and both these men were deeply influenced by him. Jacobi's work was published in 1785. In 1802 appeared Schelling's dialogue, entitled *Bruno, or The Natural and Divine Principle of Things*, which bears about the same relation to Bruno that Plato's dialogue, *Parmenidês*, does to that philosopher. After Schelling came Hegel, whose most remarkable faculty was his power of appreciating the great thinkers of the past. In his *Lectures on the History of Philosophy*, delivered at different times and places from 1805 to 1830, Hegel does justice to the great Italian pioneer. We may object to Hegel's system as much as we like, and nobody can well do so more than I; but

no one will question his power and depth or his ability to understand and appreciate systems of thought. Let us then place beside the opinion of Bruno, expressed by the unphilosophical English Hallam, the view of him entertained by the German philosopher, Hegel. He says:—

"The leading characteristic of Bruno's writings is, at bottom, a wonderful inspiration,—the inspiration of a self-consciousness which feels the spirit [the universal Spirit] dwelling in it, and knows that its essence is one with all essence. There is something of Bacchic frenzy in this grasp of such a consciousness. It overflows in order to utter this wealth, and so become an object to itself. But it is only in knowledge that the spirit reproduces itself as a whole. If it has not attained a sufficient degree of scientific culture for this, it can only seize whatever forms it can find, without giving them any proper arrangement. Such manifold, unordered wealth do we find in Bruno, whose explanations, in consequence, frequently assume a vague, confused, allegorical appearance, a mystic enthusiasm. To his mighty inner inspiration, he sacrifices all his personal relations,—it would leave him no rest. It is easy to say that he was 'a restless spirit, incapable of getting along with himself.' Whence came this restlessness? He could not get along with the finite, the bad, the common,—that was the reason of his restlessness. He had risen to the one universal substantiality, he had done away with the division between self-consciousness and nature, and with the consequent degradation of both. The result of this degrading division had been that, though God was conceived to be in self-consciousness, he was, nevertheless, looked upon as something external to it, something different from it, another reality. Nature was made by God,—was his creature, not his image. God's goodness was displayed only externally in final causes, final aims. Bees make honey to feed men, the cork-tree grows to furnish corks for bottles." Hegel's proud sarcasm is quite a match, I think, for Hallam's supercilious sneer. From Hegel's time, Bruno has become more and more a subject of interest, reverence, and study. His Italian works were published in two volumes, at Leipzig, in 1830, by Adolf Wagner. And, in 1835, an attempt was made by A. F. Gfrörer to publish his Latin works, at Stuttgart; but only a small part of them could be found, and the series was discontinued. Most of them have now been recovered, and are now in process of publication in Italy, under the auspices of Prof. Fiorentino. A considerable number of monographs have been written on Bruno, the most important of which are Bartholmê's *Giordano Bruno* (1846–47); *Ein Blutzeuge des Wissens* (1867), by Scartaglini, the great Dante scholar; and the *Life of Giordano Bruno*, by Domenico Berte, the present Italian minister of agriculture (1868). This last was followed by a supplement containing the text of the documents relating to Bruno's extradition, imprisonment, and execution. A few years ago, when I was living in Italy, and had excellent opportunities for obtaining all accessible information respecting Bruno and his work, I conceived the idea of writing a book entitled *Giordano Bruno, his System and his Times*. When I saw announced, among Trübner's forthcoming publications, *The Life and Works of Giordano Bruno*, I immediately wrote to Mr. Trübner, to inquire the nature of the forthcoming work, and learned that the author was a distinguished scholar, who had collected everything obtainable respecting Bruno and his work. I therefore abandoned my project, delighted to know that there was a fair prospect of soon seeing Bruno's system rendered accessible to the English-reading public.

CORRESPONDENCE.

THEOSOPHY AND PSYCHICAL RESEARCH.

Editors of *The Index* :—

In the last number of your paper there is an allusion to the report of the London Society for Psychical Research upon the doings of Madame Blavatsky, together with a quotation from the spiritistic journal called *Light*, commenting on the same. As *The Index* is the exponent of free religion, and as the Theosophical Society is based upon the utmost freedom of religious belief, and as the report in question has been spoken of as dealing a crushing blow to theosophy, you would probably like to hear a word from that side. In the first place, while it should be known at the start that the Theosophical Society is not based upon phenomena, and depends upon principles and not personalities, and therefore cannot be "crushed" by the demolition of personal reputations, it may be stated that there is good ground for believing that Mr. Hodgson's report for the London Society, which has been hanging over our heads for a year, was not so thorough nor impartial as it should have been, though probably well meant. As for the opinions of *Light*, the motives for its verdict may be seen in the fact that theosophy has aroused the hostility of spiritists, through its offering a scientific explanation for phenomena which the latter mildly assume to be wholly the work of beings from the "summer land." As you may be favored with something from a well-informed source concerning Mr. Hodgson's report, I will simply state here the leading objects of the Theosophical Society, which are to trace the threads of truth running through all genuine religions, however obscured they may have become through dogmatism and priestcraft; to work for the establishment of universal brotherhood by encouraging a desire for doing good to humanity; to bring to light the treasures of wisdom contained in the sacred books of India; and to investigate the hidden workings of nature and study the powers latent in man. Is this not a programme worthy of following? and are Theosophists to be sneered at as weak and credulous persons, because they find their faith in accord with what appears to them the most complete scheme of the universe, both seen and unseen, material and spiritual? But we find ourselves assailed by the bigotry of science as well as of theology, by the intolerance of unbelief as well as of belief. Too many professed scientists are unwilling to examine into the evidence of anything which they do not know themselves; and all scientific progress has had to be made in the face of such persons, who can only follow and not lead, and stand ready to persecute all who strike into new paths. Witness, for instance, the persecution of Prof. Crocker by his fellow scientists, who would not consent to examine his evidence and have not refuted his conclusions. Allow me, therefore, to suggest that science will finally find the explanation for many puzzling phenomena—the evidence of which is too strong to be resisted, in spite of multitudinous frauds—in properties of the universal ether, which is the medium for the phenomena of light, heat, and electricity.

As to Madame Blavatsky, I would like to point to something concerning her which seems quite as phenomenal as anything that has been reported. About two years ago, she was examined, at Elberfeld in Germany, by four eminent physicians, who found her suffering from a complication of maladies, including Bright's disease and dropsy. They agreed that her death was inevitable within a few months. To-day, Madame Blavatsky is in a quiet German town enjoying excellent health, and writing *twelve hours a day* on the elaborate work to be called *The Secret Doctrine*.

Permit me to close with the following extract from a letter written by Madame Blavatsky to an American gentleman: "The 'kingdom of heaven,' which, I need not tell you, is but the dominion of man's immortal spirit over the inner force of the universe, must be taken by violence. I am sorry to be compelled to tell you that the prize of wisdom and power must be won through danger, trial, temptation, and the allurements of sense, and all the besetments of this world of matter which they counterpoise,—hence, antagonist of spirit. Broad, smooth, and flower-besprinkled is the way to the world's rewards: narrow, hard, sorrow-beset the path to the temple of truth."

AN AMERICAN THEOSOPHIST.

BOSTON, Feb. 2, 1886.

BOTH FREE TRADE AND PROTECTION IN NATURAL HISTORY.

Editors of *The Index* :—

The following is from the Editorial Notes in this week's *Independent* :—

Prof. Dana, the eminent geologist of Yale College, New Haven, in a recent lecture said, among other things:—

"The only source of information of the creation which we have is this first chapter of Genesis, and this must be inspired. There would be no object in putting this description of the creation in the Bible, had it been untrue. The order of the creation must, for scientific reasons, have taken place as described in the Bible."

"Geology proves that everything which exists must have had a beginning. Science accords with the Bible in that light must have first existed; plants must have existed before animals, to feed them and to absorb the carbonic acid in the air."

"No evidences have ever been found of any inferior race from which men could be sprung. The similarity between the recent study of nature and the Mosaic law ought to satisfy the doubting students of nature of the truth of the creation as related in the first chapter of Genesis."

I have thought the above would look well contrasted with what he has said in his book called *The Geological Story Briefly Told*, edition of 1880. In the chapter upon the "Progress in Life," he gives four laws of development of animals. The fourth law, marked d, is: "Forms in a group having the body elongated posteriorly, and endowed behind with locomotive power, generally precede those that are shorter behind and superior in the anterior portion of the body and head,—a headward transfer of the forces of the structure marking all upward progress." And now follow examples with conclusions, which conclusions I italicize, to make emphatic the last case, where he neglects to draw the only conclusion which is warranted by his statements. He probably intended his readers to draw their own conclusions. The meteorological conditions of Yale College are evidently not adapted to the development of men with such an ancestry.

"The young of a crab has an elongated locomotive tail extremity, which it loses as it develops to a crab; and so the long-tailed shrimps preceded crabs in geological history. The young of a modern Ganoid or garpike has an elongated vertebrate tail, which it loses with the change to the adult; and so Ganoids in Paleozoic time had vertebrate tails, but in Mesozoic time lost them. In the young of some birds, the tail segments of the vertebral column are much elongated and free, but, with progressing development, they became greatly contracted, and often consolidated together; and so the earliest birds in part, at least, had long vertebrate tails. The young of an insect is an elongated, worm-like grub; and so worms preceded insects. The embryo of man, in an early stage of development, has a tail half as long as a dog in the same stage." But there is no "and so" appended to this. There is no meaning to the above examples, unless there is implied genetic descent. Evidently, the Professor sees he can't reconcile the irreconcilable. He, therefore, teaches both the doctrine of creation and the doctrine of evolution as applied to man, and lets his hearers take their choice. Yale teaches both free trade and protection in natural history as well as in politics.

INFORMATION WANTED.

Editors of *The Index* :—

Having just perused Mr. Charles Froebel's letter in *The Index* of Dec. 31, 1885, I feel it my duty to lay, in the columns of your journal, the following twelve queries before said gentleman:—

(1) If the universe is one "of undivided unity," how can a child be made "to feel and think out for himself" that, at best doubtful, theorem, without reference to some Pantheistic, Panlogistic, Panpsychistic, Pantelistic, Panphantastic, Panmetaphysical, Pan-cosmic, Pananthropistic, or Panegoistic authority?

(2) If parents are never consulted as to how they wish this or that branch of education to be taught to their children, must they not insist that the method of teaching be such as to make the taught ones eventually as wise as possible for the time being?

(3) If the "dogmatic way of teaching" is not alone "improper," but "immoral," how can one profess to restore religion to its objective dignity in the eyes of irreligious millions by entering it as some "branch of education," such as botany or grammar or mathematics?

(4) If "the State should be in duty bound to teach religion," shall some monistically illumined oligarchy dictate such duty, or shall also "the State" think out the theorem "of the undivided unity of the universe"?

(5) If there is neither "Presbyterian geometry" nor "Catholic algebra," is there not a right and a wrong in all questions involved in such branches of exact science? Are not even to the most perfect juvenile brain the absolute principles as well as the correct deductive applications of such sciences nothing less than natural and instinctive?

(6) If a pupil nowadays actually could be brought to "think out for himself" all the scientific theorems of academic education, "without authoritative methods," would it not be one of the greatest miracles of all ages?

(7) Has Mr. Froebel himself actually "thought out" anew the law of gravitation, and only afterward discovered his intellectual kinship with the English thinker and astronomer?

(8) If the parents are not to decide as to the method of religious instruction, shall those children who are unable to invent spontaneously all empirical discriminations of any one dogma be compelled to resort to "that phase of emotional life which is excited by the action, upon the individual, of the undivided unity of the universe"?

(9) How shall the great majority be detained from following their inherited cynical and self-brutalizing tendencies without the realistic method of religious instruction, which adds a good deal of wholesome prosaic awe to the cheap poetry of monistic idealism?

(10) If Catholicism, Methodism, and Pantheism (1) are held as concepts of one and the same degree, as merely eccentric circles within one comprising circle, is not this blunder largely due to the seduction of the ear by the rhyme "ism, ism, ism"?

(11) If Liberals "insist that religious instruction be given in our public schools," shall they also insist upon or even encourage the construction of houses of worship?

(12) If "religion" is to be taught without apostolic aid, as a mere poetical abstraction of the exact sciences, does not this demand imply the new dogma of a churchless, founderless, discipleless, prayerless, headless, and heartless "faith"?

FRED. W. OFF.

EGO ON ABBOT AGAIN.

Editors of *The Index* :—

I am sorry that my short notice of Dr. Abbot's book has stirred so unpleasantly the ego of D. A. W. For the "arrogance" with which I am charged I shall make no apology, because it is always inexcusable; and it is not the less so when it assumes that our particular friends are not to be freely criticised by the philosophic public. Nor shall I enter into a war of unseemly epithets, deeming it no sign of sense or strength or culture for men to sling such words as "goose" at those who, perhaps, think more deeply or consistently than themselves.

But why does not D. A. W. assail Mr. Underwood, who has abundantly proved my "string of assertions" to the effect that the premises of Dr. Abbot are erroneous? He shows that it is the general judgment of modern psychology that all phenomena are subjective states, and this is the sum of my egoism. To stand here, against even such a man as Dr. Abbot, is a very modest arrogance.

As to the logic of Dr. Abbot,—that, because the world is intelligible, it is thence proved to be infinitely intelligent and holy,—let his friends vindicate it, if they can, like philosophers, instead of slinging irrelevant and reproachful words and sneering at the supposed philosophic absurdities of some critic.

WM. I. GILL.

BOOK NOTICES.

STORY OF THE JEWS. By James K. Hosmer, Professor in Washington University, St. Louis, Mo. ("The Story of the Nation" Series.) New York and London: G. P. Putnam's Sons. 1886. Price \$1.50. pp. 381.

Messrs. G. P. Putnam's Sons are publishing a series of graphic historical studies under the general title of "The Story of the Nations," intended to present to the young the stories of the different nations that have obtained prominence in history. Of this series

the present volume is the fifth; while others are in process of preparation for publication.

If the *Story of the Jews*, as written by Prof. Hosmer, is a fair specimen of the other "stories" yet to follow, the young students of history to-day have a decidedly "royal road to learning" opened to them, of which older students will gladly avail themselves. Gloomy, distressful, and shameful as much of this *Story of the Jews* necessarily is, the author makes it a strangely picturesque and fascinating one, charming as a romance, while thoroughly true to history.

The first seven chapters portray, in vivid colors, the rise and ultimate splendor of the Jewish nation at the height of its glory, previous to its subjugation by the Roman emperor, Titus, in A.D. 70. From that date began the dispersion of the Jews into other lands, and that steady persecution of them by Christians, which has continued even until the present time. "Not a single Christian people," says Prof. Hosmer, "has kept itself clear from the reproach of inhumanity to the Jews. To afflict them has been held to be a merit. The times when religion has been most rife and the consciences most sensitive have witnessed the sharpest scourings and the most lurid holocausts. . . . Men and women, chivalrous and saintly, have denounced and wrung the Jew almost in proportion to their chivalry and sanctity; and this has endured almost to the present hour." Even the protesting, large-minded Luther wrote, "Know, dear Christian, and doubt it not, that, next to the devil himself, thou hast no more bitter, poisonous, violent enemy than a Jew who is set upon being a Jew"; and he proposed to meet this supposed Jewish enemy, not with Christlike tenderness and kind treatment, but with more powerful Christian enmity. Prof. Hosmer declares also that "men standing quite aloof from Christianity" have regarded them scarcely more kindly. Gibbon, he says, sneered at them, Voltaire spoke of them as "an ignorant and barbarous people," and Buckle calls them an "ignorant and obstinate race."

In that sunrise of Moorish civilization and intellectual radiance which finally shone upon, illuminated, and dissipated the cloudy murkiness of the "Dark Ages" of Christianity, the Jews bore no unimportant part, as they had previously spread themselves throughout Arabia, Mesopotamia, and Babylonia, where in the cities they established thriving colonies, and maintained at various points "schools where a learning, profound though fantastic, was taught by the Rabbis to crowds of pupils. They followed with their congeners in the path of the advancing crescent through Northern Africa, and helped essentially in the conquest by means of which the old Visigothic power of Spain was displaced. . . . An art came to flourish which could create the Alhambra; a poetry was developed that softened and ennobled manners; many a truth of physical science was anticipated. . . . When, at length, to the rest of Europe came the Renaissance, the Jews, going and coming in their intercourse with their brethren everywhere, . . . were among the chief mediators who bore the fructifying pollen from the sunny blossoming spots to the more shadowed regions which awaited impregnation."

The chapters which treat of the long and cruel persecution of the Jews by Christian nations are very sorrowful reading, and convey a strong lesson as to the inadequacy of religious beliefs to change materially or soften human nature; and it seems a strange anomaly to find the professed followers of one whose dying prayer for those who were putting him to death was said to be, "Father, forgive them, for they know not what they do," thus malignantly abusing the race for whose ancestors this forgiveness was implored.

Prof. Hosmer shows very clearly how these long-continued persecutions narrowed, intensified, and made dearer the Jewish faith to its adherents, and how its most trivial ceremonial became a matter of high importance, when its observance subjected them to indignities and senseless penalties, and made them in their turn become so narrow in their religious conceptions as to anathematize and proscribe thinkers like Spinoza and the elder Mendelssohn for their breadth of view and catholicity of spirit; and our author illogically remarks that "one's wrath at the mediæval Christian is somewhat lessened on reading the story of the treatment accorded by his own brethren to the illustrious Spinoza."

Not the least interesting portions of this *Story of*

the *Jews* is that in which, depicting the present hopeful outlook for this persistent and strongly individualized race, vivid sketches are given of the lives of Jews prominent in recent times in different departments of genius, pre-eminently in trade, music, literature, philosophy, finance, and statesmanship, as exemplified in the lives of such men as the Rothschilds, Sir Moses Montefiore, the Mendelssohns, Meyerbeer, Moscheles, Rubinstein, Rachel, Sara Bernhardt, Auerbach, Heine, Spinoza, Gambetta, Disraeli, and others. Two maps illustrative of Jewish history, with nearly two score other full-page pictures, are given; and among these are good portraits of Spinoza, Moses Mendelssohn, Nathan Meyer Rothschild, Sir Moses Montefiore, Herr Laaker, Gambetta, Isaac Disraeli, Lord Beaconsfield, Heinrich Heine, and Felix Mendelssohn.

The author, who has travelled extensively over the scenes where this story of the Jews was enacted, and who, though himself a Christian writer, is filled with earnest indignation at the treatment of and misconception in regard to the character of this people, has given us an eloquent portrayal of the most salient points of its history, and added to the charm of his own style prominent quotations from the best in song or story regarding his subject.

S. A. U.

THE NEW KING ARTHUR. An Opera without Music. By the author of *The Bunting Ball*. New York City: Funk & Wagnalls. 1885. pp. 164. Price \$1.50.

This very handsomely bound and clearly printed volume has, it seems, already attracted considerable attention from distinguished writers, judging from the extracts from letters given in the advertisement sheet which accompanies the book. Holmes, E. E. Hale, Julian Hawthorne, H. H. Boyesen, Hon. S. S. Cox, Edith Thomas, Mrs. Stowe, Edgar Fawcett, Col. John Hay, Judge Tourgée, and many others are quoted from as having tried to solve the puzzle of the authorship, which is to be declared on the 1st of March, when \$1,000 will be divided among those who have guessed correctly the author's name. Although Dr. Holmes declares it to be "ingenious, witty, fluent, and wholesome," Judge Tourgée that "it is thoroughly charming," S. S. Cox that "it is racy with humor, most exquisitely wrought," H. H. Boyesen that it shows an "exquisite power of versification," Mrs. Stowe that she was "greatly amused" by it, and Edith Thomas thinks it "unapproachable for its gay raillery and clever parody," yet it is doubtful if the average reading public will perceive all these qualities in a poem that has nothing particularly brilliant about it, but which shows in the author a facile gift of versification, an aptness at travesty, and a superficial "society" wit. This "Opera without Music" is apparently intended as a satire upon "The Idyls of the King," by Tennyson, to whom the volume is dedicated in a short poem in the same strain of exaggerated and "made-to-order" wit of the main poem. "Pinafore," and its successors in popular taste, are unavoidably suggested in the plan, method, and metres of this poetical composition, about whose authorship public opinion is so much divided, and to the discovery of the writer, said to be "one of the most brilliant of living authors." All purchasers of either *The Bunting Ball* or *The New King Arthur* are invited to aid by guessing, and to claim, if successful in that guess, their share of the \$1,000 to be distributed among those who correctly name the writer of these poems.

S. A. U.

THE *Popular Science Monthly* for February offers an unusually attractive group of papers of current interest and real importance. At their head stands an account of "The Improvement of East River and Hell Gate," by Gen. John Newton, the originator of the plan and director of the works. This paper is historical and descriptive, and is accompanied by new maps and illustrations. In "The Interpreters of Genesis and the Interpreters of Nature" are given Prof. Huxley's criticisms of an article by Mr. Gladstone on the "Dawn of Creation and Worship." Mr. Henry James Ten Eyck has an important essay on "Recent Experiments in State Taxation." In "Bishop's Ring around the Sun," Mr. William M. Davis describes a curious solar coronal phenomenon, which appears to be a legacy left by the "red sunsets." Mr. Chauncey Smith writes on the "Influence of Inven-

tions upon Civilization." Mr. John McElroy's "The Musket as a Social Force" is an account of important social and political phenomena. "Discrimination in Railway Rates" is thoughtfully and competently treated by Mr. Gerrit L. Lansing. An interesting address on "Acclimatization," by Prof. Rudolph Virchow, is published. Dr. F. L. Oswald shows how instinct may be regarded "As a Guide to Health." "Women in Astronomy," by E. Lagrange, is a short but interesting article translated from the French, mentioning the names and work of various women in astronomy, but, curiously enough, omitting from the list the names of Mary Somerville and Maria Mitchell. With a few shorter articles and papers of a more miscellaneous character are given two biographical sketches, with accompanying portraits, the subjects being Dr. William B. Carpenter, the famous English physiologist who recently died, and James B. Eads, the constructor of the St. Louis Bridge. The editor discusses standards of truth under the title of "Beecher's Position on Evolution."

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

The Religion of Philosophy; OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. FRANK. New York: G. P. Putnam's Sons, 27 and 29 West 23d Street. London: Williams & Norgate. 1885.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

SCIENTIFIC THEISM.

BY FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOOSMIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Primitive Mind Cure; or, Transcen-

denental Medicine.
By Dr. W. E. EVANS.
A comprehensive treatise on the cure of
diseases in ourselves and others by mental
agencies. Dr. Evans stands a peer among
the learned philosophers of the day, and
more than any living person gives valuable
practical knowledge on the "mind-cure."
Extra cloth, \$1.50. Postage, 9 cts.
SANITARY PUBLISHING CO., Chicago.

THE PATRONAGE of the liberal adver-
tising public is respectfully solicited for
THE INDEX. Though the paper must not be
held responsible for any statements made
by advertisers, the attempt will be honestly
made to keep the advertising pages in en-
tire harmony with its general character and
principles. To this end, all improper or
"blind" advertisements, all quack adver-
tisements, and all advertisements believed
to be fraudulent or unjust to any one, will
be excluded from these columns.

SCIENTIFIC THEISM.

—BY—

FRANCIS ELLINGWOOD ABBOT, Ph.D.

SECOND EDITION JUST READY.

12mo. Cloth. 242 pages.

Sent, postpaid, on receipt of \$3.00.

"The main purpose of the book is to show
that modern science, philosophically inter-
preted, leads not to theism, not to Agnos-
ticism, not to Idealism, but to a *Realistic*
Spiritual Theism, which will satisfy both
'head' and 'heart.'—(The Author, in the
New York Nation, Oct. 22, 1885.

"The American philosophy will, therefore,
be a *REALISM*, opposed to *IDEALISM* on the
one hand and to *AGNOSTICISM* on the
other."—[President James McCosh, in the
New Princeton Review, January, 1886.

"It may be we shall find that Christianity
itself is in some sort a scaffolding, and that
the final building is a pure and perfect
theism: when 'the kingdom shall be deliv-
ered up to God,' that 'God may be all in
all.'—[Rt. Hon. W. E. Gladstone, in the
Nineteenth Century, January, 1886.

"This work, by one of the first living
minds, is a profound attempt to place the
ism on the immovable ground of modern
science."—[*Montreal Star*.

"Only once in a great while does a work
of such moment appear."—[Rev. Francis
Tiffany.

"The great Darwin gave us the right
method of studying visible Nature: Dr.
Abbot extends the theory and method to
the universe, to the human mind, to God.
Such a book should make an epoch in the
intellectual history of our country. The
book is a very great performance."—[*Boston*
Beacon.

"It bears evidence throughout of wide
reading and close thinking; every page
throbs with brain-force. . . . It is a master-
ful treatment of its high theme, and can
but have great weight toward the establish-
ing of the religious philosophy that is to
come as the product of science,—of science
in its large sense, as applied to the whole
universe of matter and mind. . . . It has
science at its back; and with that support,
its leading ideas will, we believe, eventually
win the battle."—William J. Potter, senior
editor of the *Boston Index*.

"*Scientific Theism* is one of the great
books of our generation."—[Rev. N. F. Gil-
man, in the *Boston Christian Register*.

"It is, however, a strongly characterized
and scholarly piece of work, doing honor to
American thought; and it is much to be de-
sired that the world should see the system
developed in its entirety."—[*The Nation*.

LITTLE, BROWN & CO.,
254 Washington Street, Boston.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E.
Abbot, contains the "Fifty Affirmations"
and "Modern Principles." This especially
has received great commendation from
most distinguished men for the logical
clearness of its statements. New Edition.
Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B.
Frothingham, exposes the debasing char-
acter of the popular notions of God, and
presents conceptions of him that are wor-
thy of the nineteenth century. New edi-
tion. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the Rev.
Charles Voysey, of England, is an over-
whelming demonstration of the imperfec-
tions and errors of the Bible, both in the
Old and the New Testaments. New Edi-
tion. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F.
E. Abbot, is an exposure of the weakness,
costliness, and inefficiency of the System
of Foreign Missions. *Full of Figures,*
Facts, and Interesting Extraneous. Price 5
cents; 30 copies, \$1.00.

No. 5.—*"God in the Constitution,"* by
Rev. Arthur B. Bradford, opposes the
proposed Theological Amendment to the
United States Constitution. Price 5 cents;
30 copies, \$1.00.

bury, denounces Sabbatarian superstition.
New Edition. Price 5 cents; 30 copies,
\$1.00.

No. 7.—*"Compulsory Education,"* by
F. E. Abbot, maintains the right of every
child to be educated, and the duty of the
State to ensure it an education. Price 3
cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B.
Frothingham, treats of a subject that in-
terests everybody. New Edition. Price 3
cents; 20 copies, 50 cents.

No. 10.—*The Impeachment of Chris-
tianity*, by F. E. Abbot. 5 cents a doz.

Address
THE INDEX,
44 Boylston Street, Boston, Mass.

FOR COLDS
COUGHS
and Consumption use Cutler
Bro's. & Co.'s celebrated *Vegeta-*
ble Pulmonary Balsam. "Best
medicine in the world." In use
60 years. Price \$1.50, and 35c.
\$1 bottle the cheapest. Be sure
and get the genuine.

"FREIDENKER."

Freedom, Culture, and Prosperity for all!

(Organ of the Freethinkers of North Amer-
ica, of the Union of Radicals, and the
North American Turnerbund.)

Editor, C. Hermann Eppes.

TERMS, PER ANNUM, IN ADVANCE:

UNITED STATES AND CANADA:
Freidenker..... \$2.50
Turnerische Ausgabe des *Freidenker*
(*Amerikanische Turnzeitung*)..... 3.00
EUROPE:
Freidenker..... \$3.00
Turnerische Ausgabe des *Freidenker*
(*Amerikanische Turnzeitung*)..... 3.50
Sample copies sent, on application, free of
charge.

In this weekly, which is now in the thir-
teenth year of its existence, political, social,
and religious matters are discussed with a
view to general enlightenment and progress.
The *Amerikanische Turnzeitung* is especially
devoted to the discussion of topics pertain-
ing to physical culture and matters of in-
terest to lovers of the gymnastic art.

Since Jan. 1, 1885, the *Freidenker* has been
enlarged, thus furnishing CONSIDERABLY
MORE READING MATTER, WHILE THE PRICE
REMAINS THE SAME AS BEFORE.
For the convenience of those of our read-
ers who are chiefly interested in matters
relating to gymnastics, the *Freidenker* and
its former supplement, the *Turnzeitung*,
have been consolidated into one paper,
called *Amerikanische Turnzeitung*, with the
sub-heading "Turnerische Ausgabe des
Freidenker."

This paper contains more reading matter
than furnished by both the *Freidenker* and
Turnzeitung heretofore. In making these
changes, the publishers have incurred great
expense; and we therefore solicit the hearty
co-operation of all friends of the cause in
securing for the *Freidenker* and the *Ameri-*
kantische Turnzeitung a wider circulation.

We also publish

"Erziehungsblätter,"

fuer Schule und Haus.

A Liberal German Educational Monthly.
(Organ of the German-American Teachers'
Association.)

Editor:
MAXIMILIAN GROSSMANN, Milwaukee, Wis.
Associate Editors:
H. H. FICK, Chicago, Ill.
H. SCHUBERT, Chicago, Ill.

16 large quarto pages, with four-page cover.
Terms: \$2.12 per annum, in advance.

"Freidenker-Almanach"

FOR THE YEAR 1886.

The almanac, which is now in the eighth
year of its existence, is devoted to the prop-
agation of free-thought principles. Price
25 cents.

"Amerikanischer Turnerkalender"

FOR THE YEAR 1885.

This annual, which is now published for
the sixth time, is principally intended to
promote the culture of gymnastics, and is
permeated by a thoroughly liberal spirit.
Price 25 cents.

Orders for all kinds of books promptly
filled. Radical and Freethought Publica-
tions a speciality.

Address all orders to
FREIDENKER PUBLISHING CO.,
470 East Water St.,
MILWAUKEE, WIS.

HORTICULTURAL HALLS (both Floors).

Limited Season only. A veritable

JAPANESE VILLAGE.

A Colony of Japanese Men, Women, and
Children, in native costume, daily
illustrating the

Art Industries of Japan.

Receptions, 10 to 12, 1 to 5, 7 to 10.
Adults, 50c.; Children, 25c.

CURRENT TOPICS.

BY B. F. U.

AN intelligent Hindu heiress, who was married when a baby to a boy whose bad habits are now notorious, has refused to go to him, and has been sustained in her refusal by the courts.

THE Butler (Penn.) *Citizen* states that a man of that town who sent twenty-five cents to learn how to make \$50 a week at home, working on a capital of \$1, received the following printed reply, "Fish for fools, as I do."

THE fact that Carlyle's old house at Chelsea has fallen into the hands of the proprietor of a quack medicine, and that no word has come from Carlyle in regard to the matter, is decidedly against the belief that those whose earthly life has been extinguished can communicate with this world.

THE *Presbyterian* observes: "Half the churches who talk about the masses have no place for them if they would come, unless it might be the short pews under the stairs, or a few dusty pews with faded cushions, or none at all in the gallery." The "masses" understand this,—a fact worth considering by the church leaders who ask, "How shall we reach the masses?"

FROM the Springfield *Republican* we take this paragraph: "If Chinamen are driven out and outraged here," says Ching Hoy, the Chinese consul at New York, "why can't our people drive out all Americans from China?" And he might also ask, "If China has paid over \$700,000 for injuries done Americans in China, why cannot she in turn ask America to pay for the outrages practised upon Chinese in America?"

AT the recent opening of Parliament, after the passing of the carriage containing Princess Louise of Wales with her father and her brothers, a youngster at Westminster Boys' Corner exclaimed warmly, "Dooood fine girl, that!" an opinion instantly confirmed by all the boys who heard it, with one exception. A little fellow, who had no regard for the "consensus of the competent," discounted the beauty of the young princess by the independent remark that the young lady wasn't "a patch on her mother."

WORDS like the following from an orthodox paper—the *Interior*—indicate progress: "Crime is as much the natural outcome of the nature as charity. It used to be quite the thing to ask criminals in the penitentiary to what they attributed their evil career. In that way, statistics against lying, disobedience to parents, Sabbath-breaking, etc., were obtained in any quantities desired. But the low brow, the heavy jaw, the malignant eye, did not take their form and expression from stealing peaches on a Sunday night."

MISS SUSAN H. WIXON writes to the *Investigator* from Fall River, Mass.: "The world moves, as you will say, when I tell you that the birthday of Thomas Paine, the immortal hero of the Revolution, was celebrated by an address in the Unitarian church in this city, Rev. A. J. Rich, pastor. I have never heard more ringing words in honor of that great patriot and lover of human rights than fell from the lips of Mr. Rich on the 31st of January. This seems in order, too; for if Paine's religion places him anywhere, with any society or body whatever, it is with the Unitarians, and that he has been neglected by them so long is a marvel."

"A BEAUTIFUL example of the results of the union of Church and State," says the London *Truth*, "was exhibited at Chester last week. When the Prince of Wales was staying with the anti-debauchery Duke of Westminster, he attended the cathedral service on Sunday. The cathedral authorities were so overwhelmed with this instance of condescension that, when the prince left, the clergy and choir lined his path through the cathedral to his carriage, as if they had been so many policemen. This touching combination of the service of God and Cæsar is truly characteristic of our Established Church, and I sincerely trust that the chief performers will get all the promotion they deserve. It is quite certain that no other Church in Christendom would have been guilty of such a blasphemous piece of flunkeyism."

PROF. DANA, in his sixth lecture on evolution at Yale College, if reported correctly, said in substance: Darwin holds that man descended from a species of apes now extinct, but other naturalists hold that the different races of men came from different species of apes. We agree with Darwin that all men must have descended from one species. The likeness of man to the ape in structure is so marked that it is evident that both may have descended from the same ancestors. The form of the head of a young orang-outang is nearly like that of an infant. If man has descended from apes, it must have been from a long series of ancestors. The creation of a being with a soul must have required a divine fiat, although by evolution man may have come from lower animals, but needed help from God to complete the work. The difference between varieties and species is only a difference of degree. Permanence of species may make the variation of species by natural laws very doubtful, and some species are known to have lasted a great length of time. How long would it

take, then, to evolve from the lower animals to man? Darwin says the geological record is broken sometimes for millions of years, and here he is right. The geological record is all against the degradation of species. The cases of gradual transition brought to our view by geology are few, and go to prove the theory of evolution. Geology does not give its support to gradual variation, as it ought, on account of its broken record. The fact that the general system of progress in nature is a system of evolution is shown by the change from the lower to the higher. The living forms of the younger world correspond with the young of the modern world.

"ONE of the most useful features of the recent progress of the 'organization of labor' in the United States, particularly in this city," says the New York *Herald*, "is the multiplication of workmen's clubs, in which questions of all kinds touching workingmen's interests are publicly debated. Scarcely a week passes without reports of such debates in the city columns of the *Herald*. Sometimes, demagogues take advantage of the opportunity; but, generally, the speakers are sincere, thoughtful, and instructive. Our observation is that the New York workingman is quite as quick as his employer to detect a demagogue,—frequently, much quicker."

THE National Woman's Suffrage Association, of which Mrs. Elizabeth Cady Stanton is President, held its eighteenth annual convention in Washington, D.C., on Wednesday, Thursday, and Friday, the 17th, 18th, and 19th of February. Mrs. Stanton was detained at home by illness, and Miss Susan B. Anthony presided in her place. Very gratifying reports of progress in the movement were made from many States, and a vigorous plan of work for the coming year arranged. Among the speakers who addressed the convention during its various sessions were Miss Anthony; Mrs. Clara B. Colby, of Nebraska, editor of the *Woman's Tribune*; Madame Clara Neymann, of Philadelphia; Miss Ada C. Sweet, of Chicago, the expansion agent; Mrs. Helen M. Gougar, of Indiana; Mrs. James Bennett, daughter of Cassius M. Clay; Mrs. May Wright Sewall, of Indiana; Mrs. Virginia L. Minor, Miss Mary F. Eastman, and Mrs. H. R. Shattuck, of Massachusetts; and Rev. Rush R. Shippen. The longest discussion was on the church resolution of last year, drawn up by Mrs. Clara B. Colby, and presented by Mrs. Stanton, which had been laid over for consideration until this year. Mrs. Marilla M. Ricker advocated the resolution. Mrs. Perkins, of Ohio, and other ladies opposed it. Mrs. Meriwether offered as a substitute a resolution protesting against the imperfect construction of Biblical teachings, and urging women to read for themselves, and not trust to masculine interpretation. She claimed that the Bible was full of arguments for woman suffrage. The whole subject was referred back to the committee. A stirring letter, *apropos* of this subject, was sent by Mrs. Stanton, which we hope to make room for in our next.

ALL THE FACTS.

In the manifold problems, both thought-problems and conduct-problems, which the human mind has to settle, the thing specially desirable is to secure fairness and fulness of judgment; and, to secure fairness and fulness of judgment, all the facts concerned in the problem must be considered. To look at all the facts is, indeed, one of the chief duties of mankind, in order to arrive at correct thinking, correct feeling, and correct action. In the affairs of daily life, people are constantly leaping to conclusions from the half-facts of some broken chain of evidence; and these conclusions are hastily transformed into acts. Then, too late, they discover their mistake. The heedless haste of observation and inference becomes a wrong and a shame. They are led into gross injustice to other persons, and they involve themselves in confusion and disaster; and all because they have not followed the logic of all the facts.

The extent of this principle is very wide, and its application to ethical, political, and social matters might be profitably traced; but we here confine ourselves to its bearing on religious problems. Mr. Gladstone, in the intervals when he is not adjusting and regulating the affairs of empires, is in the habit of recreating his imperial mind by excursions into the realm of theological discussion. But, unfortunately for the value of this vacation-work, these intervals when the weight of empires is not upon his shoulders are so rare and brief that it is impossible for him to have kept pace with the great accumulations of knowledge that have been made in the last half-century upon the religious questions he is fond of treating. Prof. Huxley, for instance, has shown that Mr. Gladstone's recent article in defence of the scientific validity of the story of creation in Genesis betrays a strange ignorance or ignoring of "facts of the commonest notoriety" stated in any "respectable modern manual of paleontology or geology." Mr. Gladstone's chief authority for the pivotal scientific proposition of his article is Cuvier,—a great authority for his time; but Cuvier has been dead fifty-four years! And since his death, as Mr. Huxley says, "not only a new world, but new worlds, of ancient life have been discovered"; and these discoveries overthrow Cuvier's authority entirely for the statement which Mr. Gladstone makes concerning the order of creation. And yet, because of Mr. Gladstone's great position and repute as a statesman, there are multitudes of people who will regard his judgment on this religious question as authoritative, even though he has ignored the most important facts on which a judgment should be formed.

This founding of conclusions on only a part of the necessary facts has always been specially prevalent in the domain of religion. Religion covers the whole extent of the relation between man as a finite and derived being and the Infinite Power and Life of the universe whence he is derived. All mankind have attempted, in some form or other, to give an expression of their sense of this relation. Thus, contemporaneously with the growth of every historic people or nation, there has developed a religion; and all these religions together, by their differences as well as their unities, constitute the voice or testimony of mankind concerning these relations to the Infinite Power and Life. Yet nearly every one of the great religions has claimed to be the only true religion,—has declared its facts to be the only religious facts worthy of consideration, and denounced the claims of other religions to be impostures and falsehoods. Within the limits, too, of the single relig-

ions, sects have claimed, again, that they each had the true facts, the whole truth, and all the truth, and that the claims of rival sects were false. Thus, pious men and women have thought that their little creed contained all the facts known or that could be known concerning Deity and human destiny.

This provincialism in religion is, however, now vanishing. The claim that any one religion, be it the oldest, the latest, or even the best, contains all of religious truth, and that no other religion reveals anything true, is becoming obsolete. The scientific and philosophical view of religion that is finding acceptance among scholars and thinkers to-day—that is gradually gaining recognition even among evangelical Christians, both Protestant and Catholic—is that all the facts of all the religions are needed to tell what religion is; and that even then, so far from the sources of religious truth being exhausted, those sources are shown to be of perennial vitality, and are still producing religion on the earth. All the races and nations, whether Christian or pagan, and all the ages, ancient and modern, and all the prophets and Scriptures, whether Jew or Gentile, and all the world, of matter and mind, are needed to give the facts of religion. And yet, having all this, we have but mastered the alphabet to a sphere of knowledge that is as infinite in its scope as it is personally searching and penetrating in its application to all the details of daily conduct and life.

There are two errors on this subject that are especially common. On the one hand, the old-fashioned, narrow theologian says that the facts of religion have all been supernaturally revealed, and that he has got them safe in his creed: God and his attributes, the three holy persons in one Godhead, the creation and fall of man, the scheme of man's redemption and salvation, the eternal heaven for the saved, the endless hell for the lost,—there you have, he urges, the all-important and absolutely necessary religious facts, as gathered from the Bible. On the other hand, a materialist of the old-fashioned school says that he has looked the world all through, and that it all resolves itself at last into material atoms and material forces: thought is the result of a brain-function, just as bile is produced by the action of the liver; soul is only a word for something which has no actual existence; there is no occasion anywhere for the being called Deity, and no immortality; and hence, strictly speaking, there are no religious facts at all. Of these two representative dogmatists, occupying such antagonistic positions, it may be hard to say which holds the narrower view. Both of them are antiquated in their mental attitude, and it may be safely affirmed that neither of them has considered all the facts of the universe that are open to human knowledge. Even physical science is now teaching a broader philosophy. For it describes matter, to use Tyndall's phrase, as all athrill with "potency," or the mystic principle of Life; and, though it does not venture to declare all the attributes or the origin of this mighty principle, yet it bids people be as modest in their denials concerning it as in their affirmations. In the material universe itself, science is disclosing facts so wonderful, so majestic, so fraught with power and beauty, and so far-reaching in space and time, that all the theological creeds and cosmogonies are belittled before them, and the human mind might well be awed in their presence into silent and worshipful adoration.

Touch human life, indeed, at any one of its innumerable points, and it is needful that all the related facts be fairly included and considered, in order that character may develop into its proper

fulness and richness. Human facts, looked at from one side only, have, it is true, the taint of finiteness upon them. They are fragmentary, imperfect, broken, at war with each other. Standing alone, they are purposeless,—a pitiful cry, as it were, with no answer. But they do not and cannot stand alone,—no more than the smallest asteroid can exist and float in space without the solar system, of which it is a broken part, and which still holds it even in its eccentric orbit. Without the whole universe beneath and around him there were no man. All the facts of human life, finite, fragmentary, imperfect, inharmonious as they are, point and round upward into the full, infrangible, and perfect circle of Infinite Being. Beneath and above all finite facts is one Eternal Fact, cause, sustenance, and significance of them all; the everlasting Reality, without which there were no phenomena and no humanity, and with which every human thought and feeling and act has to do. It is this Supreme Fact which all the religions have tried to hush under some name of Deity.

WM. J. POTTER.

SENSIBLE KNOWLEDGE.

What are the nature and significance of our sensible experiences? This question Mr. Underwood has for weeks been answering in *The Index*, giving the accepted evidences and authorities on the subject; and, doubtless, he has more to say in the same line. I wish to add a few words to the discussion, in especial relation to the article of D. A. Wasson in *The Index* of February 25.

There is a common ground to this discussion; and the combatants should all stand on it, and here do their fighting. This common ground consists of the facts of experience. We differ only in our theories, which should be justified by the admitted facts. Let it then be agreed, to start with, that, whatever our theories, our sensible experiences follow the same laws, and are so far the same; that, therefore, the idealist never questions the existence of sensible objects, their relations to each other and to their subjects, as sources of pleasure and pain; and that they are the same to both or all parties. All this has been conceded by the ablest opponents of idealism, but forgotten or overlooked by inferior writers or minds less instructed in these lines.

Whatever be the causes or the reasons, the theory which affirms that all the objects of sense are subjective states has gained general ascendancy over the convictions of philosophic minds in modern times. The author of *Scientific Theism* stands alone on this subject, because he stands on a special theory of his own elaboration, which requires his peculiar sub-foundation. This book throughout is an implicit confession of this, while direct confessions of it fill many pages. (See his Part I., *Ibidem*.) He has also confessed the same in *The Index* of July 20, 1882, where he says, "If agreement has been reached on any one point by speculative thinkers since the modern period began, it is on this fundamental principle of cognition: that the individual mind knows only its own states of consciousness." We shall therefore consider that we are agreed on the question of authority as well as on the nature of the question at issue. It may be observed that, since the authority on one side is so great, and since it has originated in scientific times and conquered the convictions of even physicists of the first class, and since it is a theory which opposes all our natural prepossessions, the presumption is very strong that this theory is correct; and it is certain that it cannot be easily overthrown, and that the opposite theory can command small respect from

speculative thinkers till it has furnished far better justification than it has yet done or promised to do.

On our way to the direct study of the question, we ought to agree on our spirit and method. On both sides, we ought to guard against slandering a theory, as a preliminary to an impartial and dispassionate study of its claims to our respect, as such a procedure does not appear the straight road to such a goal. It may be allowable to call an opposed theory "a dreary doctrine," if that is the honest feeling of the writer. But it proves nothing, because tastes differ. That dreary doctrine has become to me all luminous and sublime, —a thing of beauty and a promised joy forever; and this feeling arises from a special and prolonged study of it.

But we cannot make the same allowance when the theory is described as saying that "life is a dream from which there is no awaking," and that "the conscious individual is alone in a phantom world, peopled only with phantoms," —a "world of illusion," filled with "illusive projections." Still less can we do it when told that "subjectivism rests upon two propositions: first, that the human mind has no faculty of perception, but only a faculty of mock perception; secondly, that the states of consciousness into which the universe is resolved are false," or when told that it denies that any "real object is perceived." Those who write in this way seem to have only a very confused idea of the difference between phantoms and facts, between illusion and reality, and between true and false perception and other states of consciousness.

Now let us take an example in words furnished to our use: "I look from a window and see a two-story white house, with green blinds, on the opposite side of the street. . . . What, then, is this state of consciousness? It is simply an affirmation to the effect that a house is perceived by me, the conscious person. What is true in this case is true in all cases; states of consciousness are simply affirmations of fact." Perfectly correct. But now what is the affirmation of fact here? That there is a house? House is only a word which designates the fact or, rather, sensible object so named. Now what is that sensible object called a house? It is nothing more than a combination of colors; and it is the A, B, C of the science of the senses and their objects that colors are nothing but sensations, visual sensations. The visible object is no illusion, but is a real object, because it is sensible, and comes and goes in the normal way; and, for the same reason, it is a real perception which constitutes the conscious act, affirming that the "house is perceived by me, the conscious person. What is true in this case is true in all cases; states of consciousness are simply affirmations of fact." And the converse is equally true,—that known facts are simply states of consciousness, and that the affirmations of fact affirm no more.

The visible house is visible only, not audible or tangible or known in any other way than visually. Nor does it give any information whatsoever beyond itself as a visual affection or experience. It does not tell us anything about its solidity or tangible distance, for instance. We must find out this by another experience, the muscular. When we have done this, we have found out only certain relations of this visual experience to the touch or muscular experience. We have not touched the visible house, but only the tangible. On the other hand, we do not see the tangible house, as is well proved by the fact that pictures are often taken as being associated with tangibility; and the reflection of the moon on the water is grasped at by the child, because it appears just

as solid as any other visible object. So the dog goes for his own reflection in the mirror. Tangible distance, too, remains undisclosed by sight, so that children often stretch out their arms for the moon, expecting to reach it.

The visible house, then, while it is certainly known as a sensible object,—that is all we know of it; and that is to say that all we know is that we are the subjects of this experience. All this was thoroughly expounded by Berkeley, in his *New Theory of Vision*, one hundred and fifty years ago, and no competent man after investigation has ever been able to dispute his exposition; and, to-day, it remains unchallenged and universally regnant. And we here recall it, not for defence of it so much as a reminder that dogmatic opposition to it is very greatly discredited in advance.

In reviewing the classes of arguments in favor of subjectivism, Mr. Wasson has overlooked one of the clearest,—the comparison of spectral illusions with normal vision. These spectral apparitions are seen with the eyes wide open and directed toward the objects, as in normal vision. In some cases, these illusive spectra are a constant presence, and in other cases are present at intervals for hours together, and sometimes the ear is exercised as well as the eye, and that with a clear intellect and cool, deliberate observation and study of the phenomena. Now, what is the difference between these phenomena and what we call real vision? and how do we decide between them? Spencer answers in the word "persistence." One class has a persistence which the other has not. A fuller answer would be that the one class conforms to the laws of all the senses, and the other does not; and, in that sense, it is that the one class is more persistent than the other. They are quite as clear and objective as visual percepts; but one class is lexically connected with all the other senses, and the other is not. That is all the difference. Both are visual objects or phenomena, and both are subjective states, only the two classes have not the same connection with other subjective states or sensible experiences. *Unity of experiences is the only test of reality or illusion.*

W. I. GILL.

THE SOUTHERN PROBLEM.

III.

Third Stage.

Enforced conformity, the Northern answer to the national riddle, the Sphinx rejected, and, rejecting, devoured its victims. Might destroyed rebellion and freed the slaves, but it could not abolish the social system of the South. It was altogether impossible for it to replace the old by institutions cut and fashioned upon the Procrustean bed of either party selfishness or the best intentions. The extinction of old habits and institutions can be effected by no direct and violent measures. Their coming was a growth,—here a little and there a little. Their going will be a decline,—the snapping of a twig here, the dropping of a branch there, changes biting at the roots, changes gnawing at the core, until they fall before the breath and sway of some stronger life. After fever fits, this is the course by which social revolutions proceed.

The close of the second stage of the irrepressible conflict saw the restoration of the South to power. Its ascendancy over the old slave States was now complete. But its position was not precisely what it was in 1865. The convulsions of the Republican Reconstruction period had left ineffaceable witnesses behind. The former chattel in this interval had become a citizen,—had exercised his

rights,—voted and been voted for, taken his place in the State and national governments. In his new character, he had filled a large share of public attention. His civil and political liberty had become a part of the fundamental law of the land. Here, then, was a fact, legislative and volcanic, whose existence must be admitted, and whose plan must be noted upon the political chart of the South. The formal recognition of the results of the war the South, therefore, no longer withheld. It felt the urgency of adapting itself to real rather than imaginary circumstances; to the situation as it was in 1877, not as it was in 1865. But, although this recognition of the new fact was on paper, and from the teeth out, it was not without value; it was, in one view, of considerable value. For did it not imply that the new principles had touched the groundwork of Southern institutions and risen to the surface of its conscious life? When action contradicts profession, we have in the contradiction the germ and potency of moral growth; a sort of nebular conscience by which a community—some part, surely—will some time seek to bring its conduct and performance into agreement with its promise and profession. This departure of the South was significant, not because it denoted an advance, but a turning, willing or unwilling, toward the right quarter. Direction in social and political movements, as in navigation, is of the utmost consequence. Let it be right, and there need be no thought or fear for the morrow. The morrow of nations as of individuals, according to eternal laws, will, in that event, take care of itself.

The South, at this juncture, was confronted by a fact which it could not ignore. But, because it was unable to ignore, it was no reason why it should not control or nullify it. The method of its attack thereupon changed. Universal lawlessness slowly gave way to the reign of craft and deception. Systematic frauds upon the ballot succeeded to organized violence against the same. Now, bad as it certainly is, organized fraud is yet an appreciable advance upon organized violence. We do not mean that the South has at any time entirely renounced the use of force in executing its purpose,—not at all,—but that it has preferred, during recent years, to reach its object by fraudulent rather than forcible measures. We are justified by this analysis in saying, therefore, that the revolution does not go backward.

But there is another circumstance which opened the door of the South to an invasion of a different kind. The desire for position and power more than any cause separates men in a republic into parties. The passion to rule is, perhaps, the most persistent and constant in a land of free institutions. Like the wind, it passes over the smoothest sea, and it is forthwith roused into climbing and struggling numbers. Nothing stays its steps but a sense of overwhelming public danger. But, with the re-establishment of confidence, the revival of a feeling of reasonable security, the powerful principle begins to work again.

Now, after the restoration of the South, there followed within a few years, as a matter of course, this sense of reasonable security. But, as soon as this happened, the strife for office commenced. It broke out in different and distant States,—sometimes for municipal leadership, sometimes for State control, sometimes for congressional honors. As a consequence, there appeared in Southern politics an independent element, united to the Bourbons in maintaining the general policy of the restoration, but divided from them over the distribution of the spoils. The solid South was steadily dissolving under the heat and friction generated by this contest, when the national elec-

tions of 1884 operated as a temporary check by throwing the federal offices in the South into the hands of the Democratic party. But the remarkable firmness and independence of the President will in time operate as an offset to this slight reverse. The non-partisan character of Mr. Cleveland has blasted many hopes. It is possible that the close of his administration will witness the rise of a new party in the South. The negro, in such an enterprise, becomes a factor of the highest value. And this we know means for him ultimate political freedom.

Besides this independent there is a liberal element mingling with and modifying Southern society. Mr. Cable calls it the Silent South. It no longer shapes its opinion by the ancient standard. Implicit belief in the old has gone. This class is now doubting, trying, condemning it by new ideas and measurements of right. It is the remnant which is first to perceive the contradiction between what is and what ought to be in a State. Thus quickens the moral sense of the South; and, like the young child born nineteen hundred years ago, it will yet bring peace and good will among multitudes by helping to place as the chief of the corner of the social fabric of the new South the enduring strength of the Golden Rule.

Hard as the saying may appear, it is, nevertheless, true that the Democratic party of the North has turned its back on its dead past, and stepped into the living present. It no longer masquerades in the grave-clothes of ugly principles and uglier prejudices, is no longer a horror, an infernal anachronism, squeaking and gibbering at every footprint of justice in the Republic. The everywhere striving spirit of the Revolution has striven nowhere in vain. Northern Hunkerism at last serves it. This service is none the less valuable because inspired by party selfishness. Indeed, it derives special significance from this consideration. For its performance becomes then as regular and uniform as the ebbing and flowing of party tides, the rising and setting of party suns. Every hand in the North which holds a ballot holds also a beacon, by which politicians shape their course. There is no short, direct road to office in a republic. The path of parties is a zigzag between two termini. Like the railroad, they have a variety of interests to consider,—much freight to take on, a diversity of people to accommodate. The city on the hill they must visit, the town in the valley they must look to. Wherever there is a mine, factory, or farm, they must fling out their feeders. The wants of all must be provided for,—ay, no spot where a vote may be got can be neglected with impunity in the sharp competition of rival parties.

The colored vote of the North becomes, therefore, an interesting object to the Democrats. Its solid support has more than once decided an election in favor of their Republican rival. The result in 1880 was plainly determined by this then despised power. The Republican majorities in that contest, in the States of Connecticut, New York, Pennsylvania, Ohio, and Indiana, were so narrow that the shifting of their colored vote to the side of the Democratic party would have defeated Garfield and Arthur. This discovery was an eye-opener. Democratic love of office proved stronger than Democratic hatred of the negro. For that party presently began to unload its objectionable sentiments, and lay in a supply of liberal ideas,—to trim and tack,—with a view to capturing this strategic point in 1884. Gov. Waller cultivated Africa in Connecticut, Gov. Hoadly cultivated Africa in Ohio, Gov. Abbott cultivated Africa in New Jersey. This new Democratic in-

dustry was pushed with a vengeance wherever there was a colored patch on the Northern field. The little bird sang West, and the little bird sang East; and capital music the little bird made, too. Democratic governors and Democratic legislators struck sturdy blows against proscription and for equality before the law.

This Democratic change of front is of no slight consequence. For the triumph of the principles of the Revolution in the North accelerates its progress in the South. What one wing of a party not only promises, but performs, upon a given subject, must exert an appreciably increasing influence upon the policy of the other upon the same subject. Through this reflex action of the movement, then, we may confidently look for the growth of liberal ideas and institutions in the South. Here is another of those agencies which are conspiring to abolish the Southern social system and solve the Southern problem.

A. H. GRIMKE.

PEACE OR A SWORD?

The Christian dispensation is always said among us to have come through some spirit of peculiar equity. In contrast, the spread of Mohammedanism is usually attributed to physical coercion. Christianity, therefore, represents freedom, while Moslemism implies tyranny; or, considered in another way, the former stands for the spiritual, and the latter for the material, in religion. It is not strange that such a denial of natural relationship has become current; but it is by all means desirable that the mistake it infers may not have everlasting life.

Now, in order that we may come to the conclusion accepted in Christendom, we must forget much that is historically indubitable. Inquisitions, banishments, exiles, wars, murders, *autos-da-fé*, tortures, however unquestionable, must be wiped from before the vision, and be foresworn, in the investigation of truth. Very vital facts, by a process of moral and intellectual legerdemain, must be converted into very absurd illusions. Who can mention Hypatia, the Moors, the Jews, the Hindus, the Indians, without a shudder of racial shame? Who can think of Spain, Italy, India, England, America, and not feel that history has bared a story with which Christianity, in its earlier stages, was hopelessly involved? And yet, whatever the thought these memories instinctively suggest, we are asked to look and discover no black meaning, to listen and hear no sound!

If we come into modern days for illustrations, we find little difficulty of search. England has entered Burmah, Egypt, India, and some of its island provinces, to spread peace and spur enlightenment. It calls its method civilized, and reads its warrant from its national creed. It indulges its dull, dead, cruel acts of conquest under disguise. Here is the great Jesus as our security,—Jesus, the gentle, who never raised willing hand to set races up one against another! We are shocked. Shall we try to eliminate the human element from a religion, and then parade its very vices as virtues? To the unthinking man, logic has no difficulties. From Jesus to perfection argues but a step: from Mohammed to the unpardonable sin argues but another. The truth must be so, because men will have it so. The means that propagated the Moslem faith must have been base, if the Christian theological assumptions are true; and they are true. The different energies of growth were not the same in kind: the difference was necessarily of nature rather than of degree.

"Christian" disposition may mean a thousand

and one things. To an English aristocracy, it signifies a proper subjugation of Ireland. To Bismarck, it is written in a defence of the German Empire. To a papist, it lies in the subjection of all spiritual powers to Rome. To the British in Egypt, it enfolds a justification of the theft of the land from its natives. To the American, it is recognized in the sweet dictum that "the best Indian is the dead Indian." And so on. Whether such Christianity compares favorably with militant Moslemism, one might reasonably pause to consider. Very little of that noble breadth which distinguished Jesus finds itself influential in the counsels of modern Christian States. Along with an excess of pretension there goes a deficit of substance. The "give-and-take" game takes in very few of those ethical principles which speak in explanation of the birth of Christianity.

I do not care to say that in the matter of swords there is any such peculiar nicety about that which is Christian as would make one prefer it so very anxiously to the Moslem. Nor dare I hide from myself the long list of crimes committed by cruel men in the name of Jesus. The facts of development show that the life of creed has its common course, whether projected in Eastern or Western, Northern or Southern lands. There may be differences in the intensity with which men push their decrees of propagandism, but the character of human arrogance has no more mysterious variation than these suppose. It is impossible to presume that the whole explanation of Moslem power lies in its military nature, or that Mohammed would have gone unattended to this day, had physical force never been exerted in his behalf. The secret, rather, must hide in some more occult manifestation. The Christian world has its own excuse for being; and, in venturing to make that clear, it is not necessary to discredit the credentials of every other faith. In fact, it is patent that Christianity can find its own genesis written larger or smaller in each one of the world's faiths. Carlyle spoke a word in reference to Mohammed, to which all later scholars who wish truly to grasp the significance—we might almost say, the intention—of history must pay some heed.

HORACE L. TRAUBEL.

UNKNOWN AND UNKNOWABLE.

In a previous article, we endeavored to indicate the real philosophical significance of the doctrine of the Relativity of Knowledge, to show that it does not mean simply, as Mr. Abbot claims, that "human knowledge is small and can be increased,"—a fact sufficiently evident independently of this doctrine,—but that all knowledge is and must necessarily be of a certain *kind*, relative; that it is not and cannot be knowledge of objective existence in itself, because it is the product of two factors, subject and object, of self and not self, the relation between which only makes knowledge possible.

The objective element in cognition cannot be detached from the subjective element, and, thus isolated, be observed or studied apart. Knowledge of the objective existence by itself is not therefore possible. What we know is the effects of the objective reality upon us, the states of consciousness it produces in us; and these necessarily depend both upon the constitution of the mind and the nature of the external factor. All feeling and all thought are the compound products of subjective and objective factors, neither of which can be studied or conceived separately. The chemist, as Lewes observes, having experience of an acid and an alkaloid, each apart from the other, can separate them when they are combined in a salt or

combine them when he finds them separate. "But such analysis or synthesis is impossible with the objective and subjective elements of thought. Neither element is ever given alone. Pure thought and pure matter are unknown quantities, to be reached by no equation. The thought is necessarily and universally subject-object: matter is necessarily and to us universally object-subject. Thought is only called into existence under appropriate conditions; and in the objective stimulus the object and subject are merged, as acid and base are merged in the salt. When I say that the sensation of light is a compound of objective vibrations and retinal susceptibility, I use language which is intelligible and serviceable for my purpose; but I must not imagine that the external object named vibration is the *Ding an sich*, the pure object out of all relation to sensibility, nor that the retinal sensibility is pure subject involving no vibratory element. Kant himself would assure me that the vibrations were as subjective as susceptibility."

The conception of ethereal vibrations, as we indicated last week, is an inference from subjective experience caused in us by what has appeared to the senses—sight or touch—as undulatory movement. What we conceive as vibrations among particles of matter produce in us sensations as different as sound, heat, and light. Can we say that there is an objective reality that bears any resemblance to either of these sensible phenomena, or in which there are distinctions like those between the conscious states produced in us? We cannot. We know the effects produced upon us, and can ascertain whether between these effects, these phenomena and our conceptions, there is uniform correspondence; but the pure object we cannot know, for we have and can have no experience of it. Knowledge consists in the classification of experiences. We observe distinctions existing between phenomena, and group together those that are similar. Anything newly discovered is known only when it can be classed with some other thing; in other words, only when the impressions it produces can be recognized as belonging to an existing group of impressions. "Whence it is manifest that a thing is perfectly known only when it is in all respects like certain things previously observed; that in proportion to the number of respects in which it is unlike them is the extent to which it is unknown; and that hence, when it has absolutely no attribute in common with anything else, it must be absolutely beyond the bounds of knowledge." Without distinction, which implies limitation, of course, knowledge would be impossible. All that we can compare and classify are phenomena, between which are distinguishable various degrees of likeness and unlikeness. These phenomena are effects produced in us by that which is manifested objectively as matter and force, and subjectively as feeling and thought. We can think of matter only in terms of mind, as, indeed, we can think of mind only in terms of matter. That of which both are manifestations cannot be known. "The antithesis of subject and object," says Spencer, "never to be transcended while consciousness lasts, renders impossible all knowledge of that Ultimate Reality in which subject and object are united."

There are, we are aware, those who, after making use of the doctrine of the relativity of knowledge to prove that we know only our conscious states, deny or question the existence of any objective reality that produces these states. But relativity implies object as well as subject, and would have no meaning unless there were existence, known only as it affects us and unknown as pure object. The statement that a house of a certain

size, form, color, etc., is what it is conceived to be only in relation to consciousness, implies that there is something beyond consciousness that exists *per se*, and that, as such, it is unknown. The statement that knowledge is relative involves the statement that there is absolute existence,—existence that does not depend upon our consciousness, and of which we know only its effects upon us. If, in asserting the relativity of knowledge, we do not postulate absolute existence, the relative itself becomes absolute; and that involves a contradiction of relativity,—the very indisputable doctrine by which the so-called qualities of matter are shown to be sensible phenomena.

An oyster is conceived as having some vague sort of consciousness of its environment. In this consciousness, man is not included. If we conceive the oyster as a creature out of whose consciousness we exist, is it not a trifle absurd to say that there is no objective reality; that our conception of the oyster, instead of being the product of the co-operation of the mind with an external something, is only one of the modifications of ourselves, uncaused by anything existing objectively; and that, therefore, the oyster exists only in our own minds? And other human beings than ourselves cannot be regarded as but so many modifications of our own consciousness. The truth is that, while we know directly only our own conscious states,—the material out of which is woven all thought,—we know by inference other human beings, although, of course, relatively only; and that which is not known is the Reality which awakens in us all similarly perceptive activity.

Mr. Fiske, who has fully grasped the doctrine of the relativity of knowledge, although a pronounced theist, says in his work, *The Idea of God*, "That Deity *per se* is not only unknown, but unknowable, is a truth which Mr. Spencer has illustrated with all the resources of that psychologic analysis of which he is incomparably the greatest master the world has ever seen."

The conviction "that human intelligence is incapable of absolute knowledge," says Spencer, "is one that has been slowly gaining ground as civilization has advanced. . . . All possible conceptions have been; one by one, tried and found wanting; and so the entire field of speculation has been gradually exhausted without positive result, the only result arrived at being the negative one above stated,—that the reality existing behind all appearances is, and must ever be, unknown. To this conclusion, almost every thinker of note has subscribed. 'With the exception,' says Sir William Hamilton, 'of a few late absolutist theorizers in Germany, this is, perhaps, the truth of all others most harmoniously re-echoed by every philosopher of every school.'"

The doctrine of the Unknowable is unwelcome to theologians and those theologically inclined, perhaps because it is opposed to all systems and theories based upon the assumption of the knowledge of God,—his nature, attributes, purposes, etc. It is opposed by others of anti-theological views, because, perhaps, they think, especially when they see Unknowable printed with the initial letter a capital, that it implies the existence of a God more or less like the theological conception which they have renounced. Both classes may, when they come to appreciate fully the reasoning by which the conclusion has been reached by men like Kant and Spencer, reconsider more carefully their objections, and adopt the view in which are united all that, in our opinion, is tenable in the affirmation of the theist with all that is warranted in the criticism of the atheist.

B. F. UNDERWOOD.

EDITORIAL NOTES.

BY B. F. U.

THE National Woman Suffrage Association of Massachusetts will hold its fourth annual meetings at the Meionson, in this city, on Tuesday and Wednesday, the 16th and 17th inst. Meetings will be held on Tuesday evening at 7.30, and on Wednesday at 2.30 and 7.30 P.M. Mrs. Lillie Devereaux Blake, of New York, will be the principal speaker. Others not yet announced will give addresses. Mrs. Dora B. Smith and Miss Fannie Worcester will give some appropriate recitations.

MRS. CLARA NEYMANN, well known to our readers as an enthusiastic agitator for woman's suffrage, delivered lately some lectures at Washington. A prominent lady of Philadelphia who was present writes to a Boston friend: "When in Washington last week, I saw Mrs. Neymann, and heard her deliver two addresses, which were unsurpassed by anything given at the Convention. She possesses true eloquence, and an earnest, attractive manner as well. She is a great acquisition to our ranks. I wish I knew her better, though it would not be needed for my appreciation of her. Miss Anthony was charmed with her, and her friends may well be proud of her able advocacy of this most important cause."

MR. J. W. CHADWICK has these sensible words in regard to the Sunday paper: "It seems to me that, if the churches cannot hold their own against the Sunday newspaper, the sooner they succumb, the better. I do not believe that those who do not go to church can be drawn to church by twisting the Sunday newspaper into a rod for their refractory backs; in other words, by taking it away from them. . . . I am sure that there are Sunday papers from which one might extract more of religious help and cheer than from the majority of Sunday services. But I would like to see them all more anxious than they now appear to be to set up a standard of decency and honor and consideration, to which the week-day paper might look, and be encouraged to improve its morals and its manners."

F. M. H. WRITES: "The *Freidenker* for February 21 discusses at some length the question whether Emerson can be brought up as an exception to Karl Heinzen's statement: 'America cannot show a single man who has brought the whole field of thought within his range of vision, worked out in himself the fundamental principles of intellectual and social life, and developed their results in all directions.' 'Americans, with all their ability and all their freedom of thought, have no idea of what we Germans call radicalism,—that self-mastering position of the human mind in the world of nature, that cosmical manifoldness, that proud disregard of consequences in laying bare the roots of all knowledge, and that power of comprehensive generalization which grasps all the laws of development in their mutual relations, and thus brings them into harmony.' It is true that America has no Herbert Spencer. Has Germany?"

A NEW YORK correspondent of the Boston *Herald* writes thus in regard to Col. Ingersoll:—

One of his friends was saying to me the other day that, whenever I saw Ingersoll announced to lecture, I could be sure that he needed ready money. "He hates to talk in public," said this friend, "and under no conditions has it ever been possible to induce him to contract for a season of public speaking. He can always be sure of drawing about \$2,000 a night in any of the large cities; and, of course, it doesn't take him long at this rate to pile up enough money to relieve his pressing wants. But, as soon as he is easy, he stops lecturing, and doesn't take it up again until

his monetary affairs require renewal. He could make \$60,000 in any three months of the winter period that he might choose to devote to this kind of work; and, as it costs him about that much a year to live, he might have an easy career of it, if he saw the utility of working steadily for any length of time. But he prefers desultory employment, and mixes his law practice with his lecturing, thus earning in all a very large though not steady income."

SAYS the London *Inquirer*: "The limitation of the hours of marriage from eight to twelve in the morning has often been felt as a practical grievance in rural districts, and among the working classes of our larger towns, who cannot always afford to lose a day's work. A Marriage Hours Bill, brought in by Mr. Carvell Williams, Mr. Richard, and Mr. Ince, enacts that, after the passing of the act, marriages may be lawfully solemnized between eight in the forenoon and four in the afternoon. The operation of the bill is confined to England and Wales. It applies to all marriages, wherever celebrated; but its primary purpose is to diminish the difficulties now experienced in country districts in securing the attendance of registrars at marriages in nonconformist chapels during the present prescribed hours,—difficulties arising from distance and prior arrangements. An extension of the time would be for the convenience of all parties."

JOSEPH COOK says: "Let us be thankful that Lotze's philosophy is coming to the front, and that agnosticism is declining. One or two in this country, formerly classed as Spencerians, are coming upon theistic ground. One of them seems to have discovered a Supreme Being, and is to be congratulated." Allusion is here made evidently to Mr. John Fiske. How he "discovered a Supreme Being," whether with a telescope or a microscope, is not stated; but he is "to be congratulated" on having discovered what "His Lectureship" has known all along. Mr. Fiske once characterized Mr. Cook as "a charlatan," since which time the latter has lost no opportunity to make a sarcastic remark in regard to his not over-courteous critic. Mr. Cook, having soon after the appearance of the article in which he was thus characterized returned the compliment by declaring that Mr. Fiske was the "echo of a charlatan" (Spencer), ought now, especially since said "echo" has "discovered a Supreme Being," to treat his brother in the theistic faith more fraternally. He should remember, too, that Mr. Fiske wrote in favor of theism, "cosmic theism,"—a phrase which Mr. Spencer never regarded with favor,—some years before his alleged recent discovery, and before Mr. Cook was known to a long-bearing and indulgent public.

REVELATION. *For The Index.*

How often light doth come to thee
From far-off heights thou canst not see,
And hope, to still thy doubt and pain,
Doth fall from clouds unseen as rain!
The force that speeds its subtle will
Defies thy fear and worketh still.

When worlds are hushed and skies are free,
And magic signs are hid from thee,
Love seeks not with unruly hand
To drive its boat upon the strand:
Out on the waters, it is one
With boreal wave and southern sun.

Though souls may find no question thrown
On fiery scrolls from the unknown,
There is a message still that leads
Unto the shrine of holy deeds:
Time's sacred seasons are not bent
To serve the meed of discontent!

Sweet is the day to duty pledged!
Grand is the life all golden-edged
From fire of human hearts! The flame
May guide the will from ways of shame:
To hungering trust, to loving thirst,
Doth Truth in aerial splendor burst!

HORACE L. TRAUBEL.

The Index.

BOSTON, MARCH 4, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, : : : : : } Editors.
BENJAMIN F. UNDERWOOD, : : : : : }

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole, nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all assigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

GIORDANO BRUNO.

BY THOMAS DAVIDSON.

On the 7th of January, 1865, the Roman students assembled in the Campo de' Fiori, lighted a fire on the spot where Bruno had been burned, and consigned to the flames the Papal Encyclical, published a month before. Then the hierarchy which had condemned Bruno remembered his prophetic threat and began to tremble. And it was time. Five years more, and Rome, by an overwhelming vote of its people, aided by the arms of Victor Emanuel, passed out of the hands of the pope and became the free capital of free Italy, whose freest and noblest men are now seeking to honor the memory of her martyred son with a statue, to be raised on the spot where, in the agonies of death, he turned away in anger from the crucifix.

Thus, though Bruno died a lonely, unpitied martyr, and his fame has grown but slowly, that growth has been very sure and continuous. All that it now requires to make it immortal is that his philosophical system should be made fully known to the world; and this, as we have just seen, is soon likely to be accomplished. When this takes place, it will be found that Bruno was not only a brave martyr, which men have often been for a bad cause, but that he was a martyr for the most sacred of all causes, the cause of pure truth. It will be seen that, instead of being a hot-headed dreamer, as he is slanderously believed to have been, he was one of the profoundest thinkers that the world has ever seen,—a thinker from whom we have even now much to learn, and who is destined to be the guiding star of future thought.

These are large claims, and I doubt not that to many they will seem exorbitant. I hope in what remains of my lecture to prove to you that they are not. What, then, were Bruno's views? What was there so opposed to the dogmas of the Church in them that the Church should think it necessary to condemn him to a cruel death? What, moreover, was there in them that justifies us in calling him a martyr, not only to truth, but to free thought? The answer to the first of these questions will involve answers to the other two. What, then, were Bruno's peculiar views?

These must be divided into two classes: (1) his physical views, (2) his metaphysical views. Let no one shrink when he hears that Bruno held "metaphysical" views. John Stuart Mill says that, until we have a metaphysics, we shall never be sure that we really know anything. And Bruno happily lived before the rise of the strangest of all superstitions, that crude dogma of Positivism, which, on pain of scientific anathema, forbids all men to have any dealings with the demon of metaphysics. In spite of this, when I was in Paris some years ago, Mr. Lafite, the present head of the French Positivists, told me that he was writing a book on the metaphysics of Positivism. I could not help asking whether his next book would not be on the theology of Positivism. He did not see the point of the remark; and, indeed, Dr. Bridges denies that the Positivists are atheists. Indeed, no scientific system that means really to explain anything can be without a metaphysics, since all explanation whatsoever is in metaphysical terms. At all events, Bruno was a metaphysician; but his metaphysics were very closely bound up with his physics, and indeed seem, in a great measure, to have had their origin in the impulse given to physical science by the then recent astronomical theories and discoveries of Copernicus.

Astronomical theories do not seem to bear very closely upon human affairs, and yet few things so much contributed to overthrow the mediæval ideal of human existence and to introduce the modern one as the astronomical theory of Copernicus: albeit, it was put forward timidly, and the work embodying it dedicated to a pope. Although this work appeared in 1543, five years before Bruno's birth, the Copernican theory found little acceptance or currency for nearly a century.*

It seemed so harmless that the Church did almost nothing to oppose it, until it was propounded and rendered familiar by Galilei, who was tortured and made to recant in 1616 and 1633. One of the very earliest adherents of the Copernican system was Giordano Bruno, who not only accepted it, but drew from it all the consequences, both physical and theological, which the world has been slowly drawing in the last three hundred years. The most important and fundamental of these consequences was one of which Copernicus had never dreamt,—namely, that there is not only one solar system, but many; and that the universe is infinite. This view seems now so much a matter of course that it is hard to believe that, in the sixteenth century, Giordano Bruno was perhaps the only man who held it, and certainly the only man who saw its bearings.

It is hard for us who are familiar with the true view to conceive what an inspiration it was to the man in whose soul it was first revealed, how it new-created the universe to him, and filled him with a living fire of enthusiasm, which even the dungeon and the stake could not quench. As Froude says: "The floor of heaven, inlaid with stars, had sunk back into an infinite abyss of immeasurable space; and the firm earth itself, unfixed from its foundations, was seen to be but a small atom in the awful vastness of the universe. In the fabric of habit which they had so laboriously built for themselves, mankind were to remain no longer." With the flash of the eye of genius, Bruno saw, from the Pisgah peak of the Copernican doctrine, the whole promised land of modern thought and science, in its essential outlines. I doubt whether any man, even up to our own day, has seen it again as clearly as he did.

"The universe is infinite," said Bruno to himself; "and every part of an infinite is necessarily

* Hallam, *Introduction to the Literature of Europe*, vol. ii., p. 318; vol. iii., p. 394.

infinite. I am part of the infinite: therefore, I am infinite." This was the sublime syllogism which made Bruno a moral hero and a deathless martyr. It may seem a very rash syllogism; but, I think, the more carefully we consider it, the more thoroughly shall we be convinced of its truth. It can be shown in the most direct way that no number of finite parts will make an infinite whole. It follows at once that the parts of the infinite must be infinite, or, which is the same thing, that the infinite has, strictly speaking, no parts, but only modes, and that each of these modes is the infinite itself under a particular form.

I am afraid that this will seem to some of you mere gibberish; and you will perhaps say to yourselves, "Bruno must have been a dreamer, not to say a fool, to stake his life for any such vague proposition as this." I shall be sorry, indeed, if any one arrive at this conclusion; for Bruno's doctrine, when fully comprehended, proves not only to be true, but also to be so important a truth as to be the only possible basis for free thought or, indeed, of any freedom whatsoever. The subject of this lecture is the relation of Bruno's philosophy to free thought. I am now able to state this relation, which is this: that Bruno's fundamental thought, for which he sacrificed his life, is the sole and essential condition of free thought, that free thought can have no other foundation. Not only is it the irresistible solvent that will melt the triple fetters of servitude welded upon the human spirit during the Middle Age, but it is the strong barrier that will in the future prevent a new triple servitude from being imposed upon it by the theory of evolution as at present construed. Let us see if we can make this clear.

And, first, as regards the enslaving doctrine of the Middle Age. The fundamental concept of this doctrine was this: God is all in all; man is a finite creature, the work of God's hands, made out of nothing, dependent in every way upon God, utterly unfree save by the grace of God, having no rights whatsoever as over against God, who may, and probably will, condemn him to eternal pain for the sin of his first ancestor, unless, by chance, he has heard of a revelation made at a particular moment in an obscure corner of the world, and has proved traitor to his intelligence, in order to swear a blind allegiance to the bearer of this revelation. This is even a mild putting of the mediæval view, which was by no means confined to the Middle Age and the Roman Church, but is not without adherents in our own time. From the *Evening Post* of the 10th of this month, I copy a quotation from a memorial made by the first missionaries to India to the governor of Bombay, in 1813: "We looked upon the heathen; and, alas! three-fourths of the inhabitants of the globe had not been told that Jesus had tasted death for every man! We saw them following their fathers in successive millions to eternal death. The view was overwhelming." Overwhelming to the pitiful missionaries apparently, but by no means so to their omniscient, omnipotent, all-loving God! And it was this God and his characteristics and interests that the Church professed to represent. The best and the worst thing that we can say about it is that it did fairly represent them. For there can be no question that, if this theory of the relation between God and man were true, the Church was right, and is right now. The only way to undermine its position was to deny and disprove the doctrine that lay at the foundation of it; and this was just what Bruno did, and what the Church, true to her theoretical rights, burnt him for doing.

Giordano Bruno was the first man in modern

times that took the truly scientific view of the supreme power in the universe and of man's relation to it. He maintained that God is not one thing, and nature another, and his creation; but that God and nature are one and the same thing, distinguishable only by mental abstraction. God apart from nature, nature apart from God, are both abstractions. Abstracting the power of nature from its manifestation, we call it God; putting manifestation and power together, we call the latter the soul of the world; taking the separate manifestations by themselves and relating them individually to the supreme power, we call them monads, or souls, or spirits, or intellects. Let me translate literally Bruno's own words: "There are three kinds of intellect,—the divine, which is all; the mundane, which does all; the other particular intellects, which become all." One is at first somewhat surprised to hear Bruno speak of three intellects; but this surprise ceases, when one remembers that this is only a form of expression borrowed from Aristotle. Bruno's meaning, to be sure, is very different from Aristotle's; but the phraseology is the same. Both mean that intelligence has three aspects,—Being, process, and the result of process. Intellect, regarded as being, we call God; regarded as process, we call it nature; regarded as the result of process, we find a world of particular existences, ordered in accordance with an intelligible law. This is exactly the modern scientific point of view, the view toward which all thought, even that of the unmoving Catholic Church, is irresistibly tending.

Let me quote a few more sentences from Bruno: "As to the efficient cause, I maintain that the universal physical efficient is the universal intellect, which is the first and fundamental faculty of the soul of the world, which is its universal form. . . . The universal intellect is the intimate, most real and proper faculty of the soul of the world. This is the identical one which fills all, illuminates the universe, and directs nature in fitly producing its species, and thus stands related to the production of natural things, as our intellects to the analogous production of rational species (or ideas)."

"We have, therefore, an internal principle of form, eternal and subsistent."

"The universe is one, infinite, immovable. One, I say, is the absolute possibility, one the act, one the form or soul, one the matter or body, one the thing, one the being, one the greatest and best, which, since it plainly cannot be comprehended, is illimitable and interminable, and therefore unlimited (infinite) and untermiated, consequently immovable. It has no locomotion, because there is no outside whereto it could transport itself, since itself is all. It does not generate, because there is no other being which it could desire or expect, since it has all being. It does not decay, because there is nothing else into which it can change, seeing it is everything. It can neither diminish nor increase, because it is infinite; and to the infinite nothing can be added, and from it nothing can be subtracted, because the infinite has no proportional parts. It cannot undergo any modification, because there is nothing outside of it, by which it could be modified or affected. . . . It is not matter, because it is neither figured nor figurable, neither terminated nor terminable. It is not form, because it does not give form or figure to anything else, seeing it is all, is a maximum, is one, is the universe. It is neither measurable nor measure. It is not comprehended in anything, because there is nothing greater than it. It is not comparable, because it is not one thing and another, but is one and the same. Being one and the same, it has not

being and being; and, because it has not being and being, it has not part and part, it is not compound. It is a term of such a sort that it is not a term; it is form in such a way that it is not form, matter in such a way that it is not matter, soul in such a way that it is not soul; because it is all indifferently and therefore one—the universe is one.

"It is not only possible, therefore, but necessary, that the incomprehensible best and greatest (absolute) should be all, through all, in all, because, being simple and indivisible, it can be all, through all, in all. Hence it was not vainly said that Jove fills all things, inhabits all parts of the universe, is the centre of that which has one being in all things, and by which all is one. This, being all things, and comprehending in itself all being, brings about this result,—that everything is in everything. But, if this be so, you will ask me: Why then do things change? Why does particular matter force itself into other forms? I reply that change is not seeking another being, but another mode of being. And this is the difference between the universe and the things of the universe, because there is nothing that comprehends all being and all the modes of being. Of the things in the universe, each one has all being, but not all the modes of being."

All this is expressed in language deeply dyed in scholasticism, in which Bruno was reared. Nevertheless, it is not only a full expression of the profoundest views of modern scientists, but is a better expression of the truth than any of these, so far as I know, has found. Here we find shadowed forth not only the doctrines of the correlation of forces, the persistence of force, the identity of force and matter, the identity of matter (when properly defined) and spirit and so on. Indeed, in spite of many faults of expression which were unavoidable, Bruno, the first real pioneer of modern thought, grasped its chief and fundamental outlines, its spirit, better than any one that came after him. In the white heat of the new birth, he saw the outlines of the future world of thought with unparalleled clearness. Successive thinkers have only elaborated different sides or portions of his great, comprehensive view; and these sides, slowly and painfully filled in by experiment and deduction, are, in their union, slowly rising into the imposing structure of modern science and thought. Modern philosophy and modern science are little more than a filling out of Bruno's grand outline, and I think this outline would be much sooner filled up if it were better known than it is to philosophers and men of science.

We have seen that Bruno distinguished three aspects of intellect,—Being, which is all, Process, which produces all, and Existence, which is the result of Process. These are not three things, but three inseparable aspects of the same thing. They are the true ultimate distinctions that exist in all that is in the universe. They were dimly seen by Aristotle; they were made objects of idolatry in the mythical Christian Trinity. Viewed objectively, they are force, time, and space; viewed subjectively, they are spirit, feeling, and intelligence; viewed ontologically, they are the ideal, the moral, and the real.* No philosophy that does not accept these three aspects of being as final, and do justice

* In using the term intellect here, I ought to note that I do not mean by it conscious intelligence, which is merely an act of intellect under certain circumstances. Anaxagoras, who first introduced the term, or rather its Greek equivalent, *noûs*, had no intention of making it equivalent to consciousness; and the same is true of Aristotle, Plotinus, and the Schoolmen. The Latin term *intellectus* means a gathering between, a bringing of many things into one or under one; a making one thing present to many; in one word, universality. Now, universality, when it is raised to a high power, to a white heat, so to speak, becomes luminous, and results in consciousness. If we would but remember this, we might find little to object to in the assertion that the world displays an intelligible order, and seems the product of intellect.

to them as such, can ever give us a satisfactory account of the universe or make life seem rational and worth living. Whoever would hope to profit by Bruno's patrimony must take it entire.

This, however, is just what succeeding thinkers have failed to do. They have divided up Bruno's patrimony among them. In fact, the three inseparable parts of it have been taken as the whole by three different classes of thinkers, who together have been the producers of modern thought; and it is this single fact that explains why all modern thought is so little satisfactory. The best representatives of these three classes of thinkers are Spinoza, Leibniz, and Hegel. The first of these tries to found a philosophy on pure being, the second upon particular existence, the third upon process; and each tries to deduce from the one aspect which he adopts the other two aspects. You may search modern thought through, and you will find but one thinker that cannot be classed along with one or another of these great names, and that one is a Roman Catholic, a man altogether irrational and fanatical whenever the dogmas of the Church are in question. I mean Rosmini, who, Catholic as he is, is the true spiritual son of Bruno. Rev. Heber Newton tells that "Bradlaugh does not look like a child of Cardinal Newman, but he is." So Rosmini does not look like a child of Bruno, but he is.

Of the three systems of philosophy built upon shreds of Bruno's patrimony, that of process, best represented by Hegel, is the one that now has the widest currency. It has many apparently dissimilar forms, agreeing in little else except in adopting the process now usually called evolution as their first principle. Such are the systems of Schopenhauer, Von Hartmann, Comte, Darwin, and Spencer. Some of these, *e.g.*, the systems of Comte and Spencer, do not deny the existence of the other aspects of being; but they declare them to be unknowable. While one may object to these systems, if put forward as complete and ultimate systems of philosophy, one may regard them with much satisfaction when they present themselves as partial systems, due to that division of labor which is the characteristic of our times. If we would only supplement Darwinianism and Spencerianism by Spinozism and Leibnizism, we should have a most satisfactory philosophy, which might very fairly be called Brunism.

Now, I maintain, and I wish to show, that it is Brunism, and Brunism alone,—carefully developed, indeed, and elaborated,—that must form the theoretical basis of any social system in which man shall enjoy true freedom, and develop his powers to the fullest. The reason of this is that it is the only system which recognizes and makes provision for freedom in its very first principle. Bruno, as we saw, maintains that, "of the things in the universe, each has all being, but not all the modes of being." This is only a way of saying that each real being is potentially the Absolute, and can realize the Absolute within himself. This, again, is only the philosophical way of saying that any being is free. For let us suppose that any being, man, for example, did not contain all being,—that is, all the possibilities of being,—the result would be that he would be limited in his development, and his evolution would cease when the possibilities of being contained in him were all realized. His existence, if he then continued to live, would be absolute stagnation and monotony, which, after all, is death. For what is death but the cessation of power to receive new impressions and put forth new acts? But to receive impressions and to put forth acts is to realize possibilities: hence, the cessation of power to realize possibilities is death.

Still, it might be said man, even if he did not contain the absolute in potentiality, might be free within certain limits and for a certain time. I reply that even this would be impossible; and the best proof of this is that the freedom of the will, so called, has been uniformly denied by all persons who either denied the existence of any Absolute or refused to acknowledge that it is present in every human being. Mr. Spencer, for example, who is one of the latter class, pointedly denies the freedom of the will. Many of his followers find this denial leading to such absurdities in practice that they not unfrequently maintain that he does not make it, and accuse those who say that he does of either misunderstanding or misrepresenting him. I will therefore quote a sentence or two from his *Psychology*. He says that "every one is at liberty to do what he desires to do (supposing there are no external hindrances), all admit; though people of confused ideas commonly suppose this to be the thing denied. But that every one is at liberty to desire or not to desire, which is the real proposition involved in the doctrine of free will, is negatived as much by the analysis of consciousness as by the contents of the preceding chapters."

"I will only further say that freedom of the will, did it exist, would be at variance with the beneficent necessity displayed in the evolution of the correspondence between organism and environment."

I shall not stop to point out the errors in fact and logic contained in these sentences. I merely wish to show that the ablest of modern deniers of the doctrine for which Bruno went to the stake—at which no beneficent necessity was displayed in the correspondence between his organism and environment—denies, likewise, man's freedom. And he must do this, if he is at all logical. For freedom, even in its faintest form, implies the existence of the Absolute in the persons who exercise it. If the human intelligence had to choose between finite, commensurable motives (and all finite things are commensurable), man, certainly, would not be free; but, as soon as he comes to choose between incommensurable motives,—*e.g.*, between an absolute, an infinite, on the one hand, and a relative and finite, on the other,—then he must be free. But, before he can choose or even reject the Absolute, the Absolute must be in him; for the power that comprehends the Absolute must be itself absolute, at least potentially. No one can comprehend that which he is not himself potentially. This is a fundamental truth too often ignored in this form, though often enough repeated in another form; namely, that no one can comprehend what he has not experienced. But even this form is sufficient for our purposes. Since all experience is a modification of the thinking subject, any subject that experiences the Absolute must be capable of taking an absolute modification; that is, must be potentially the Absolute.

I do not wish here to discuss the question whether men grasp the Absolute or not. All I am concerned about is to show that, unless they do, there is no freedom possible for them, and that there is no more use in doing anything or talking about doing anything for human improvement than there is in counselling a stone to walk off to the moon, to escape being rained on. How clearly Bruno saw all this, we may learn from such expressions as "[the Absolute] is neither measure nor measured." "All the parts of the Infinite are themselves infinite." But we learn it best of all from the simple fact that, rather than admit that he was a finite, relative creature, dependent upon an environment or an organism, he chose to be burnt at the stake, thereby asserting a freedom

which certainly could not have its origin in a merely physical organism, entirely subject to necessary laws. I repeat, therefore, that the philosophy of Bruno is the only one that is capable of affording a substructure for true freedom and endless evolution.

Thus far, I have dwelt mainly with Bruno's relation to what we may call speculative or theoretical philosophy; and I have shown that all modern systems of thought are but more or less complete developments of the different sides of his system. It now remains for me to say a few words respecting his relation to the sciences, the physical and the moral.

As to the former, we have already seen that his astronomical views were very advanced,—indeed, that he had reached the modern view. We have also seen that he forestalled some of the most famous of modern theories, those of the persistence of force, the correlation of forces, the identity of force and matter and of matter and spirit. His view with regard to transformation in general is set forth in this remarkable passage: "What was seed becomes herb; from what was herb is made ear of corn; from what was ear of corn is made bread; from bread, chyle; from chyle, blood; from blood, seed; from seed, embryo; from embryo, man; from man, corpse; from corpse, earth; from earth, stone or anything else; and thus it goes on to all the forms of nature." This passage has sufficient intrinsic interest, but this is heightened by an extrinsic circumstance of no small moment. There can hardly be any doubt that Shakspeare had these words in mind when he wrote (*Hamlet*, V., 1):—

"Why may not imagination trace the noble dust of Alexander, till we find it stopping a bung-hole? thus: Alexander died, Alexander was buried, Alexander returneth into dust; the dust is earth; of earth we make loam; and why of that loam, whereto he was converted, might they not stop a beer-barrel?" *

"Imperious Cæsar, dead and turned to clay,
Might stop a hole to keep the wind away:
Oh that that earth, which kept the world in awe,
Should patch a wall to expel the winter's flaw!"

But it was not only in astronomy and physics that Bruno had ideas far ahead of his time. In biology, he came very near the Darwinian theory, and arrived altogether at a doctrine of evolution. He says: "As from one and the same wax or other material are formed different and contrary figures, so from the same bodily material are

* There are many other passages in "Hamlet" that show Shakspeare to have been familiar with the writings of Bruno, and some passages can be explained only by reference to these writings. Polonius asks Hamlet, "What do you read, my lord?" and the latter answers, "Words, words, words." So, in Bruno's *Candelajo*, Manfuro asks the pedant, Octavio, "What is the matter of your verses?" Whereto the latter answers, "Letters, syllables, diction, and speech, parts near and parts remote." Hamlet says, "There is nothing, either good or bad, but thinking makes it so." Bruno says, "Taken absolutely, nothing is imperfect or evil: only in relation to something else does it seem so, and what is evil to one is good to another." To be sure, the same thought occurs both in *Hērakleitos* and *Sophoklēs*; but it is highly improbable that Shakspeare knew either of these. Bruno, it must be admitted, may have derived it from *Hērakleitos*, some of whose fragments he seems to have known. Hamlet, after soliloquizing to himself thus, "For if the sun breed maggots in a dead dog, being a god kissing carrion," suddenly breaks off, and says to Polonius, "Have you a daughter? Polonius replies, "I have, my lord." Hamlet says, "Let her not walk i' the sun: conception is a blessing, but not to your daughter may conceive." These words have no meaning till we know Bruno's doctrine that "the sun and man beget man" (*Sol et homo generant hominem*). I am not sure that any one ever thought of inquiring what book Hamlet is supposed by Shakspeare to be reading, when he is interrupted by Polonius; but I venture, from numerous indications, to conjecture that it was a volume of Bruno, and one containing that admirable comedy, *Il Candelajo*. Hamlet calls the author a "satirical rogue," but evidently enjoys him. I feel convinced that Shakspeare meant to indicate that Hamlet was a follower of Bruno; and it is worthy of notice that Bruno taught for two years (1586-88) at Wittenberg, the very university where Hamlet and his friends are said to have studied. We know, moreover, that about that time several young Englishmen and Scotchmen studied at Wittenberg; and, among these, Shakspeare may have found the prototype of his too curiously thinking Hamlet. (See *Philosophische Monatshefte*, vol. II. pp. 495, sq.)

formed all bodies, and from the same spiritual substance are all spirits" (he does not say, "are formed all spirits"). "Moreover, by reason of different causes, habits, orders, measures, and numbers in body and spirit, there are different temperaments and conditions, there are produced different organs, and there appear different species of things." This doctrine was no doubt suggested to him by Hērakleitos and Aristotle; but, in his day, no one, perhaps, but himself held it. So much for Bruno's physical ideas.

His view with regard to morals and their relation to religion may best be seen from the following words addressed by Momus to Jove: "It will be sufficient if you put an end to that lazy tribe of pedants, who, without doing good, according to the divine and natural law, consider themselves, and wish to be considered, as religious men, agreeable to the gods, and declare that it is not by pursuing good and shunning evil that men become worthy and pleasing to the gods, but by believing and hoping according to their catechism." Elsewhere, he makes Wisdom say: "Wherefore, it is an unworthy, foolish, profane, and reprehensible thing to think that the gods demand reverence, fear, love, worship, and respect for any other good end or utility than those of men themselves, inasmuch as being perfectly glorious in themselves, and therefore unable to add any glory to themselves from without, they have made laws, not so much to obtain glory from men as to communicate glory to them. Hence, laws and judgments fall short of the goodness and truth of law and judgment, just in proportion as they fail to order and approve, above all other things, that which consists in the moral actions of men with respect to each other." I doubt whether the Society for Ethical Culture could frame a better statement of the relation between ethics and religion than this of Bruno's. Reading this, we are at no loss to understand why Bruno, though he spent some time in Geneva, and afterward in Protestant England and Germany, never became a Protestant. He appears, from recently discovered documents, to have got into considerable trouble at Geneva; and no wonder, when he puts into the mouth of Wisdom words like the following, concerning the chief reformers: "While they say that all their care is about invisible things, which neither they nor anybody else ever understood, they maintain that, in order to obtain grace, all that is required is fate, which is immutable, but which is determined by certain affections and fancies on which the gods are especially fond of feeding." Indeed, his contempt for the doctrines of the reformers, who exalted faith as all-potent for salvation and despised works and a moral life, is without bounds. His treatment of the doctrine of predestination is not only contemptuous, but funny.

I think I need not say anything more to convince you that Bruno was one of the mighty, one of those strange, incomprehensible, pioneer geniuses that lived centuries before their time, destined, apparently, to lay out the tasks for many succeeding ages. He rose not only above the dogmas and superstitions of half-obsolete mediæval Catholicism, but, with equal ease and firmness, above the new follies of growing Protestantism. He belongs not to the sixteenth century, but to the nineteenth, and even to the *élite* of it. Great in philosophy, great in science,—physical and moral,—he was greater still in practice, in life and in death. No man ever labored more or suffered more, in order to be free himself and help others to be so. No one ever met death more firmly and heroically. Among the martyrs for truth and freedom,—those first essentials of man-

hood,—he occupies the highest place. Calvin and Luther and all the reformers are, or soon will be, matters of history; but Bruno will live on, and be honored as a present saint, as long as men love truth and freedom and heroism.

I cannot better close this long lecture than by reading a translation of two of Bruno's sonnets, in which the whole man, in his character, aspirations, and firm resolutions, is summed up. The former may be called his creed,—the expression of that which inspired him, and became the ruling power in his life. It is also a prayer, uttered in the true attitude,—that of firm, unwavering resolution to cling with the whole soul to the Highest, and never to lose sight of it in the chaos of outward wrong or inward passion. It is perhaps the truest and manliest prayer that ever was uttered. I prophesy that it will be often repeated in the future.

"Cause, Principle and One, the Sempiternæ,
On whom all being, motion, life, depend.
From whom, in length, breadth, depth, their paths extend
As far as heaven, earth, hell their faces turn:
With sense, with mind, with reason, I discern
That act, rule, reckoning, may not comprehend
That power and bulk and multitude which tend
Beyond all lower, middle, and superne.

"Blind error, ruthless time, ungentle doom,
Deaf envy, villain madness, zeal unwise,
Hard heart, unholy craft, bold deeds begun,
Shall never fill for one the air with gloom,
Or ever thrust a veil before these eyes,
Or ever hide from me my glorious sun."

The second is a statement of his purpose in life and a prophecy of his death,—almost of the manner of it. It shows us that he was perfectly conscious of what he was doing and what it might lead to. It shows, also, that he, poor, lonely, unrecognized wanderer, had taken his life in his hand, and was prepared to suffer the worst for the sake of the glorious new revelation that had been made in and to his soul.

"Since I have spread my wings to purpose high,
The more beneath my feet the clouds I see,
The more I give the winds my pinions free,
Spurning the earth and soaring to the sky.
Unwarned by Icarus' sad fate to ply
My flight near earth, I farther heavenward flee.
That I shall sink in death, I know must be;
But with that death of mine what life will die?"

"Across the air, I hear my heart's voice cry:
'Where dost thou bear me, reckless one? Descend!
Such rashness seldom ends but bitterly.'
'Fear not the lofty fall,' I answer, 'rend
With might the clouds, and be content to die,
If God such glorious death for us intend.'"

Such glorious death God did intend; and the poet met it, as an exceptional honor, without fear, without complaint, without appeal. Such, in life and death, was Giordano Bruno, the first of modern men, the Messiah of free thought and free life.

(Concluded.)

CORRESPONDENCE.

NOT SO.

Editors of The Index:—

I shall not wrangle with the excellent and irate Mr. Gill, but must beg leave to correct him in one or two particulars. He says that I called him a goose. If so, I was very rude. But, indeed, I did nothing of the sort. I said that, if inclined, he has a right to call himself so, but denied the right of another to speak of him in such terms. The point was that one may lawfully take liberties with himself which must not be taken with him by any other. Mr. Gill has perspicacity enough to have seen the point, had not his Christian temper stood in the way. As matter of fact, I have called myself a goose many times, and shall be lucky if I have no occasion to do the like again. Very likely, Mr. Gill is on better terms with himself, and has never been in a mood to give himself any worse title than that of philosopher. So my answer didn't answer, but affronted his dignity. To make amends, I here say of myself what was said

of him,—namely, that I have a right to call myself a goose whenever so disposed; and I will leave to say the same in my behalf a thousand times over, if he likes. Mr. Gill farther remarks that Mr. Underwood has criticised Dr. Abbot's book to the like effect with himself. That is nothing to the purpose: he mistakes the point again. I object to a style of assertion and expression which Mr. Underwood, to the best of my knowledge, has never used. Style is the matter in question. One man takes up a grave argumentative work, and in the absolute tone, in raw terms and with studied smartness, pronounces the argument worthless. Another takes up the same book, and, having read it carefully, is impelled to say that he must think the premises of the argument unsound and the conclusion not sustained. The two men agree in opinion, but differ in style. The one pronounces absolutely, like an infallible pope, and pronounces in terms that do not mitigate his tone of papal supremacy: the other expresses his personal judgment simply as such, and expresses it in terms at once clear and becoming. And herewith I bid a respectful farewell to Mr. Gill.

D. A. W.

MISS ALICE STONE BLACKWELL, in the *Woman's Journal* of February 28, writes: "A good book was never put to a worse use than when, at the recent Toronto municipal election, the Bible was used by the whiskey men to keep some of the newly enfranchised women away from the polls. The regard which these gentlemen usually show for the Scriptures is on a level with that of Petroleum V. Nasby's fellow-townsmen. It will be remembered that Ingersoll took the side opposite to Nasby's in a political campaign, whereupon Nasby was seized with a fit of unwonted zeal for religion, and denounced him from the stump as an 'infiddle.' 'What's that?' asked several of his auditors. Nasby continues (I quote from memory): 'I explained to them that Ingersoll wanted to destroy the Bible, which infooated them. "What!" they cried, "ain't we to be allowed our reg'lar township Bible? What'll we have to swear the witness on in horse cases? Go on! Go on! Down with the infiddle!"' In Toronto, any person who presents himself to vote may be challenged, and made to swear to his identity. By what seems to have been a preconcerted plan, the supporters of Mr. Manning, the whiskey candidate, insisted upon swearing almost every lady who came to cast her vote, even those who were well known, and about whose identity there could be no question. They exacted, in addition, that every woman should 'kiss the book.' The *Toronto Globe* says: 'We know many of the excellent of the earth, and of the sterner sex, too, who would have nothing to do with volumes which, if kissed, might give them small-pox. It was, accordingly, a shrewd device to make ladies believe that they had to kiss a volume that had been handled by many dirty fingers, and had still upon it the aroma of many unsavory breaths, and the impress of lips the very reverse of all that was wholesome and attractive. Such a supposed necessity was trying to the courage of the bravest, and our wonder is not that a few looked and smelled, and feared and fled, but that any actually faced the foe and kissed!' Dickens makes Rogue Riderhood say, to show the reliance that may be placed upon his affidavit: 'When I takes my Alfred David, I kisses the book. I don't kiss my coat-cuff: I kisses the book.' Now that the ladies have shown their courage by kissing so unpleasant a volume as the Toronto public Bible seems to be, no one ought hereafter to question the sincerity of their desire to vote."

AN Englishman, on returning home from a visit to America, writes to the *Critic* as follows: "I have been told by many gentlemen in New York that they never allow their daughters to read a daily morning paper. It is quite impossible, I know, to keep such things out of the papers, especially when they get into the police courts; but your daily papers seem to tax their utmost ingenuity and skill to give the greatest prominence to unsavory subjects. Take up a New York morning paper, and you will find the platform utterances of your chief statesmen dismissed in a few words, whilst its leading pages will be covered with headings such as 'She Shoots Herself,' 'Attacked by a Negro in her House,' 'The Child Polygamist,' 'Miss Jones Elopes,' 'She Left Him Forever,' 'He Loved Her Too Well,' and so on, *ad nauseam*. In London, this kind of newspaper work is intrusted to the Police

News and Town Talk, and other such papers which respectable citizens would never admit into their houses and no respectable hotel would leave on its tables. I have no Utopian idea regarding the press. I know scandals must get into the papers. But why, in the name of common decency, do editors, who are gentlemen of education and refinement, serve these little details with all their skill and energy, as though it were of the greatest interest to the general public to know that John Jones had run away with Sarah Smith? In England, we regard the leading London journals as the teachers of the people. But it is quite impossible for the press in New York to assume a dignified position as long as newspaper editors make no effort to get out of what appears to be this rut of American journalism."

In an article on the celebration at Concord, September 12, of the two hundred and fiftieth anniversary of that famous and beautiful town, the *Boston Journal* said: "Other towns are often discontented with themselves, and torn with jealous factions which neglect the best interests of the town in selfish rivalry; but Concord has always been the object of the love and pride of its townsmen, and its dignity and beauty have been maintained and cultivated through generations. Every historic spot is guarded carefully, and every noble memory preserved devotedly. The monuments to the dead, and the historical tablets which were placed Saturday to commemorate the deeds of the generations, are illustrations of the prevalent public feeling. As the orator of the day remarked, the secret of the history of Concord has been the connection of her generations with each other. Many New England towns have become dull and hopeless from the westward or cityward emigration of the children; but Concord has maintained a stable population, and retains in an unusual degree the descendants and the names of the early settlers. As it was once a typical Puritan town, it is now a pure New England community, retaining the democracy of the town meeting, and inhabited by an honest New England people. Each generation shows its vitality in its power of producing strong men,—strong in statesmanship, in letters, in art; and the present age holds its high place with firmness and spirit. When the stranger enters the cheerful valley of contentment, he realizes the proud spirit of the townsmen, and respects old Concord for its eminent self-appreciating individuality. Its smiling fields are not on a dead level: they are rather a high plateau of pride and glory."

BOOK NOTICES.

DIAGRAM OF PARLIAMENTARY RULES: Showing the Relation of any Motion to every other Motion, and answering at a glance over five hundred questions in Parliamentary practice; together with a key containing concise hints and directions for conducting the business of Deliberative Assemblies. By Uriah Smith. Battle Creek, Mich.: Review and Herald Publishing Association. Price 50 cents.

This diagram is folded, like a map, in the front page of the key, and is to the study of Parliamentary practice what a map is to the study of geography. Its size, when opened, is twelve and one-half by six three-fourth inches, and is printed on bond paper, not liable to tear. By a very simple arrangement, motions of all kinds, in the order of their precedence, are arranged in the centre, printed in large type, and their relation to every possible rule is indicated by connecting lines. The diagram and accompanying key contain the very essence of Parliamentary practice in an immediately available form. It is recommended by the *New York Independent*, Speaker Keifer, and various speakers of State legislatures, judges, senators, and others competent to judge from experience of its merits.

GEORGE ELIOT'S TWO MARRIAGES. An Essay. By Charles G. Ames. Philadelphia: George H. Buchanan & Co. Fourth edition, paper covers. pp. 34.

This is a thoughtful, sympathetic, appreciative, and careful consideration of the questions raised by the marriages of Marian Evans. While fully sensible of the shock given to the moral sense of the world at large, by both of her eccentric marriages, Mr. Ames sees much in the peculiar characteristics and environments of this wonderful genius to excuse and explain her course. He says, among other things: "From childhood, she had dwelt apart, solitary in society,

her aspirations crippled by self-distrust, yet craving and giving no end of love. This profound reserve and withdrawal may help to explain her non-conformity. She was not lawless; but, more than most women, she lived out of the reach of conventional influences and standards. She could not hold the traditional theories of marriage, any more than of religion. But her non-conformity did not spring from lawlessness, caprice, or wilfulness, much less from lower impulses. Her whole life and character, every sign and trace found in her letters and private journal, testify that she was superior to any loose or base action." The candid and impartial spirit in which Mr. Ames discusses this much mooted subject cannot fail to impress and interest all readers of this essay, whatever may be their own private convictions or prejudices on the matter.

HISTORICAL ESSAYS. By James Anthony Froude. Selections from *Short Studies on Great Subjects*. New York: John B. Alden. pp. 368. Price 50 cents. Cloth.

Mr. Alden is determined that, before the passage of any international copyright law, he will give the American public the very "cream" of English literature. Literary "pirate," as he confesses himself to be, he is yet of that generous class of pirates of whom our earlier literature has much to say, who pilfer only for the pleasure of doing good to others less bold or more conscientious. The name of the author and the titles of the essays thus reproduced are sufficient guarantee of the worth and cheapness of the book. The eight essays contained in this compact volume are as follows: "Erasmus and Luther," "Spinoza" (a peculiarly interesting essay), "The Dissolution of the Monasteries," "England's Forgotten Worthies," "Homer," "Society in Italy in the Last Days of the Roman Republic," "Lucian," and "Divus Cæsar."

In the *Century* for February, that most spiteful, vacuous, and dreary of all the stories written by Henry James, Jr., "The Bostonians," is finished, and a new story by Howells begun, "The Minister's Charge," which does not, as one would at first thought imagine, treat of a ministerial ordination, but of the fortunes of a green country aspirant for literary honors,—an undeveloped youth, whom we hope Mr. Howells will allow to evolve into a noble manhood ere the story closes. Mrs. Foote's "John Bodewin's Testimony" increases in interest. Frank R. Stockton takes cognizance of one of the phases of modern "mind-cure" in the characteristic beginning of "A Borrowed Month." "An Unfortinit Creeter" is a unique story by Mat Crim. Henry Eckford contributes an interesting paper, profusely illustrated, on the French artist, "Antoine Louis Barye." Another interesting illustrated article is "Recent Architecture in America," by Mrs. Schuyler Van Rensselaer. A goodly instalment of the Grant Memoirs is given; and there are war articles by Gen. Longstreet, Gen. W. F. Smith, Allen C. Redwood, Gen. E. D. Keyes, Col. Fred Grant, and others. The department of "Open Letters" is particularly interesting, giving as it does the views of over forty distinguished authors on "International Copyright." Anecdotes of Gen. McClellan are given, also a frontispiece portrait of him. George W. Cable has a Southern sketch, with illustrations, entitled "A Dance in Place Congo." Cupples, Upham & Co.

The February *Magazine of American History* is filled with timely articles of fresh and absorbing interest. It opens with a well-written article, by Frederic G. Mather, on the "City of Albany," with unique illustrations, showing the progress for two centuries of that quaint old State capital. The portrait of James II., for whom Albany was named, forms an appropriate frontispiece. The second paper is by Gen. John Watts de Peyster, who writes eloquently and with discrimination of Gen. "Anthony Wayne." Dr. Prosper Bender has an article on the "Disintegration of Canada," Mr. A. W. Clason adds another to his brilliant papers on the Constitution, entitled "The Charleston Convention, 1788"; J. McDonald Oxley, LL.B., B.A., of Ottawa, writes of the "Historic Aspects of Sable Island"; Mr. A. A. Hayes gives a stirring account of "The New Mexican Campaign of 1862," and Major William Howard Mills (United States Army) treats of the reorganization of the "Army of the Potomac under Hooker"; Gen.

"Baldy" Smith adds some highly interesting and significant data in connection with Major Mills' article on "Burnside" in the January number; and the editor discourses briefly on "The Outlook for 1886," under the general head of "Historical Jottings." Price \$5.00 a year in advance. Published at 30 Lafayette Place, New York City.

Among the many interesting articles contained in the February number of Alden's *Library Magazine*, we have space only to note the following: "Hinduism," by a Hindu; "The Interpreters of Genesis, and the Interpreters of Nature," by T. H. Huxley; "Reason and Religion," by A. M. Fairbanks; "Bulgaria and Servia," by Edward A. Freeman; "The Origin of the Alphabet," by A. H. Sayce; "On Modern Chances of Chivalry," by Edward Garrett; "The Elder Edda, the Bible of Germanic Paganism," by H. H. Boyesen; and "Suns and Meteors," by R. A. Proctor. From the titles and authors of these strong, pertinent papers, our readers will understand the worth of the selections made by the editors of this eclectic monthly. \$1.50 per year. John B. Alden, New York.

Bound Volumes of The Index

For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

The Religion of Philosophy;

OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERLIN.

For sale at THE INDEX Office. Price \$3.00.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

SCIENTIFIC THEISM.

BY FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."
1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 30 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

KÖENIG'S LIVER PILLS, sure cure for Headache, Indigestion, Piles, and Constipation. For sale by all Druggists. 25c. a box, 6 boxes for \$1.25. Sent by mail. Jos. T. BROWN & CO., Boston.

Shipman's "Binder" for THE INDEX.

Has a flexible back which adjusts itself to any thickness. So simple in construction that any one can bind their own paper one number at a time. Serves for a temporary or permanent use equally well.

For sale at INDEX Office. Price \$1.25.
Postage 20 cents.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. *Full of Figures, Facts, and Interesting Extracts.* Price 5 cents; 30 copies, \$1.00.

No. 5.—*"God in the Constitution,"* by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—*"The Sabbath,"* by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—*"Compulsory Education,"* by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 3 cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B. Frothingham, treats of a subject that interests everybody. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 10.—*The Impachment of Christianity*, by F. E. Abbot. 5 cents a doz.

No. 11.—*The God of Science*, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 12.—*Is Romanism Real Christianity?* Two essays by Francis W. Newman and F. E. Abbot. Price 5 cents; 30 copies, \$1.00.

No. 13.—*On the Vision of Heaven*, by Cornell Univ Lib, England, analyzes Heaven. Price 5 cents; 30 copies, \$1.00.

No. 14.—*Religion: The Name and the Thing*, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 15.—*The Battle of Syracuse*. Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 5 cents; 30 copies, \$1.00.

Address THE INDEX,
44 Boylston Street, Boston, Mass.

THE ABSENCE OF DESIGN IN NATURE. By Prof. H. D. GARRISON. A Lecture delivered before the Philosophical Society of Chicago. Price 10 cts. For sale at THE INDEX office.

FOR COLDS AND CONSUMPTION use Cutler Bros. & Co.'s celebrated *Vegetable Pulmonary Balsam*. "Best medicine in the world." In use 60 years. Price \$1.50, and 35c. \$1 bottle the cheapest. Be sure and get the genuine.

STANDARD PUBLICATIONS

FROM THE PRESS OF

Charles H. Kerr & Co.

THE UNIVERSITY. A LITERARY WEEKLY. Popular, but not sensational; scholarly, but not pedantic; conservative, but not old fogyish; progressive, but not iconoclastic. It numbers among its contributors many of the brightest writers of the day. Its matter is wholly original and is edited with discrimination. \$2.50 per year; three months on trial for 50 cents.

UNITY. A LIBERAL RELIGIOUS WEEKLY FOR THE HOME. Seeks to adjust religion and culture; to make thought worshipful and worship thoughtful; to find a unity beneath conflicting dogmas; a community in all denominations; a sympathy between all religions. It seeks to emphasize the abiding elements of religion—love, justice, truth—practically applied among all men. \$1.50 per year; six months, trial subscription, 50 cents.

THE UNITARIAN. A MAGAZINE OF LIBERAL CHRISTIANITY. Aims to popularize and carry far and wide the best thought of rational Christianity. Its writers are the ablest; its matter fresh, varied, practical; its price, 50 cents a year.

SPECIAL COMBINATION OFFER.—For \$1.00 we will send THE UNIVERSITY, UNITY, and THE UNITARIAN to any address four months on trial.

VALUABLE BOOKS OF INTEREST TO INTELLIGENT READERS.

- The Consolations of Science.* By Jacob Straub. \$2.00
The Morals of Christ. By Austin Bierbower. 50
Unity Songs Resung. Original poems by various noted writers. 1.25
Synonyms and Antonyms. By the Right Reverend Samuel Fallows. 1.00
Foiled. By a Lawyer: A Story of Chicago. 1.25
Seed Thoughts for the Growing Life. From Robert Browning and others. 20
Bardo: A Study in George Eliot. By Mary E. Burt. In preparation.

*Any of the above mailed postpaid on receipt of price, or may be ordered through booksellers. Descriptive circulars sent upon application. Address

CHARLES H. KERR & CO.,
175 Dearborn Street, Chicago.

RELIGIO - PHILOSOPHICAL JOURNAL.

Established in 1865.

A Paper for all who Sincerely and Intelligently Seek Truth without regard to Sect or Party.

THE JOURNAL, in the estimation of a large proportion of the leading authorities on Spiritualism, stands pre-eminent as a fearless, independent, judiciously fair advocate of Spiritualism. It has received more general notice, and more frequent and higher commendations from intelligent sources, regardless of sect or party, than any other Spiritual or liberal paper ever published: the records will confirm this.

The JOURNAL is uncompromisingly committed to the Scientific Method in its treatment of the Phenomena of Spiritualism, being fully assured that this is the only safe ground on which to stand.

The JOURNAL is unsectarian, non-partisan, thoroughly independent, never neutral, wholly free from cliques and clans.

TERMS OF SUBSCRIPTION:

One Copy One Year, \$2.50
One Copy Six Months, \$1.25

BY B. F. U.

MR. J. E. REMSBURG, of Kansas, gave last Sunday, at Paine Hall, a vigorous and eloquent address on "Sabbath Breaking," in which he told some truths that need to be presented to the public.

W. S. BAILEY, who was editor of the *Liberal*, a little free thought paper published at Nashville, Tenn., is dead at the age of eighty. He was one of the anti-slavery veterans; and, years ago, his articles against slavery in his papers, the *Free South*, published at Newport, Ky., and the *Leader*, at Covington, aroused strong prejudice against him. More than once, his presses and type were thrown into the Ohio River by the mob.

THE *Week* (Toronto) thus refers to the late discussion between Mr. Gladstone and Mr. Huxley: "With a courteous but crushing stroke of his critical sledge-hammer, Mr. Huxley reduced Mr. Gladstone's science, especially his geology, to a total wreck; and, an attempt having been made by Mr. Gladstone to defend his essay, Mr. Huxley has repeated the death-blow. It is hoped, for the sake of religion, that there will be no more adventures in this direction."

THE Gladstone-Huxley controversy will be continued in the April number of the *Popular Science Monthly*, which will contain Mr. Gladstone's "Proem to Genesis," that appeared in the March issue, Henry Drummond's comments on the views presented by the distinguished disputants, and, in a supplement, Mr. Gladstone's original paper, "The Dawn of Creation and Worship," which first called out Prof. Huxley. A most interesting and valuable number is promised.

MR. RUSKIN is, without doubt, a master of English prose; but, when he declares that "Gibbon's is the worst English ever written," and that the author of the *Decline and Fall* was without imagination or logic, picturesqueness or wit, he exhibits more prejudice than judicial spirit or truthfulness. Has Mr. Ruskin ever written a finer sentence than

the following, in which Gibbon describes the Greek language: "In their lowest depths of servitude and depression, the subjects of the Byzantine throne were still possessed of a golden key that could unlock the treasures of antiquity, of a musical and prolific language that gives a soul to the objects of sense and a body to the abstractions of philosophy?"

DR. MORTON PRINCE, of this city, gave a lecture before the Parker Memorial Science Class last Sunday, on "The Mind and Brain," which, as the *Boston Transcript* justly says, "was pronounced one of the most lucid in exposition and most thoroughly scientific in discussion of its kind ever given before the class, and it elicited a unanimous vote of thanks at its close." In referring to the connection between mind and matter, he said: We know matter only as bundles of sensations representing an external reality that cannot be known, since our knowledge is limited to the effects this reality produces upon us; in other words, to the conscious states it produces. An interesting discussion followed the lecture.

A REMARK made by Joseph Cook in his last Monday's lecture, reflecting upon the Prince of Wales, was greeted with some applause, amid which was heard one vigorous hiss. Thereupon said Mr. Cook excitedly: "Who is it here that defends the position of a spaniel of aristocracy? Who is it here that expresses himself in language belonging to one of the shallowest of creatures, and opposes an effort to pluck innocent maidenhood out of the jaws of that minotaur of respectability which is rotten to the core? If any Englishman hisses here!"—Mr. Cook was here interrupted by a small man in the gallery, who stood erect with right arm aloft, as if to rebuke the speaker, who raised his eyes, and looked at his interrupter in silence,—striking the attitude, as one of the papers said, of Ajax defying the lightning. The cheering prevented the would-be critic from saying anything. When the applause ceased, and the effect was gone, the lecturer proceeded with his remarks.

AFTER mentioning that, less than thirty years ago, Christian nations used cannon to force an entrance for European traders into China, and that now brutal outrage and cold-blooded murder are the means being used to force the Chinese out of Christian lands, the *Ottawa Free Press* observes: "The solution of the problem of white vs. yellow labor, of the supremacy of the Caucasian over the Mongolian races, can surely be reached without our vaunted civilization being disgraced by outrages which savor of the barbarism of a semi-civilized people. . . . There is little doubt that the mass of the Americans and Canadians sympathize warmly with the whites on the Pacific Coast, who desire to be rid of Mongolian competition; but all human and Christian feeling revolts against the methods adopted to remove that competition. Under the ballot there is a legal power in the hands of the whites to remove the Mongolians,—namely, by electing men who will enact legislation, making the employment of Chinese labor by

whites, under specified circumstances, illegal; and it affords a process which, though slow, yet will be effectual. Let this problem be solved in a manner which will give the people of this continent no cause to blush in anticipation of the verdict of historians."

A CORRESPONDENT inquires about the accuracy of a recent paragraph in these columns about child marriages in India. These abominations were prohibited in the British provinces in 1872, by the Native Marriage Act, due largely to the exertions of Fitzjames Stephen and Keshub Chunder Sen. The latter, however, allowed his own daughter to be married, five years later, to the rajah of Kuch Behar, though neither party had reached the age prescribed by this law. The reform had not then been introduced into a State which had paid tribute to England for more than a century, and actually been governed during fourteen years by a British commissioner. More than fifty millions of the Hindus are either wholly independent of English rule or under native princes who pay tribute. Some States of the latter class are still so uncivilized that it was impossible to ascertain their population in 1872, except by guess. There seems to be nothing improbable in supposing that a child in British India was married, some five or ten years ago, to a boy in some State then under native rule. That the girl should, on reaching maturity, have refused to let herself be bound to a worthless husband, is much to the credit of Hindu women.

LAST Friday, the Judiciary Committee of the Massachusetts House of Representatives gave a hearing to petitioners for a change of the public statutes, so that the testimony of atheists may not be discredited on account of their religious views, and so that deceit and fraud practised on Sunday shall be punishable the same as when practised on other days. Mr. F. M. Holland, Hon. Samuel E. Sewell, Mr. Horace Seaver, Walter Wright, and others, addressed the committee, who were manifestly in sympathy with the petitioners, and from whom favorable reports to the House may be confidently expected. But whether the action of the House will be more favorable this year than last is doubtful.

MR. LABOUCHERE's motion in the House of Commons for the abolition of hereditary peerage was rejected by thirty-six votes only, a fact which, when we remember that the House has nearly four hundred members, and that Mr. Gladstone threw the weight of his great influence against the motion, is indeed significant. When the vote was announced, Mr. T. P. O'Connor exclaimed, "Tis the writing on the wall for Belshazzar." In his witty speech, Mr. Labouchere said: "I should no more think of refusing a thistle to a hungry, needy donkey than of refusing a baronetcy to anybody who wanted it." Evidently, the tenure of the Lords hangs upon a slender thread of popular favor; and they will think twice before opposing important reforms that have been favorably acted upon by the House of Commons.

CHRISTIAN JUSTICE AND THE HEATHEN CHINESE.

President Cleveland has sent a special message to Congress giving the result of the investigation that has been made into the outrages committed upon the Chinese miners at Rock Springs, W.T., several months ago. The investigation has revealed a story every whit as shameful as was the first report of the mobocratic violence. The President says:—

The facts, which so far are not controverted or affected by any exculpatory or mitigating testimony, show the murder of a number of Chinese subjects in September last, at Rock Springs, the wounding of many others, and the spoliation of the property of all, when the unhappy survivors had been driven from their habitations. There is no allegation that the victims, by any lawlessness or disorderly act on their part, contributed to bring about a collision. On the contrary, it appears that the law-abiding disposition of these people, who were sojourners in our midst under the sanction of hospitality and express treaty obligations, was made the pretext for the attack upon them. This outrage upon law and treaty engagements was committed by a lawless mob. None of the aggressors—happily for the national good fame—appear by reports to have been citizens of the United States. They were aliens, engaged in that remote district as mining laborers, who became excited against the Chinese laborers, as it would seem, because of their refusal to join them in strikes for higher wages.

The one redeeming fact in this succinct statement of the atrocity is that no United States citizens were engaged in it. Yet this amounts to very little, if citizens of the United States allow such crimes to be committed in their borders by aliens. And, if not greatly belied by popular report, one of the most powerful organizations of the country, the greater part of whose members are beyond question citizens,—the Knights of Labor,—winked at, if they did not directly incite, this crime against the Chinese. Nor thus far, though there has been no question of State sovereignty concerned, has the United States government been able to bring to punishment any persons who participated in the outrage. On the contrary, the President confesses that there has been a "palpable and discreditable failure of the authorities of Wyoming to bring to justice the guilty parties": which means, we suppose, that its law officer has been derelict in duty, or the grand jury—composed necessarily of citizens—failed to bring an indictment against the "guilty parties," notwithstanding the notorious fact of their guilt. But Wyoming is a Territory. Its legislation is subject to Congressional authority, and its administration of the law is still more directly subordinate to the national Executive. And, if there be no law nor power in the United States government "to bring to justice" alien criminals for the commission of rapine and murder on another class of alien persons within its domains, it is high time, for the sake of the nation's honor and standing in civilization, that there was. Until the nation has such power, and uses it, to punish and prevent such outrages, there is little room for complacent pride over "the national good fame," because the unpunished bloody criminals do not happen to be naturalized citizens.

Leaving aside in this article the question whether the United States had any just right to pass the law now on the statute-book preventing the emigration of Chinese laborers into the country, there is not the slightest question that those of the Mongolian race who were in the country when this law was passed, and have since remained here, are entitled to the fullest governmental protection. Indeed, in the new treaty which was then made with China, the United States govern-

ment solemnly pledged itself in a special manner to see that no harm should be done to Chinese subjects already in the United States. This is the language of that treaty: "If Chinese laborers, or Chinese of any other class, now either temporarily or permanently residing in the territory of the United States, meet with ill-treatment at the hands of any other persons, the government of the United States will exert all its power to devise measures for their protection, and to secure to them the same rights, privileges, immunities, and exemptions as may be enjoyed by the citizens or subjects of the most favored nation, and to which they are entitled by treaty."

Now, the treaty which contains this pledge is the same treaty which gave Congress the right to pass the law preventing Chinese immigration; for previous treaties had forbidden such legislation. The moral predicament, therefore, in which the United States government stands is this: It pressed a new treaty upon the Chinese government whereby laws might be passed prohibiting the further immigration of Chinese laborers into this country. In securing this right, it promised China that it would "exert all its power to devise measures" to protect Chinese laborers already here from "ill-treatment at the hands of any other persons." The treaty having been made, it immediately enacted the laws prohibiting immigration; but it has not to this day, and four years have passed, enacted a single law or devised any other measure for protecting the Chinese in the country from the abusive treatment they are constantly receiving. That is, the United States hastened to carry into effect the parts of the treaty it deemed for its advantage. The other parts, which China asked for and which were conceded by solemn pledge, it suffered to drop out of sight and left unexecuted.

In this condition of things, the Chinese government would be justified, were it to consider the treaty violated by the United States, and thereby rendered null and void. A nation of equal rank with the United States would doubtless have taken that or even more aggressive ground. Imagine subjects of Great Britain to have been maltreated in this country as were the Chinese at Rock Springs, and again, only a few weeks ago, at Seattle, W.T. The Queen's demands for full reparation and a revised treaty would have been at Washington within a week, and some of her naval vessels would have been on their way to rendezvous in the waters of our Pacific Coast. But the Chinese are patient and long-suffering. Their government has only just presented its claim for an indemnity for the Rock Springs spoliation and massacre. And it was the presentation of this claim that made the occasion of the President's message on the subject to Congress.

But, though the President speaks with due severity of the outrage, and adds that the evidence shows "entire absence of provocation on the part of the victims," and though he expressly refers to the treaty stipulation above quoted, by which the United States government has engaged "to exert all its power" to protect Chinese residents from such violence, his argument comes to a strange *non sequitur* in its conclusion. As one reads, one is led to believe that the President is certainly going to recommend that the Chinese claim should be paid without hesitation or haggling, as the smallest atonement that can be made for such a wrong. One would suppose that, even if there were no treaty obligation by which the United States government is bound specially to give protection to the Chinese in its domain, the common obligations of humanity and of international law among civilized nations would enforce the claim

which the Chinese government has presented. And, when to this is added the express provision in the treaty guaranteeing protection, the question would appear to be settled beyond dispute that the United States should pay damages for the violence from which it failed to protect. The President, however, does not thus reason. He fails to find either in the treaty or in international law any obligation either expressed or implied which would require the United States to indemnify the Chinese sufferers for the losses they have sustained; and, therefore, he recommends their hard case to the "benevolent consideration" of Congress. If he reached this conclusion because the perpetrators of the crime have been proved to have been not citizens of the United States, the reasoning might be allowed to pass in a pettifogging lawyer; but it is not worthy of a great government in adjusting its relations to other governments. Moreover, the treaty distinctly says that the United States will exert all its power to devise protection from violence not merely at the hands of United States citizens, but of "any other persons" in its territory.

Here, therefore, is no question for benevolence, but for justice. It is not a matter to which Congress should be asked merely to give its "benevolent consideration": it is a matter that calls for common honor and honesty. It may be legitimately questioned whether it is the province of the United States government to extend benevolent aid to any sufferers in its domain, unless it can be shown that their suffering is the result of its own neglect of obligations. And, then, it is justice that makes the claim. It may make no difference to the sufferers in this case whether they receive compensation on the ground of justice or benevolence; but it will make a great difference to the "good fame" of the United States in the court of the public opinion of the civilized world whether it honestly keeps or not its treaty obligations, and whether, if the unoffending subjects of other nations are massacred and pillaged within its border, it makes or not all the reparation in its power. When a like outrage was committed on American citizens in China, the United States government demanded and received an indemnity. Did it appeal at Peking for justice or benevolence? It asked for justice, and received it in full measure. According to its demand then, let it measure its duty to China now.

WM. J. POTTER.

CAUSALITY.

It is strange that sometimes, apparently, the most positive truths manifested everywhere around us are those which have been longest hidden from our eyes. They are like those puzzle-pictures which bear the inscription, Where is the woman? When we have once discovered the outlines of her face, we wonder that other people do not see her, since her features are so plain and obvious. So those philosophical truisms that are most simple, far from being the easiest of access, are generally the most difficult problems until some one grasps their meaning and points it out to the world. Then the solution seems so easy that we wonder that greater minds than ours did not see it before.

If true of any subject, this is certainly true of causality, which, theoretically, is so simple a process that any one must understand it, and ought to know it from his own reflection and experience. Yet I have found no philosopher who has given a clear and simple explanation of it. Many consider causation slippery ground, since David Hume disputed its being provable; and, generally, it is held to be a mystery, as the link between cause and

effect is supposed to be missing. Realizing the importance of the causal law not only for philosophy, but for science at large, I ventured on this ground with a German essay, *Grund, Ursache, und Zweck* (Dresden, Von Grumbkow, '81), and have the confidence that I succeeded, in this pamphlet, in solving the question which has troubled philosophers since Hume's essay was—I had almost said published; but no: we know its first publication was of no avail until it was—heeded, read, noticed, and contradicted. I propounded the views which I had laid down in *Grund, Ursache, und Zweck*, in a condensed form, in the third and fourth chapter of an English pamphlet, "Monism and Meliorism." In this essay, I argue that causality is a law of motion.

Cause is an event in a state of things which necessarily leads to a change. If you take from a heap of stones one of the undermost, all those resting upon it will rush after, and in some way alter their position. There is no other alteration than that which is caused by motion. Everything save the arrangement remains the same after as before the change. But there was an occurrence which disturbed the equilibrium of the whole state of things; and, to restore it, a motion of the disturbed parts became necessary. The disturbance of the equilibrium is the cause, its restoration the effect. A spark thrown into powder results in an explosion. The spark is not the cause, but its being thrown into the powder, its approach to the inflammable material. The effect is the change in the composition of the powder. Nor, in the first instance, is the stone the cause, but its removal; i.e., the act of its being taken away. Causes as well as effects are always some events, occurrences, incidents, which happen. They are never things or objects which exist. And so the term means an alteration in some state of circumstances, a change of situation, position, posture, or a replacement and new arrangement of some conjuncture. In one word, *causality is a law of motion*. One alteration in some state of things produces another. Thus, effect is a change in consequence of another prior change. Matter, however, as we know from the law of preservation of force and matter, remains unaltered and unchanged. After the explosion, all the single atoms of the powder are still in existence, though in an entirely different composition. But, apart from this difference of the combination of atoms, matter is the same before and after the explosion. It remains identical in the change; and, accordingly, we may call causality the *identity in change*.

Consequently, cause is always a fact that happens or has happened. It is some event; and, as such, it is some force acting in the world of reality, it is motion. Without motion, you cannot even imagine the possibility of a cause.

I have pointed out in my essay, *Grund*, etc., the errors of our chief philosophers on this subject. Let me now add a few critical remarks on the explanations of George Henry Lewes, given on this subject in his *Problems of Life and Mind*, IV., Chap. II., "Force and Cause." To be sure, Mr. Lewes is not an original philosopher, as were Kant, Schopenhauer, or Comte. None the less must we respect his accuracy and depth of thought, for he is in power of reasoning by no means their inferior. And, as the lack of originality includes an absence of pet theories, it makes him more than others a representative of what may fairly be regarded as the generally accepted views in philosophy.

Mr. Lewes says, "A spark causes the explosion of gunpowder"; and, three lines further, "Gravitation is the cause of a body's fall," as if both instances were like each other. Gravitation is no cause, gravitation is a *law*; and this law, if it is

known as such, serves to explain all phenomena which it comprises,—the attraction of sun, moon, and planets as well as the falling of stones. It is the *reason* why the stone falls to the ground as soon as my hand lets it go. But it is not the cause: the cause is rather the opening of my fingers. The cause is a single event: gravitation is an explanation of many events. Cause and effect are necessarily antecedent and consequent, for they are temporal. Time would not exist but for causality; namely, the law of motion. Without reference to motion, the idea of time has no meaning. Gravitation, however, is neither antecedent nor consequent to the fall of a stone. As an abstraction of many observations, it is rather inherent in all observed cases of attracted matter.

Mr. Lewes quotes Locke's definition,—"*Cause, a substance exerting its power into act; to make one thing begin to be*"; and he apparently agrees with Locke. Let me repeat that cause, which must not be confounded with *reason*, is still less a *thing*. Mr. Lewes ridicules John Stuart Mill for regarding the well-known scholastic dictum, *Cessante causa cessat effectus*, a fallacy. Mr. Mill is right, after all, at least on this point, although he is unable to indicate what is erroneous; and his views of causality are by no means satisfactory. The formula means to say, *Cessante ratione cessat effectus*. Mr. Mill makes many mistakes, but Mr. Lewes has no fewer errors. I confine further criticism only to a few instances. He says (p. 350), "A glass of punch is *made* by adding together whiskey, water, sugar, and lemon. Each of these elements we know separately, and know them as the causes of the punch." What confusion! Then rags are the causes of books, because their paper is a fabric manufactured out of rags! The elements of matter, as they are indestructible, are eternal. They are not caused. Their combination or their shape is caused, not their existence.

Contingent upon the same misconception is another passage on page 347: "Every event that happens has a cause, everything that exists is a cause. This is evident." It is by no means evident; and the confusion of calling *existing things* causes is the more remarkable, as Mr. Lewes in the following lines propounds a correct explanation, saying, "For an event to happen, there must be a change in existing relations; and this change must be the result of some previous change." Why does Mr. Lewes not stick to it, to draw the consequences? The *coup de soleil* is dimmed by the cloudy idea of the thingness of cause. Nor would I subscribe, either, to the philological explanation of the German word, *bedingt*. Mr. Lewes says, in the same paragraph, "Every effect, change, is, as the Germans say, *bedingt* (*bedingt*). The causes, conditions, agents, of this change, are the *bedingings* (*Bedingungen*)." Every effect is caused,—is, in German, *verursacht*. *Verursacht* and *bedingt* are no synonyms. *Bedingung* is *condition*. It is not derived from *Ding*, an object, but from the verb *bedingen* (to postulate, to state a condition). The word is connected with German *dingen* (to hire) and with Norse (*folk*-) *thing* (an assembly of the people endowed with the legal right of jurisdiction and legislation). Thus, *Bedingung* means literally the same as the Latin *conditio*, derived from *con* (with, by, in German, compounds *be-*) and *ditio* (legal power). Certainly, causes may be effective only under certain conditions. But, then, conditions and causes are not identical. You might say that they are causes of the effectiveness of the cause. Yet not even to this formulation should I agree. For conditions themselves do not cause, nor are they in motion: they merely give us the explanation *why* the cause takes effect. They are the modifying circumstances.

By the by, Mr. Lewes seems also to take the German word *Ursache* in the sense of *original thing*. He says, on page 374, "Cause to them (namely, Metempirics) means what the German word indicated, primal existence,—*Ursache*." To be sure, the German word *Sache* is now used in modern High German almost as a synonyme of *Ding*; but, in Old German, it means *cause*, as did the Anglo-Saxon word *sacu* (sake, dispute, cause), and is connected with the High German *suchen*, English *to seek*, Anglo-Saxon *sacan*, to strive. Thus, the German word *Ursache* defines *cause* very appropriately as a striving or seeking; namely, a motion.

I trust that our philosophers will by and by lay more stress on the settlement of Hume's problem, as soon as they learn how far it goes to do away with confusions of all kinds, and solve many problems which at first sight scarcely seem to be connected with it.

PAUL CARUS.

RELIGION FOR WOMEN AND CHILDREN.

An out-and-out English agnostic remarked to a friend, who wondered that he still said grace at table and regularly attended divine worship: "We must keep up the church as the most powerful police institution we have: it would be an awful calamity to take their religion from the laboring classes, and especially from women and children. All these are more easily governed through their fears, as their capacity to reason is very limited."

In regard to the first proposition, all history shows that there have been more outrages committed by the Church, through its ecclesiastics, in the name of religion, on the sacred rights of humanity and the best interests of society, than by all other organizations together.

It has, indeed, been, in all ages, "a powerful police institution," to rob the poor, to suppress free thought, to make martyrs of noble men and women; but when has it ever risked its own safety to fight the battles of the people against the oppressions of the State? When, by wise counsels as a united body, has it ever averted the settlement of one vexed question by war? In the prolonged anti-slavery struggle for forty years, it spoke with no certain sound, until the clashing arms and roaring cannon proclaimed liberty throughout the nation. But when the indignant masses awake from the lethargy of ages the world over, as they have already in France, and see how they have been deceived, defrauded, and priest-ridden, they will repudiate the Church and the creeds that have so long held them in bondage. As, with more general education, with the light and knowledge of science, the people cannot be much longer swayed by worn-out superstitions, is it not better for their spiritual teachers to begin now to teach them what is true, as far as they themselves know, and to stop teaching them mere speculations and superstitions, the wild vagaries of unbalanced minds, the accumulated errors of the ages? They tell us, by way of excuse for their unfaithfulness, that the people are not ready for a more rational theology, that the undeveloped mind is not prepared for the whole truth about anything. But a measure of the truth, as far as it goes, must be better than error; and, if they are always deluded with falsehoods, how will they ever be prepared to accept what is reasonable? We must remember that truth is the natural food for the human soul, the atmosphere in which all its finest qualities most readily develop. Hence, those who hold the vantage-ground of thought should give freely of their richest treasures to those who would be delivered from the errors of the past. We pride ourselves

on the munificent charities of this Christian civilization, on our unbounded almsgiving to the poor and needy; but behind those outstretched hands, those appealing eyes and pleading lips, are hungering souls oppressed with fear of an angry God, an all-powerful devil, a judgment day, and everlasting punishment.

When educated men emancipated from these old errors excuse themselves from preaching the truth as they see it, because the people are not ready to hear it, they should be reminded that, as self-constituted religious teachers, their special business is to prepare the people for steady onward steps. Archdeacon Farrar, in the January number of the *North American Review*, says truly:—

There must be progress. Churches have been very slow to learn this lesson. They have fought to the last for exploded doctrines and antiquated traditions. They have often resisted to the last the advancing knowledge of mankind. They have become revolutionary and convulsive in the effort to keep things fixed when the world is moving forward, and they have tried to preserve when it was their duty to improve. They have kept their earthen vessels closed, so that the swelling tide of human progress did but shatter them upon the shore, or, at the best, roll them hither and thither with their stagnant doctrines rotting in a dead theology.

Here is the opinion of a churchman as to this "police institution," claimed to be so necessary to the good order of society.

While the people would be unspeakably happy to be lifted out of all their harassing superstitions and harrowing fears of the eternal future, it is the height of cruelty and injustice for the educated classes, who live on their labor, grinding them to powder by a cunning system of legislation, dooming them in this life to ignorance, poverty, and rags, to fasten on their sorrowing souls the belief that their miseries here are but the foreshadowing of infinitely worst suffering hereafter. If we think it is not safe to tell them the simple truth, that we know nothing of what lies beyond our mortal horizon, we might at least picture for them some beautiful visions of peace and joy in comfortable homes eternal in the heavens. If all fear of future misery could be banished from their minds, the darkest clouds that hang over their earthly pilgrimage would be lifted. It is too bad to defraud them of the comforts and necessities in this life and of all bright hopes in the celestial world hereafter. If some dreams and speculations must be sent forth as a kind of police chart of instructions, pray let them tell of a golden age to come, when the blessings of life shall be shared equally by all the children of earth.

And, as to the women and children,—ah! how little strong men dream of all they suffer in a sincere belief of the gloomy doctrines of our Christian theology! Men, with their steady nerves, strong muscles, equable temperaments, trained to reason and self-reliance, in contact with the stern facts of life, cannot comprehend the multiplied and ever-present fears and apprehensions of coming danger that poison the lives of most women and children, growing out of their more nervous organization, more fertile imaginations, and that natural timidity that accompanies a sense of helplessness in danger. Alas for the children! Their lives are beset with fears. They are afraid of their parents at home, of their teachers in school, of the police in the street, and of the omnipresent God and devil, at all times and in all places. It is folly to hope much from the lessons of love, taught in sweet-sounding phrases, so long as they are reminded every hour in the day that they are doing something to make God angry and the devil smile. While fathers and husbands rejoice in their emancipation from the bondage of the

Christian theology, and discuss with each other the rationalism of the great German thinkers, of the French scientists, and the English historians, laughing among themselves at all the gods and the devils of the old theologies that have made humanity tremble, now crumbled to dust, how can they calmly contemplate, from day to day, the fact that all these withering, crippling superstitions are being fastened on the minds of their own trusting wives and daughters, and their innocent young children, whom they are bound to protect, not only from physical harm, but spiritual slavery!

How carefully they would guard their children from measles, whooping-cough, and scarlet fever,—diseases that will never give them one-half the suffering that will come to them with a faith in the doctrines of original sin, an angry God, a cunning devil ever whispering in their ears, coaxing them to lie and steal and swear, a day of judgment, the last trump, and everlasting punishment in a lake of fire!

And alas, too, for the pale-stricken mothers of the race who believe all this, and still more that, through their folly, through that one fatal interview in the Garden of Eden, all this misery entered the world, and hence the pangs of maternity were to be their punishment,—the curse pronounced in the beginning on all Eve's daughters. And multitudes of women believe this to-day, instead of referring their sufferings to their artificial habits of life,—to tight waists, heavy skirts, high heels, improper diet, and want of exercise. Passages of Scripture perpetuating all these cruelties and absurdities are still read in our pulpits, with a holy unction that makes them seem plausible to unthinking minds. How can educated men of common sense and kind feeling live side by side with women and children year after year, and never share with them the freedom and blessedness of a more rational religion? A system of theology that the agnostics, the scientists, the philosophers, the historians, and the most enlightened and progressive clergymen themselves repudiate cannot be the most nourishing spiritual pabulum for women and children, to say nothing of the laboring masses.

I can truly say, after an experience of seventy years, that all the cares and anxieties, the trials and disappointments, of my whole life, are light in the balance with my sufferings in childhood and youth from the horrible dogmas I sincerely believed and the gloomy environments connected with everything associated with the name of religion,—the church, the parsonage, the graveyard, as it was called in those days, and the solemn tolling bell on Sundays and many other days for funerals, which seemed to be of more frequent occurrence there than any other place in which I have ever lived. Everything connected with death was inexpressibly dolorous. The body, covered with a black pall, was borne on the shoulders of men; the friends in crape walked with bowed heads, weeping and sobbing; the neighbors who had tears to shed did so copiously; and the rest summoned up their saddest facial expressions. Round the grave came the solemn warnings to the living and, sometimes, unwelcome prophecies as to the safety of the dead. And all that pageantry of woe, and visions of the unknown land beyond the grave, haunted my midnight dreams and shadowed the sunshine of my days. The parsonage, with its bare walls and floors, its shrivelled mistress and blind sister,—more like ghostly shadows than human flesh and blood,—and two black servants racked with rheumatism, odoriferous with a pungent oil they used in the vain hope of making their weary limbs more sup-

ple, and the aged graduate from the Scotch University in Glasgow, buried in his library with musty books and papers, one window looking to the south and a flickering fire in the hearth, was the spot where I spent hours in the exhilarating study of the Greek Testament and in recitations from the Westminster Catechism. These were considered special privileges and pleasures, vouchsafed to no other child, as there were none born to that household. The church, with its bare walls and floors and severely angular architecture, with no furnace to keep us warm, no organ to gladden our hearts, no choir to lead our songs of praise in harmony, was sadly lacking in all attractions for the youthful mind. The preacher, shut up in an octagon box high above our heads, gave us sermons over an hour long, and the chorister, in a similar box below him, intoned line after line of David's psalms; and, like a flock of sheep at the heels of their shepherd, the congregation, without regard to time or tune, straggled after their leader.

A few years later, the introduction of stoves, a violoncello, Wesley's hymns, and a choir, split the church in twain. The old Scotch Presbyterians were opposed to all innovations that would give to their people paths of flowery ease on the road to heaven. So, when the thermometer was twenty degrees below zero on the Johnstown Hills, four hundred feet above the Mohawk Valley, we trudged along through the snow, foot-stoves in hand, to the cold hospitalities of the "Lord's house," to hear sermons on "predestination," "justification by faith," and "eternal damnation." To be restless or to fall asleep under such solemn circumstances was a sure evidence of total depravity and the machinations of the devil to turn your heart from God and his ordinances. As I was guilty of all these shortcomings and many more, I early believed myself a veritable child of the devil, and suffered endless fears lest he should come some night and claim me as his own. To me, he was a personal, ever-present reality, crouching in a dark corner of the nursery. Ah! how many times I have stolen out of bed, and sat shivering on the stairs for hours, where the hall lamp and the sound of voices from the parlor would in a measure mitigate my fears! With a vigorous constitution and overflowing animal spirits, I endured the strain of all these depressing influences for years, until my reasoning powers and common sense triumphed at last over my imagination. The memory of my own suffering has saved me from the cruelty of ever shadowing one young soul with any of the superstitions of our Christian religion.

But there have been many changes, even in my native town, since those dark days. Our old church is turned into a mitten factory, where the pleasant hum of machinery and the glad faces of men and women have chased the evil spirits to their hiding-places. We now have there beautiful churches, ornamental cemeteries, cheerful parsonages, and some educated men and women, emancipated from the old theologies. But, with many, the dogmas and superstitions of a worn-out faith are still considered good for women, children, and the laboring masses.

ELIZABETH CADY STANTON.

TENAFLY, N.J., Feb. 22.

A PROFIT-SHARING EXPERIMENT.

In my opinion, the only hope of putting an end to this antagonism between capital and labor and its consequent evils lies in the introduction of some plan which shall more closely and plainly unite the interests of capitalists and workmen,—for instance, a plan based upon a principle similar to that which

has been adopted to some extent by manufacturers in England. The constant complaints of workmen and their frequent strikes for higher wages and fewer hours have caused many capitalists in that country to adopt the plan of selling to their workmen small shares in their business concerns. A provision for payment is made by small weekly or monthly deductions from the wages of the employes. It is claimed, and apparently with good reason, that the effect of this plan will be to make capital and labor work for the common interest in a manner more direct and certain than where the workmen have only their weekly or monthly stipend to look forward to as an encouragement to work. There seems to be nothing impracticable about this plan; and there is every reason for the opinion that its general adoption by the manufacturers of this country would put an end to the complaints, and be for the best interests of both parties concerned. It is not uncommon now for our manufacturers to sell small interests to their agents and superintendents, that the prospects of the latter may in some degree be bound up in the establishments, and they thereby have the strongest incentives to advance the business. The arrangement, I believe, generally works well, giving satisfaction to both parties. Why not extend it farther, and allow all the industrious and sober employes to acquire an interest in the business to which their services are devoted? That this or some similar policy will be found necessary, and will eventually be adopted by the capitalists of this country, I am very confident. Until that time, we may expect to be afflicted with impracticable schemes of political demagogues, who are ever ready to foist themselves upon workingmen and to make capital out of movements for labor.

The above is an extract from an article which we wrote about twenty years ago, and which at that time was printed over our initials in the *Narragansett Weekly*, a journal then published and still published at Westerly, R.I. The article, although it gave rise to some discussion in certain circles, has probably long since passed from the memory of all who read it, and might never have been thought of again by us but for the experiment on a large scale, just brought to the notice of the public, to share profits and to adjust the relations of capital and labor now being tried in the town in which our views were given to the public. There was nothing original in the thought; nor is it claimed that, except in that sense in which all things in the universe, physical and mental, are inter-related, the article had anything to do with bringing about the experiment now in operation at Westerly, which, nevertheless, has for us an interest somewhat increased perhaps by the fact that the experiment is an attempt to carry out a scheme akin to the plan we advocated in the same community nearly twenty years ago.

The Westerly experiment is being tried by the New England Granite Company, organized seventeen years ago, in whose employ are some five hundred workmen. It went into operation at the beginning of the present year. The plan in its detail is the work of J. G. Batterson, of Hartford, Conn., president of the company and a well-known capitalist, by whose influence and authority the experiment was inaugurated. In 1871, the men employed by the company united in a strike which was very determined and protracted. It resulted in a victory for the company; but the bitter feelings aroused by the struggle, during which some of the men were arrested and imprisoned for using their influence in favor of the workmen's union, lasted long, and led to antagonisms and difficulties much against the interests of both the company and its employes. There were subsequent strikes, in consequence of which the company was compelled to decline large orders lest it should be involved in heavy loss and damages; and thus capital and labor have both suffered by the unpleasant relation between employer and employes. The tendency of late has been toward a stronger organization of the workmen than has hitherto

existed. A desire to avoid future collisions by uniting directly the interests of the company and its workmen seems to have led to the inception and inauguration of Mr. Batterson's plan of co-operation.

The plan, briefly stated, is this: Of the profits to be figured at the end of the year, one-third shall be reserved as a guarantee fund, to which shall be charged bad debts, etc., and the other two-thirds shall be divided between the stockholders and the workmen as dividends. The labor contributed to the business for the year shall, for the purpose of a dividend, be treated as so much capital at its market value, thus the share of the stockholders and workmen being in proportion to their interest in the business. If the amount of capital invested be \$100,000 and the amount paid for labor be \$150,000, three-fifths of the dividend fund will go to the workmen, and two-fifths to the stockholders. Since the labor dividend is intended for labor only, no officer, superintendent, overseer, agent, clerk, or other employé, drawing a salary, nor any subcontractors, are to participate in the dividend paid to labor. No officer or employé shall draw pay except for service actually rendered. All work done or money earned by the employment of machinery is to be counted to the credit of labor and capital alike, and the profits made thereby to be subject to the same rule for distribution as for profits otherwise made. The rate of wages per day, the bill of prices for piece work, and the number of hours to constitute a day's work shall be determined by mutual agreement, on or before January 1, each year; and all disagreements that may arise during the year between the superintendent and workmen shall be settled by arbitration. No workman discharged for good cause, such as drunkenness, bad workmanship, etc., or who leaves the employment of the company without the superintendent's consent in writing, shall participate in the year's dividend of profits; no man discharged because there is not work enough for him is to be excluded. The control of the business shall be wholly in the hands of the stockholders. If the guarantee fund (one-third of the profits) proves insufficient to cover losses, the amount must be made up by the stockholders. If it is more than sufficient, the surplus shall go to them. The books shall be open to an expert accountant or auditor, to be agreed upon by both parties. With a capital of \$100,000 and a payroll of \$150,000, in a good year, Mr. Batterson says that the profits ought to be \$25,000. Of this amount, one-third (\$8,333.33) would be credited to the guarantee fund; of the balance, two-fifths (\$8,666.67) to capital, and three-fifths (\$10,000) to labor. A workman whose wages amounts to \$600 would have in addition to his wages a dividend of \$39.96.

Mr. Batterson thinks that, if the seasons are good, the plan will prove a success; but that, if the first two years there are no dividends, the men are likely to lose confidence in the profit-sharing experiment, if not in his good intentions. As a voluntary effort on the part of a sagacious and successful capitalist to meet the growing demand for more equitable relations between capital and labor than generally exist, this experiment is most significant and important; and it will be watched with profound interest by thousands.

B. F. UNDERWOOD.

REV. JOSEPH COOK says, "I solemnly believe that Carlyle had yielded in a sense to God in conscience." If it were possible to get Carlyle's comment on this sentence, it is not improbable that Mr. Cook's name would be better known in future ages than it is likely to be merely from his own utterances.

EDITORIAL NOTES.

BY B. F. U.

THE *Freidenker* defends the use of the word "religion" against those who say, "We want no religion, not even free religion."

THE names included in the largest number of lists sent to this office in response to the request for the names of ten persons who have contributed most to intellectual freedom are the following: Luther, Bacon, Voltaire, Paine, Goethe, Darwin, Spencer, Emerson, Parker, and Mill. Nearly all who made out lists did so in the belief that the names of modern thinkers and reformers only were desired.

"MONISM and Meliorism," by Dr. Paul Carus, is an able essay, in which the author expounds Kant, argues in favor of a monistic philosophy in opposition to dualism, and advocates that view which finds the purpose of life in aspiration and effort for constant amelioration in opposition to both optimism and pessimism. A few copies of this work are for sale at *The Index* office, at 50 cents per copy.

A MEETING will be held on Thursday evening, March 18, in Tremont Temple, for the benefit of the Massachusetts Woman Suffrage Association. Mr. Sidney Dickinson will give his fine lecture, illustrated with the stereopticon, on "St. Petersburg and the Art Treasures of the Czar." Music by the Mendelssohn Ladies' Quartette of Boston. The organist will be Edward E. Kelsey, of Somerville. Tickets for reserved seats, 50 cents, for sale at *The Index* office.

"SMITH" desires Mr. Gill to answer the following question: "If what Brown calls the moon is 'all in his eye,' how is it that Smith sees precisely the same thing in the same place?" Mr. Gill, to whom we referred this question, answers: "Brown and Smith never see the same thing as all scientists. Smith's experiences answer to Brown's, because both are constructed on the same plan; and the pre-scientific mind confounds lexical phenomena with identity."

MR. ARTHUR WOLLASTON HUTTON, M.A., who was formerly a beneficed clergyman of the Church of England, and later was for eight years one of Cardinal Newman's Oratorian community at Birmingham, will shortly contribute to our columns a series of autobiographical articles giving an account of his journey to "Free Thought via Rome." Mr. Hutton's career will, we think, prove interesting to our readers, as it has brought him into close contact with many of the ecclesiastical notabilities, both Catholic and Anglican, of the day.

You attribute personality and consciousness to God; but what, then, do you call personality and consciousness? That, no doubt, which you have found in yourselves, become cognizant of in yourselves, and distinguished by that name. But, if you will only give the slightest attention to the nature of your conception, you will see that you do not and cannot conceive of this without limitation and finality. By attributing that predicate to this being, you, in consequence, make of it a finite one,—a creature like yourself. You have not, as was your wish, conceived God, but merely the multiplied (enlarged or amplified) representation of yourselves.—*Fichte*.

DR. EDMUND MONTGOMERY, the author of the essay on "Scientific Theism," begun in this number of *The Index*, needs no introduction to our readers. In Europe, better than in this country, he is known to thinkers by his scientific researches and his philosophical writings. In Germany, his book, *Die Kant'sche Erkenntnisslehre widerlegt vom Stand-*

punkt der Empirie, written in 1869, just after his retirement from medical practice, while it offended German pride in a great philosophical hero, contributed essentially to bring about the neo-Kantian era; and it is now highly appreciated by the experiential school at least. For several years, Dr. Montgomery—while, for his health, living in retirement in the South—has been pursuing his biological investigations, the results of which are published, from time to time, in Germany and England. He is a leading contributor to *Mind*, the ablest philosophical periodical in the world. His opposition to the cell-theory was regarded unfavorably by his fellow biologists generally; but, in a letter written some months ago, not designed for publication, but from which we have his permission to give passages, at our discretion, he writes: "Now, I am receiving spontaneous letters from prominent scientists expressing their adherence to my views, though with considerable caution as yet. But, since the plant-physiologists have come round, I consider the matter practically decided. The cell-theory was the greatest obstacle in the way of a monistic philosophy of life. The recognition and clear demonstration of the unity of the organic individual constitute the solid basis for all my thinking. . . . I speak of all this, that you may understand how grateful I felt in receiving your generous appreciation of my solitary endeavor. Perhaps, some day, I shall be able to break through my captivity, and, making straight for Boston, once more revel in the mutual kindling of thought, joyously flashing on new and beautiful prospects in the boundless realm of Truth. How strange it will feel after so many silent years! Perhaps that source in me is dried up altogether. Liebig—dead long since—was the last being with whom I shared this delight, hour after hour, never tiring to probe the depths of science. He was a true genius, glowing with fervent enthusiasm to the last."

KNOWING Dr. Montgomery to be a profound and learned thinker, we sent him recently a copy of Mr. Abbot's book, *Scientific Theism*, expressing the hope that he would, while reading it, be able to make a few notes indicating his concurrence with or dissent from the author's main positions. In response came his remarkable essay on "Scientific Theism," with a letter saying: "It was my intention merely to jot down a few detached remarks; but the thing got hold of me, and worked me as its slave till I had done what I here send. It has made the matter expand considerably, though I forcibly suppressed a thousand and one things."

THE *Congregationalist* says: "It is important that the effort to secure women the ballot upon temperance questions be defeated promptly and thoroughly. That effort is only an entering wedge for their full suffrage." The argument for woman suffrage made by advocates of the temperance cause, that women, if allowed to vote, would favor "temperance measures," does not impress the *Congregationalist* favorably. "Not only," it says, "is there no sufficient proof of this, but there is abundant evidence that thousands of them—and the very ones who would be most likely to vote regularly—sympathize, and would vote, with the liquor men." Since the leaders of the women suffrage movement circulate among those who accept the Bible as authority tracts which aim to show, however contrary to the truth, that this book is in favor of the equality of woman with man and of woman suffrage, perhaps they will make a tract of the *Congregationalist's* statements for circulation in the saloons, which, it is well known, have a very powerful controlling influence in the politics of Boston and other American cities.

The Index.

BOSTON, MARCH 11, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, BENJAMIN F. UNDERWOOD, : : : : : } Editors.

NO WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

"SCIENTIFIC THEISM."

BY DR. EDMUND MONTGOMERY.

I.

The Noumenal and Phenomenal World.

"What hope of answer or redress? behind the veil, behind the veil!"

We are determined to seek. Never again can we rest satisfied till we recognize the veritable real. Sayings, however oracular and from whatever source, have lost their ancient power over us. Vanished for good has the childlike trust in voices from fairyland. We are "striving after truth,"—truth pure and undisguised; and the key to its mysteries shall be the "scientific method,"—the discovery, verification, and comprehension of perpetual facts.

With profound sympathy and bated breath, we draw near and listen to every earnest and sustained scientific effort to render intelligible the great enigma of existence. And, when a thinker of Mr. Abbot's depth and compass, who has devoted a lifetime of passionate endeavor to its probing, comes, at last, to offer us the gift of his matured results, we feel eager to open wide the inlets of our understanding, and admit whatever of revealing light may be vouchsafed to us. Here no mere ideal flight of fancy shall bear us up to the blissful realm of eternal fulfilment. We are promised actual entrance there by strictly and assiduously attending to the sober teachings of science. For, whatsoever individual life, in ceaseless interaction with cosmic reality, succeeds in perceptively realizing of it, that much, we are told, has become truly one with itself, so that, by slow grades of arduous recognition, finite existence is destined to work out its ever-deepening identity with infinite perfection.

A beautiful creed this! and one whose essential meaning of infinite perfectibility through perceptual realization a scientist may well approve. Only, he will feel bound at once to confess that, abstracting from human fellowship fellow-feeling and culture, the scientific eye in its perceptive gaze has as yet utterly failed to discern the least trace

of enviable super-excellence anywhere among all the other things of our earth or in yonder million worlds.

Physical science, the science of whatever we recognize through our senses, proceeds by assuming the veritable reality of what is thus perceived. In our modern era, since Boyle and Newton, physical investigation has consistently set about its task, as if every sensible thing were actually made up of minute particles of matter, more or less densely aggregated into masses, and acting mechanically upon each other. It is under this supposition that it has endeavored to explain the outside world and all its phenomena, and that it has gained its signal triumphs.

Philosophy, on the other hand, worked up simultaneously to an entirely opposite conclusion. It finally came to assert that the world we are perceiving is, in truth, a purely mental phenomenon; that perceiving and being are identical; and that, consequently, nothing external corresponding to our mental percepts can be found anywhere in its existence.

On the scientific side, a world of aggregated and agitated matter; on the philosophic side, a mere perceptual world. How, then, can these two entirely disparate worlds be unified?

In pursuance of such an aim, it became the extreme endeavor of physical science to demonstrate how mind is in verity the outcome of processes occurring in the material universe. The extreme endeavor of psychical science, on the contrary, was to demonstrate how the material universe is but an outcome of processes occurring within the mind.

But taking, as most philosophers actually did, the existence of both worlds, the inner and outer, for granted, the problem was intelligibly to bring about their inter-communication or to effect their coalescence into a higher unity. Manifold have been the attempts to accomplish this. But to all such attempts physical science remained indifferent. However much it might modify the conception of its own units of mass and of the forces actuating them, it stubbornly adhered to the assumption that such units of mass, together with their motion, are real facts of existence, independent of the perceiving mind. Thirty years ago, this was the settled opinion of almost all students of physical science.

Meanwhile, a strenuous though futile effort to identify nerve force with electric force led to the discovery of a current of molecular activity arising during the transmission of every sense-impression up to the central organ, and from the central organ down again to the muscles. In 1850, Helmholtz succeeded in accurately measuring the velocity of such currents of activity within the nerve system, and found them immensely slower than electric currents.

This new experience opened the field, from the scientific side, for no end of further speculation on the burning question of the intercommunication of the two worlds, the one outside, the other inside the brain.

As regards the higher organs of sense, the eye and the ear, it was obvious that the quality of the sensations aroused through their instrumentality was delicately dependent on the nature of the stimulating media and the frequency and force of their impacts. All the characteristics of the light-wrought image on the retina, or of the aerial wave-figure reaching the auditory nerve, are evidently transmitted through the sensory nerves to the central organ. It is obvious from most accurate observations, according to the "scientific method," that nothing but motions of intervening media strike against the eye or ear, and that noth-

ing but corresponding motions can possibly be propagated through the nerves of these sensory organs to the brain.

How, then, is this motion-woven universe, so spectrally and yet so faithfully representing the real external one,—quite visibly so on the retina,—how is it converted within the brain into a congruous universe of conscious sight? We are scientifically certain that, by dint of the motion-woven image of yonder landscape on the retina of the subject before us, this very landscape is perceived by him just as it lies out there. Could there be a more perplexing puzzle? No wonder that from now on this very problem of external reality, motion, and sensation, became the central enigma of the scientific philosophy. And it is a solution of this same problem—a scientifically intelligible unification of the brain phenomenon and the external reality—that Mr. Abbot offers us as the indispensable entrance to his system of Noumenism. Fully to comprehend the difficulty of the task undertaken, let us first see how vainly some of the most prominent scientific thinkers have grappled with it.

First of all, then, How can a specific configuration of motions produce a congruous configuration of sensations? How can motion in any way produce sensation? Most scientists, following the example of DuBois-Reymond, are resting convinced that this wholly incommensurate production of sensation from motion is utterly incomprehensible, is, in fact, an ultimate mystery.

Other thinkers, more speculatively inclined, have tried to find or to force a solution. And here the conception that all forces in nature are only so many modes of motion, and that these modes of motion are all convertible into each other,—this new and sweeping generalization enticed Mr. Spencer to bridge the chasm between motion and sensation by boldly declaring that the sundry motions reaching the brain become actually converted into their corresponding sensations,—converted in the same way as mechanical motion becomes converted into heat, and heat into electricity, etc. Unbiased contemplation has, however, no difficulty to detect that this notion of the mutual convertibility of the various modes of the physical and mental, would, when consistently carried out, exterminate, at one fell swoop, both science and philosophy; for it is clear that under its supposition nothing from the outer world—to which our own body likewise belongs—can ever reach our potential consciousness, save a most complex system of rhythmic energy-pulses, deriving their existence from the surmised eternal source of all energy, the now much current "Unknowable." And it is clear also that this system of energy-pulses becomes immediately converted into a conscious system of "sensations, emotions, thoughts." Of course, the objective pulses cease themselves to exist, in being thus converted into their conscious equivalents. And such consciousness, wholly constituted by mentally transmuted physical forces, is, indeed, the only *ego* that can at all be ours under the conditions. For all influences from our so-called body, all its own or its transmitted energy-pulses, lose their existence in becoming mental energy-pulses. Consequently, when we exist, the system of energy-pulses, which to us individually constitutes the outer world, is non-existent. And, when it exists, then we are non-existent.

How a knowledge of existence, a philosophy of being, can at all become established among such mere transient confluences of modes of the Unknowable surpasses altogether our scientific understanding. No doubt this oscillation between Being and non-Being, this Subject-Object swing, as outcome of our most recent and popular scien-

tific philosophy, must greatly delight the venerable shade of William Frederic Hegel.

In keeping with the theory of equivalent transmutation, it is undeniable that, when we become unconscious, our whole mental energy, of which alone our *ego* can consist, must have been recon-verted into physical energy. Our existence is therefore completely annihilated for the time being; and physical science is rendered impossible, not only by our non-being, but by the production of physical forces from mental sources. The assumption that physical forces can be originated in any manner through mental agency is the death-blow to all natural science. This has been well understood by scientists for the last two centuries.

Lewes undertook to unify motion and sensation simply by identifying in name a unit of nerve motion with a unit of sensation. These, his "neural units," he declared to be motion when viewed from the objective side, and sensation when viewed from the subjective side, just as a curve remains one and the same existent, whether it be viewed from its convex or from its concave side. We have, then, a uniform neural medium agitated through quantitatively disparate pulses, emanating from a variety and vast number of sensory points. Thus, an exceedingly complex and ever-changing wave-configuration is kept in motion; and all its formations rising beyond a certain level of amplitude are said to constitute our consciousness. This is so-called psycho-physical monism, a conception easy to manage in thinking transactions, but whose daring *petitio principii* is very transparent when disengaged from verbal entanglements.

Other scientific philosophers, like Haeckel, try to avoid the cerebral dilemma by at once smuggling a modicum of sensation into their primitive elements of reality, into their units of matter-stuff, mass stuff, force-stuff, motion-stuff, mind-stuff, or whatever stuff they set out with. This flimsy device cannot hope to escape detection by hiding itself in the recesses of all but infinite diminution.

There, still, stand the two worlds, wholly irreconciled and appealing for scientific unification. Here the phenomenal world within our individual mind, there the noumenal world outside of it,—both, most evidently, signifying one and the same reality.

Promising to keep faith with the "scientific method," how does Mr. Abbot settle this supreme scientific question, this great "previous question," as he emphatically calls it? He declares the phenomenal world within our mind to be identical with exactly so much of the noumenal world as actually appears to us, or rather as is actually apperceived by us. When, for instance, I perceive yonder tree, so much of it as is apprehended in my perception is, according to this view, strictly identical with its own noumenal nature. Phenomenon and noumenon are "indissolubly one."

Thus, the identity of Being and Knowing, which hitherto, from a scientific standpoint, has always been considered the boldest of all speculative assumptions, is here maintained as a scientific fact. "Transcendental synthesis of Being and Knowing in the I is precisely what constitutes the mystery, and yet the undeniable fact of all consciousness" (p. 155). "Experience is the joint product of two equally important factors, noumenon-subject and noumenon-object,—the actual co-existence, union, and interpenetration of the real appearance and ideal appearance" (p. 104). This is what Mr. Abbot positively tells us. If he were enunciating this dyadic dogma on mere speculative grounds, we should not feel so very much surprised; but to declare in the name of science

that one and the same existent can be in two different places at one and the same time amounts to a complete reversal of what science has always held to be one of its most fundamental tenets. Mr. Abbot maintains, as the grounding proposition of his entire system of "Noumenism," that our perception coincides *spatially* as well as otherwise with the noumenal existent thus perceived; that, in fact, in the act of perception, the ideal percept and the real noumenon are one and the same identical existent.

Well, then, let us soberly examine this grounding proposition by means of the scientific method. Here is a boy looking at a chair which I have placed at a distance of ten measured steps from where he stands. Mr. Abbot has to concede that the noumenal boy and the noumenal chair are really ten steps distant from each other, just as I have placed them and am at present perceiving them. Now, it cannot be denied by scientific noumenism that the boy also perceives the chair. The chair itself and the boy remain, however, as I distinctly perceive, in their exact positions, ten steps away from each other. His perceptive chair is located somewhere within his head; for I scientifically know all about light-waves, image on the retina, optic nerve, etc. Mr. Abbot, according to his premises, is bound to look upon this chair in the boy's head as the identical noumenal chair ten steps off. This means, without escape, that one and the same noumenon can exist in two different places at once. And, as the boy in his turn perceives me at a certain distance from the chair and knows that I am also perceiving the chair, and that my perception of it is where I am and not where the chair is, there must be either three noumenal chairs in existence or the same noumenal chair must exist in three different places at once. Indeed, each new person happening to perceive the chair from any distance and in any relative position heightens Mr. Abbot's difficulty; for he has to maintain that each person perceives in his own head the veritable noumenal chair as it really exists and in the veritable place where it noumenally stands.

This single argument robs Mr. Abbot's settlement of the "previous question" of its entire validity. Fully understood, it would at once decide the whole question of "Noumenism," its train of transcendental consequences included. But let us proceed. As any perception of the boy and the chair are noumenal reality, the image of the chair I am perceiving on the boy's retina must also be noumenal reality. Now, how can this merely motion-woven image of the actual chair, ten steps off, be transformed in the boy's head into the veritable noumenal chair standing out yonder? The Roman Catholic dogma of Transubstantiation does not involve so stupendous a miracle.

Mr. Abbot's assertion that "experience is the chemical union, so to speak, of the noumenon-object and the noumenon subject, the former appearing really and the latter appearing ideally in a positive third, which is neither one nor the other of the two elements alone, but a positive coalescence of both essentially different from either" (p. 105),—this assertion, however scientifically unwarranted and incomprehensible in itself, cannot in the least destroy the force of the above criticism. For it is a cardinal principle of Mr. Abbot's system of Noumenism that space is an objective and all-comprising reality. Speaking of time and space, he says, "The noumenism of the scientific method establishes their necessary objectivity, as *condiciones sine quibus non* of noumena themselves" (p. 168). Therefore, the surmised coalescence of the noumenon-object and the nou-

menon-subject in a positive third essentially different from either cannot work any change in space relations, which are declared to be absolutely real for every kind of existent, phenomenal as well as noumenal.

But does the scientific method justify in any way this assumption of a coalescence or chemical union, so to speak, of the noumenon-object and the noumenon-subject? Giving full play to the unifying propensities of our constructive imagination within the facile realm of ideas, it is no doubt highly tempting to think of the lucid world of perception, so strangely flashed upon us with vivid and irresistible compulsion,—to think of it, nay, to feel it as the mystic union of our inmost being with whatever constitutes the true essence of the world of otherness. Every mystic with faith in intellectual intuition, every thinker who has yielded to the charm of Berkeley's beautiful thought, has felt this hallowing oneness with the Power not ourselves. But not so readily, forsooth, does the awakened feeling within us flow together with whatever of subsisting reality is therein felt. Ha! with what tedious, tortuous, tearful stress, through ages upon ages of world-formation, has life untiringly toiled so to elaborate its wondrously sensitive foil, that, to the wild onrush of multitudinous commotions from everywhere besetting and bestirring it, it now exultingly responds by casting back upon it, in phenomenal repose, the becalmed and beauteous image of a harmonized universe!

Science, with its austere scrutiny, completely dispels the brilliant illusion of our actual and instantaneous coalescence with the powers phenomenally revealed in perception. It teaches us irrefutably that nothing, absolutely nothing, enters our being from outside when our sensory surface is being stimulated. It cannot even be plausibly argued that the energy-pulses reaching us from outside are, as such, transmitted through the nerves. They only specifically, delicately upset the molecular equilibrium within the minutely predisposed sensory organs; and the marvellously complex commotion which thereupon supervenes within the nerve system is entirely an intrinsic organic process, deriving no assistance whatever from outside. It is only through the study of connatural evolution that we ever can come to understand how, nevertheless, the minutely corresponding mental phenomenon arising from such commotion happens to be significantly congruous with the existents from which the stimulating influences emanate.

Mr. Abbot, in order to establish his "transcendental synthesis of Being and Knowing in the I," has thus transgressed, not only against the most stringent rules of the scientific method, by ignoring everything which is seen to lie between the perceived object somewhere in space and its perception in the head of an individual, but by so doing he has also irretrievably jeopardized the fundamental assumption of his own Noumenism; the assumption, namely, that what we perceive of things—their spatial relations and everything else—is truly identical with their noumenal existence, that, in fact, our percepts of things are in the same place as the things themselves.

This assumed apperception by the individual of the exact noumenal nature of existents, what Mr. Abbot calls the intelligibility of their immanent relational constitution, is, according to him, "the absolute ground of the identity of Being and Thought,"—nay, the very "condition of existence" (p. 133). If this were really so, then, by faithfully adhering to our "scientific method," we must have succeeded in abolishing, by the demonstra-

tion of the spatial non-coincidence and only remotely representative character of the phenomenal world, not only the identity of Thought and Being, but in abolishing *existence* itself; and there would be, consequently, nothing left for our further argumentation to work upon.

But, as this surmised intelligibility of "the immanent relational constitution" of nature and its constituent objects is at present playing a rather important part in preventing a true understanding of our own relation to the world at large, it will be well clearly to elucidate the fact that nothing whatever of the immanent relational constitution of things is really intelligible to us.

II.

The Alleged Intelligibility of Noumenal Relations.

A complex organism is undoubtedly of all known existents the one which presents to us most strikingly an immanent relational constitution. The question is, How much of this immanent relational constitution is really intelligible to us? Let us assume, with Schleiden, Schwann, and most other physiologists, that we have established the doctrine that the complex organism is composed of a vast number of individual cells. By what intelligible principle, then, do these completely individuated billions of elementary lives so arrange themselves as to form the marvellously intricate and definite structural constitution—"the immanent relational constitution"—of the complex organism? By what intelligible principle do they then, each by merely carrying on its own individual life, nevertheless succeed in achieving the harmonious and aim-directed results so strikingly apparent in the actions of that which forms the unity of their assemblage? The closest student of biology will have to admit that, of the real nature of these constitutive and relational bonds, science is hopelessly ignorant. It understands absolutely nothing of the immanent relational constitution of the cell-aggregate or complex organism.

Or start, if you will, with Darwin's gemmules or Spencer's physiological units or Haeckel's plastidules, and again nothing at all is intelligible to us. The mode of multiplication of these living units, the principle of their specific way of aggregation, and then their marvellously concerted activity,—all and everything which concerns the "immanent relational constitution" of the organism remains utterly unintelligible, however much we may empirically learn of the spatial distribution of the parts and the sequence of their activities.

If you contemplate inanimate objects, just as little of their immanent relational constitution becomes intelligible. We do not understand how molecules cohere to masses; how the elements composing such molecules coalesce in chemical union; how molecules come to arrange themselves into strictly stereometric forms; how any individual system of immanent relations can at all exert any influence on other such systems. We only learn by experience that it is so, never why or how it is so.

The power we possess over nature is not due in any way to the intelligibility of its noumenal relations, nor to our mental apperception of the real bonds which make up the structure of noumenal existence. It is due to our being able to take the perceptually represented structure to pieces, finding out thereby what changes such pieces undergo when detached from their normal connections, and then artificially essaying what other possible combinations the detached pieces will fall into among each other. Thus, our genuine scientific concepts are formed. Not by a

gathering up into simultaneous perceptive presence of the parts composing the universe and intellectually penetrating the essence of that which constitutes their actual noumenal order and combination, but simply by knowing from experience what changes each part will undergo in whatever situation it may happen to be placed. We learn in this way, for instance, that what we know as the fragment of nature, called water, owes its fluidity to the pressure of the air and the temperature of its surroundings; that it is forced to assume this state under these special conditions. You remove the air, and it is rapidly changed into a gas. Or you lower sufficiently the surrounding temperature, and it is turned into a solid. You bring it into contact with burnt gypsum or lime, and it enters into chemical combination with these substances. Then you discover a way of chemically breaking up the very water itself into two entirely disparate components. Thereupon, by further experimenting, you find out by degrees all about these new chemical fragments of water. You detect that one of them is an actual constituent of our atmosphere; that it is, moreover, an active principle in combustion; and this, again, leads to more and more experience, and so on without end.

It is obvious, then, that the potency of our natural science does not consist in our knowing the actually existing noumenal constitution of the individual things, and that it never can hope, in its utmost extension, to wield a knowledge of the immanent relational constitution of the whole cosmos. It consists simply in our having learned from experience all possible states which perceptually realizable fragments of the outer world will assume under definite conditions, and also all possible combinations they are capable of entering into. This experience yields us a wealth of natural knowledge far transcending our apperception of the actually existing state of things, allowing us not only to draw conclusions about former states and combinations of constituent parts of the outer world, but also to forecast future states and combinations, and, principally, to induce through our own instrumentality the formation of such new states and combinations as best suit our human purposes.

In no case do we understand why things assume such or such a state under such or such conditions, or why they enter into such or such a combination with such or such other fragments of the outer world. The principle of the immanent relational constitution of things is utterly unintelligible to us. This is undeniably the irreversible decision of all investigation carried on in keeping with the "scientific method."

The utility of classification and the success of our analogical reasoning lie not in our mentally operating with an understanding of the noumenal nature of things, but in the advantage which nature affords to our memory and unifying tendencies in the actual similarity of properties and powers possessed by numbers of its individuated fragments. Mr. Abbot is certainly right in asserting that all these centuries of philosophizing have not yet rendered clear the true nature of universals. They are neither *ante rem* nor *in re* nor *post rem*. But are they *inter res*? This is Mr. Abbot's contention, and his reason for it rests on the same belief of the intelligibility of the immanent relational constitution of noumenal nature. He says: "The species is an individual thing of a higher order, inasmuch as it possesses a relational constitution immanent in the totality of its individuals as a self-related whole." "If the species as a whole—that is, as an assemblage of all the individuals composing it—were ever presented to percep-

tion, then it would yield both a percept and an image; but just as the percept would be a percept of the assemblage, so the image would be an image of the assemblage, and not of any 'generic individual,'—which is a sheer absurdity." (pp. 140, 141.) The trifling absurdity of trying to fabricate or to conceive "generic individuals" may be fully conceded; yet, if all the individuals of a species were actually present in my perception, should I, even then, in the least understand "the relational constitution immanent in the totality of its individuals as a self-related whole"? The same old limits of our intelligence would here, even more effectively than with single individuals, prevent us from ever comprehending the system of noumenal relations, which would constitute the "assemblage of all the individuals composing a species as a self-related whole." But, even if we were capable of understanding the immanent relational constitution of things, it is hard to see how the presence in simultaneous perception of all the individuals of a species would help to solve the question of the similarity of properties and powers possessed by such individuals, in which fact the problem chiefly lies.

Surveying all the evidence scientifically allowed us, we are almost at a loss to conjecture what may have induced Mr. Abbot to assume that noumenal relations are at all intelligible. The clew may probably be found in one of the rare concrete examples brought forward in illustration of Mr. Abbot's abstruse principles. He says: "For instance, the object of vision is formed color: color (reflected rays of light) is perceived by sensibility; form (which is nothing but a system of relations of outlines, boundaries, or mere limits of extension) is perceived by the understanding" (p. 137). And then, to our utter astonishment, we learn further on that sensibility—the same faculty by which we were told that color is perceived—"is not an intellectual function of the mind; no part, therefore, of the knowing faculty." This complete wiping out of everything "perceived by sensibility" from our world of recognition, as counting for nothing in our intelligible apperception, is quite useless in assisting us to understand the immanent relational constitution of objects,—this sudden clearing leaves us face to face with nothing but bare, unqualified space-relations. These, and these alone, it must, then, evidently have been that Mr. Abbot had all the time in mind when he spoke of the "immanent relational constitution" of things. For, after deducting all data of sensibility, nothing remains in our apperception save empty space-relations. We cannot be mistaken in this; for Mr. Abbot unambiguously declares, "Inasmuch as only related qualities are intelligible, and as all relations of qualities in the thing belong to its relational constitution, it is evident that the thing can be understood, not by the sensibility, nor even by the sensibility and understanding together, but only by the understanding alone" (p. 27). This means in plain words, simply and exclusively, that we perceive and understand space-relations exactly as they noumenally exist, and that we understand nothing else in nature. The whole problem of noumenism and intelligibility, then, is strictly reduced to the single question stated (p. 27): "If the sides of a triangle exist objectively, the angles must exist objectively also; but, if the angles are merely subjective, so must the sides be also." That immanent relational constitution of noumenal nature, of which we have heard so much, consists, then, after all, in no other reality than determinate space-relations. Thus, the "scientific method," which went out to gain an understanding of the inexhaustible wealth of nature revealed to us in perception, has merely confronted us with

the ancient *crux* of abstract thinking; for these same geometrical space-relations have played strange tricks to philosophers and scientists ere now.

Has Mr. Abbot, perhaps, been brought to rely upon the efficiency of intelligible space-relations to open to us the mysteries of the noumenal world by taking his science on trust from the mechanical evolutionists? They, surely, ought to know; and Mr. Fiske, who has made such evolution his special study, has again told us in his last Concord lecture (p. 150) that, "from particle to particle, without cessation, the movement passes on, reappearing from moment to moment under myriad Protean forms; while the rearrangements of particles incidental to the movement constitute the qualitative differences among things." How very plain and intelligible! The mere spatial rearrangements of moved particles constitute the qualitative differences among things! make, for instance, that water is differing from mercury, or sulphuric acid from ammonia, or a human organism from a dust-heap. Well, we can test this matter easily enough. The particles of dust in the well-known acoustical experiment which, under the influence of different rhythms of motion, arrange themselves in different, well-defined figures, is a perfect illustration of this "rearrangement of particles incidental to the movement." But we may fiddle away till doomsday, and not a trace of a new "qualitative difference" will ever make its appearance. It is time that this unconscionable influence, so generally attributed to the mere spatial distribution of particles, be abolished for good from scientific thinking; be utterly shelved, never again to be hung in needy pretence as a cloak on the miserable vacuity of the mechanical conception which, with its pitiful impoverishment of reality, is despoiling the universe and our lives therein of their sublime significance. And with it may be laid in eternal rest the innumerable bustling ghosts of that Persistent Protean Force which, like a hundred thousand legions of possessing devils or rapping spirits, are rushing to and fro among the inert and helpless particles of our world, shaking them into all manner of ephemeral shapes, to no earthly purpose save the fussy gratification of their eternal instigator. Avaunt, ye madly dashing, ever-mutating apparitions of sentimentally unknowable Force! Let alone those dead heaps of cosmic dust! We ourselves will henceforth manage the ordering business. Sentient human life, feelingly responsive, with its garnered wealth of a million fruitful years, is steadfastly advancing, winning over to its realm of sympathetic tenderness perversely plying powers, and adorning it with all the treasures of an exuberant world.

(Concluded next week.)

CORRESPONDENCE.

THE SO-CALLED EXPOSE OF MADAME BLAVATSKY.

Editors of *The Index*:—

Will you give me a little space in your valuable paper for a few words regarding the so-called exposé of Madame H. P. Blavatsky, and the report of the Society for Psychical Research of London upon theosophic phenomena?

This report extends over several hundred pages, and is called scientific.

It must not be forgotten that, first, the investigation was self-constituted, and not requested by the Theosophical Society; and, secondly, that it related to a part of the history of theosophy which is not of great importance, nor dwelt on much by its members. We are a society devoted to Universal Brotherhood and Philosophy. It was true that Col. Olcott, the President, related to Mr. Hodgson nearly all the phenomena he had ever seen; but that was only injudi-

cious, for they were not performed publicly nor for the public.

Now, I was the third person engaged in founding the society here, in 1875. Have been very active in it ever since. Went to India, via London, in 1884. And yet Mr. Hodgson did not interrogate me, nor did he get the facts he relates in his report at first hands.

He says, among other things, that "Mr. Judge, an American, was at Adyar, and was not allowed to see the shrine or its room." This is false. I went to India expressly to be concerned in the coming exposure by the Coulombs, and I took charge of everything the moment I arrived there. I had the final and exhaustive examination made. I myself removed the shrine to an adjoining room, from which that night it disappeared. This was months before Hodgson arrived in India. If he saw what he thought was a part of the shrine, it was a joke put on him by Dr. Hartmann, who would be pleased to lead such a wild investigator into a trap. No part of it was retained by Hartmann.

Again, he describes a hole in the wall behind the shrine. There was none, and he gets it all at second hand. There was an unfinished opening in the second wall, behind the shrine, having jagged projections of lath ends all around it,—just as Coulomb had to leave it, when we stopped him. The cupboard put up against it was unfinished, and the false door thereof could only be opened with mallet and pry. All this was Coulomb's concoction, ready to be opened to Missionary Patterson at the proper time. But the proper time never arrived, and I will tell you why. I was in Paris in April, 1884; and, while there, a message was received,—in the very way which Hodgson thinks he has exploded,—informing us that the Coulombs had begun operations, and that, unless some one went and stopped them, they would get their traps finely finished, with a due appearance of age and use to carry out the conspiracy. So I started for Adyar, with full authority. But, while on the way, the people had received there a similar intimation, so that I found the Coulombs just out of the place when I arrived. At once, a register was opened there. Over three hundred people examined the place, who signed their names to a declaration of the condition and appearance of things; and then a resolution prohibiting further prying by the curious was passed. The very next day, Missionary Patterson, expert Gribble & Co., came to examine. It was too late. The law was already in existence; and Mr. Gribble, who had come as an "impartial expert," with, however, a report in full in his pocket against us, had to go away depending on his imagination for damaging facts. He then drew upon that fountain.

I tell you, Mr. Editor, the report of Hodgson is only half-done work. No account has been taken of the numerous letters received by me and others, during these years between 1874 and 1884, from various adepts, under circumstances entirely free from Blavatskyism. And he has failed to get the evidence regarding things at Adyar of the only person who went there free from excitement, and who remained cool while the rest were wild. An experience of ten years had placed my mind where the puerile traps of missionaries, or resemblances of letters from adepts to Blavatsky's writing, could not affect it. For I will divulge to you this, sir, that, if an adept wanted to write to you, the curious circumstance might be found that the writing would resemble your own. I once saw a message thrown upon the leaf of a book; and it was in the handwriting of him holding it, who was as much amazed as any one else.

One word more. Mr. Hodgson's argument on the evidence proceeds thus: Damodar says, in a separate examination, that the figure of the adept "went over a tree and disappeared," while Mohini says, "The figure seemed to melt away." Ergo, they lie, because they disagree as to the disappearance. This is sheer folly. Then he goes through what happened in Paris when I was present, asking Mohini and Keightley if a man might not have entered the window. They had forgotten the window. I say the window was in my room; and its height from the stone courtyard was over twenty feet, with no means of reaching by climbing.

Finally, I received in Paris several letters from American friends, ignorant of adepts; and inside were pencilled notes in the familiar handwriting which Hodgson has exploded and proved "fraudulent."

The report is valuable as a contribution to history; and when Mr. Hodgson has gained some acquaint-

ance with the several adepts, of whom he does not dream, who are engaged with the society, he and your readers may be pleased to revise conclusions, as science has so often been compelled to do.

Yours,
WILLIAM Q. JUDGE.
New York, February, 1886.

A QUESTION OF WORDS.

Editors of The Index:—

May I call attention to the following period in Emerson's "Over-soul"? "In youth, we are mad for persons. Childhood and youth see all in them. But the larger experience discovers the identical nature appearing through them all. Persons themselves acquaint us with the impersonal." Is this not an absolutely incorrect and sense-destroying use of the word "impersonal"? Ought it not to have read, "Persons themselves acquaint us with the universal personality"? For the "identical nature appearing through all persons"—appearing as personality in you and me and all—is therefore, as far as it does appear, personality and not impersonality. If the meaning was to say that this "identical nature" in all persons or their common personality does not belong to one or another in special,—nor to all, but all to it,—would not the wording suggested have been the correct one: ["Persons or individual personalities] themselves acquaint us with the universal personality"?]

It is a question of words, but errors often spring from a word. As will be seen in one case, the Universal Spirit does really appear, reveal itself through men, its nature through human nature. In the other case, it does not appear through men; and human nature is not a revelation of the Divine, but different in him or perhaps opposite to it.

Is it not another misuse of terms in one place to speak of the impersonality of the Universal Spirit, in another of the universal self? What is the difference between selfhood and personality?

It is worth while to settle the meaning and right use of words so frequently used, and that for our most important ideas.

H. TAMBS LYCHE.

REVELATION AND MORALITY.

Editors of The Index:—

Many are still afraid, even to-day, to believe that it has been man's own thought, experience, and actual social necessities which have evolved the ideas of morality now held by all nations. This, however, according to the best light and wisdom of modern research, is the actual state of the case. There has never been any supernatural "revelation" of the way of life. There has never been any direct word to man from out of the sky concerning duty or religion or social requirements. Man himself, through painful need and much of sorrow, has discovered and contrived all morality,—all the high, right, fine duties of man to man the world over, operated upon, however, of course, we must admit,—in a general, natural way,—by the high, right, fine forces of the universe, obedience to which has always been the condition of man's best life and progress.

If these fine forces of the universe are "God," and if man's growth under these forces and his continual rise to higher life, through the discovery and following of the wisest means and laws of his existence, may be counted a "revelation," then we may say there has been a revelation. But only thus. For we know to-day that there has never been a break anywhere in the orderly continuance of the world's natural energies. There has never been a time or place for any direct, special, "supernatural" revelation. Man has sought out and seized upon and utilized. And this that he himself has found, concerning the requirements of the highest kind of life, he has taken to himself in after time as a "revelation." Later generations and peoples have deemed it specially God-given, have deemed it "writ large," even as by the finger of Deity itself, on tables of stone, and then have themselves gone on discovering!

Practically, the highest kind of life has ever been for man his best-served deity. So that we find the moral sense slowly strengthening as the years have gone on; and, as through the ages it has grown and ripened, it has brought with it "codes of duty, ethical commandments, precepts of public and private conduct, legislative enactments, courts for enforcing

these, instrumentalities for ethical education, and numberless other beneficent organizations for securing human rights, for redressing human grievances, and for promoting human welfare."

Moreover, the best interests of humanity have been not only, but should ever be, the transcendent deity of man. For thus only shall the highest forces of the universe—which still we may call God, if we wish—blossom out for all sentient being into increasing glory.

JAMES H. WEST.

For The Index.

WHAT IS RELIGION?

What is Religion, in whose name
Such fearful deeds are wrought,
And dogmas yet more fearful still
Unto the spirit taught?

"It is the gift of God to man,
And to none else beside,
The breath of life unto his soul,"
A sage to me replied.

A yearning of that soul to bridge
That chasm which divides
The known from the unknown, and read
The secret which it hides.

'Tis not devotion, worship, praise,
The pious act or deed,
Though these may be the fruit and flower
That from its root proceed.

We know the earth was ages old
Before it had the power
Upon its face to bear a tree
Or show a single flower.

Its heavy air, unfit for life,
Supported giant ferns alone,
Which left the impress of their leaves
Imbedded in the stone.

So does religion in each age
Express man's yearning needs,
And leave an impress on the race
Recorded in its deeds.

Now rude and fierce with human blood
Behold its altars reek,
While fruit and flowers are offered by
The beauty-loving Greek.

Gotama and Confucius both,
Like fern leaves in the coal,
Ere Jesus came their impress left
Upon the human soul.

"The joys of life, e'en life itself,"
Loyola cries, "I'll give
Unto the holy Mother Church,
And die that she may live."

But perfect Love, which casts out fear
And raises and refines
Life's conduct, is the living Truth
The heart of man enshrines.

Creeds, dogmas, fables, myths, and all
Shall crumble and decay,
But Love, the kernel, live when faith,
The husk, has passed away.

Then cast aside all fear, O soul,
Religion cannot die:
The good and true of every age
The next shall purify.

MARY BAYARD CLARKE.

NEW BERNE, N.C.

THE journal of the National Indian Association for January takes the title of the *Indian Magazine*, and begins, with this number, a new series. This is an excellent journal, ably edited, with a corps of talented contributors, who deal mainly with the educational, literary, and social matters pertaining to life in India. It is published in London, by C. Kegan Paul, French & Co., price sixpence per number, or five shillings English money, if paid yearly in advance. The design of its publication is to promote mutual understanding and cordial relations between English people and their fellow-subjects in the East. The present number contains, among other timely articles, the following: "How to preserve Health in India, with Special Reference to Medical Women," by Dr. C. R. Francis; "A Word about England-visiting Indian Youths," by A. Kashmiri Pandit; "The Indian and Colonial Exhibition, 1886"; "Commercial Education at Madras," by R. M. M.; "The Countess of Dufferin's Association for Supplying Female Medical Aid to the Women of India"; "The Vernacular Lit-

erature and Folk-lore of the
Training College for School-mis-
—"A Christmas Dream,"—by Mary Lau,

THE *Atlantic Monthly* for March contains instalments of the serial stories by Henry James and Charles Egbert Craddock, "The Princess Casamassima" and "In the Clouds"; a quaint, short story, entitled "A Brother to Dragons," by an anonymous writer; an article on "Grant," by Col. Higginson; "The United States after the Revolutionary War," by John Fiske; and a memorial paper on "Elihu Mulford," by Horace E. Scudder. Dr. Holmes' "New Portfolio" gives two of the poet's latest "occasional" poems, together with some pages of pleasant moralizing. Other articles are by Justin Winsor, Dr. F. H. Hedge, and Henry Van Brunt. The poems are by Louisa Imogen Guiney and Andrew Hedbrooke. "A Shaksperian Scholar" is a review of Richard Grant White's "Studies in Shakspeare." Other long reviews are "Gen. J. E. B. Stuart," "Folk Tales," and "Tennyson the Conservative."

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI), inclusive, will be furnished at special rates.

The Religion of Philosophy; OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. FERRIS.

For sale at THE INDEX Office. Price \$3.00.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

SCIENTIFIC THEISM.

BY FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOOSMIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 30 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

POPULAR BOOKS

A new Liberal Monthly, entitled

THE UNITARIAN,

Edited by BROOKE HERFORD, Boston, and J. T. SUNDERLAND, Chicago.

Assisted by Robert Collyer, Charles G. Ames, Oscar Clute, George L. Chaney, H. Price Collier, and Mrs. Eliza R. Sunderland.

28 Pages, Size and Type of Harper's Monthly.

Subscription Price, 50 cts. per Year.

The magazine aims to popularize and carry far and wide the best thought of Liberal Christianity. Its writers are the ablest; its matter is fresh, varied, practical; its price is low enough to enable it to go into every home in America.
Send 50 cents for a year's subscription (or a dollar for two years) to J. T. SUNDERLAND, 175 Dearborn Street, Chicago.

J. HART & CO., BANKERS, Doylestown, Pa.

Draw Bills of Exchange on England, Ireland, and other points in Europe. Agency for the American Line of Steamers.

Primitive Mind Cure; or, Transcendental Medicine.

By Dr. W. E. EVANS.
A comprehensive treatise on the cure of diseases in ourselves and others by mental agencies. Dr. Evans stands a peer among the learned philosophers of the day, and more than any living person gives valuable practical knowledge on the "mind-cure."
Extra cloth, \$1.50. Postage, 9 cts.
SANITARY PUBLISHING CO., Chicago.

THE PATRONAGE of the liberal advertising public is respectfully solicited for THE INDEX. Though the paper must not be held responsible for any statements made by advertisers, the attempt will be honestly made to keep the advertising pages in entire harmony with its general character and principles. To this end, all improper or "slandering" advertisements, all quack advertisements, and all advertisements believed to be fraudulent or unjust to any one, will be excluded from these columns.

FURNITURE MANUFACTORY IN NEW ENGLAND.

Bargains in Fine Goods.

F. M. HOLMES FURNITURE CO.,
116 Tremont Street, Boston.

CHEAP RADICAL TRACTS!

No. 1.—Truths for the Times, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—Fear of the Living God, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—Lecture on the Bible, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—Christian Propagandism, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. Full of Figures, Facts, and Interesting Extracts. Price 5 cents; 30 copies, \$1.00.

No. 5.—"God in the Constitution," by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—"The Sabbath," by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—"Compulsory Education," by F. E. Abbot, maintains the right of every child to be educated, and that of the State to ensure it an education. Price 5 cents; 20 copies, 50 cents.

No. 8.—The Present Age, by O. B. Frothingham, treats of a subject of interest to everybody. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 9.—The Impeachment of Christianity, by F. E. Abbot. 5 cents a doz.

No. 10.—The God of Science, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 11.—The God of Science, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 12.—The Battle of Syracuse. Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot, concerning the Future of Christianity. Price 5 cents; 30 copies, \$1.00.

Address THE INDEX,

CURRENT TOPICS.

BY B. F. U.

"WHAT IS THEOSOPHY?" is the title of a volume by a well-known Newport lady, which is to be published at once by Messrs. Cupples, Upham & Co.

THE death of the eminent New York physician, Dr. Austin Flint, leaves a great gap in the ranks of the medical profession. He was born at Peterham, Mass., Oct. 20, 1812. He had but recently accepted an invitation to address the British Medical Association on Medicine, in July,—an honor never before shown an American physician.

JUSTIN MCCARTHY says: "It is a melancholy fact that mendacity is becoming recognized as an art in parliamentary government in England. . . . I distinctly assert that the late government would have brought in a home rule scheme of some kind, if the elections had given them, combined with the Nationalists, a large majority over the Liberals. When they found they had not that majority, they got it into their heads they would be only working for Mr. Gladstone in that direction, and had better try to get up an anti-Irish feeling, and posture as the champions of the integrity of the Empire."

At the monthly dinner and discussion of the Unitarian Club in this city, one evening last week, Mr. Edward Atkinson spoke of the impolicy of setting apart a large amount of capital to build churches, used only one day in a week, when we cannot spare it. Indeed, he thought it rather superstitious to set aside so much. It was the truth of the sentiment preached, and not the place in which it is spoken, that is to be considered. On the score of economy, he said ninety per cent. of the people in this country have only forty or fifty cents per day to support them; and they cannot have much to pay for expensive worship.

SAYS the Boston Sunday Herald: "A bill passed by the Connecticut Legislature the other day renders it lawful for infidels to testify as witnesses;

but the privilege will not be of much value to the unbelieving dogs, since, as the newspapers of the State remark, Christian jurymen and Christian judges will take their testimony for what they think it is worth. And this, of course, is just nothing at all; for it is utterly absurd and unreasonable to suppose that the word of a Deist or Agnostic, Jew or Mohammedan, Buddhist or fire worshipper,—of anybody but a Christian, indeed,—is worth anything whatever. They are sure to be everlastingly damned in the next world; and the fewer privileges they have in this, the better."

At a meeting of the King County Bar, held at Seattle, W.T., February 27, resolutions were adopted declaring that the assemblage of the mob in that city, on the 7th and 8th of February, "was an unparalleled outrage upon the city of Seattle and its law-abiding citizens, and ought to meet the strongest condemnation of every honest, loyal man residing in it, and of every true American in the whole country"; and that those who are devoting themselves "to arraying one class against another—by lies and incendiary appeals—are the worst enemies of society; and are especially the enemies of our honest workingmen, whom they are striving to dupe and trick into becoming law-breakers, and whose livelihood they already have imperilled by frightening capital out of the country, and by breaking up industries which have only been established after years of laborious exertion and sacrifice."

MR. SETH HUNT, in a letter to the Springfield Republican, referring to the case of Adams, condemned to the gallows in this State, says: "In spite of the praiseworthy efforts of legal counsel, medical experts, philanthropic editors, and other humane individuals, a miserable man, with an unbalanced organization, a prey to a disordered nervous system, is to be dealt with under the savage law of retaliation,—the taking of life for life. In view of such a barbarity, one wonders whether Christians believe that Jesus was in earnest when he repealed the old retaliatory laws, and forbade the taking even of an eye for an eye or a tooth for a tooth. Capital punishment belongs to a dark and heathenish age, when bloody sacrifices were deemed necessary to atone for sin and appease the wrath of the gods, but is out of place here and now,—like a baleful star jostled from its eccentric orbit through blackness of darkness into the clear blue of the sunlit heavens."

THE following references to authors and their works are from a private letter written us by a friend, himself an author, who recently returned to this country, after a vacation of several months in Europe: "On my way back, I spent an evening with Leslie Stephen, who is hard at work on his Biographical Dictionary, and well satisfied with the success of his Life of Fawcett, I imagine, though he says he fears it is a failure. Prof. Croom Robertson's little book on Hobbes (Blackwood Series) is well received. It is certainly very well written. Grant Allen, I regret to say, is in very feeble health. I spent an hour with Mr.

Spencer at the Athenæum about two weeks ago. He talked discouragingly about his physical condition; but, to me, he seemed pretty well. I detected no signs of feebleness. James Sully is revising his *Psychology*. Shadworth H. Hodgson (who ought to be better known and more fully appreciated in this country) is carrying on with success the work of the Aristotelian Society. Prof. Robertson speaks very highly of the articles that are sent him for *Mind* by American contributors. He commends particularly the work done by the Johns Hopkins University people,—Stanley Hall and his coadjutors."

FIVE of Rabbi Schindler's lectures were recently reprinted from *The Index* in the Painesville, Ohio, *Telegraph*. In reply to an inquiry, Rev. Joseph Cook sent to that town, from this city, the following statement: "Excepting a few notices in sensational journals, I have seen nothing in print in Boston concerning Rabbi Solomon Schindler. I have never heard him or his utterances once mentioned in conversation here. You know more of him than Boston at large does." And yet Rabbi Schindler's lectures, entitled "Messianic Expectations," were printed in the *Herald*, *Globe*, *Transcript*, *Post*, and we know not how many other Boston dailies, not to speak of the Boston weekly journals in which they appeared. The Sunday *Herald* and the Sunday *Globe*, of November 1, had editorials on the lectures. On November 2, Rev. Dr. Gordon's reply to them appeared in the *Herald*. On November 3, the *Globe* had a long article presenting the views of different persons in regard to them. Several articles concerning the lectures appeared in the *Transcript*, and among them an editorial in the issue of December 23. They were, indeed, the subject of comment by the Boston press generally. The space given to Mr. Cook's lectures in the Boston papers this season is, we believe, not one-fourth, probably not one-sixth, of that given to Rabbi Schindler's lectures. Mr. Cook's statement, above quoted, therefore conveys an impression that is entirely false. It serves as an illustration of his method and habit of distorting the truth and disparaging men who differ from him, when, by so doing, he can make a point; and it is in keeping with his statements made a few years ago in regard to German students, the Free Religious Association, Emerson's change of belief, the position and claims of distinguished scientists, etc. He often tells his hearers that it is an "incontrovertible truth" that "character tends to permanency," and that there is no probation after death. Mr. Cook is now at middle age: his habits are formed, his character, such as it is, established, and becoming more and more fixed every day. He will, we trust, since he is so free with advice and exhortation to others, pardon us for suggesting to him that he should make an earnest effort—with prayer, if that will help him—to overcome, "before it is everlastingly too late," his rancorous disposition toward free thinkers and the bigotry and prejudice which cloud his judgment, and make him so often a perverter of the truth and a calumniator.

PROGRESS OF LIBERALISM.

Persons holding liberal views with regard to religion are often charged with having no missionary zeal; and often, too, they frankly admit that the charge is true, and they reproach themselves for the fact. Many of them are accustomed to say that the great mass of the people are all ready to be led out of the evangelical churches to the new views, if the new views only had as fervent a band of apostles to propagate them as have the old beliefs. Far be it from us to underrate the importance of the missionary temperament and zeal. We wish that Liberalism had a great deal more of active enthusiasm in the work of spreading its ideas than it has. If it has not and cannot have the same urgent motive as the old-fashioned evangelical believers have,—that of saving souls from the torments of a future hell,—it may have at least a very noble motive; namely, the motive of enlightening the human race and lifting it up to the capacity of wiser beliefs and more rational and righteous conduct.

But we much doubt whether the utmost missionary temperament and zeal would have any great success in carrying the modern rational and liberal views of religion directly to the masses of the people. The masses of the people like a religion of mystery and miracle. That a thing should be incredible, that a proposition should be unbelievable to man's natural reason, does not at all trouble them. They have, in fact, been taught for centuries that religion is a matter of faith, not of reason. The less they understand it, the more do they call it religion. Then, too, for the masses of the people who have any attachment to religion at all, especially for the great multitude sheltered by the Church of Rome, sentiment, association, and tradition count for much more than ideas. The work, therefore, naturally allotted to liberals in religion appears to be that of the gradual education and reform of public opinion,—beginning with the small circle of thoughtful and inquiring people closest at hand, and thence the influence percolating through adjacent circles and larger religious bodies, until at last it reaches the masses. If Liberals are doing their full share in this work, if they generously and zealously support any well-considered and well-guided efforts that are made in this direction, they have no occasion to reproach themselves for neglecting the great mass of the people, even though the latter do not as yet largely read their journals or flock to hear their discourses.

Progress, however, is not wanting. This work of propagating liberal ideas would not be void of results, even though the evidence of its actual power within the time of a single generation were much less conspicuous than it is. Emerson and Parker left no sect of their founding behind them. They did not plant churches. It was not the mass of the people, whether rich or poor, learned or unlearned, who went to hear them. It was the men and women whose minds were open to inquiry, who believed in mental and moral independence, and who were more inclined, perhaps, to work alone than in any organization. The few independent societies that sprang up in consequence of the ideas which Emerson and Parker had sown came for the most part for a special cause or were kept alive by a personal leader, and they have now nearly all disappeared. But any one who should argue from this fact that Emerson and Parker had no influence and left no power in the world to work after they were dead would greatly blunder in his observation of historical facts. The Unitarian denomination, which disowned them and their heresies a generation ago,

has now virtually accepted their theological positions. Emerson it already reckons among its saints; and his books are increasingly read by an increasing number of persons, of various beliefs, who go to him as one of a small group of writers in all the ages who are perennially resorted to for moral and spiritual inspiration. And Parker, by leading Unitarians, is now placed by the side of Channing in the denomination's history, his portrait is to grace the walls of the new Unitarian building in Boston, and a volume of his writings has just been published by the American Unitarian Association as one of their missionary books. Meantime, Western Unitarian conferences and societies, not to speak of many individuals and a few societies in the East, have pretty generally advanced to the principles of the Free Religious Association in framing their platforms of church organization and fellowship. Those of us who were in Cambridge at the time when, less than thirty years ago, the choice of Theodore Parker for their graduation preacher by a class in the Divinity School was vetoed by the faculty of the school, and the young men who sympathized with Parker's views were plainly told that they were not wanted in the denomination, can but wonder at these evidences, not only of the great change, but of the rapidity with which it has been effected.

Nor is it only in so-called liberal religious organizations that these evidences of progress appear. Orthodoxy also has been rapidly moving forward. What is called Liberal or New Orthodoxy to-day occupies a position very near the camp of the Channing type of Unitarianism. It is in some respects *beyond* the old Unitarian position. Henry Ward Beecher said in a recent sermon that the doctrine of evolution will rightly abolish the distinction between natural and revealed religion. In the same sermon, he spoke of "the fable of Adam's fall"; and, again, of the Bible, in these words:—

Men know perfectly well, when they use the Bible as their spiritual guide, what parts to select. They select the things that they need, the things that stir them, the things that their moral consciousness adopts. They know the different value between the long genealogical chapters in Chronicles and the Gospels of John and of Matthew. They know there is a different weight and value to different parts of the Bible, a volume of sixty-six different books, in different languages, published in different ages, with a thousand years between some of them, representing the lyrics and the literature, all the legislation, all the judicatories, and the slender stock of medical knowledge of the Jewish race. That volume, put together in such a way, is not of uniform value in all parts. The doctrine of inspiration which teaches us that God wrote it, and the whole of it right straight through, men do not believe, nor will they now fight for it. Ministers may assert it officially in the pulpit, but they do not personally believe it.

Now, Mr. Beecher may not be accepted as a representative of the New Orthodoxy. But he is its pioneer. Many are following whither he leads. Theologically speaking (and we are considering him only in that character), he stands to Orthodoxy as Theodore Parker stood in his lifetime to Unitarianism. Yet Beecher has met no such denominational antagonism as did Parker. His Church is still popularly, if not officially, counted in the list of Orthodox Congregational churches. But, with regard to the Bible and the history of religion, Plymouth Church pulpit is proclaiming doctrines which the old Federal Street Unitarian Church in Boston would have reckoned heresies, if Dr. Channing had gone so far as to utter them. A pure specimen of old-fashioned Orthodoxy it is not easy now to find. The sects have all made some progress, whether they are ready to confess it or not. More liberal views have, to a considerable extent, permeated and educated them. The

Congregationalist, in a late notice of Mr. M. J. Savage's last volume of sermons, said that the author's "statements of evangelical belief will not be assented to by those who hold it." Yet Mr. Savage doubtless knows what he himself was taught and believed when he was in the orthodox church; and if those who hold the evangelical belief to-day do not assent to his statements of the orthodox creed in which he was bred, this may testify to the fact that they have moved forward over a part of the road on which he has advanced.

Then, again, there is probably a larger body of thoughtful people outside of all churches, whether orthodox or liberal, than ever before. In this class are large numbers of scholarly and scientific men, and also people of keen understanding, without much advantage from culture, who have imbibed liberal thought from the general mental atmosphere of the age, and have also had a habit of thinking for themselves. Col. Ingersoll, with all his stores of intellectual wit and his brilliant gifts as a popular orator, could not have drawn, a half-century ago, such vast audiences as he attracts to-day, to hear his attacks on evangelical theology. Probably the largest cities could not then have furnished hundreds, where now thousands flock to hear his ridicule of the orthodox creeds,—even if, fifty years ago, he had been allowed to speak in such fashion at all. And, if it be said that he does not really attack the orthodox creeds of to-day, but only the ghosts of past creeds, this interpretation of the fact bears even stronger witness to the progress that has been made. If Col. Ingersoll were talking of things which had never been believed and had no genetic connection whatever with present orthodox beliefs, what possible interest could his lectures have to audiences? It is because he talks of beliefs which have been outgrown just far enough to become subjects of ridicule and yet not so far as not to be recognized as having been veritable creeds, if not even now somewhere in existence, that his topics have so much popular interest.

Next week, we shall draw certain inferences from these several facts of progress, bearing on the question of liberal religious organization and work.

WM. J. POTTER.

THE SOUTHERN PROBLEM.

(Continued.)

IV.

Third Stage.

We perceive that everywhere mighty forces are at work upon the social fabric of the South; that those forces have not been idle in the North; that, in fact, the modelling of society anew upon democratic principles is progressing throughout the Republic; that from every quarter influences are assailing, undermining, besieging the old régime with its inequalities and wrongs. We know that its surrender, if not immediate, is certain, and that, when it comes, it will be unconditional and absolute. We have no fear. We do not doubt. We have an abiding faith that the whole country is in motion, moving according to the everlasting instincts of human kindness to that state where there shall be no white or black, no superior or inferior race, but children all of the same national mother and equals before her laws.

To hasten this time, much devolves upon the colored race. It, too, must be in motion. It, too, must feel the vast push and stir of the social revolution. Its shoulders must strain against the wheel of this immense car, and with invisible allies do its part.

How, then, are the new ideas affecting the social

life of this race and through it the social life of the South? We shall see.

At the close of the war, the blacks numbered about four million five hundred thousand. To-day, they number between seven and eight millions. This increase has been made against all odds,—amid universal lawlessness, misgovernment, and oppression. It speaks of physical health, a certain freshness and vigor. Proves that in the untried struggle for existence during the first twenty years of freedom they have more than held their own. If population is wealth,—in our country, who doubts it?—the blacks have done much toward enriching the South. They have nearly doubled the labor power of that section. Freedom has not deranged its industrial machinery. Notwithstanding the convulsions of this transition period, plantations have glistened with cotton and glowed with rice. These millions have lived and labored, rearing families, erecting churches and school-houses, buying land and building houses. The agricultural interests have prospered through their industry. The blacks have not, then, been a race of sluggards. To this extraordinary increase of numbers must be added a surprising aggregation of wealth. From the condition of chattel slavery, these people have become the owners of millions of dollars in real and personal estate. To industry they have united economy, and back of these are advancing self-respect and self-reliance.

Again, they have attacked their terrible illiteracy with an earnestness and success which have no parallel in the history of education. The old and the young, male and female, have turned their faces toward the light with one accord. The Pentecostal shower of the Alphabet and the Primer made them drunk with the joy of learning. Their thirst for knowledge was stronger, more thrilling, than the wild longing of Xenophon's ten thousand for the sea. By the glimmering glory of pine fagots, they have groped their way to a grander sea, wide-shining and sounding.

The social currents of the race life are flowing then in the right direction. And direction is all-important. Do not misunderstand us. We will not excuse its follies and errors. What we mean is that, notwithstanding these drags and drawbacks, the race is keeping well abreast the revolution,—meeting in a manly way its obligations to itself, the South, and the country.

There is a circumstance articulated to this portion of the subject which must not be overlooked in this discussion, for the part which it is destined to play in the solution of the problem is hardly inferior to any other cause. I refer to the rise of a class of small farmers in the South. It is an event of far-reaching consequence. Before the war, the whites owned not only all the land, but all the labor. This double ownership was the fundamental fact upon which rested the whole Southern system. The legal ownership of labor has disappeared. The exclusive ownership of land is beginning to do likewise. While it is true that the great body of this new class are small white farmers, its tendency to abolish this land monopoly is none the less effective. For, as it increases in strength, it will force distribution upon the South. The cost of production is less for this class than for the great planter class. The great planter class is not able to compete with it in the world's market. It is slowly modifying the landed interest, therefore, by compelling the large holders to adjust themselves to new conditions. These are subdividing and selling or letting a portion, at least, of the patrimonial estate. The rising class is thus re-enforced by a natural movement, and the agrarian wedge enters deeper the trunk of the ancient order.

This innovation reacts favorably upon the colored race. The increasing necessity for land-partition creates an increasing demand for tenants and buyers. The large holders must look largely to the industrious and reliable of this race for the supply. Intelligence, thrift, temperance, domestic well-being, on its part, will enhance the value of Southern property and increase Southern dividends. Common schools for the instruction of the blacks in elementary subjects, industrial schools for their training in the agricultural and the mechanical arts, will steadily grow in public favor, until public opinion makes them compulsory throughout the old slave States.

The struggle of the negro toward a higher life receives incalculable aid from this lateral movement of economic forces. He cannot remain stationary. Rise and advance he must. He will acquire property and knowledge. He will climb slowly, but surely, in the scale of civilized life. With material improvement will come new moral wants and a desire to gratify them. Respectability, a manly self-assertion and independence, will be no laggards. They will knock at the gate of inequality and oppression, and summon them to surrender. And surrender, then, they must. For, with him, irresistible powers are in league. Everywhere, they are fighting his battle, and bearing him to victory. Vast social energies are migrating Southward. They are moving from every quarter,—this Cimmerian host of liberty and equality,—closing in upon wrong, trampling down prescription, saying to the long-suffering victims of American caste, "Fear not, little flock; for it is your Father's good pleasure to give you the kingdom." When this little flock of the Republic shall have fully entered into the promise, the Southern Problem will be solved; and the union of the two sections under a common government finished by the more perfect union of a common social system.

A. H. GRIMKE.

A PLAN OF ETHICAL STUDY.*

Our aim is to awaken an interest in the study of ethics. What do we mean by ethics? What is its place in the scheme of human knowledge? It differs, of course, from all the physical sciences, in that, while they deal with nature, it deals with man. But ethics also differs from psychology and what is known as sociology; for these deal with what men and societies are, and ethics deals with what they should be. The aim of ethics is to find a supreme rule or rules for human action, whether as individuals or societies. Ethics starts out with a presupposition; namely, that there is *something right* to do in the various circumstances of life,—by right being meant simply what we ought to do. This presupposition cannot be proved, if anybody doubts it. It can only be taken for granted, just as science takes for granted the idea of truth; and ethics seeks to find out what is right, as science, in the strictest sense of the term, seeks to find out what is true.

What is the *special* problem of ethics for us? It is, I may say, to find a supreme rule of action that commends itself immediately to our reason. If our ancestors, five or six hundred years ago, had been asked what was the highest law for men, many of them would have answered, To obey the Church. Two or three centuries later, they would have said, To follow the Bible. Probably some of our own fathers and mothers have taught us to find the rule of life in the teachings of Jesus or of Moses. But the most striking phenomenon in the modern intellectual world is the sense of the humanness and

fallibility of all these authorities. The Church is an assembly of men; the Bible was written by men; even Jesus and Moses were human beings, not essentially unlike ourselves. Why, then, should we bow before them? Even if we do bow before them, there must lie a reason for doing so; and that (reason) must lie in the fact that what they teach voices the instinctive and, perhaps, unconscious ideas of right that are in our own minds. And, if we do not show this reverence, it must be because something within us, at least dimly seen, commands a higher reverence. We have then to leave these ancient authorities out of account, and ask for a rule of action that commends itself directly to us.

It is sometimes held that each man's conscience is itself a divine guide. But the consciences of men vary from one another, the only constant thing being the idea of right and the sense of a sacred obligation to obey it. And what is right, what are the definite rules or rule of action, we have still to determine. And, even if the consciences of men did not vary, the question now is, What do they teach, what do they give us as supreme rules or rule of life? It is not impossible that perfectly mature consciences would agree, would find but one really rational rule of life. We have now only to ask, What is the nearest approach we can make toward discovering that rule? Our attitude is to be one of inquiry. Leaving aside all authority and trying to be as free from superstition about the matter-of-fact sort of consciences we have within us as about the great personages and institutions of the past, we are simply to ask, What is the supreme rule of life? We are to look on it as an open question. As the man of science is ready to be convinced by whatever appeals to his senses, so are we to be ready to be persuaded by whatever appeals to our reason, and to let the rationality of an idea alone determine us in accepting or rejecting it.

It would be quite out of place, then, for me to propose any rule that commends itself to myself. This is not a class in the ordinary sense,—at least, it is not my class. We are rather to learn at the outset what the great minds of the race have said. Our own several opinions, mine and yours, will come more naturally at the close of our investigations than at the beginning.

I have recommended to the committee in charge to take up, first, certain leading scientific writers of our own time. Science is one of the most striking of modern developments, and it will be particularly interesting to learn how men trained in its methods look upon ethics. Darwin is, perhaps, the foremost figure; and he has elaborated a theory in the third, fourth, and fifth chapters of Part First of his great work, *The Descent of Man*. This view has been defined and popularized, and presented in most readable and fascinating form, by the late W. Kingdon Clifford, whose brilliant career as a mathematician and physicist was ended all too soon, and whose loss does not cease to be lamented in the higher circles of English thought. Then there is the philosopher who stands in such close sympathy with the scientific movement of our day,—Herbert Spencer,—who has developed an analogous though slightly different view in his *Data of Ethics*. Besides, there is the little treatise of John Stuart Mill on "Utilitarianism."* As the easiest and most taking introduction to our subject, I should recommend Clifford's essays entitled "The Scientific Basis of Morals" and "Right and Wrong," and then the study of Darwin, then of Spencer, and lastly of Mill.

* Remarks made before a class of young people formed for the study of Ethics, at its opening meeting.

* I might add, for those who read German, Dr. Georg von Gitzky's *Grundzüge der Moral*. It were much to be desired that a translation of this excellent little manual of utilitarian ethics might be made.

How should we approach these authors? I should say, in the first instance, simply with the effort to understand them. It is vain to criticise before we understand. In reading, we should let our minds lie open, and receive the full impression of the author's views. Then, perhaps, in a second or third reading, we should try to test those views, critically examine them,—not, of course, to find fault with them nor to defend them, but to see clearly what answer it is they furnish to our problem, and whether the answer really satisfies us. There are two tests we may apply quite impartially and without regard to the particular views we may be inclined to. First, are the rules or rule proposed the highest we can conceive of? Second, is there any duty, anything commended by our instinctive moral sense, that is not covered by the rule? It goes without saying that any moral principle, to be a principle, must be one than which no higher can be conceived; and, also, that, if there is a single duty that is not accounted for by the proposed principle, it is shown thereby to be untrue,—i.e., inadequate.

Later on, we might take up some of the great writers of the past. Kant and Aristotle,—I suppose there are no names quite equal to those in the history of ethical speculation; and, certainly, we should know something of them at first hand. I must not omit to mention, however, a book of the present time that, I sometimes think, will take rank with Kant and Aristotle in the future. In some respects, it is superior to them; for it is marked by a spirit the like of which I have never seen in any other ethical treatise. Most books on ethics advocate and urge a theory. This book seems to be written in search of a theory. I have never witnessed a calmer temper, a more judicial spirit. The leading theories of ethics are classified, and then taken up,—not to disprove or to defend them, but to inquire about them, whether they meet something like the tests I have already mentioned. It is *The Methods of Ethics*, by Henry Sidgwick.

All that I have thus far spoken of relates to the theory of ethics. After satisfying ourselves if it is possible, on this point, I should propose that we pass on to applied ethics. We should consider the duties of the individual in detail, the duties of society. We should take up, for example, not only personal ethics, but the ethics of the family, the ethics of business, the ethics of government. It is in these applications of the supreme principles that ethics will become rich and fruitful. Very clearly, we shall see that ethics is not a copy of facts, but an ideal for facts; that it is not the study of human life as it is, but of those rules obedience to which would bring life to what it should be. We should familiarize ourselves with the ideal of the family, with the ideal of industry, with the ideal of society as organized in the form of the State; and, instead of being dry and stale and commonplace, I suspect you will be surprised at finding how transforming and even revolutionary a genuine ethics would be.

But one word in closing. I trust you will give an illustration here of honest work and temperate and courteous discussion. I would almost say, Never debate here. Debates are often amusing and even convincing to those who take part in them; but these are not always, to use a good old word, edifying. Let each one endeavor to do justice to the author under consideration, and be conscientious in any objections he makes to his views. I should say that the leader or leaders of the evening should make it their special duty to present fair *résumés* of the chapter under consideration, and only after that should others present their difficulties or criticisms, or they themselves indi-

cate their own mind and conclusions about the author's view. And, above all, be expeditious. Discussions can often continue indefinitely, as long as the disputants have strength to speak and listeners patience to hear. But simply to present one's own difficulties or state one's own beliefs, without regard to others, need not take so long. The work should not drag, should not become wearisome to any one.

I am heartily glad, my friends, that you have undertaken this work, and of your own motion. I think you will be doing what no other body of young people in our city is doing. I take it as a fresh proof of the life there is in the younger element of our society; and, with these few words, I bid you a cordial goodspeed!

W. M. SALTER.

A LIFE OF JESUS.*

Since Jesus of Nazareth is worshipped as a god throughout the United States, a work which treats of his life, written by an eminent American, should naturally excite a wide interest.

The difficulty which Christians have in appreciating such a work is purely a literary one. In literary matters, the followers of Jesus are perfectly straightforward. They divide the writings of the world into two great categories, the sacred and the profane. The illustrious period of sacred literature is ushered in by the Decalogue, "written by the finger of God himself on two tablets of stone,"† *Anno Mundi* 2513 or B.C. 1491, just twenty-nine hundred and eighty-one years before the discovery of America by Columbus. The purity of the line of sacred literature is preserved by the ingenious method of declaring that "the Supreme Being is the author of all the books in the Old and New Testaments, as the writers spoke by his immediate inspiration." By this simple and precise arrangement, controversy is silenced; for, if all inspired pens can trace their lineage to "the finger of God himself," there certainly can be no dispute as to the authority of the sacred canon. All works of inspired authors belong to sacred literature. As to other writings, they are profane.

The book under consideration is profane. Its author is not inspired in the vulgar sense of the word. He is simply an eminent citizen and scholar, of unimpeachable character and most humane motives, who has endeavored, after a prodigious amount of study and research, which has been conducted in a perfectly judicial spirit, to state the truth concerning the life and character of Jesus. He has written in an age which is peculiarly rich in materials for forming a correct judgment as to who Jesus really was, the places he visited, the people he associated with, and the doctrines he sought to promulgate.

The first thought that arises after reading Mr. Talbot's book is of the disaster which must come to the beliefs of all Christians who are bold enough to study it. Anything resembling the belief that Jesus was a god is simply impossible, unless Mr. Talbot's numberless authorities and the conclusions which they authorize are false; and we have been unable to detect any inaccuracies among them. The next thought that arises is that Christianity has the power of living on quite independently of any amount of proof that its doctrines are false and that its creed is ridiculous. It is a physical organism which has acquired a sufficient store of vitality to last, for centuries to come, in the midst of the most unfortunate circumstances which it is possible to imagine for it.

If this is the case, it will be asked, Of what use

* *Jesus: His Opinions and Character*. By A. Layman. Boston: George H. Ellis. 1883.

† Exodus xxiv., 12.

are such critical works as Mr. Talbot's? They prove Christianity to be a false religion. They prove the doctrines of Jesus to be hopelessly contradictory and to a large extent unpractical, and yet their effect on the Church is almost imperceptible. It would seem, indeed, that Christians are just as happy and just as contented with themselves after as before these attacks. This question is of the same order as that propounded by a prominent business man of New York, in an eloquent defence of Christianity made recently before the Nineteenth Century Club. "Where are the philosophers and the critics who have opposed the religion of Jesus?" triumphantly demanded the orator. "What do they amount to? The New York Stock Exchange is widely conceded to be an assemblage of men fairly representing the brightness and mental force of our nation. Ask the Stock Exchange, if you will, Where are Immanuel Kant and Auguste Comte and Strauss and Renan; and, in all probability, they will reply that they have never heard of them." Had the speaker not been interrupted by the laughter which this display of innocence elicited, he doubtless would have continued, "Now ask the Stock Exchange who Jesus was, and they will all know."

This *naïve* manner of estimating the comparative extent and significance of reputation admirably explains the position and utility of Mr. Talbot's book. Christians, in general, do know just about as well as the New York Stock Exchange does who Jesus really was. But, until Christians familiarize themselves with the history of thought and the achievements of the great religious critics, they will not know much more about Jesus than the Stock Exchange does; and this is why they continue, obedient to the behest of their priests and ministers, to worship him as a god.

To the careful observer of passing events, it is more and more obvious that there is an aristocracy of intelligence in this country to which a few members of the New York Stock Exchange undoubtedly belong and from which the great body of orthodox Christians is rigidly excluded. This aristocracy is for the most part unconscious of its existence and of its exclusiveness. It is merely the result of that distinction which naturally belongs to minds of good critical ability. The creation of such an *élite* is the inevitable consequence of our government and institutions. The contact of our race with the cosmopolitan culture of Europe has already developed the fact that the American orthodox Christian is simply intolerable. His views of life, of history, and of humanity are so narrow and provincial as to appear grotesque in the eyes of the liberally educated. This state of things is well understood abroad, and it is beginning to be understood at home. It means that orthodox Christianity is regarded by the enlightened world as a species of illiteracy, as decidedly vulgar. And vulgar is merely a synonyme for uneducated, not refined. Such men as Mr. Talbot in the critical world and as Mr. Courtlandt Palmer in the social world are unconsciously, but none the less adroitly, giving form to this natural aristocracy of intelligence; and woe betide Christianity, when it has been discovered that to swing censers before altars, and to elevate the host while the cringing multitude bend the knee, or to affirm the inspiration of the Scriptures or the divinity of Jesus are, in an intellectual sense, coarse and vulgar practices, as they undoubtedly are!

When the illiteracy of orthodox Christianity is more widely understood, such powerful thinkers as Prof. John Fiske and such bright men as Phillips Brooks and R. Heber Newton will find it less advantageous to be classified as followers of Jesus.

RAYMOND S. PERRIN.

EDITORIAL NOTES.

BY B. F. U.

MR. CONWAY'S "Armageddon" next week.

"GIORDANO BRUNO AND THE RELATION OF HIS PHILOSOPHY TO FREE THOUGHT," by Thomas Davidson, in pamphlet form, is for sale at *The Index* office. Price, ten cents per copy.

SAYS Dr. Hedge, probably the ablest philosophical thinker among American Unitarians: "There is a greater word than even 'religion,'—a word of farther reach, of more momentous import, including religion with how much else! That word is 'humanity.'"

MR. GLADSTONE is obliged to admit that the science of Genesis, though, as he conceives, supernaturally accurate in the main, is not accurate throughout, so that, according to his hypothesis, the Supreme Being, though deficient in information on certain points, and perhaps believing in the Ptolemaic system, has, considering the circumstances, made a highly creditable approach to truth.—*The Week*.

AS THERE was an error in Mr. Gill's reply to "Smith," as printed in *The Index* last week, the question and answer are here reprinted, with the latter corrected: *Smith*: "If what Brown calls the moon is 'all in his eye,' how is it that Smith sees precisely the same thing?" *Gill*: "Brown and Smith never see the same thing, as all scientists now agree. Smith's experiences answer to Brown's, because both are constructed on the same plan; and the pre-scientific mind confounds lexical correspondence with identity."

GEORGE HENRY LEWES calls the doctrine which he expounds in *Problems of Life and Mind* "Reasoned Realism." He says: "It is a doctrine which endeavors to rectify the natural illusions of reason, when reason attempts to rectify the supposed illusion of sense. I call it Realism, because it affirms the reality of what is given in 'Feeling,' and 'Reasoned Realism,' because it justifies that affirmation through an investigation of the grounds and processes of philosophy when philosophy explains the facts given in feeling."

MRS. JULIA ROMANA ANAGNOS, who died last week, at the age of forty, was the eldest daughter of Julia Ward Howe and the late Dr. S. G. Howe, and wife of M. Anagnos, superintendent of the Perkins Institute for the Blind in this city. She was a woman of culture and benevolence, and her life was a truly noble and useful one. Mrs. Anagnos was president of the Boston Metaphysical Club, at whose meetings she was accustomed to preside with gracefulness and tact. Possessed of rare social qualities, she was personally known to many; and her death is deeply deplored by a large circle of friends.

THE *Independent Pulpit* comes to us this month enlarged to twenty-four pages, every one of which is filled with interesting matter. Under the management of Mr. J. D. Shaw, who for conscience' sake left the Methodist pulpit a few years ago, this monthly has not only gained in circulation, but it has steadily improved in quality; and now it is one of the very best of our free thought exchanges published in this country. Mr. Shaw, who is a good speaker as well as a forcible writer, has done valuable work for free thought in Texas; and we are glad to see that he and his journal are so well sustained. The subscription price of the *Independent Pulpit* is \$1.50 per year. Address, J. D. Shaw, Lock Box 159, Waco, Texas.

"MENTAL SCIENCE MAGAZINE AND MIND-CURE JOURNAL" is the name of a monthly journal published at Chicago in the interest of the new sci-

ence of mental healing. "It does not," its prospectus says, "voice any ism, but advocates a revival of the 'faith once delivered to the saints,' whereby healing from sickness and saving from sin and death are made proofs of divine favor." The editors are Rev. A. J. Swarts and Mrs. Emma Hopkins. Among the contributors to the March number, we notice the names of Dr. W. F. Evans, Dr. J. R. Buchanan, Dr. E. J. Arens, and Mrs. A. M. Diaz. There have already been developed among the representatives and adherents of the "mind-cure method" considerable variety and even contrariety of belief. It seems to be the aim of this journal to afford all a medium for the expression of their thought and the exposition of their theories. The subscription price is \$1 per year. Address, *Mental Science Magazine*, 161 La Salle Street, Chicago.

MR. CLARK IRVINE writes: "You made some mistake in reply to an inquiry as to the oldest books of Scripture in *The Index* of February 4. Evidently, you have not seen Robertson Smith's lecture on the 'Old Testament in the Jewish Church,' the ablest criticism of the Bible ever made. He holds it off, and sees it as a whole, perfect master as he is of Hebrew. He proves that even Ezra was not written by Ezra, let alone Moses by Moses. Scholars must be correct." Our friend seems to have mixed up Amos and Moses badly. Robertson Smith, in his article on "Prophets" in the *Encyclopædia Britannica*, refers without dissent to the previous article on Amos, when it is said of his discourses, "There never has been a doubt of their genuineness." Our statement that Amos is probably the oldest book of the Bible (about 800 B.C.), remains unimpaired, so far as we know, by anything that Dr. Smith has written.

S. E. CASSINO & Co., Boston, have published *Messianic Expectations and Modern Judaism*, by Rabbi Solomon Schindler, in a handsome volume of two hundred and ninety pages. The preface is by Rev. M. J. Savage. In addition to the ten lectures given last winter under the title of "Messianic Expectations," this book contains seven others; namely, "The Pittsburgh Conference: Its Causes," "The Pittsburgh Conference: Its Work," "Modern Judaism," "The Sinaitic Revelation," "Moses," "Propagation of Religion," "Churches and their Relation to Morals." These lectures, so remarkable for their directness and boldness, have already been widely read, as reported in the Boston daily papers and copied into other journals throughout the country; and, in the substantial and convenient form in which they are now issued, they will, we are confident, be welcomed by many. Copies are for sale at *The Index* office, at \$1.50 per copy.

THOMAS JEFFERSON, in the year and month of his inauguration, wrote: "Officers who have been guilty of gross abuses of office, such as marshals packing juries, etc., I shall now remove, as my predecessor ought in justice to have done. The instances will be few, and governed by strict rule, not party passion." In another letter, he said: "Of the thousands of officers, therefore, in the United States, a very few individuals only, probably not twenty, will be removed; and those only for doing what they ought not to have done. I know that, in stopping thus short in the career of removal, I shall give great offence to many of my friends. That torrent has been pressing me heavily, and will require all my force to bear up against; but my maxim is *fiat justitia, ruat cælum*." He concludes his celebrated letter to the New Haven merchants upon the subject of removals with the historic declaration: "The only questions concerning a candidate shall be, Is he honest, Is he capable? Is he faithful to the constitution?"

In eight years, President Jefferson made but thirty-nine removals; and not one of them, he positively affirmed, was made for party reasons.

HENRY GUY CARLETON, in an interesting article in the *Scientific American* on "Rattlesnakes and their Peculiarities," thus refers to the sand or "desert" rattlesnake, so commonly believed to be on friendly terms with the prairie dog, whose burrow he occupies: "I have reason to believe that, when the rattlesnake inserts himself in the bosom of a prairie dog's family, he does so on fraudulent grounds, and is unwillingly entertained. The prairie dog carries no life insurance, and cannot afford a quarrel; and the snake is mean enough to take advantage of him. There is a little, brown, and very comical owl who likewise takes up residence with the prairie dog; but he makes at least a show of earning his rent by remaining at the entrance, and acting as janitor, politely bowing to everybody who passes. Neither snake, dog, nor owl seems to mind the other's presence, but are exceedingly sociable. The strange companionship is explained thus: The prairie dog's burrow is the only shelter afforded the snake from the intense heat of those arid plains; and, as the dog always sinks a well on his premises, it is the snake's only means of getting water, and I have demonstrated to my satisfaction that rattlesnakes speedily perish without it. In return for this hospitality, the rattlesnake takes charge of the census, and thoughtfully prevents the prairie dog from accumulating a larger family than he can conveniently support."

In a lecture on "Progress in Religion," delivered in this city last Friday evening, Rabbi Solomon Schindler said:—

Truth has come to be judged by its own merits, and error can no longer hide behind an illustrious name. Critical analysis has shown that the Bible, instead of being of divine authorship, is the work of many different individuals, and is wholly a human composition. The Liberal of the present age protests emphatically against the canonization of the past. He believes that the world has improved, instead of retrograding; that the ideal man is before us, and not behind us. This plank in the platform of Liberalism is of the highest importance, for it tends to upset the whole religious fabric of the past. If our ancestors are not our superiors in genius, wisdom, and goodness, if we know more than they did, if we are better than they were, why should we be guided by their instructions? Their laws have then no bearing upon us, their authority vanishes, their ideals disappear, and we have the right of legislating for our present wants and needs, as they did for theirs. No law of theirs is binding for us, merely because a Moses, a Lycurgus, or a St. Paul has established it. It can stand only if supported by its own intrinsic merit and if applicable to our present condition of affairs. The intercession of our ancestors as mediators between God and ourselves becomes useless from the moment that we consider ourselves as near, or even nearer, to God than they ever were. In a word, the whole system of religion which is built upon the superior goodness and wisdom of past generations collapses.

A UNITARIAN paper says that there is a moral in the following anecdote, childish as it seems: "A little six-year-old boy entered the house of a Methodist preacher, and told him that he had some kittens that he would like to sell him; that they were straight Methodist kittens, and he would sell them for one dollar apiece. The minister did not care to purchase, and finally the boy left. A few days after, the good preacher went to call upon a Unitarian minister; and, while they were talking, who should come in but the little boy who had the kittens to sell! Going straight up to the Unitarian minister, he commenced to plead with him to buy his kittens, assuring him that they were *Unitarian* kittens, all smart, and he might have them for a dollar apiece. The Methodist

preacher looked at the boy a moment, and then said: 'How is this, little boy? You told me only a few days ago that they were *Methodist* kittens.' 'Ah!' said the little fellow, 'they were Methodist kittens then; but now they've got their eyes open, so they are Unitarian kittens.' If the kittens were Methodists while blind and Unitarians a few days later, when they had just "got their eyes open," what did they become as they outgrew kittenish notions, and abandoned kittenish ways, and developed into full-grown, experienced, thoughtful, discriminating, sensible, and judicious cats? While holding fast to the categorical truths, they probably came to distrust everything dogmatical, whether called by Methodist, Unitarian, or other denominational names.

A CORRESPONDENT writes: "Are you not giving too much space to the discussion of Mr. Abbot's metaphysical and theological ideas, put forth under the imposing title of *Scientific Theism*? They could hardly receive more attention in *The Index*, if they were some great world-revolutionizing discoveries in science, instead of being what they are,—mere speculations, very old, and some of them, it seems to me, the opposite of 'scientific.' Although your own dissent from the conclusions of 'Scientific Theism' is pronounced, you seem to be trying to secure for the work an amount of attention which it does not merit." A scientific or philosophic thinker cannot consistently or fairly assume that his position on debatable questions is the true one, and that an author who differs from him is wrong, and that, therefore, little or no attention should be given to the author. Men do not write books on speculative and philosophical subjects to make money, or to get applause from the multitude; and, when a thinker of ability presents to the public the results of years of study and thought, the least we can do, in common fairness and in the interests of truth, is to give his views careful consideration, and encourage their candid examination by competent minds from every point of view. Whether the discussion result favorably or unfavorably to the views in question, it can hardly fail to stimulate thought and advance the truth. Buckle expressed the correct view of discussion in these words: "The great enemy of knowledge is not error, but inertness. All that we want is discussion; and then we are sure to do well, no matter what our blunders may be. One error conflicts with another: each destroys its opponent, and the truth is evolved. This is the course of the human mind; and it is from this point of view that the authors of new ideas, the proposers of new contrivances, and the originators of new heresies are benefactors of their species. Whether they are right or wrong is the least part of the question. They tend to excite the mind, they disturb the public sloth."

SONNET.

For *The Index*.

Oh, could we but forget! Thank God, we come
From the eternal past, no memory kept
Of those celestial bowers in which we slept
'Mid amaranths and roses,—floated home
O'er seas of amber,—neath the crystal dome
Of unremembered suns and stars! We wept,
And with our tears oblivion came. Then stepped
We through the ivory gates of Life, weird foam
Cast on the shore, forgetful of the coast
From whence it came; and we from thence go on,
Accumulating thought on thought,—wild tossed,
Full-freighted barks, the sad winds making moan
All through our heavy sails; no memory lost
Of all our dire mishaps and griefs,—not one.

ELIZABETH OAKES SMITH.

HOLLYWOOD, N.C.

The Index.

BOSTON, MARCH 18, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for MR. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For *The Index*.

"SCIENTIFIC THEISM."

BY DR. EDMUND MONTGOMERY.

(Concluded.)

The true relation of exact science to space is easily understood. Noumenal existence reveals itself in strictly determinate modes of space-occupation. Noumenal changes are indicated by corresponding changes in such space-occupation and, moreover, in specific time-determinations. The business of our exact science is to learn, through most accurate experiential measurement, the specific modes of space and time determination of the natural objects and their changes. These specific determinations, thus fixed in numerical symbols, are available for mathematical operations; and the conformity of mathematical results with natural occurrences rests on the uniform progression of the actual changes undergone by the interacting noumenal powers.

In presence of the question of the veritable noumenal existence of space and its relations, as we actually perceive them, to which Mr. Abbot's pleading for "Noumenism" has been reduced, first by his own exclusion of all data of sensibility, and then superabundantly also by the annulment of space-influence as productive of qualitative distinctions, we have arrived at the very problem which gave rise to the critical philosophy and its peculiar theory of knowledge. Kant had learned from Hume, who thought and wrote under the influence of the "scientific method," that no dialectical trick of pure reasoning, no mere logical operation, can ever extend one jot our knowledge concerning matter-of-fact occurrences. After merely seeing a piece of bread, we might reason about it till the end of time and never find out, without further experience, the other properties it possesses,—how it feels, smells, tastes, nourishes, etc. As Kant himself expresses it, "We can never, by means of our understanding, come to gain an insight how anything can be a cause or possess power: these relations have to be taken altogether from experience." With his profound philosophi-

cal insight, he discerned at once that, if this be really the case, then—inevitably—are we forever and wholly confined in our knowledge to what is actually given to us in perceptual experience, that thought can never transcend the world of sensible facts, that all attempts at metaphysically over-reaching sense-experience must end in nothing but Utopian castle-building. For all that, he himself cherished most devoutly the belief in a sphere of transcendent subsistence. Was there then no way legitimately to prove its veritable existence? Within the whole compass of our legitimate knowledge is there to be found no science which erects its edifice without help of sense-material? If so, perhaps, after all, a justifiable way may be discovered of entering by rights of our human reason the sacred precincts of the intelligible world.

Many years, Kant worked with all his might at this great problem. How can reason, unaided by sense-material, construct valid knowledge? How are synthetical propositions *a priori* possible? At last, he thought he had discovered a way. The apodictic certainty and independence from sense-experience of propositions expressing geometrical relations seemed to warrant the actual existence of such *a priori* propositions, which fact would, in verity, prove the ability of our reason to construct, by force of its own intrinsic functions, universally valid knowledge free of sense-compulsion. How, then, is such spontaneous thinking-feat accomplished? It is obvious that, if anything in geometrical conception,—in the very space-relations by means of which Mr. Abbot hopes to grasp noumenal truth from the sensible side,—if anything assisting in the formation of geometrical propositions is at all derived from sense-experience, then there is an end for good of our hope of ever catching a glimpse of the intelligible world. It was under the influence of such considerations as these that Kant came to discover that space, and then time also, are in reality our own subjective forms of perception; and that all sense-material appears as a passive content of these otherwise empty forms. Now, geometrical constructions being put together without help of external sense-affection, we must evidently—so thought Kant—be gifted with a power of determining from within empty space. This power he named productive imagination. But, moreover,—and this is the pivot on which all mental philosophy turns,—we must also be gifted with a power capable of gathering up, of synthetically apperceiving and comprehending, space-determinations of any kind whatever, whether induced from within or from without. This synthetical power Kant called "understanding," just as Mr. Abbot does in the same sense. Understanding, then, is to these thinkers, and must ever be to all such as assume a constructive force inherent in mind itself, the only synthetizing power anywhere in existence.

It is, therefore, understanding or intelligence which, in Kant's opinion, constructs not only geometrical percepts, but puts also together from mere passive and scattered sense-data the entire perceptive or objective world. "Der Verstand macht allererst Natur." But, in spite of this all but wholly creative power attributed to intelligence, the end result of all Kant's laborious researches he himself sums up in the one supremely momentous and pregnant sentence: "Noumenon non datur scientia." We know nothing of the noumenal, intelligible world. Human intelligence can work only upon given sense-material.

When we consider that, after life-long fervid endeavor, this final sentence contains the deep sigh of resignation, the sacrificial offering on the altar of truth of the highest aspirations of one of the world's greatest thinkers, we bow our head

in profound veneration at so exalted an act of devotional self-denial.

If intelligence were really the synthetical power within us, then there would be no escape from Kant's verdict that nature is made, is actually constructed, by such intelligence. Nay, it can be clearly shown, contrary to Kant's assumption, that the sense-material, coming to us and falling into the empty forms of time and space, that these very "appearances" themselves are through and through synthetical products, and must therefore likewise be made up by the only synthetizing power admitted in existence; that, consequently, the entire world is, in verity, out and out the creation of intelligence.

Mr. Abbot differs here with Kant—the great consummator of Nominalism, Subjectivism, Phenomenalism, in fact, of all the isms he so strenuously opposes—in one single point only. With him, also, intelligence is the sole synthetic power, the sole establisher of relations between things. But, unlike Kant, Mr. Abbot maintains that the relations synthetically apperceived by individual intelligence are the identical relations which actually subsist in the noumenal world. As this is the focus of Mr. Abbot's entire system of "Noumenism," let us clearly summon up before our mental eye the presupposed state of things. In the noumenal world there is an infinite intelligence which creates the system of relations constituting the real cosmos. Our individual intelligence, being also a synthetic power, a constituter of relations, realizes or, in fact, recreates a minute fraction of the infinitely complex noumenal system. Now, this individually recreated fraction, however deficient as a realization of the entire noumenal constitution, is absolutely identical with so much of it as is thereby actually apperceived. We remember that, in the course of our argument, all that is merely "perceived by the sensibility" has been eliminated. Consequently, the entire question turns again only on space-relations; for time-relations are merely incidentally brought in, and their fate goes along with that of space-relations. Are there, then, in noumenal existence space-relations identical with those we individually perceive? Is Kant right in asserting that space is merely a subjective form of our own sensibility, ready for the reception of given sense-material? Or is Mr. Abbot right in maintaining that space itself is an absolute existent, and, like destiny, above all the gods?

He says: "Space and time are not known at all except as the universal conditions of all existence,—as absolute forms of all Thought because, and only because, they are absolute ground-forms of all Being" (p. 168). "The universe as divine object, and therefore the universe as divine subject, are thus absolutely conditioned on Space and Time" (p. 167). "The evolution of the universe" "is the *Infinite Life of God in Time and Space*." The creation of all things, then, takes place on the side of infinite intelligence solely by establishing determinate time and space relations, and on our finite side by re-establishing by dint of our individual intelligence a part of these very same time and space relations. This, then, is the gist of it all, the eternal business of infinite and finite existence. For, as "sensibility is no part of the knowing faculty," "as only related qualities are intelligible," and as "the thing can be understood only by the understanding alone," the understanding or knowing faculty can only comprehend time and space relations. And, as whatever it comprehends is identical with the "immanent relational constitution" of the noumenal world, it follows that this much-yearned-for noumenal world—if it existed at all—would consist of nothing

but intelligibly created space and time relations; would be, in fact, a kind of self-evolutionizing geometry. Mr. Abbot denies that Kant's arguments for the purely subjective or phenomenal subsistence of space are conclusive. The little experiment of the boy and the chair ought, however, to go some way to induce him to reconsider his position. But a still easier and more striking experiment will, rightly considered, entirely settle the matter. Crossing one's fingers in the old Aristotelian way, not, however, over a pea or the tip of one's nose, which objects are then felt double, but placing between the fingers thus crossed a knitting-needle or something similar, Prof. Croom Robertson observed that we recognize not only two distinct tactile impressions; separated from each other by a definite space, but that the impression coming from the finger occupying the upper position in visual space is felt in tactile space to lie *underneath* the tactile impression received from the finger occupying the lower position in visual space, and *vice versa*. This is due to no error of judgment, to no fault of our understanding. It is as positive a perceptual experience as any in nature. This being so, which space, then, is the real one, the tactile or the visual? Or, taking the two, widely separated, tactile impressions, which of them corresponds to the noumenal position of the one object? The fact is the tactile nerves of the fingers enter the central organ in the order actually felt, which means that our apperception of space is dependent on the arrangement and specific energies of our nerve system. When you feel or see a single object double, the nerves have played you that trick. It is not your intellect which is mistaken. There are actually two objects in the field of apperception. Normally, you feel your leg occupying a certain position in space; but the sensory nerve and the leg and its space are gone. "Oh, no! look, the leg is still there." Well, then, the tactile space-relations of the leg being annihilated, there must be another space in existence with other relations. Shut your eyes, and that space, also, together with all its relations, is gone. "But, surely," so idealistic and realistic Transcendentalists aver, "it is not the nerve system that originates space and its relations." Explain, then, intelligibly, scientifically, how space-perceptions are actually formed. When you hold an orange in your hand, you feel it, by means of that very hand, occupying a certain space and having a certain form: you see it, also, by means of your eyes, occupying the same space and having the same form. The sensory points of the hand and those of the eye, through which the respective impressions are conveyed to the brain, are two feet distant from each other. They convey to the central organ the impressed relations on two entirely different roads. Are these two entirely different sets of relations reaching the brain unified there by the intellect? Quite obviously, the intellect has nothing at all to do with their unification. They appear in consciousness at once fully and magically unified as one single percept. There is no mental elaboration at all at play.

Here is a man who has lost his arm years ago. He, nevertheless, distinctly feels his missing arm and hand occupying a definite position in space. He can even move his missing fingers just as he used to do when the hand was still there. This is what actually happens, what he truly apperceives within tactile space. His intellect is forced to acknowledge the fact, is forced to admit that, though no noumenal existence whatever corresponds to this compelled apperception, yet there it unmistakably is. Surely, the power that can thus create a tactile arm with no noumenal presence

to go upon will be found competent to do any amount of such like work. Dreams and hallucinations, the most positive proof imaginable of a subjective origination of space and all its relations, are declared by Mr. Abbot to be unreal, because they are not "regulated by the intellect." If the order of our perceptive world—all we feel, see, hear, smell, and taste—were in the least dependent for its perceptual realization on regulation by the intellect, we ourselves and the rest of it would then, indeed, be in a most pitiable and desperate fix: our perceptual world would immediately crumble into disconnected atoms, and we ourselves would perish before an hour was over.

We have to come to a positive decision about these relations. It will not do to go on seesawing, generation after generation, on questions so fundamental that on the answer given must to us, as intelligent beings, depend at last our whole course in life. The alternative lies between spiritual Transcendentalism and its ethical consequences or Naturalism and its very different ethics. Mr. Abbot himself is a genuine spiritual Transcendentalist, as will clearly appear; and science and its method have no room in the philosophy of intellectual creation.

Every individual carries his potential space about with him, as a functional capacity irradiating from his apperceptive focus. Everything that affects his skin, his retina, or even his other organs of sense, energizes definite positions of this space-sensibility. Thus, the veritable noumenal order of existents is only symbolically reproduced in this subjective medium. When we consider how comparatively few and selected are the attuned points which we offer to the entire scale of objective agitations, and what an immensely complex organic effect a few slight objective hints awaken in us; how, furthermore, this complex commotion results in a harmonized and significant percept within our unitary apperception,—we may come to feel that we stand before a far more profound mystery than one of perceptive realization through a mere intellectual mirroring of a system of preformed noumenal relations.

We have seen that our world of perception is not the result of a coalescence of the noumenon-object and noumenon-subject; that the immanent relational constitution of the noumenal world is in every respect utterly unintelligible to us; that even the bare space-relations, to which we found ourselves at last reduced, are, in reality, purely phenomenal revelations, in which the creative synthesis of intelligence plays no part whatever.

Herewith, this special investigation, urged by no other impulse than our common philosophical "striving after truth," may be considered to have reached its goal. For the entire transcendental superstructure of "Noumenism" falls untenably to pieces with the disintegration of its basis. As the immanent relational constitution of the noumenal world is not intelligible,—as, furthermore, finite intelligence is not the power which builds up or creates our perceptive order,—the conclusion is inevitable that infinite intelligence, as analogically conjectured, is not the power which creates the noumenal order, not the power which originates and energizes the immanent system of relations constituting the noumenal universe.

III.

The Universe neither Alive nor Organic.

Mr. Abbot, in contemplating the adaptation of means to ends, recognizes that "the finite intelligence originally deals with relational systems only in that which is given to it from without," while "an infinite mind would necessarily originate from within both matter and form of the

relational systems." "Hence," he says, "there must be unessential differences between the finite and infinite intelligence" (p. 149). The *unessential* difference which Mr. Abbot here notices is simply the one between my using a given tree for some purpose or other or making the tree myself, between employing ready-made material or creating it, between newly ordering the pre-existent powers which make up the immanent relational constitution of things or originating *de novo* these very powers themselves. This distinction Mr. Abbot has to call unessential, in order to uphold his system of Noumenism; for, then, "the nature of intelligence, as such, is"—rather, has to be—"identical in all possible forms and degrees" (p. 150). The fact is, in the whole wide range of actuality and potentiality, there can exist no difference more fundamental and essential than the one here slurred over. If we could, scientifically, get the very least inkling of how the system of interacting powers which constitutes the noumenal universe comes to exist and to display its activity, then, indeed, should we have succeeded at last in forcing a peep "behind the veil."

Mr. Abbot labors hard to make out that the cosmos is a huge, space-filling existent, livingly evolving itself in time,—an "infinite organism," as he calls it. To show the utter inadequacy of this—in our scientific era—far-fetched analogical conception, no attempt need be made to pierce into the realm of transcendental subsistence, as we were compelled to do in seeking for "infinite intelligence." The facts for actual comparison in this case are given in one and the same realizing medium. Here before us is the real organism, and there the real cosmos, or, at least, such a part of it as will either clearly sustain or clearly overthrow the analogical conception. Mr. Abbot tells us that the chief characteristics of an organism are that it "lives and grows." Now, the growth of an organism means, *essentially*, that a germ derived from a pre-existent organism reconstitutes a nearly exact copy of the organism it came from. Does, perchance, the growth of the "infinite organism" tend to reconstitute a nearly exact copy of another infinite parent organism from which it is derived? The life of an organism means, *essentially*, that, in the functionally disintegrating interaction with its environment, it maintains itself by reintegrating its structure with complementary material appropriated from the environment. Has, then, the "infinite organism" any environment in the interaction with which it can carry on any kind of living function?

We are dealing here with solemn problems. It behooves us punctiliously to give ourselves up to the guidance of verified truth, to submit with utmost fidelity to what nature scientifically teaches us. A mind not versed in scientific research can hardly imagine how great must be the self-negation, how complete the subordination of individual opinion and bias to actual fact, that go to make a true scientist. Mr. Abbot tells us that "it is no longer possible to point out where the line is to be run between living and non-living matter" (p. 185). Now, this very line between living and non-living matter is, of all lines, the sharpest possible that can in any way be run among material things. It is true we can artificially induce the formation of chemical compounds, which we call organic, because, normally, they are derived only from organic beings. One can possibly argue that no very clear line can be run, from a chemical stand-point, between substances thus called organic or inorganic. But, between a substance that is alive and one that is not alive, the difference is radical. Just watch, only for a few minutes, under the microscope, a moner, the sim-

plest "living matter" in existence, and you will become immediately aware of the unsurpassable gulf that separates its most specific and complex activity from all the dead particles around.

The peculiarities of life clearly realized, who would, with Mr. Abbot, maintain that "on the right settlement of the question whether the universe must be viewed as wholly organic or wholly inorganic at last depend all the highest ideal hopes, all the highest moral interests, all the highest religious aspirations of mankind"? (p. 186.) If this were indeed the decisive alternative, then *lasciamo ogni speranza*: with a wail of infinite despair, let us withdraw once for all from the cruel and meaningless sport. For the universe is in all reality wholly inorganic as well as wholly lifeless. The scientific method has to deal with stern facts, not with wishful imaginings. A substance or anything else is called organic or inorganic solely on account of its molecular structure, and its derivation either from organic beings or from inorganic things. Now, outside of plants, animals, and their remains, we can discern in the whole universe, from its farthest worlds, whose rays still make their way to our spectrum, to all the familiar substances that compose our own globe,—in the entire material world, we can discern nothing whatever that may legitimately be called organic. It is quite certain, then, that the universe is neither alive nor organic.

Mr. Abbot, in this fanciful investment of the cosmos with organic life, is as much mistaken as the Pythagoreans, Platonists, and Stoics of old, who did the same thing. Evolution, rightly understood, has not, as is often believed, abolished teleology altogether. It must be admitted that the universe is a most complex system of immanent relations. But, here again, the mystery of such universal co-adjustment of interactions lies far deeper than our shallow-sounding thought has yet come to fathom.

Casting a dazzled glance at the throng of visionary analogies bursting upon our view as surmised life-manifestation of the cosmic organism, at what final conclusion do we find Mr. Abbot eventually arriving? He emphasizes Bichat's great distinction between the two lives, the organic and the relational; between the life which subserves the "indwelling or immanent End," incarnate in the entoderm, and the other life which subserves the "outgoing or exient End," incarnate in the ectoderm. Mr. Abbot distinctly recognizes that, so far as finite organisms are concerned, the relational life subserving the exient end is vastly superior to the organic life subserving the immanent end. The latter, he himself tells us, is the life of "self-preservation," "self-development," "legitimate selfishness." The former—the exient, relational life, namely—is the life of "self-sacrifice," "self-devotion," "legitimate unselfishness." The two lives of the finite organism, taken together, accomplish, however, according to Mr. Abbot, well-nigh everything that is worth accomplishing in this world. He says, "The immanent end shows itself, by the pursuit of happiness, of knowledge, of moral and religious culture in general; 'by the foundation and fostering of institutions of all sorts for the preservation and spread and progress of civilization, and so forth; while the exient end shows itself in the reproductive and philoprogenitive instincts, in patriotism, in philanthropy, in devotion to the discovery of truth, and so forth; but, above all, in the supreme activity of love, veneration, and self-consecration'" (pp. 192, 193).

If it were profitable, we might argue that the "infinite organism," having only "internal ends," must be devoid of what we universally consider the higher faculties; for these are embodied solely in the relational life, in the life of exient ends.

No organism can fulfil these higher relational ends, unless it find befitting outside existence to fulfil them with. Indeed, as even, according to Mr. Abbot, the "human understanding and the will" "create absolutely," "in the world of actual existence," all those "systems of objectively real relations" (p. 117) which compose the veritable medium for the exertion of the relational life, including everything to which we attribute any real worth, what becoming sphere of action is, in truth, left for the "infinite understanding and will"? Under Mr. Abbot's own guidance, we have found that the "infinite understanding and will" are, indeed, wholly occupied with the abstract and empty task of constructing the infinite geometrical relations which our finite understanding then partly apprehends as a veritable but inadequate revelation of noumenal existence. Contemplating the wealth of our human life of finite relations, we feel almost tempted to exclaim with the great Christian mystic Angelus Silesius:—

"Ohne mich kann Gott auch kein nun mehr leben.
Wenn ich nicht wär', müsst er den Geist aufgeben."

"Scientific Theism," closely examined, appears as one more vain effort to transport human intelligence—out of its proper sphere among sense-manifestations—far away into the Utopian realm of intelligible subsistence. Like Berkeley's early thought, it sets out by proclaiming the identity of perception and being, exulting in the coalescence of the finite and the infinite presence within the luxuriant actuality of perceptual revelation. It ends by substituting for the spontaneous mystery of the all-containing perceptual manifestation the eviscerated expanse of infinitely vacant space and time relations. Like Berkeley's later thought, it summons from out the empyrean waste the creative power of infinite intelligence, to construct in abstract self-sufficiency a perfect order of existence. From within human life, individual intelligence is then set to recreate, by dint of growing recognition, this same higher, sense-purified, intelligible reality,—finite intelligence identifying itself with infinite intelligence by reconstructing its purely intelligible order. "Hence," says Mr. Abbot, "man's present intelligence, if only infinitely expanded without the slightest change in its essential nature, would be thereby rendered adequate to the absolute comprehension of the absolute All" (p. 148). Here, also, the same old, old story,—a blank, ratiocinative formula filled up with human sensibility and suffused with human emotion, human thought felt as a tiny islet of inadequate recognition emerging from the infinite expanse and profundity of all-comprising perfection; the goal of human striving, a widening and deepening of such recognition, so as, at last, to become one with the "absolute All." This, in essence, is also the creed of "Scientific Theism." And, in truth, it is a goodly company in which we find its high-minded author, including many of the greatest and most aspiring souls that have ever lived. What profusion of sublime enthusiasm has been sunk into this emotional abyss of boundless fulfilment ever since the human heart began to crave for ideal perfection! We mean, therefore, no personal disparagement, no irreverential disregard, by once more exposing to severe scrutiny the vagaries of the spiritual assumption. Spiritual Transcendentalism has ever been a lofty creed.

Still, it is the same old, Oriental, world-sick philosophy and religion, seeking victory over the arduous stress of actual life, over the ever-anxious, never-completing strain of temporal exertion, seeking joy unalloyed or restful ease by admittance at last to the eternal fulness of beatified Perfection, if not to the absolute quiescence of Nirvana.

What we are in need of in our new, hope-abounding, Occidental world is a philosophy and religion of life itself,—a nature-rooted creed that will hallow human achievement by its fervid devotion to the common weal.

"Surely, whoever speaks to us in the right voice, him or her, we shall follow,
As the water follows the moon, silently with fluid steps
anywhere around the globe."

CORRESPONDENCE.

CRITICISM.

Editors of The Index:—

Dear Sir,—I noticed in last *Index* a review of a book called *Social Wealth*, by J. K. Ingalls, in which you quote the author's definitions of the terms Interest, Profit, and Rent. Interest, it seems, is "a fraudulent claim of one party to an exchange, by which a charge is made for the flight of time between the inception and completion of an exchange"; Profit is "a false entry in the business ledger, in which a dealer charges time for the same thing"; and Rent is "an immoral tax." The review speaks of the "real merits of the volume and the intelligence, earnestness, and independence of the author"; but I think that any rational reader would be more disposed to question the sanity than to recognize the intelligence of the author. There is a sort of diseased fervency about the socialistic writers of the present day, which may be called earnestness; but it is not deserving of so fine a name. They seem to fix their minds so completely and abstractedly on the cases of the Stewarts, the Vanderbilts, and the Goulds that they lose sight of the true nature of capital, and do not appear to have the slightest conception of its fertilizing effects on the commerce and manufacturing industries of the world. Interest, so far from being "a fraudulent claim," is a deliberate bargain between lender and borrower, by which the borrower agrees to pay to the lender a portion of the profits he will make on the use of the money. Profit, instead of being "a false entry in the business ledger," is the legitimate reward of the merchant who brings the products of far distant lands and places them at the consumer's door, or who buys the goods of the manufacturers and carries them within reach of the poorest laborer in the land. He is engaged in a great public service. The difference between the price which he pays for his goods and that at which he sells them is his profit, on which he lives and pays the expenses of his business. Only the diseased mind of a socialist could see anything false about it. Rent is a charge made for the use of land or buildings. So far from being "an immoral tax," it is a great boon to the houseless, who have no means of building for themselves, and who would otherwise be deprived of shelter for their families. Something will always be paid for the use of land, whether we go by Henry George's nostrum and call it tax, or whether we call it rent. Nobody will pay for the use of land, unless he sees a fair prospect of making his living by it. I should not like to put much trust in the morality of a man who sees anything immoral in rent. It is the duty of every man, out of the produce of his labor, to lay something by for old age. To do this, it is, in the majority of cases, necessary that he should deny himself many indulgences; and he must feel assured that his accumulations will belong to himself and to nobody else. If he puts his savings into the shape of a house, and hires it to a man who has no means of building for himself and who cheerfully pays for the accommodation, there is a mutually beneficial exchange of services. No sane man would dream of calling the bargain an immoral one.

It does not seem easy to reason with men capable of giving utterance to such absurdities; but, considering the mischievous effects such ideas may have on ignorant minds, I think it is the duty of the press to take every opportunity of exposing them and explaining the fallacies on which they rest.

J. G. WHYTE.

OTTAWA, CAN., 19th Feb., 1886.

[A writer may have very erroneous and absurd views on one or more subjects, and yet be, as we think Mr. Ingalls is, intelligent, earnest, and independent. A mere statement of the theories above criticised was

thought sufficient, without any attempt to point out to the readers of *The Index* their fallacious character.

B. F. U.]

TIME.

Editors of The Index:—

Herbert Spencer, as quoted by Mr. Underwood in a recent able article, says that time is the blank form of all succession and coexistence. Is not this to define by covertly slipping the thing to be defined into the definition as the defining term, thus defining it only by itself, with a show of doing much more? For what is succession? A mode of relation in time. And what is coexistence? Another mode of relation in time. What, then, is it that Mr. Spencer says? Why, that time is the blank form of relation in time. That is, it is the blank form of itself as a ground and order of relation between objects or events,—the blank form of relation in the same blank form? To my poor wits, such a definition seems proper to a rather blank form of philosophy. I can make nothing of it, and beg to be instructed. To define anything whatsoever as the blank form of blank-form relation is to speak in terms that will remain quite meaningless to me until I shall, if God will, get light upon the matter from wiser men. And, obviously, this is done in defining time as the blank form of time-relation. Time is, no doubt, an order of relation. Our idea of it as such, whether acquired or innate, is a simple, irresolvable datum of the mind. As applied to objects and events, it has two modes, synchronous and serial relation. With what propriety it can be called the blank form of its own modes, I do not see, nor by the small force of my unaided wits am I likely ever to see. I see only that, when abstracted from all actual relation in time, it becomes a purely abstract conception,—of course.

D. A. W.

[Mr. Spencer's views and reasonings in regard to space and time may be found in the second volume of his *Psychology*. They cannot be disposed of by any such criticism as the above. The discussion of the subject would require more space than we care to give to it, considering the comparatively few interested in such a discussion.—B. F. U.]

KINDNESS OF D. A. W.

Editors of The Index:—

Please permit me to express my warmest thanks to D. A. W. for his singularly generous allowance that I may call myself a goose if I wish, and for his humble confession—the justice of which I am incompetent to dispute—that the term is often applicable to himself. I hope he will also allow that I am at liberty to refrain from thus characterizing myself, which, in public at least, I do not propose to do.

Respectfully,

WM. I. GILL.

P.S.—I am almost sorry that my style has such power on the mind of D. A. W.

BOOK NOTICES.

SARAH AND ANGELINA GRIMKÉ: *The First American Women Advocates of Abolition and Women's Rights*. By Catherine H. Birney. Boston: Lee & Shepard. 1885. pp. 319.

In reading this record of the wonderful and gifted Grimké sisters, it seems almost possible to believe—as they did in their own cases—in the supernatural "setting apart" of some lives for a higher "mission" than that of common men and women. These two, out of a family of fourteen, with twelve years' disparity in their ages, the daughters of John F. Grimké, a wealthy and influential Southern gentleman of Charleston, S.C., born, as they were, in a slave-holding community, and accustomed from birth to the ministrations of a race held in bondage; brought up in luxury, and with no environment which could be expected to give any impulse toward the life of reformers,—it is wonderfully interesting to note the gradual processes which changed the whole tenor of their lives, and made of these modest, refined, cultured, fashionable, and, above all, conscientious young girls the evangelists of abolition, the irrepressible pioneers in the woman's rights cause, the faithful defenders of liberty of conscience in religion, the daring advocates of free speech, and self-denying philanthropists, who were known to the world as Sarah Grimké and Angelina Weld.

It was conscience, awakened by common sense and inspired by religious devotion, which first gave them an impetus toward the glorious though unattractive path of reform. They became, early in life, searching for some higher incentive of living, religious devotees, almost fanatics. Sarah, the eldest, drifted, in this search, from Episcopacy—the family religion—to Methodism, thence to the Quaker belief, and at last into a more liberal but earnestly held religious faith. Angelina, the younger, more beautiful and more intense, found her way out from Episcopalianism, through Presbyterianism, into Quakerism, and so to a broader religious outlook.

When we read how, during the first years of their more enthusiastic religious life, the sisters, at different periods, "labored" with the other members of their family; how they constantly "bore testimony" against the evils of slavery, in the midst of a slave-owning circle of friends and relatives; how Sarah was severely "exercised" in mind because of the acceptance of a handsome umbrella from her brother Henry, a slaveholder, and finally returned it; how Angelina refused for a time to enter her mother's drawing-room, because of its too handsome upholstery and adornments; how they both abandoned all finery or display in dress, and took their finest lace veils, flounces, trimmings, etc., to stuff a cushion with, believing it would be a sin even to give such gaudy trappings to any one else, for fear of encouraging vanity; how they both sacrificed their favorite novels by cutting them up; how they thought it wrong to jest or be merry; how their commonplace and conservative mother was worried by these and other conscientious antics of these "ducklings" of hers,—we can guess that they must have been, in spite of—nay, because of—their goodness, very uncomfortable members of an aristocratic, ease-loving, luxury-enjoying Southern family.

But, while the reader sympathizes involuntarily with the alternately shocked and bored relatives, whose most sacred family traditions were so sternly attacked by these "foes in the household," it is impossible not to admire the genuine earnestness of these two high-souled, truth-loving, truth-speaking, and truth-living sisters, whose noble conscientiousness, though severe and strained, restores one's faith in the possibility of keeping true to one's highest ideals, even in this age of seeming superficiality, shams, and indifferences.

Nothing could more strongly reveal the evils of slavery, not only in its effects upon the dependent people who suffered most directly from it, but upon those who assumedly reaped what benefits were to be derived from it, than the horror with which the practical working of the system inspired Sarah and Angelina Grimké, although they were "to the manner born."

It reads more like a romance than a prosaic statement of facts which really occurred within the memory of some living, when we read how these daughters of the South renounced a luxurious home, tender family ties, high social position, dear friendships, with all the pomps and vanities usually so enticing to girlish hearts, at the dictate of conscience, pleading in behalf of humanity, and entering their unflinching protest against slavery as a sin in the very stronghold of the evil. The story of such lives is full of inspiration toward higher living and thinking.

The Anti-slavery Movement, appealing as it did to the sympathies of women and arousing intense interest among the most thoughtful, earnest, and feeling of that sex, who were, however, forbidden by usage, precedent, and prejudice to take any effective active part in a work so suited to them, very soon turned attention to the anomalous position of women in society. Among the first to arouse public opinion to a discussion of this position, by inveighing against the injustice done their sex, were the Grimké sisters. It was in 1836 that they began to give public lectures against slavery; and, in the following year, we find Angelina expressing herself thus in a letter to a friend: "At Friend Chapman's, . . . I had a long talk with the brethren on the rights of women, and found a very general sentiment prevailing that it is time our fetters were broken. . . . I feel that it is not the slave only that we plead, but the cause of woman as a moral responsible being."

From this time on, she (and her sister Sarah as well) worked as earnestly for one cause as for the other, and bravely spoke at all times her sincere convictions in regard to the injustice done to women,

even when advised by such staunch friends of the women's cause as John G. Whittier and Theodore D. Weld (whose beloved and loving wife she afterward became) "to let it [the question of women's rights] alone for the present, because it will involve topics of such vast importance, . . . and the wrongs of the slave are so much greater than the wrongs of woman they ought not to be confounded," etc.

The records of the Anti-slavery and Woman Suffrage Movements would be incomplete without these memoirs of two brave, bright, devoted women; but, apart from the light thrown upon the gradual progress of these movements, this volume has a charm all its own in the romantic story it unfolds, with many strange and touching episodes and incidents, which we have no space even to hint at here. The one thing lacking in the volume, nicely bound and printed as it is, and concise in its statement, is portraits of each of the sisters, which would give added interest to the biographical sketches. S. A. U.

A SHORT HISTORY OF NAPOLEON THE FIRST. By John Robert Seeley, Regius Professor of Modern History in the University of Cambridge, and author of *Ecce Homo*, etc. Boston: Roberts Brothers. 1886. pp. 315. Price \$1.50.

As is well known, Prof. Seeley has for years made Napoleon and his times a subject of careful study. And, when the publication of the work was announced, it was expected that it would prove a profound analysis of the theme, a philosophical as well as an historical treatment of the Corsican's wonderful career, and a real contribution to Napoleonic literature. The expectation is fully sustained. The work is no mere compilation from ordinary authors, nor a mere condensation of others' views. Prof. Seeley has studied the despatches preserved at the Record Office, the Napoleonic correspondence, and availed himself of sources but recently opened,—Jung's works, Hüffer's, Von Sybel's, Count Boulay de la Meurthe's study of the Egyptian Expedition; the Memoirs of Hardenberg, edited by Ranke; Oncken on the *War of Liberation*, and original researches now being made by A. Stern. In this volume is incorporated the substance of the author's article, occupying thirty-six pages in the *Encyclopædia Britannica*. A third of the volume, which is entirely new, deals with Napoleon's relation to his age, his place in the history of France and of Europe; and it is especially valuable for its political generalizations. The author endeavors to write without prejudice or passion, but this is something very difficult for an Englishman, writing of Napoleon, to do; and Prof. Seeley does not, we think, succeed completely. Yet the work is one of the best short histories of Napoleon's career, if not the best, that has been published. A likeness of the remarkable man, from a portrait painted by Boilly, accompanies the book; and on page 236 are two views of his head from a cast taken after death. B. F. U.

NATURAL THEOLOGY, OR RATIONAL THEISM. By M. Valentine, D.D., ex-President of Pennsylvania College and Professor of Theology in the Lutheran Theological Seminary, Gettysburg, Penn. Chicago: S. C. Griggs & Co. 1885. pp. 274. Price \$1.25.

This volume comprises the substance of lectures given to the students of Pennsylvania College, and furnishes a compendious statement of the various theistic evidences, made with such judicious modifications as the author believed requisite to make these evidences harmonize with the best accredited thought and knowledge of our times. The evidence is divided into "Presumptive," "Ontological," "Cosmological," "Teleological," and "Moral"; and "The Attributes of the Deity" and "The Relation of God to the Universe" are discussed at some length. While the book offers no original view of the theistic question, it has decided merit as a comprehensive and concise presentation of what may be advanced in support of natural theology. In the concluding chapter, Dr. Valentine declares that this natural theology vindicates the existence of God, but that it can give only a partial view of God's character; that it leaves us in ignorance of one specific end in life and the means of accomplishing it; that it gives intimations of immortality which yet fail to bring it to full light; that it furnishes no remedy for sin; and that men left to the mere light of nature and reason are lacking in the knowledge necessary to a right and happy life. A supernatural revelation is therefore necessary, and that we have in the Old and New Testaments. B. F. U.

The opening article in the *Popular Science Monthly* for March, "Biological Teaching in Colleges," is by Prof. W. G. Farlow, of Harvard University. In "A Thinking Machine," Prof. Grant Allen shows the insufficiency of the ultra-materialistic way of accounting for mental phenomena. In "Health and Sex in Higher Education," Dr. John Dewey, of Michigan University, presents the results of the first properly directed effort that has been made to ascertain, from the facts, the average influence of college study upon large numbers of young women who have been engaged in it. "Prom to Genesis" is Mr. Gladstone's reply to Prof. Huxley's "Interpreters of Genesis and Interpreters of Nature." Dr. Charles C. Abbott discusses the value of the "Animal Weather Lore," on which country people relied more before the civil service reports were started than they do now. Prof. Edward S. Morse furnishes an illustrated article on "Japanese House Building"; Dr. Samuel A. Fisk presents the advantages of "Colorado as a Winter Sanitarium"; Dr. Heinrich Mayr discusses the "Durability of Resinous Woods"; Dr. Grace Peckham considers the condition of "Infancy in the City"; Mr. N. H. Egleston speaks a word in favor of the general institution and observance of "Arbor Day"; Mr. Lansing has an instructive paper on "Discrimination in Railway Rates," and Chauncey Smith's article on "The Influence of Invention upon Civilization" is concluded. A portrait and biographical sketch are given of Sir John Bennet Lawes, the founder and manager of the famous Agricultural Experiment Station, at Rothamstead, Eng. The editor, at his "Table," has some very plain talk on a recent case of "literary piracy." New York: D. Appleton & Co.

The March *Wide Awake* opens with one of Lungen's best frontispieces, "Under the Electric Light," a brilliant night scene, and some charming verses by Edgar Fawcett, entitled "Pictures on the Pane." Among its many attractions are a stirring poem by Elizabeth Stuart Phelps, "The Tenement House Fire," illustrated by Hassam; "An Unintentional Chase for a Polar Bear," by Fred Schwatka; "Stoned by a Mountain," by Rose Kingsley; and "The Horsehouse Deed," a story of colonial times, by Mary F. Wilkins. There is a brief sketch, with portrait, of Mrs. H. B. Stowe, a poem by James Berry Bousel, with many other interesting articles, stories, and poems.

The February number of the *Revue de Belgique* contains the third and last part of D'Alviella's "Religious History of Fire." This is summed up in four periods. 1. Man knows fire, but cannot use it. 2. He can use it, but not produce it. 3. He can light it by rubbing or knocking bits of wood or stone together. 4. He has invented such means of lighting it as the flint and steel, mirrors, lenses, and matches. There is also an account of a journey from Zanzibar to Kerema, and a review of the laudatory Report on Primary Instruction in the United States, recently presented to the French minister of public instruction by M. Passy.

"LIPPINCOTT'S MONTHLY MAGAZINE" for March, in addition to its two serial stories, has an interesting short one by Brander Matthews, entitled "Perchance to Dream." The poems in this number are by John B. Tabb, F. D. Sherman, Clinton Scollard, and Helen Gray Cone. Lawrence Hutton discourses of "The American Play," which he declares is yet to be written. The most notable article is one by W. H. Babcock, entitled "Song-games and Myth-dramas at Washington." Randle Holme writes of "The One Pioneer of Tierra del Fuego."

The New York *Fashion Bazar* for March, in addition to its large colored fashion plate, contains twelve full-page and a large number of half-page illustrations of latest styles in dresses, wraps, hats, bonnets, etc., for ladies and children, with full explanations in regard to their many fashion notes. And also long instalments of charming stories, written by "The Duchess," Mary E. Bryan, and others, with many domestic hints and recipes. Published by George Munroe, New York. \$3.00 per year.

"OUR LITTLE ONES AND THE NURSERY" for March sustains its reputation as a juvenile zoological magazine by its stories of "A Feathered Hero," "The Pet Seal," "Coonle," "A Bad Neighbor" (a mud-fish),

"Scamp and the Dutch Dog," "A Hotel for Dogs," "The Mouse and the Music-box," and a story of a pet lamb, entitled "Pete in the House." All these, with the other stories and poems of the number, are accompanied on every page by handsome illustrations by the best artists.

The March number of the *Pansy* is as bright and winning as its flower namesake. It has good serials from Pansy herself and from Margaret Sidney; while every branch of good reading is represented,—history, natural science, travel, behavior, and morals,—all in the most entertaining style. *Pansy* is only ten cents a number. D. Lothrop & Co., Boston, Mass.

GENERALLY, what hinders discussion is irritation; and irritation and anger start up from a great many sides and from a great many reasons. Directly people's own pet theories are controverted, a natural resentment takes possession of them; and when this is the case, in however small a degree, there is no hope, or little hope, of a satisfactory conclusion being come to from any argument they may embark in.—Unknown.

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

The Religion of Philosophy; OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERLIN.

For sale at THE INDEX Office. Price \$3.00.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS. By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC THEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 40 cents; 50 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

POPULAR BOOKS

Fourth Edition, Crown 8vo, cloth. Price 8s.

Buechner (Dr. L.). Force and Matter; or, Principles of the Natural Order of the Universe. With a System of Morality based thereon. Newly translated from the 15th German edition, enlarged and revised by the Author. With Portrait and Biography.

This celebrated work, of which 15 German and 6 French editions have already been issued, and which has been translated into most living languages, here appears in the Fourth English Edition, carefully translated from the last German, and revised by the Author. No educated, and especially no liberal-minded or truth-seeking person can afford to overlook this epoch-making book, in which, under 27 separate heads and in the most attractive form, are developed the fundamental principles of the Natural Order of the Universe with rare freedom and insight, and no less rare knowledge of the subject.

Published by ASHER & CO., 13 Bedford Street, Covent Garden, London, W.C., and to be had of all Booksellers.

CURRENT TOPICS.

BY B. F. U.

MR. GLADSTONE declined last week to recommend the appointment of a day for national humiliation and prayer because of the distress among the working classes.

SAYS the Boston correspondent of the *Springfield Republican*: "Joseph Cook is not making the stir with his Monday lectures he used to make. They are an old story now, and have lost their bloom."

THIS item is from one of our Boston dailies: "A Boston publisher gives as his opinion that there is no such profitable piece of book property as 'a novel with a great deal of religion in it; not too much, but a good deal.'"

WHEN Gov. Robinson appoints April 8 to be kept throughout this Commonwealth as "a day of fasting, humiliation, and prayer," knowing that it will be a day of unusual feasting and merriment, he indulges in religious cant, and none the less so because the meaningless words appear in an official proclamation.

MR. GLADSTONE, in the Irish Reform scheme which he has formulated, is evidently far in advance of public opinion in England; and if, in spite of all opposition, his great influence shall induce the majority of the electors of the United Kingdom to support his measure, his success as a leader will be one of the most remarkable in the political history of modern times.

IN response to a letter of request signed by many prominent New York people, among them Felix Adler, Carl Schurz, E. L. Youmans, George William Curtis, Parke Godwin, Robert Collyer, the poets Stedman and Stoddard, and others quite as well known, Mr. M. D. Conway has consented to give four lectures at the University Club, Madison Square, on the evenings of April 1, 8, 15, and 22. The subjects will be "The England of To-day," "London: Its Prose and Poetry," "The English in India and Australia," and "The English Church and the Question of Disestablishment." Mr. Conway's impressions, derived from his long residence

in England and his visits to some of its colonies, cannot fail to be deeply interesting.

THE funeral of Senator Miller, of California, cost the government about \$20,000. A special train of four cars was considered necessary to convey the body, the wife and daughter, one senator and five congressmen, to the Pacific Coast. "What the expense would have been," says the *Springfield Republican*, "had the death been better timed for a pleasure trip and thus attracted a full committee of senators, it is only possible to surmise. All congressmen do not, however, come from so distant a State; and the ordinary expense of a funeral is from \$5,000 to \$7,000,—luxurious apartments at hotels, champagne *ad libitum*, and generally high living being, according to congressional usage, essential for the proper expression of poignant grief." For the extravagance of congressional funerals there is no excuse, and it ought to cease at once.

SAYS the London *Secular Review*, whose editor is himself a Scotchman: "When a Scotsman is common, he is damnably common, and egregiously inflated with the most irritating kind of conceit. What struck us when we visited Ecclefechan was that such a cedar as Carlyle ever grew from such a midden as the nadir of the Scottish peasantry. In and about Ecclefechan, we found some specimens of the most ignorant of all God's creatures. Hardly a soul we met seemed to have read a line of Carlyle. He had shot up completely from them, and above them, like the terrible pyrotechnics of a volcano from the uninteresting expanse of a stercorous swamp. Not a man seemed proud of him, not a woman seemed to have the faintest idea why people from a distance made a fuss about him; but they were all anxious enough to turn a penny over him, if they could only know how."

MANY of our business men who in past seasons have gone to Florida and other Southern States, to escape the February and March weather at home, have this year followed the line of the Mexican Central Railroad into the land of the Aztecs. *El Monitor Republicano* of the City of Mexico says that the small floating population of that city has lately been swelled by American excursionists, including bankers, railroad directors, newspaper men, merchants, and manufacturers, all anxious to study the country; that the hotels can scarcely accommodate the visitors who pour into the capital city by every train; and that strangers are to be met with everywhere, in the streets, on foot, in hacks, on the street cars in the city and suburbs, until it looks as though the Yankees had marched on the neighboring republic and taken possession. A very inviting place is Mexico to the tourist at this season of the year, and it is now comparatively easy of access. In the near future, we are likely to have closer business and social relations than hitherto with this land of ancient American civilization.

A WASHINGTON correspondent of the *Pittsburg Leader* says that a very large per cent. of the people throughout the country seem to be bent on

"evangelizing President Cleveland," who recently remarked to a friend, "If the advice given me was concentrated on Africa, it would civilize and Christianize that whole wild and wicked and dark country." Many people, when they grasp the President's hand, breathe an audible prayer for him. This, we are told, has a very perceptible effect upon him; "for he said he didn't think any man or woman with sense and a heart could fail to be affected by the prayers of an earnest people, when he or she knew they were so constantly delivered." "It is something like love in its physical effect," said Mr. Cleveland, one day. "Now, if one is very earnestly and sincerely loved, that affection is sure, if kept up and demonstrated, to have its way, unless the suitor is absolutely offensive. The mere fact that so much confidence and affection are persistently bestowed will touch a heart of stone. So the intense interest shown by so many in a man's spiritual welfare must eventually touch him, if he thinks. And the man or woman who cannot be reached by the prayers of a nation is a strange being, indeed, when he or she knows the prayers are being offered."

VERY significant are the speeches made in the English House of Lords last Friday, with the vote by a majority of fourteen, that "the time has come when, in the interest of religion and education, all national collections should be opened to the public on Sundays as on other days." The ideas and practices of the Jewish Sabbath revived in England about four hundred years ago, and maintained by the Protestant clergy, in defiance of reason and common sense and against even the plainest teachings of the New Testament, are fast losing their hold on the English people, thanks to the increase of popular intelligence and the decline of priestly authority. Lord Bramwell, turning to the Archbishop of Canterbury and his fellow bishops,—who, of course, opposed the motion,—said: "I am perfectly satisfied that it is the religious part of the matter that is at the bottom of the opposition to the motion. We are alone in Christendom in observing Sunday in the way we do. The English view of Sunday is a novelty. I object to the way in which Sunday is observed, because it is a day wasted. It ought to be a day of recreation and enjoyment. There is nothing in a man's nature which tells him that it is wrong for him to enjoy himself on Sunday. The proper interpretation of the supplication 'And lead us not into temptation' is, Do not lay down for us a rule for Sunday which we cannot observe. Prince Bismarck has recorded that, when he was in England, he always had a painful impression of the English Sunday; that he was always glad when it was over, and that he was sure that many Englishmen had the same feeling. That is the condition of things that I ask the House to set about to remedy. The English Sunday is misspent. It is worse than misspent." It is not doubted that the Commons will follow the Lords, and that the "Sunday opening question" in England will soon be settled by the victory of progress over conservatism and cant.

SLOW GROWTH OF LIBERAL ORGANIZATION.

We spoke last week of the rapid progress of liberal religious ideas in the last half-century. Yet, notwithstanding the facts that give abundant evidence of this progress, if we look for the result in the special organization of religious Liberalism, we shall be disappointed. The religious Liberalism that has broken away from the churches has shown as yet little genius for organization. It has been much stronger on the destructive than on the constructive side. And the classes of people that are naturally reached by the new ideas appear, for the most part, either to prefer the iconoclasm of Ingersoll, uncombined with any religion whatever, or to stay in evangelical churches where Liberalism takes the form of a doctrinally diluted Orthodoxy, flavored with the religious sentiment of the churches and possibly with some of the traditional emotions of the discarded Calvinism.

Even the liberal religious denominations that have regularly organized churches do not manifest a progress that at all corresponds to the general progress of liberal ideas. Universalism, taking the country through, is acknowledged to be losing ground rather than gaining. There appears, indeed, to be no longer any need of a Universalist sect for promoting the Universalist doctrine, which has now obtained recognition in several sects. The growth of the Unitarian denomination is very slow, not at all keeping pace with the increase of the population in the United States. In the West, the number of Unitarian churches shows a slight yearly advance. In the East, the denomination barely holds its own. In Boston, the Unitarian stronghold, it keeps its twenty-eight or twenty-nine churches (including mission chapels); but the number has been about the same for many years, and meantime the city has been doubling its population. In New York, with its nearly one and a half millions of people, there are but three Unitarian societies; and there have been the same for twenty years. In a few other Eastern cities and towns, the showing might be somewhat better than in New York and Boston; but, in others, it would not be even so good. Liberal Quakerism and other sects of so-called Liberal Christianity do not appear to manifest any better signs of active growth.

If we look at liberal movements outside of all the old sects, there is Spiritualism, which has a great multitude of followers and is actively propagandist; but it is divided into factions and has no organization as a church, while portions of its disciples are seriously compromised by fraud and moral uncleanness. With all its activity, and with its one distinguishing cheerful belief, it has yet manifested little or no organizing capacity. The National Liberal League was launched ten years ago, with as perfect a constitution as was ever put on paper. But, for reasons which need not be recounted here, the organization soon went to wreck; and even the fragments of it, which have been since floating around, have now pretty nearly disappeared. The Free Religious Association came to work upon public opinion through the platform and the press, and has confined itself to that mission. The Ethical Culture Movement, fired with all the moral earnestness and zeal of the old Hebrew prophets, applies itself to the task of organizing local societies. Perhaps it is to have a success proportioned to its zeal in the organization of the Liberalism which has broken away from Churches, whether Hebrew or Christian, into a constructive working body. We sincerely hope it may be so. But, in ten years since this movement started, it has formed only three soci-

ties; and it cannot therefore be said to have gone very far in reaching the masses of the people. There are a few other societies, here and there, that are doing similar constructive work for Liberalism on an independent basis, apart from all ecclesiastical affiliations or names; but they can be counted, probably, on the fingers of the two hands, if not of one.

Now, we would not belittle the work which these sporadic liberal societies, and the Ethical Culture Movement, and the pioneer liberal sects are all doing toward solving the problem of liberal religious organization. They are all helping onward that coming Church of Reason and Humanity which the radical believer has been wont to prophecy in his vision of the "new heavens and the new earth," and we wish them the fullest success in accomplishing their highest aims. But, useful and necessary as these efforts are, a consideration of all the facts of religious progress does not lead us to look to the organizations of Liberalism alone for the signs of the coming Liberal Church. Did we see no signs elsewhere, we should not be so hopeful of that rational and humane Church of the future as we are. This new Church for the new times is to come, in our opinion, very largely, if not mainly, by the gradual enlightenment and transformation of the great religious bodies which now occupy the field, and have held it for generations and centuries. The existing Churches are, to our view, the important missionary field of Liberalism. They are to be converted. And a radical religious society, whether of the free Congregational, Ethical Culture, or liberal Unitarian order, is working constructively,—not merely for the few scores or hundreds of people whom it may count in its membership, but for all the churches and synagogues around in which there are any thinking men and women whose minds are open to new ideas, and who are inquiring for a more real and rational religion. These reform movements, though small in themselves, point the way whither the great religious bodies will slowly follow. Gradually, the leading spirits of the Churches, their theological seminaries, their ministers, their denominational publications, will catch the light of the new era of thought, and absorb a more rational doctrine; and, then, the new views will be distilled through a reformed administration and activity of church life to the masses of the people.

Religious Liberalism, then, is not called to the task of building a great ecclesiastical structure to shelter the multitude. It is summoned to the reformer's mission of inoculating public opinion with truer religious ideas and a more robust moral sentiment. Its work is to present religion in a form acceptable to Reason and satisfying to the highest ideals of Morality. Where the conditions favor, let it organize societies and create institutions that shall serve as tentative models for the coming Liberal Church. But let it not be discouraged, if these do not spread rapidly. As the mental atmosphere of society is purified from the dust-clouds of error and superstition and the human mind is penetrated by the sunshine of higher truths, gradually the old Churches will take down their shutters, open their windows to the light, let in the more salubrious air of the new day, sweep the cobwebs of dogma and tradition from pulpit and pew and communion table, and teach the higher worship which is the service of truth, right, and humanity. In a word, it is the main work of religious Liberalism to sow ideas, with no great anxiety over the question who are to harvest or when the harvest is to be. It is enough that all earnest liberal believers, whether working alone or in company, by their unwavering fidelity

to their principles, by their thorough faithfulness in their own characters and lives, by their charities and philanthropies, are surely helping to increase the harvests. Liberalism is not responsible for furnishing the ears that will hear its word; but every earnest word, backed by earnest deed, draws to it a somewhere waiting, listening ear.

WM. J. POTTER.

THE PARIS SCHOOL OF RELIGIONS.

The Ecole Pratique des Hautes-Etudes is about to open a new section, that of the Religious Sciences. The religions of India, Egypt, the far East, and Arabia, the Shemitic and Islamic creeds, the Hebrew language, the history of the origins of Christianity, of dogmas, of the Christian Church, of canon law, and an exposition of Christian literature,—such is the programme of studies for the first session of this new school. The faculty is composed of twelve professors, several of whom are known on your side of the Atlantic. M. Hartwig Derenburg, who will fill the chair of Islamism and the religions of Arabia, is the son and grandson of distinguished Hebraists, and is himself an authority in France on all that pertains to Oriental subjects. M. Léon de Rosny, the learned ethnographer and Orientalist; M. Albert Réville, professor of the History of Religions at the College of France; M. Ernest Havet, whose writings on Christianity are of the first order; M. Sabatier, professor at the Paris Protestant Theological School; M. Bergaigne, professor at the Sorbonne,—such are some of the eminent scholars that are to give the stamp to this new departure in religious science at this great university centre.

It appears from the *Temps* that the announcement of the creation of the school has occasioned no little commotion in the Catholic circles of this country. This was quite natural, however, following as it did so closely upon the suppression of the State theological faculties. Some of the Catholic journals, according to the writer in the *Temps*, have pronounced the proceeding to be scandalous. The government is blamed for its choice of professors, and particularly because no real Catholic has been offered a chair. Hence, they say, there is no truth in its boast that the school is to be neutral. More than that, it is aiming to advance the cause of irreligion. The fact is, on the contrary, that the Minister of Public Instruction did everything he could to obtain Catholic professors who would labor side by side with Protestant, Jewish, and free-thinking colleagues. But all his efforts were in vain. Repeated and pressing invitations were given, but neither priests nor laymen would accept a professorship in a school based on absolute neutrality in the matter of creeds. And, curiously enough, their reason for refusing was this very neutrality. I remember a similar instance of this Roman narrowness that occurred in America. The authorities of Cornell University have never been able to get a priest to speak from the pulpit of Sage Chapel, where Protestants of every denomination, and even no denomination, have been only too glad to ventilate their peculiar views on religious questions.

The French Catholics pretend that the object of the school is to propagate incredulity. But the *Temps* answers this objection very satisfactorily by pointing out that, if this had been the aim of the government, the lectures would have been given a popular form, and would have been thrown open to the public. Quite the contrary, however, is the plan that has been adopted. The term lecture cannot strictly be applied to the manner of treating the subjects to be taught. The classrooms are situated in the contracted library of the

Sorbonne, and there is room for scarcely a score of pupils. The professor and his students are seated around a common table. It is evident that scientific truth and honest scholarship, not proselytism and propagandism, are to be the ruling spirit of this choice body of teachers and disciples; and there is every reason to hope that their influence will be soon felt on the future religious life of France.

"Is there any ground for the complaints of the Catholic press?" asks the writer in the *Temps* who then proceeds to answer his own question, as follows: "There is in this new creation an innovation that Catholicism cannot tolerate. It means the secularization of religious instruction. It is the last step in a reform that began in the primary school, and now ends in the theological seminary. When theology is treated scientifically, it loses its confessional character and becomes a subject of university study, like all the other branches of human knowledge, and at the same time escapes from the yoke of authority, to be examined critically, freely, and honestly. It is quite evident that a church that accords the laymen only the right of submitting, and that recognizes as the arbiter of all differences only visible and official and religious authority, will be very slow to accept such a new conception. But we think there is no reason to be alarmed at this. A freer and more serious study of religions and religion will not only have as its effect the lessening of the fanaticism of Conservatives, but also that of Radicals, which is no better, and is, in fact, of the same nature. Hatred and intolerance are both born of prejudices. In dissipating prejudices, impartial science does a work of peace and liberty." All American Liberals must say Amen to these sentiments.

THEODORE STANTON.

PARIS, February.

DUALISTIC AND MONISTIC CONCEPTIONS OF NATURE.

1.

The *Fortnightly Review* for April, 1885, contains an article by Prof. St. George Mivart on "Organic Nature's Riddle," in which he says: "A thoroughly mechanical conception of Nature is the scientific ideal of an influential school of thinkers. They follow the lead of Descartes, who would be surprised, could he see his doctrine of Animal Automatism and the mechanical evolution of new species of plants and animals so eloquently advocated." Dr. Montgomery, in a paper on "The Dual Aspect of our Nature" (see *The Index*, November 5), terms this scientific ideal a **MECHANICAL FALLACY**. He says "that this scientific ideal, in its purely kinetic form, does not exist in Nature. This notion of a definite fund of available and manifest force attached to matter, and giving rise, through mere redistribution, to all the varying phenomena of nature, is a doctrine involving, without mistake, a fatalistic determination of all actions of animate as well as inanimate bodies. It is impossible, therefore," he says, "to make any headway in a monistic and non-necessitarian understanding of our life and doings, without clearly exposing the fallacy of such" mechanical interpretations. Montgomery brings the physiological conception of nature to bear with considerable force on the mechanical views of this influential school of thinkers, especially on the views of Huxley, Spencer, and Haeckel.

But, as he regards it to be important to make some "headway in a monistic" understanding of our life, it will be well to ascertain what notions are involved in the *Monistic Conception of Nature*. Concerning this conception, Prof. Tyndall says (*Fragments of Science*, sixth edition): "When mat-

ter was defined by Descartes, he deliberately excluded the idea of force or motion from its attributes and from its definition. Extension only was taken into account. And, inasmuch as the impotence of matter to generate motion was assumed, its observed motions were referred to an external cause. God, resident outside of matter, gave the impulse. Against this notion of Descartes, the great deist, John Toland, strenuously contended. He affirmed [two hundred years ago] motion to be an inherent attribute of matter, that no portion of matter was at rest, and that even the most quiescent solids were animated by a motion of their ultimate particles. The success of his contention, according to the learned and laborious Dr. Berthold, entitles Toland to be regarded as the founder of that monistic doctrine which is now so rapidly spreading."

If Toland's contention with Descartes' philosophy was a success, why has it been without influence on modern thought? A consideration of Huxley's lecture on Descartes before the British Association at Belfast, in 1874, may throw some light on the question. But, to clearly comprehend the advances which have been made in the sciences of physics and physiology in the last few years, it is necessary to notice the confusion which has taken place in the meaning of the terms used in these sciences. One of the highest authorities on physics in England is Prof. Tait. In his last work (*The Properties of Matter*, 1885), he says there are two classes of things only, matter and energy. Consciousness and volition do not belong to the domain of physics. Matter, he says, is distinct from energy, and that matter is the means of manifesting energy. The properties of matter comprise the ideas that cluster around mass or inertia, such as those of weight, cohesion, elasticity, etc. Tait has selected from various writers definitions of matter. According to his own definition, matter is whatever occupies space. The physical universe has objective existence. Our knowledge of it is derived solely from the senses, and he further says the knowledge is always imperfect and often misleading.

In a lecture to the students at the Edinburgh University, in 1877, on "The Teaching of Natural Philosophy," Tait says Newton described it as the study of the powers of nature, the investigation of the motions they produce, and the application of the results to explain other phenomena. Newton, by a powerful mathematical method, developed the laws of motion, and applied them to physical astronomy, and hinted that a similar method would be extended to other phenomena of external nature. This has been done to a remarkable extent during the two centuries which have elapsed since the publication of the *Principia*. In many respects, life itself is dependent on physical conditions; and, recently, the physiologists have seized the natural philosopher's method of experimenting. But the supposition that the highest as well as the lowest forms of life, including consciousness and volition, can be fully explained on physical principles alone, is simply unscientific. Tait further says: Physical science does not lend any support to such an idea. The supposition that life, even in its lowest form, is wholly material, involves the denial of the truth of Newton's laws of motion, or it is an erroneous use of the term matter. Both suppositions are alike unscientific. The modern extension of Newton's statements enables us to specify more definitely the range of physical science, which may now be called the science of matter and energy. These are the only real things in the physical universe, and they are unchangeable in amount. Matter consists of parts that preserve their identity; while energy is

manifested only in the act of transformation, and though measurable, cannot be identified.

Judge Stallo holds that the creed of an ordinary physicist forty years ago was something like the above. He terms it the atomo-mechanical theory, and says that it is in irreconcilable conflict with modern theoretical chemistry. It is the theory which Tait taught in 1877, and he holds the same theory now. But it is dualistic, and utterly opposed to the monistic conception of the universe, which Tyndall says is so rapidly spreading.

As to the teaching of the natural philosophy described by Newton, Tait says that it ought to be taught popularly, of course; but the majority of popular scientific works are written by authors who, as a rule, have not exact knowledge of their subject, and who avoid committing themselves among difficulties which they must appear to explain. Each author has, therefore, recourse to vague generalities and the use of fine language, which is out of place in science. If an author endeavors to escape from a difficult position by darkening all around, by an inky cloud of verbiage, like a cuttle-fish, close the book at once, and seek information elsewhere. A great deal of the shallowest of the pseudo-science of the present day probably owes its origin to the habitual use, with reference to physical phenomena, of terms applicable to the actions of human beings alone, and not to matter and energy. In this pseudo-science, the stars are to love and hate one another, to feel pleasure and displeasure, and to try to move in a way corresponding to these feelings. The latest phase of this peculiar non-science tells us that all *matter* is *alive*, or, at least, that it contains "the promise and potency of all terrestrial life," whatever these may be. Of course, this is a fling at Tyndall's Belfast address in 1874.

Tait said to the students of the natural philosophy class at the Edinburgh University that, from the state of the great majority of our schools and of our elementary text-books, he should prefer that they came there completely untaught in physical science. Then they will have nothing to unlearn, for to unlearn is the hardest task ever imposed on a student. The old metaphysical pretenders to science had some small excuse, from the fact that true science was all but unknown in the days when their *a priori* dogmatism was looked upon as science. This race is well-nigh extinct; and the paper scientists have taken their place, who pour out a strange mixture of half-apprehended fact and thoroughly appreciated nonsense of a self-contradictory character, who pester men of science to an extent disproportionate to their own importance in the scale of being.

It must be admitted that there is much truth in what Tait says of the shallow pseudo-science of the present day, of the popular scientific works, and of the elementary text-books on natural philosophy used in English schools. The same may be said of what is taught in the colleges and schools of America. I have an intuition that Tait would place Herbert Spencer among the paper scientists. Tait is a clear-headed, but somewhat splenetic writer. De Blainville, it is said, thought that his *spleen* was as good as Cuvier's *gall*. It is probable that Tait may think that his spleen is as good as Huxley's gall, but I have never seen any keen "encounter of their wits." It is a mistake to suppose that the "old metaphysical pretenders to science are well-nigh extinct." They are "as plentiful as blackberries" now. Judge Stallo's profound declaration ought always to be borne in mind, that the opinion of contemporary physicists is erroneous, who affirm that there was a break of continuity in the progress of knowledge at the time of Galileo and Newton

and Bacon, and that since then the old metaphysical method was discarded in science. On the contrary, Stallo says the endeavor of scientific research is constantly thwarted by the insidious intrusion into the meditations of the men of science of the old metaphysical elements. In support of Stallo, Montgomery says: "Not a single item in the original [Descartes] conception of life has any foundation in reality. Yet, in a slightly modified form, it still dominates our biological science."

Even in Montgomery's summary (in *The Index*) of the various physiological articles which have appeared in *Mind* during the last few years there is an intrusion of the metaphysical element; and, without disrespect be it said, there is a "cloud of verbiage," which makes it difficult to follow and to clearly understand him. A patient reader must admit that this is a fact. I do not know how it may be with other readers; but I must confess that, after reading Montgomery's summary over several times, I could not pick up a salient phrase to form the starting-point for a criticism or see what was the goal he was aiming to reach. Such does not occur in the *Unseen Universe*, by Profs. Tait and Balfour Stewart, although they pretend to know all about the populations in that universe. It may be "poor stuff," as John Stuart Mill said of Leibnitz's *Monadology*; but what they mean can be clearly understood. Want of space does not allow much to be said about the words that have been used during the last forty years to replace the old words of matter and motion, or about the change of meaning which they have undergone, or about the new terms which Montgomery uses to replace them, such as kinetic influences, objective substratum, power complexes, mental presence, and extra-mental presence. It may be said that biologists and psychologists have produced such a confusion of terms that, to use Bishop Berkeley's phrase, they have kicked up such a dust there is no seeing through it.

JOHN CHAPPELLSMITH.

EDUCATION IN UTAH.

As every fact in regard to the condition of society in Utah is of great importance at the present time, I would like to call attention to the report of its educational position in the last issued report of the Bureau of Education for 1883-84.

In 1884 there were 48,889 youth of school age, six to eighteen. This was an increase of 2,981 over the year before. Of these, 59.98 per cent. were enrolled in public schools; and the average attendance was 39.01 per cent. The average term of schools was 135 days. The expenditure for schools was \$204,340; the whole number of teachers, 592; the average monthly pay of teachers, \$49.80 for men, \$28.80 for women.

The superintendent says, "There has been a natural and vigorous growth in the schools, and a great improvement in the character and value of the instruction given, an increasing demand for good and well-trained teachers and for good and well-furnished school-houses, with a determination on the part of school officers and people to do all that is possible toward securing these." The Territorial and county superintendents in convention determine what text-books are to be used in the public schools. Public schools are supported from a tax of three mills on a dollar of ordinary taxable property, from taxation of railroads, sale of estrays, and a special district tax not to exceed two per cent. a year. The University of Deseret gives free tuition to forty normal students, in addition to the forty annually provided for by the Territory

The County Teachers' Association holds ten sessions annually, and discusses the following, among other subjects: the grading of schools is economy of means, time, and labor; the employment of non-progressive and transient teachers is not a remunerative investment; the encouragement and support of proficient teachers are public benefits; the school should be made a pleasant place of resort, instead of a purgatory, for boyhood. The University of Deseret is the only public high school reported. Hon. L. John Nuttall is Territorial superintendent of district schools, Salt Lake City.

I have selected Montana as offering as fair a comparison as could be made of the educational condition of Utah with another Territory. In Montana are 15,082 children of school age; the percentage enrolled is 53.82; and the attendance 29.60. The average term of schools was 103 days. The expenditure for schools was \$260,030; the whole number of teachers, 292; the average monthly pay of men, \$71.40, and of women, \$54.50. The superintendent reports encouraging improvement in the schools. The schools are supported by a county tax of not less than three or more than five mills on a dollar, from taxes voted by the districts, various fines, and sales of lots. No normal instruction is reported, but some beginning of high schools and of teachers' institute.

The only very marked difference in the statistics of the two Territories is in the greater cost of schools and teachers' salaries in Montana. Otherwise, with a little superiority in the attendance, the condition of education in Utah seems very similar to that of other Territories. The same high expenditure appears in the report of Washington Territory; and the enrolment, 70.70 per cent., and the average attendance, 63.66 per cent., are also high, but the number of days is only ninety-two. The whole number of teachers is eight hundred and thirty-one, averaging only a little over twenty-six to a teacher, which would seem to show that some of those transient and inefficient teachers are employed who are not approved of by the institute of Utah. The other Western Territories are not very well reported, except Dakota, which has 77,499 children of school age. Her record of enrolment and attendance is similar to that of Utah; while the number of teachers, 2,911, is extraordinary, allowing less than eighteen pupils to a teacher. The expenditure for schools is \$1,306,879. If the results of education in Utah are at all equal to those of the other Territories, the greater economy in the use of means is very striking. At least, this report does not show an illiterate and barbarous community having no regard for education; and, if we have the faith in public education which we have always professed, I think we may augur favorably for the future destinies of the "desert State."

E. D. CHENEY.

THE LEGAL "AGE OF CONSENT."

In this "Christian Commonwealth," a girl ten years old has reached the "age of consent,"—the age at which she may consent to her own ruin. If at this age, when the girl-child has no legal right to consent to anything in regard to property or in regard to her person,—with the exception named,—and when she is incapable of understanding the meaning of consent to her own violation, she is corrupted and outraged by a heartless wretch, who is afterward able to make out the case one of free choice on her part, she is without legal redress. There is no criminal law under which the offender can be punished for thus taking advantage of the ignorance and innocence of the female child. We have a statute which pun-

ishes with fine and imprisonment the abduction of a girl under sixteen for purposes of clandestine marriage or public prostitution, but not for abduction merely for seduction. The father may institute a civil suit against the violator of his daughter for "loss of service," and that is all, when the offence committed is one of the meanest and blackest possible,—the corruption of youth, the murder of virtue and innocence; in many cases, the degradation of a life full of possibilities of usefulness and happiness to shame and infamy. Recently, a bill was introduced in the Massachusetts House of Representatives, and is now pending in the Senate, to raise the age of consent from ten to twelve years. This bill reflects little credit upon its authors. In England, when the age of consent was thirteen, the wrongs done to girls were so numerous and so outrageous that Parliament, in response to an aroused public sentiment, enacted a law changing the age of consent from thirteen to sixteen. And, now, the legislators of this State propose to raise the age from ten to twelve! What knowledge has a girl of twelve to qualify her to decide intelligently and responsibly in regard to an act likely to launch her upon a life of which she, in her innocence and purity, can have no conception? Hon. Elijah A. Morse, of Canton, is entitled to the thanks of the people of this Commonwealth for moving in the Senate, on March 12, when the House bill came up for engrossment, that the age under which young girls cannot legally consent to their own ruin be raised from twelve to sixteen. The Massachusetts legislature is now being urged to amend the bill still further by changing the age of consent to eighteen. The wide-spread and increasing interest in this subject is likely to wake up our sleepy legislators, and to suggest to them the importance of making the law regarding the protection of female children harmonize with the public opinion of to-day, which is not satisfied to see women treated as slaves and young girls unprotected from dangers to which their innocence exposes them.

B. F. UNDERWOOD.

THE fourth annual Convention of the National Woman Suffrage Association of Massachusetts, held in this city last week, was fairly well attended. Mrs. H. R. Shattuck, president of the association, opened the proceedings with an able and pertinent address, explaining "The Basis of our Claims," after which Mrs. Dora Bascom Smith, under the guise of a recitation from *Josiah Allen's Wife*, "Sweet Cicely," gave a mirth-provoking yet thought inspiring lecture on Woman's Rights, which was greeted with applause, as were the songs sung by that old-time "sweet singer in Israel," John W. Hutchinson. Mrs. Lillie Derveaux Blake, of New York, spoke of the methods of suffrage work as carried on by herself with others in her own State. She was followed by Mr. S. C. Fay, who, in his usual chivalric spirit, defended the rights of woman to the ballot. Miss Lavina A. Hatch gave a comprehensive résumé of the practical work of the association during the past year in distributing leaflets, circulating petitions, sending letters to congressmen, writing suffrage items for the daily press, organizing a class for the study of politics, etc. She was followed by Mrs. H. H. Robinson, corresponding secretary, who reported from the Woman Suffrage Associations with which this society has been in correspondence, consisting of sixteen States and local associations and organizations in Canada, England, Scotland, Ireland, France, and Denmark. Rev. J. W. Hamilton gave some reasons why women should have equal political privileges with men; and Dr. Salomé Meritt earnestly urged that moth-

ers should have a voice in legislation, if for no other reason, to protect their little daughters, referring to the Massachusetts "law of consent"; and brief addresses from Miss Emma F. Clair and Mrs. Lucy S. Daniels explained, humorously, why those ladies "wished to vote." A number of resolutions were adopted at the close of the session, among which was one demanding that the "age of consent" in Massachusetts be raised to eighteen years. At the last session, addresses were given by Mrs. Martha Sewall Curtis, of Burlington, Mass., a young and enthusiastic claimant for her rights; by Judge Robert C. Pitman, who argued the justice of the women's claim for self-representation, and by Mrs. Blake, who pictured an ideal "True Republic," in which all citizens were represented, where "taxation" meant also "representation," and where a government "of the people, by the people, for the people" was something more than a mere formula.

ATMOSPHERES. *For The Index.*

Low and heavy, cold and gray,
Hang the clouds in drear November;
While the wind, with sullen moan,
Train of ill its undertone,
Sweeps upon us from the east,
Head and heart and flesh the prey
To Pandora's woes. Dark day!
'Tis a day we shall remember.

Winter comes, and northern wind
Blows from coldest arctic places,—
Lands where slender flowers pale
Waft no fragrance on the gale.
Pure and strong, thy breath we find,
Spirit of the frost and sleet.
Only stout and stanch can meet
Thy cold touch upon their faces.

Sweet south wind, from land so fair,
Balm of love and fragrance flinging,
Lurks no poison, chill, and death
On thy soft and scented breath.
All is harmony in thee.
Wafted on thy laden air,
Mingling with its perfumes rare,
Joyous notes of birds are ringing.

Brave west wind, yet gentle, too,
Thou, of all, art for my choosing.
Wholesome is thy influence,
In thy touch beneficence.
Life and joy and strength are thine!
Thou art trusty, thou art true
As thy heaven's expanse of blue,
Charms of north and south winds fusing.

Knowest thou not, O friend who feels,
Of the human atmosphere?
Hast thou, in its alien air,
Felt depression, doubt, and care
Chilling thee like eastern wind?
Subtle, still, it o'er thee steals,
Bruises, irritates, not heals,
Tortures with distrust and fear.

Atmospheres thou, too, hast known,
Like the icy wind from far.
Those who have them,—strong are they,
Yet of warmth impart no ray.
Tender ruth, they know thee not!
For the weak who, stumbling, moan
Ne'er, by shrift, to them atone.
Pure they shine, like heaven's bright star.

Friend, my gentle friend, in thee
Dwells the south wind's atmosphere.
Doubt and care and vague unrest
Find no place within my breast:
Ne'er a haunting shade to mar
Cometh between thee and me.
All is sunlight, flooding, free,
Looking in thine eyes so clear.

Friend, like west wind, true and brave,
Well for those who own thee nearest;
And, if any know thee not,
Drear must be their earthly lot.
Never weakling thou, and yet
Still so tender thou canst save
Hope and courage from the grave.
Gentle, strong, thou art the dearest!

ANNA OLOOTT COMMELIN.

The Index.

BOSTON, MARCH 25, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }
No WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

OUR ARMAGEDDON.

BY MONCURE D. CONWAY.

To your welcome my heart responds. But your kindness must be met by candor. At whatever risk, I must utter at once my confession of faith. It is this: God is good. On that paradoxical ground I stand, and you must be prepared for the worst. And, as it is from this point of view that we shall presently review the fields of Armageddon, I must dwell on it. This my faith, that God is good, has been reached late in life. During a long study of demons, I made the discovery that, after refining my conception of a god by Unitarianism and theism, my deity had still a demonic touch about him,—was still a giant, often using his strength like a giant. I tried to recover on the field of philosophy a deity lost on the field of theology, but soon found that a spiritless search. Walking once with Strauss beside the Neckar, I asked his thought about immortality. His answer began with the remark, "It is a question of anthropology." Later, I found that theistic controversy was engaged on a problem of dynamics,—whether or not nature was created by a personal power. Then an old Adam of Methodism rose in me. I felt that religion was properly not concerned with theories about the remote origin of nature or the preternatural destiny of man, but with this salvation of man from evils that actually afflict and degrade him. John Wesley relates that, when he was involved in doubts, William Law said to him: "I see where your mistake lies. You would have a philosophical religion, but there can be no such thing. Religion is the most plain simple thing in the world. It is only, 'We love Him because He first loved us.' So far as you add philosophy to religion, so far you spoil it." This remark made a lasting impression on Wesley, though he never realized how much of what he thought religion was remnant of primitive science. Men are never conscious of their superstitions. No doubt some think we are superstitious in believing there is

any reality in religion at all. For one, I feel certain that religion is a reality, and that it is separated by an impassable gulf from every form of theology. The problems of philosophy are interesting: tender feelings and hopes are often concerned with their solution. A man's desire to live after death is as natural as his desire to live tomorrow: his desire to meet his loved and lost in heaven is the same as his longing to keep them out of heaven as long as medical skill can do so. It is natural that, amid the evils and contradictions of this world, man should cherish the faith that somewhere in the depths of the universe there is a mind to which all disorder is order, all discords musical. To views and hopes involving the happiness of any, and not claiming to be essentials of religion, one is glad to offer the hand of a sympathetic agnosticism. But neither the theories nor the agnosticism have any necessary relation to the moral and religious sentiment. E. von Hartmann says, "To the religious consciousness, it is meaningless to say there is a God without saying what he is." We love that God who loved man: no other conception can really kindle the heart. What woman loves Jehovah as she loves her babe?

If you ask my definition of religion, it is sufficient now to answer that, by suffrage of the world and the ages, religion is essentially the love of good and hatred of evil. There never has been but one religion. Whatever deities men may believe in, or whatever theology, their religion consists in the pursuit of some things as good, and abhorrence of other things as bad. Therefore, I say, God is good. Jehovah may proudly claim, "Behold, I create good and I create evil." The Unknowable,—which meets us as the mother of Odysseus met him in Hades: "Thrice I sprang toward her, and was minded to embrace her: thrice she flitted from my hands as a shadow or even as a dream,"—the Unknowable may claim to be the source of all phenomena; but religion must have a God it can love, and it cannot love the source of all phenomena. Good men may extol with their lips a deity who says, "Shall there be evil in a city, and the Lord hath not done it?" But their real opinion of the evil in a city, and of its author if they get hold of him, may be gathered from police reports. A god deduced from nature would be unmoral as nature, and must sometimes inspire a fearless mind to say, with an English poet, "I believe in God, but am against him." Progress is a perpetual war with nature, and religion a revolution against the gods of nature. Religion has no need of any Almightiness: it needs a Heart. Its enthusiasm is for the weak,—not for Omnipotence, but for its victims,—Zoroaster, Prometheus, Jesus.

The religions of mankind are not traceable in gods embodying the forces and phenomena of nature, but in gods that interrupt the laws, arrest and coerce the forces for service to man. Most of us have borne a part in the battle of science against supernaturalism; but, now that the victory is won, we may do justice to the enemy. My own belief is that the religion of every people is expressed mainly in the miracles it believes. The New Testament miracles show what the people think a god ought to do and would do, if he moved among men and women, and saw their want and hunger and tears. I think so too. And I do not believe the sects that locate all miracles among ancient tribes will ever prevail against Catholicism and Spiritualism and Salvationism, beneath whose vulgar signs and wonders works a revolt against the Christian restoration of pagan heavens, with blissful gods indifferent to human agonies. The other day, a relative in Virginia

told me of a pious negro woman who related in meeting a wonderful story. She declared that, having gone to a spring for water, she heard the sound of Gabriel's trumpet. Her Baptist brethren could believe a good deal, but this was a little too much for them. Heads were shaken, and a brother expressed the general scepticism by saying there might be doubts whether the sister "really 'scerned the trumpet or only thought she 'scerned it." The woman was in evident trouble at having her statement doubted; and, at length, an aged man arose and said, "Arter all, bruthren, maybe Gabriel *did* give the poor gal a toot or two."

What could be more reasonable? Assuming that there is a Gabriel, that he has a trumpet, and that he knew the poor creature was thinking about him, surely, the least gentlemanly feeling would prompt Gabriel to give his humble friend "a toot or two." The old negro's conception of the archangel seems an improvement on Milton's. It was to such lowly Baptist believers beside the Jordan that the dove descended, and the divine voice said, "This is my beloved." A heavenly "toot or two," heard by sorrowing and expectant hearts, whether beside the Rappahannock or the Jordan or the Ganges, is enough to explain the mythologies of the world. It is easy for science to smile at this folk-lore: it is more important that science should comprehend it; and it is absolutely necessary that Free Religious people should recognize the truth and prophecy in it. Those are the prayers which science is to answer, the miracles it is to surpass, the dreams and visions which are to be more than fulfilled by a human trinity of head, heart, and hand.

Two things, then, are assumed in every variety of religion: first, that goodness alone is divine, that it is by no means omnipotent, but sometimes even helpless,—hanging on a cross; second, that this divine spirit is in steady conflict with the actual forms of evil and with the mass of evil in the world, which it never created, but hopes to subdue. This limitation of Deity, this recognition of the conflict between good and evil, is as fully present in modern Positivism as in ancient Parsaism. From the year One and from the banks of the Jumna, we hear the incarnate Krishna saying to his hero, Arjuna: "I am born by means of my delusive power: whenever there is a decline of religion and an insurrection of vice and injustice in the world, I create myself; and thus I appear, from age to age, for the preservation of the good, the overthrow of the evil, and the establishment of virtue." To that grand strain, the nineteenth century responds beside the Thames, by the voice of Clifford: "The human race embodies in itself all the ages of organic action that have gone to its evolution. The nature of organic action is to personify itself, and it has personified itself most in the human race. . . . In this principle, therefore, we must recognize the mother of life, and especially of human life; powerful enough to subdue the elements, and yet always working gently against them; biding her time in the whole expanse of heaven, to make the highest cosmos out of inorganic chaos; the actor, not of all the actions of living things, but only of the good actions; for a bad action is one by which the organism tends to become less organic, and acts for the time as if inorganic."

Among the old legends that veil the maternal spirit, ever in travail for the happier world, is that of Armageddon. The new English translators, against protest of the Americans, have made it Har-Magedon, which looks like literal translation into vulgar English. The legend itself has many times been adapted to vulgar notions. Ar-magedon, "the hill of Magedon," was

a sort of Bunker Hill to the Jews, where Saul was defeated and killed, when invading the Philistines, and Josiah met the like fate, when fighting the Egyptians. But they had legends of earlier victories won there by Barak and Gideon. The hill and plains had been the scene of historic conflicts,—of alternating victories and reverses for Israel,—so that, when they had adopted the Persian idea of a war between Ormuzd and Ahriman,—the good and the evil Power,—this old battle-ground served as a similitude. To the early Messianic believer, it became a metaphor. There the seer of Revelations saw gathered the brood of the dragon,—unclean spirits, spirits of devils working signs, and kings of the whole world, gathered unto the great day of God,—and there the vials were poured out upon them. A good many were destroyed,—wicked kings and merchants and all the abominations of Babylon,—but not the old dragon, deceiver of them all. He was chained in a pit, to be loosed after a thousand years. It has seemed to many an instance of misdirected clemency. But there was a reason for it. When Man Friday asked Crusoe, "Why not God kill debbil?" the pious man could not explain; but he might have answered: "It would have been idle to report the devil dead. The story would have been too thin."

To mediæval Christians, this allegory and vision became realistic,—real as their oppressions if they were poor, as their ambitions if they were powerful; and all looked forward to the completion of a thousand years, when the battle of Armageddon was to take place and the hosts of evil to be overthrown. That year passed peaceably, and with it the millennial dreams of the Church. And, it must be added, its millennial fears; for many a bishop and many a king breathed freer for not hearing that sound of Gabriel's trump, for which the poor listened and longed like our negro woman in Virginia. All this is but the form familiar to us of a universal tradition and faith. In every country there has grown up a corresponding history, to be transmuted to allegory and crystallized to a creed. Antiquated by experience for cultured Christendom, Armageddon is still seriously expected by Parsees and Moslems. Among Europeans, this belief, since the year 1000, has shown an increasing tendency to collect its converts in asylums. But now and then in England, and here also, an enthusiast of that kind gets loose in the world. A remarkable instance appears in the career of the late Gen. Gordon, the so-called "Christian soldier," who has left in Africa the reverse reputation of a slain antichrist.

When the Mahdi was approaching Khartum on one side, and the English expedition for rescue on the other, Gordon wrote in his diary the word Armageddon. Soon after, an Emir wrote, We have slain the antichrist Gordon. The Moslems are nearest in their faith to the humble believers in Christ for whom the Book of Revelations was written. Their Christ is the figure of primitive folklore, and they ever watch for his coming to cast down the latter-day Pharaohs and Neros who oppress them. That late war in the Soudan was a literal Armageddon; fought on the old lines, characteristic of the end of an Old World, and deserving careful survey from this New World, destined to increase as that decreases. If ever a man was apparently doing the literal work of an antichrist,—of an opponent to the Saviour of men and lover of enemies,—it was this man who insisted on slaughtering a people from whom neither he nor his country had suffered wrong, and in whose destruction he and his country had no actual interest. There was a cynical gratuitousness about the thing which precisely fulfilled the

traditional conditions of Armageddon. The ideal Ahriman, or Satan,—the *diabolos* hid in the Moslem Iblis,—is animated by a disinterested love of destruction and evil. The Messiah—the Mahdi—is animated by a disinterested love of good. The situation was perfectly plain to the Soudanese: they fought for God and his Christ with an inspiration of which England has not been capable since the crusades. Gordon was about the one Englishman willing to wage war for Orthodoxy, which alone was involved. In his mad-bull rush at heresy, he trampled down patriotism and humanity, to perish at last with the flower of the British army.

To Gordon's fanatical Trinitarianism, to his purely theological enmity, the Mahdi and his friends opposed an actual religious enthusiasm. For them, all the law and the prophets were summed up in an order to throw off an oppression. To them, it was war against every kind of villainy, and for life or death,—a genuine Armageddon, where God had set himself to Satan. This great defeat of theological and ecclesiastical Christendom, with all its wealth and power, by religious and believing Christendom, in its poverty and ignorance, is a writing of flame on the walls of the world, showing that this vaunted Christian civilization has been weighed and found wanting. There is a power generated by religion,—that is, by passionate love of the right and passionate hatred of the wrong,—which tends to evaporate under the influence of a theology made to imperial and priestly order. There is a great deal of religious feeling among Christians of all sects. It is visible in their charities, which confront all sufferings save those of heretics. But the evils they oppose continue. The statistics are not materially affected; kindly Christian efforts still appear like sweeping a little snow here and there, to find the like drifts next day. It is winter in the air that causes the trouble, and to clear that away is now no part of the hope or aim of any Church. To our great and wealthy Christendom, the early spread of Christian faith by poor and ignorant apostles appears miraculous. But that was the natural effect of perfect faith in a new earth at hand, and nothing like it is attainable by a theology which surrenders the earth and bids hope wing its way to a world beyond man's influence.

The average theological instruction is that there is one God, of whom are all things and by whom are all things; that all sin and wrong are permitted by him; that the crimes and evils of the world are overruled by Providence to good ends, but that those by whom they are committed will be punished in another world; that the powers that be are ordained of God, who is king of kings; therefore, they should be submitted to and obeyed; and that all should consider their lot in life and their troubles providential, be resigned thereto, and look for compensation in spiritual improvement here and happiness after death. That is a comfortable creed for bishop or monarch,—for all who have found godliness profitable. But it is not really believed by anybody. Nobody is resigned to any pain he can escape, however providential. If a man has lost an arm, ordinary shrewdness may lead him to accept any compensation, spiritual or other; but, if the other arm be endangered, no promise of spiritual benefit will induce him to part with it. No race ever believed in one god only. Those that make most pretension to monotheism—Jews and Moslems—have heavens populous with angels, genii, and demons, presiding over all the departments of nature and life and death. It is impossible for human beings to deal with all the crimes and agonies and diseases of this world as the work of a good God. The laws of evolution

are against it. People must try to better themselves, because nature has for ages been securing the survival of such and extinction of the resigned.

There was one side of theology which temporarily buttressed moral order,—its doctrine of heaven and hell. This tremendous bribe and menace did once restrain mankind a good deal, though real morality got small share of the benefit compared with that derived by tyrannies that identified their law as God's. Social and political progress have been largely arrested by these tremendous sanctions, as may be seen in the crushed condition of countries where such beliefs linger most. Granting that individual conduct has been made more orderly by such hope and fear, they have lost their old force. Modern theology has so rationalized away heaven, to suit a sceptical age, that its attractions have faded; and as for hell, in order to keep it, they have had to make it a rather comfortable place. In a late number of the *North American Review* there was a defence of the eternity of future punishment by a theologian, at the close of which he admitted that hell might be a pleasant place, and he did not suppose its residents would leave it were heaven offered them. This is probably the last defence of the doctrine we shall see. It reminded me of an answer Carlyle once gave to a notorious fellow who, half-tipsy, came to him, saying that he was anxious about his soul. "And what's the matter with your soul?" said Carlyle. "I'm afraid I'll go to hell," said the fellow. "Varra likely," answered Carlyle; "and you ought to be thankful you've got a hell to go to." We have no hell now, only *sheol*. Who's afraid of *sheol*? *Sheol* is only a decent shroud for a dead dogma. Its pallid ghost survives to frighten only those that need not be frightened,—pious women and children. Both heaven and hell must lose their effect progressively, as society passes farther from the ages of barbarous punishments and enjoyments amid which these notions originated.

Now, it may be asked, if theology is not virtually believed, why complain of it? Why slay the slain? I answer, It is necessary to recognize that the evils they once confronted are not dead. We have our battle of Armageddon yet to fight, and the old weapons have broken in our hand. Nor can they be mended or remade, or used if they were made. For, in truth, Armageddon has changed, with all its conditions. It isn't even a battle any more. We have got Eastern Scriptures written amid war, captivity, and ransom, so deeply in us that religion speaks military language, and is in perpetual parade. About a dozen new religious armies register themselves annually in England; and they seem to do some good by substituting a more harmless intoxication for that which afflicted many homes, also by giving poor prisoners of the Sabbath a legal Christy minstrelsy. But, as regards the great aim of religion, as regards the new heaven and earth, salvation armies are the reduction of militantism to absurdity.

Armageddon has dissolved into another view altogether. The holy war between God and Satan and their angels has faded into a vast illusion. All arbitrary powers have passed out of the universe, which is always what we think it, however much such phantoms may still haunt brains unsunned by thought. Darwin's great generalization struck the hour that unmasked the wild carnival of gods and demons, revealing forces inferior to man. The dread Fates are clerks of the statistical bureau. Eolus edits the weather column, and Jove is a dynamiter. Man rises from his knees, rises to his feet, and discovers that he has all along been the victim of natural evolution, because he did not know its art of war.

Now, he has learned that he can shape a world to his fancy as certainly as he can shape a sheep. Now, man is his own fate, makes the winds his servants and his messengers a flame of fire.

When Franklin bottled the lightning, he was considered an Ajax: the pulpit thundered against his daring impiety. It was echo of the ancient curse on the first tiller of the ground, the first builders of towers, the first bearer of fire and the arts to men. Nevertheless, one of Jove's bolts was bottled; and, from that time, it has been studied and analyzed, until science has learned how to store up lightning and regulate its action. Some years ago a Frenchman crossed the English Channel bringing sixteen thunder-storms in a Gladstone bag. He conveyed them to Sir William Thomson, at Glasgow, who showed them to me,—so many little metal boxes, canned lightning. Dr. Buchanan came in one day to borrow one of these boxes, saying that he wanted to use it on a patient,—a little child that had a tumor on its tongue, which he was afraid to cut off or to burn off in the old way: the heated wire sometimes loses its heat, has to be reheated, causing much pain. The stored electricity was taken to the child's room, the wire was kept at one heat. In one second the lightning touched off the tumor, painlessly, soft as a mother's kiss; and the child is well.

"Curtain thy heavens, Jove, with cloud and mist,
And, like a boy that moweth thistles down,
Unloose thy spleen on oaks and mountain-tops;
Yet canst thou not deprive me of my earth,
Nor of my hut, the which thou didst not build,
Nor of my hearth, whose little cheerful flame
Thou enviest me!"

"I reverence thee?
Wherefore? Hast thou ever
Lightened the sorrows of the heavy-laden?
Thou ever stretched thy hand to still the tears
Of the perplexed in spirit?"

This is the revolution wrought by religion, and it is marvellous in our eyes. Human worship began with man adoring the elements, and ends with the elements adoring man. Gods begin with pronouncing the human heart totally depraved, and end with citing the human heart to prove their existence. The stream of tendency that makes for righteousness is the tendency that has made man. Nature's one great balance, outweighing her weeds and ferocities, is to have evolved the conscience of man. But for that, atheism or pessimism would be the only alternative of thought.

On the other side of Armageddon battlefield, the unmasking of devils has changed the character of man's moral struggle for existence. The waste of human energy in prayers and sacrifices to deities that did not exist, in passionate loyalty to phantasms, was like the waste of steam before engines were invented. The outlay of religious force in combating demons instead of evils was like the pious culture of deadly snakes in India, along with hymns to gods for slaying imaginary dragons in the clouds. And it seems there are Indias not far away. Hindus will not burn bodies that have died of small-pox, because small-pox is held to be a person who will be angry if scorched. Canadian Catholics regard small-pox as a retributive power to be propitiated by processions, which draw crowds and diffuse the disease. Such misdirection of the attack on evil is like troops firing on friend for foe. The only conceivable advantage of the devil theory is that it might tend to make men look beyond evil phenomena to their causes; but that advantage can only be gained when the superstition ceases, because the fictitious cause not only misleads remedial effort, but makes every evil moral and mental also. If loyalty to a god can say, "Though he slay me, I will trust in him," hatred to a god's supposed enemy may say, "Though he heal

me, I will kill him." Men have killed many of their friends and saviours, because they supposed them soldiers of Satan, being unable to judge them by their fruits, because their theology confuses good and evil. Satan may come with the fruit of knowledge, to found a college in Eden: he may come with art and beauty and mirth. Jehovah may come with cursings, thorns, and thistles. Under the sorcery of superstition, mankind will put Satan's light for darkness and Jehovah's darkness for light. And thus by faith man can give his phantoms form, can turn his nightmares to daymares that trample him in the dust.

More wonders can be wrought by the creed-breeder than by the cattle-breeder. The priesthood may deny evolution, but they have created their world by it. They have taken care that their regulations shall be approved to every man by appropriate blessings and cursings, however little those regulations may be related to the facts of nature or morality. The Church has always known how to tame its shrews, if they prefer truth to creeds and charity to sacrifice. "How bright and goodly shines the moon!" quoth Petruccio. "The moon! the sun!" says Catharine.

"Now, by my mother's son, and that's myself,
It shall be moon, or star, or what I list,
Or ere I journey to your father's house."

Poor Catharine has got through her fight. She is very hungry.

"Be it moon, or sun, or what you please;
And, if you please to call it a rash candle,
Henceforth I vow it shall be so for me."

The world is beginning to recognize the difference between sunshine and moonshine; but it will be some time yet before mankind trust their senses, longer yet before they utter the verdict of their senses. The most radical are tamer than they know. The world has so long been divided into believing sheep and unbelieving goats, there has so long been a survival of the sheepish,—we are all descendants from the sheep,—that for some time the majority will be dumb before their shearers who give them green pastures. But let us not fail to recognize the higher influences that are now with the old pastures. Beyond the force of self-interest, beyond the force of habit, there are sweet and tender associations with the ancient homes of faith, and sweet virtues have climbed over those feudal walls; and it will require a long time for any new abodes to equal their charm. It must content us for the present that the old is increasingly willing to adopt improvements. For some time, Christianity has been ashamed of its fire and fagot; and it is now maintaining a God of love instead of wrath, a human Jesus in place of a Christ casting unbelievers into outer darkness.

It is not easy now for any preacher to describe how Nero celebrated his own divinity with burning Christians for torches, and proceed to declare that Christ will eventually manifest his divinity by the light of burning unbelievers. In an early century, the god of wrath recovered his lost altars by alliance with the gentle Jesus; and though that lover of enemies, raised to Jehovah's right hand, was appointed to damn his enemies, yet now he in turn has to ally himself with the human Jesus, recovered by sceptics from his cold celestial sepulchre.

Such victories as this are won in our new Armageddon,—victories in which none are defeated. Free Religion can never desire a partisan triumph: it cares most for kingdoms that come without observation, like soft summer dawns. It is not pressing a set of opinions.

It is important that the search for abstract truth shall go on; for, in the end, every truth will prove productive. But those whose past is in the moral

and religious and social service—whose aim is humanization of the earth and the joy of mankind—need not suppose that sects and superstitions will yield to logic and criticism. Lucian and Celsus and Bruno before us piled up arguments. It is even doubtful whether there were not relatively as many mediæval as modern free thinkers. Their intellectual shafts made little impression on the mass. Those who never reached their creed by logic will not lose it by logic. It is folly to suppose that a man of untrained critical faculty, accustomed to submit to juries and majorities questions he has no time to investigate, will yield his comfortable relations with this world and comfortable certainties of another for novel criticisms and negations. All that must be left to the forces of evolution, which happily are accelerated by the diffusion of education; and the special task of the Free Religious man is to insist on the religious and ethical factor of the evolution,—to introduce it everywhere, increase it, intensify it. We are not seeking a syllogistic victory, not victory for any abstract principle. Anacharsis Clootz declared to the revolutionary assembly in Paris that the democratic principle is so precious that it would be cheaply purchased by the destruction of the whole human race from the face of the planet. That opinion may accord with the deity who deluged the world, but hardly with the deity revealed in the heart of man. The religious principle is unknown save by successes manifest in the elevation of all. It aims to recover the whole world for justice, peace, and happiness. There can be no triumph of Free Religion which leaves behind the institutions and churches. These cannot speedily be given new heads, but they can be given new hearts. Belief in witchcraft is nearly as wide-spread now as it was a thousand years ago; but we hardly recognize it, because it has a new heart,—a heart created in the age of Channing and Parker and Emerson, full of faith in progress and sympathy with human sorrow, far removed from the weird and malevolent incantations of serfs invoking devils against their oppressors. The appearance of man on the planet does not involve disappearance of the anthropoid, but it does involve disappearance of the wolf. The higher religion must be content, for the present, with clearing the world of brutal, immoral, hostile forms of faith, and hope that these new conditions will lead on the intellectual wisdom.

In this is indicated the method of our work in Armageddon. The wise man, says Confucius, uses what is in man to reform man. In mankind, love for what is good and fair, the moral sentiment,—though it may be paralyzed by terror, and sometimes silenced by temptation,—is the ancient foundation on which human society was built. It has been overlaid by wild growths of ignorance, but in all their stems is something of the original granite. How confident the average Christian is that his Bible, his Word of God, is opposed to polygamy, favorable to the elevation of woman, to progress, freedom, equality, human fraternity! That mistaken brother has got a new heart. It beats amid an organization inherited from antiquity,—an organization of notions contrary to tendencies of our age. Primogeniture, despotism, thrones, race hatreds, masculine domination, intellectual thralldom, are not merely textual in Christianity: they are its foundation stones. Take from it these ideas,—the only son of a supreme monarch selecting favorites from a particular race, promising his disciples thrones over mankind, resting his favoritism on blind belief in supernatural pretensions,—take away that, and you have a good and wise street preacher, but no distinct system of belief. This man with the new heart, propitiating

his past with phrases while his spirit marches with the present, is not a favorite with free thinkers. They say he has no right to his uniform, and ought to be made to declare under which king he will fight. But that only shows how far militantism survives among "free thinkers," some of whom are inverted sectarians. To a thinker really free, to one who has no camp and seeks only that the light he loves shall prevail,—rejoicing if it steal through crevices and visit spirits in prison, or in dogmatic dungeons tint some flower with hues of the wide sky,—to such a one, the man who has put a nineteenth century Jesus into his antiquarian frame is the man he is primarily seeking to create. Bodies are not built up or renewed at once, but atom by atom, until all the old ones are replaced. When you have got a healthy heart beating inside, it will steadily build the kind of head and hand it needs.

Liberal public teachers have been wearied with the question, "If you pull down our creed, what are you going to put in its place?" Some one asked Voltaire that, and he answered, "I remove a cancer from you, and you ask what I shall put in its place!" As a matter of fact, it is impossible for one belief to depart, save through the presence of another. If a man refuses to believe that two plus two equals five, it is because he has discovered that two plus two equals four. Every clear denial is an equally clear affirmation. But beneath that persistent question the real one is, What institutions are you going to put in the place of these Christian ones? what homes, hopes, affections, characters, are to replace these which, with all their faults, bring much happiness?

To answer that what they so value is no more Christian than the sunshine would be preposterous,—in the literal sense of that word, putting first what should come after. Our position is that we desire to remove only the acknowledged faults and defects of our civilization, to heal social and physical diseases, respecting all that is sound and whole. Every free man believes as much as he can, and agrees with others as much as he can. It is only a survival from ages of intolerance that makes a heretic pugnacious. But where dogmas promote discord, where hearts are frozen by creeds, where men sacrifice justice and liberty to idols, and bind heavy burdens on their fellows in the name of religion, there is our Armageddon, where truth and right must stand and strive till they prevail.

They will prevail only as they strive lawfully, and not in the old militant way. Evolution has taught us that. The religious thinker of to-day stands amid established errors as primitive man amid the gourds and briars he has changed to melons and roses. He did not bruise them. He co-operated with what was best in them, and commanded by obedience to their law. The victims of error are to be shown wherein they are its victims, how their moral natures are lowered and their culture arrested and their Christ crucified by discouragements of thought, dislike of honest opinion, and by laws that coerce conscience.

Our theory is that these evils have a deep root, like that birthmark in Hawthorne's story, which the chemist removed from his wife's cheek. Life went with it. If Christians should treat good atheists and good Brahmins and Buddhists like brothers; should they allow perfect freedom on the Sabbath; should they tax a church the same as a theatre, since otherwise every citizen is taxed for that church; should they encourage every thinker to utter his thought, and honor his courage if his thought be against their creed; if they raised moral character above Orthodoxy,—then intellectual errors would surely follow the arbitrary, unjust, immoral, and uncharitable usages

that make their habitat. So I think, but shall be happy if Christians believe their system can survive withdrawal of all artificial supports, and show their confidence by such withdrawal. That would make society a friendly Armageddon, where all shall compete in services to truth and right, and the best method be made manifest, to the joy of all.

In other words, the first task of religion is to convert Christianity. It needs to have a clean heart created within it and a right spirit renewed within it. When it gets that, it may still require some time to shed its superstitions,—as long, perhaps, as it took the early believers in Christ to discover that their new faith was inconsistent with Jewish ceremonies. That is comparatively a small matter. The main thing is to bring the Church under conviction of its sins against the charity, the humanity, the justice which its members claim for their Christ. And that we can best do by so representing in our own lives the justice, generosity, and humanity required, investing truth with the sentiment and sweetness that twine like roses round old altars, till pious fears shall be allayed, and devout women and children confidently move to frontiers once associated with the pioneer's axe and hut, but which shall now be seen bright with happy homes. It seems to me that the negative task of free-thought is about ended. Its duty was to convince the tribunal of reasoning minds, not the unreasoning; and the verdict is clear. I cannot help thinking that the service most needed by Truth is now rendered by those who associate it with the loveliness of life, with culture and refinement of manners, with the oil and wine which soothe and refresh the weary, wounded travellers on the world's hard highway.

Science, too, must become a subject of grace. It is a dismal feature of our time that there is no religion in which Science can believe. But Science is our chief miracle-worker: the coming human religion must depend on that trinity of Heart, Head, and Hand,—of Love, Knowledge, and Wealth,—whose undivided substance shall perform the true miracles; that is, shall introduce a power able to control and apply natural forces to humane ends, to create by purposed selection, to be thus a providence to mankind. The man of the past offered prayers: the man of the future will answer them. Emerson's first volume of Essays ends with the pregnant prophecy, "When Science is learned in love, and its powers are wielded by love, they will appear the supplements and continuations of the material creation." That is precisely our need. The world is a very fair study of a world, but it is sadly unfinished; and now, when the discovery has been made of the art by which it was made thus fair, we find the power that might continue the creation, and do away with its brutality, without the required "enthusiasm of humanity." Science has for centuries been a suspect to religion: it has had to gain freedom through fire and fagot, making its records in tongues unknown to the people, and has acquired an instinct that shuns both priest and priest-ridden. Until religion is entirely detached from the crude science of antiquity, now preserved as theology, we cannot hope that Science will be thoroughly humanized. It will one day be felt as astounding that great scientists should reverence the law of evolution without perceiving that they are reverencing the heartless gods of primitive man, visiting the sin of fathers upon their children, consecrating predatory instincts. To know the law of evolution endows man with the giant's strength, but we had better not know it than to use it like a giant. The order of nature is moral disorder. There is needed a religion

which shall move men to substitute moral for natural selection, and steadily remake nature into the image and stature of a perfect man.

To that end, religion must also convert wealth. I see your incredulity, and admit that the camel's passage through a needle's eye seems small compared with this last miracle. But, with the God I am thinking of, all things are possible, even the melting of these golden icebergs into streams that shall make our waste places rejoice and blossom like the rose. Wealth, also, is without a religion. In all the Christian ages, no divine man has appeared, saying to it, "Sell that thou hast, and give to the poor, and follow me." I conceive that many a millionaire, if convinced that he could by large outlay permanently remove any disease or evil from the world, would not count the cost. Religion has never yet set before wealth any such hope or motive. It has admitted the fatal superstition that the evils of this world are necessary, incurable, disciplinary, only to be redressed in another. This leaves wealth without an ideal.

What sanctions are left to a religion that can promise neither hell nor heaven? What motive can it use to curb selfishness and animate duty? What answer can it give to the man who asks, "Why should I give up any enjoyment for the advantage of another?" If the old fears of hell and faith in heaven actually availed so to curb and inspire mankind, this would be a more serious question. But they do not. The terrors are laughed at; the rewards, even when believed in, are offered for favors to God, and not for services to man. The destructions of time cannot be arrested; and, in the presence of these decayed, uninhabitable ruins of Eastern faith, we must hasten to build us new mansions.

And what solid material have we to build with? I believe that religion needs a heaven to animate it, but it must be a heaven unclouded by doubt. That heaven it can only find in the vision of a perfect world,—a world purified of evil, whose inhabitants shall no more say, "I am sick," where tears shall be wiped away from all eyes. I believe that religion must dread the hells of disease and selfishness and strife. And that all the great forces of the world will be concentrated upon the extermination of those hells, the realization of that heaven, when a generation is trained from the cradle to serve no god but perfect man, to dread no hell but human corruption, to seek no paradise but an earth transformed by art and science, a society transfigured by truth and love. Stones rejected of the builders because unsuited to support the thrones of prelate and potentate, ruling by terrorism and favoritism, practised in this world and projected into another; the sense of honor, left to be defiled on the duel-ground and battle-fields of barbarism, yet there able to command more courage and sacrifices than any deity; sympathy, compassionateness, which dogmas have tried to consume with their implacable god and purposeless hell; example, by which a community is made of one language,—the sculptor of character,—whose power is perverted by prayerful transfer, of parental responsibility to the Holy Ghost; the love of happiness, largely left to creep in rank tangles of self-indulgence, because not consecrated and cultured to find its flower of joy in bringing happiness to others, its thorn in selfishness,—these, rejected by the builders of an authority not based on reason or right, but on abjectness of fear and desire, must be corner-stones of the human religion.

These are the forces of religion, by which it were able to turn its back on heaven and cheerfully enter hell for the sake of its beloved. When the soul falls in love with its ideal, it is not a Pla-

tonic affection: it must win and realize its vision, or perish. The old forms idealized by the souls of men have fallen: what they thought stars have proved to be meteors. There is nothing left but to lavish our spiritual affections on what we have. We are not the first who have done that. It is said that after Mohammed had his heart taken out by an angel while he slept, and put back after something had been removed from it,—perhaps his orthodoxy,—he gazed upon one grain of sand in the desert where he sat alone. As he gazed, the grain of sand swelled to a beautiful world, and bowers of paradise with waiting brides. Let us not see less in this fair New World than Mohammed saw in his desert! Great things are still visible to great souls. There is a Republic of Man at hand. Not by observation does it come: but wherever the man of science is at work seeking some farther knowledge of the secrets of nature whereby he may master its wild strength; wherever the scholar and the poet burn the midnight oil that they may bring to man that history of his past and that image of his future which shall give this life some range of eternity; wherever the physician is striving to gain knowledge that shall soothe anguish, and the philanthropist confronting every form of misery, there are at work the forces of the true religion, angels of a new heaven building the new earth around us.

WOMAN SUFFRAGE AND THE CHURCH.

Whereas the greatest barrier to woman's emancipation is found in the superstitions of the Church, and the literal rendering of Scripture text and allegories by which those in authority are armed with the potent words, "Thus saith the Lord," to compel woman's subjection and belief in dogmas that cripple her development and freedom,—therefore

Resolved, That a thorough consideration of this question should now be urged in the American church; and, for this purpose, delegates from State and national conventions should be sent to all sectarian conventions, and committees appointed to visit the clergy in their own localities, to urge more enlightened teaching in their pulpits in regard to woman.

With this resolution, Mrs. Stanton sent the following letter to the National Woman Suffrage Association, of which she is president, and before which it was read, at the recent convention held in Washington, D.C.:

"*Dear Friends*,—My convictions from year to year have been steadily growing stronger that, before we can secure woman's emancipation from the slavery and superstitions of the past, we have an important work to do in the Church. Hence, I would suggest in our plan of work for the coming year that we now begin the same vigorous agitation in the Church that we have kept up in the State for the last forty years. As the canon law, with all the subtle influences that grow out of it, is more responsible for woman's slavery to-day than the civil code, with the progressive legislation of the last half-century, we have an interest in tracing to their origin the lessons taught to woman in the churches, and a right to demand of our theologians the same full and free discussion in the Church that we have had in the State, as the time has fully come for woman to be heard in the ecclesiastical councils of the nation. To this end, I suggest that committees and delegates from all our State and national associations visit the clergy in their several localities, and attend their various convocations and general assemblies, to press on their consideration the true position of woman as a factor in a Christian civilization. Woman to-day, as ever, supplies the enthusiasm that sustains the Church; and she has a right in turn to ask the Church to sustain her in this struggle for liberty, and not only as individuals, but as influential organizations, to take some decided action with reference to this momentous and far-reaching movement. It matters little that here and there some clergyman advocates our cause, so long as no sectarian organization has yet recognized our demand as a principle of justice; and the debate is rarely opened in their councils, being generally treated as a speculative, sentimental question un-

worthy serious consideration. Neither would it suffice if they gave in their adhesion to the demand for political equality, so long as by Scriptural teaching they perpetuate our social and religious subordination.

"The State has long granted us respectful hearing before congressional committees and legislative assemblies, and it is now full time for the Church to follow her example. Lawyers and judges have listened to our arguments; while the civil code has been essentially modified, and some of the worst features of the common law abolished. Leading statesmen have taken part in the debate on the constitutional rights of woman, and recognized our claims as citizens of the republic. Scientists, in a rigid analysis of sex, have proved by innumerable facts that the primal form of all life is feminine, exploding the fable that man was first in the creation.

"And now the time has come for theologians to give expression to some well-digested ideas on this question, and substitute arguments for the sophistries too often used in our pulpits. In view of the intelligence, morality, and liberal education of the women of this period, all those texts of Scripture and parables referring to her as the author of sin, as an inferior, and a subject,—a weaker vessel,—should no longer be read in our churches, as they humiliate woman and destroy the respect that is her due from the rising generation. All these ideas should be relegated to the ancient mythologies as mere allegories, having no application whatever to the woman-kind of this generation.

"Everything points to a purer and more rational religion in the future, in which woman, as mother of the race, will be recognized as an equal in both the Church and the State. Archdeacon Farrar, in an article in the January number of the *North American Review*, says, 'The three elements which are essential to the teaching of a strong, living Church are Tolerance, Freedom, and Progress.' He gives in his article suggestions on various popular questions, on which he says it is the duty of the Church to make its voice heard. To his list, I add, 'Justice, Equality, and Liberty for woman.'

"ELIZABETH CADY STANTON."

CORRESPONDENCE.

A PREDICTION.

Editors of The Index :—

In reply to the following paragraph which appeared in your last issue, I have a word to say:—

"The fact that Carlyle's old house at Chelsea has fallen into the hands of the proprietor of a quack medicine, and that no word has come from Carlyle in regard to the matter, is decidedly against the belief that those whose earthly life has been extinguished can communicate with this world."

Carlyle has possibly found, as so many men of letters have done before him, that his scorn of and his neglect to investigate the most important and most fully demonstrated truth which his era held has given him such an unenviable position among the conceited ignorant that he is only too glad to earn his way into better company by an absorbing study of the A, B, C, of life! In that case, he is not particularly anxious about the fate of a forsaken domicile, however dear the associations which formerly had centred there. I venture the prediction that, when he gets ready to speak, he will say something that will make the ears of those tingle who dare ridicule the sublime facts of modern Spiritualism!

Cordially yours,

OLIVIA F. SHEPARD.

Boston, March 8, 1886.

[We shall be glad to hear from Carlyle when "he gets ready to speak," and to print in *The Index* anything he may see fit to communicate for the world's enlightenment. If he does speak, his words will bear ample evidence of their genuineness. There has been only one Carlyle.—B. F. U.]

HOPE AND REFLECTION.

Editors of The Index :—

I hope for a better development of universal reason and for a scientific method attaining to a universal religion and philosophy enjoyed and comprehended by all intelligent persons.

If a writer has studied the philosophy of Spencer up and down to the Unknowable, and somebody ex-

presses a hope for a future "philosophy which must be comprehended by all rational beings," it is inadequate to proclaim that "such a philosophy must be so extremely simple as not to be entitled to the name of philosophy at all"; and, after giving several definitions of his philosophy and of his master, he finishes his reply with the peculiar dictum, "Such a philosophy can be comprehended only by clear-headed and profound thinkers."

When a noted philosopher proclaims, and his disciples believe in, an "Unknowable," a majority of good thinkers generally will try to ascertain something more regarding the clouds and mountains, but will not look down with them into their abyss. Such thinkers experience and appreciate facts. They value rational doctrines of the atheist, materialist, theist, and of the scholars Berkeley, Spencer, and others; but, when it comes to individual notions and conclusions, one said, "If Berkeley says there is no matter, it is no matter what he says"; and, when Spencer concludes his philosophy with the theory of an Unknowable, it is not known what he means, "powerful reason" and "concurrence among modern psychologist and philosopher that our knowledge is limited to our state of consciousness," notwithstanding. To set God and infinite wisdom on a throne in heaven is one extreme, and to assume that finite wisdom has arrived at an ultimatum is another. There are many thinkers who cannot find a limitation on either side. But they are going on striving to ascertain more and more from the unknown. They agree with Longfellow, when he says:—

"Dust thou art, to dust returnest,
Was not spoken of the soul."

CARL H. HORSCH.

DOVER, N.H., March 15, 1886.

BOOK NOTICES.

THE LIFE AND GENIUS OF GOETHE. Lectures at the Concord School of Philosophy. Boston: Ticknor & Co. 1886. pp. 454.

This volume contains thirteen of the lectures and essays read before the Concord School of Philosophy in July, 1885. Several of the lectures on Goethe are omitted here, the lecturers having either published their essays elsewhere or withheld them for other uses. A condensed report of these lectures was given to the readers of *The Index*, by Mr. F. M. Holland, at the time of their delivery. Hence, we shall now notice them but briefly. We give a list of subjects and speakers: "Goethe's Youth," Prof. H. S. White; "Goethe's Self-culture," John Albee; "Goethe's Titanism," Thomas Davidson; "Goethe and Schiller," Rev. C. A. Bartol; "Goethe's Märchen," Rev. F. H. Hedge; "Goethe's Relation to English Literature," F. B. Sanborn; "Goethe as a Playwright," W. O. Partridge; "Das Ewig-Weibliche," Mrs. E. D. Cheney; "The Elective Affinities," S. H. Emery, Jr.; "Child-life as portrayed by Goethe," Mrs. C. K. Sherman; "History of the Faust Poem," Denton J. Snider; "Goethe's Women," Mrs. Julia Ward Howe; and "Goethe's Faust," W. T. Harris.

The tendency in most of these lectures is to idealize the great poet through too excessive a veneration. The essayists, recognizing his work and strength as a great thinker, philosopher, and charming poet, having made a special study of him, flatter themselves that they have discovered, in their careful attempts at analyzation, the occult meanings hidden in the various phases of his work, and proceed at once "to gild refined gold, to paint the lily"; but only rarely does the criticism or analysis here given furnish the reader with any particularly new interpretation or revelation in regard to the great German writer, in spite of the frequent pretty tricks of transcendental word-jugglery exhibited by many of these partakers in this Goethe symposium. The commonplace moralist, however, cannot fail to be struck with the prevailing tendency in these lectures—even when the lecturer is a professional teacher of morality, like Rev. Dr. Bartol—to excuse or gloss over the palpable immoralities in the life of the man, because of their admiration of the thinker. While the confessed sins of Goethe's life are thus generously overlooked or condoned, his theological heresies are carefully explained away, the meaning of certain expressions stultified, warped, and twisted to conform to his admirer's wish. Of Mr. Davidson's paper, which is marked by discrimination in discussing the character of the great genius, and some

others, this cannot be said. In spite of Mrs. Cheney's charming idealization of Goethe's comprehension and admiration of the "supreme abstract idea of womanhood," the "eternally womanly"; of Mrs. Howe's choice culling from his writings of the most ideal among his women characters to show his supposable underlying appreciation of the best in womanhood; and of the side-lights thrown in the same direction by Mrs. Sherman in her lecture on "Child-life as portrayed by Goethe," the impression remains to the unbiased reader of his works—an impression deepened by the story of his life—that to him women owe no great debt of gratitude as a champion or true interpreter of genuine womanhood, outside of the distortions of sentimentalism and romance. Yet we find in the list given of the works of various authors treating of Goethe no less than fifteen by women writers and admirers. The handsome portrait of the poet which adorns the frontispiece may, perhaps, easily explain one reason for his personal attraction for the women who knew him during his lifetime. This portrait and the engraving of his bust, taken in old age, show us a noble head and a winning physiognomy.

S. A. U.

TWENTY-FOUR SERMONS PREACHED IN ALL SOULS' CHURCH, NEW YORK, 1835-1881. By Henry W. Bellows, D.D. Selected and edited by his son, Russell N. Bellows. Published by the editor. New York, 1886.

This volume has been lying too long on our table waiting to be read. Nor have we now had opportunity more than to take pieces of it at random here and there. But these are sufficient to enable us to say that the son has done well to collect and print these sermons as a posthumous memorial of his father's pulpit work. The congregation that heard the discourses must be specially glad to have them. But Dr. Bellows was a leader among the Unitarians so conspicuously commanding that the volume must find, in the denomination at large, many welcoming readers. The sermons range through the last sixteen years of his life, though no dates are assigned to them individually, except to the last, which was an occasional sermon delivered at the dedication of a church in 1881, not many weeks before the preacher's death. This sermon is of generous breadth in its thought and spirit, at the same time that it is a vigorous plea for keeping historic connection with the Christian Church and retaining the Christian name and the attitude of discipleship to Jesus. It is kind toward those who no longer profess to be Christians, but it is an argument against their position; and it closes with ascribing to Jesus the title of "Master and Lord." Yet that Dr. Bellows, at least in the latter part of his life, used this title only in a metaphorical sense, is evident in the sermon immediately preceding this, on "The Distinctive Mission of Unitarian Christianity," in which he said: "We find and we acknowledge no finality in the Scriptures, no finality in the word or person of Jesus. It is only the Truth that is our finality." This latter discourse, which also bears the marks of having been an occasional one, is a fervent plea for Reason as the final tribunal of authority, and gives proof throughout of a great change in Dr. Bellows' views after the time of his famous discourse on "The Suspense of Faith," in 1859.

W. J. P.

THE FINAL SCIENCE, OR SPIRITUAL MATERIALISM. Being a Strict Application of the most Approved Modern Scientific Principles to the Solution of the Deep-seated Problems of the Age. New York: Funk & Wagnalls. 1885. pp. 194.

This volume professes to be a defence of materialism, and an attempt to explain the universe on materialistic grounds. But it is really a take-off, and its object is to make materialism appear ridiculous. The work is a very clever piece of satire. It abounds in witty thrusts, and its sarcasm is sometimes very keen. This passage in regard to atoms gives some idea of the vein in which the work is written: "At one time, the atoms were originally at rest; but then there was insurmountable difficulty in getting them to move. Therefore, they were originally endowed with motion. Sometimes, the atoms were all alike; and then there were only quantitative relations, not qualitative differences. They retained this state so long as motion was imagined capable of accounting for the variety found in the universe: when the imagination became enfeebled, qualitative differences were introduced into the atoms. Their present status

is hard to determine, since they are not stationary enough to admit of careful examination."

THE MESSAGE OF THE BLUEBIRD TOLD TO ME TO TELL TO OTHERS. By Irene E. Jerome. Boston: Lee & Shepard. 1886. Price \$1.00.

Those who are already acquainted with Miss Jerome's exquisite work as poet and artist in her *One Year's Sketch-book* will welcome this beautiful and artistic souvenir, a dainty combination of song and illustration, which is remarkable as being the product of one woman's hand and brain. It makes a lovely and unique Easter offering, and consists of eight full-page woodcut illustrations of spring scenes, accompanied by refined, descriptive, and poetic verse, printed on plated paper, bound in covers of "imperial antique," knotted with silk floss of several bright colors, neatly packed in an attractive box, and makes one of the most æsthetic gift-books of the season.

A STRIKING portrait of the Spanish orator, Emilio Castelar, adorns the frontispiece page of the *March Century*, and is accompanied by two articles in regard to him and his influence on Spanish politics, one by William J. Armstrong, entitled "Castelar, the Orator," and the other by Alvey A. Adee, giving some "Reminiscences of Castelar." The most fully illustrated articles of this number are "Italy from a Tricycle," written by Elizabeth Robins Pennell, illustrated by her husband, Joseph Pennell; "City Dwellings," by Mrs. Schuyler Van Rensselaer, "Mountaineering in Persia," by S. G. W. Benjamin; and "Shiloh Reviewed," by Gen. Buell. Frank R. Stockton's psychometric story, "A Borrowed Month," is concluded. Mrs. Foote's unique "John Bodewin's Testimony" foreshadows speedy conclusion, and the second installment of Howells' story deepens our interest in it. The short story entitled "John Toner's Experiment," by Miss Kernan, is strongly written. Washington Gladden has a timely article on "The Strength and Weakness of Socialism." The departments of "War Memoranda," "Topics of the Times," "Open Letters," and "Bric-à-brac," while containing much that is interesting, yet call for no special mention; and the poetry of the number offers nothing of particular merit.

THE Freethinkers' Magazine is published now every month. The March number contains well-written and interesting articles, among which are "Cremation vs. Burial," by Charles Well, M.D.; "Spiritualism," by William Henry; "An Address" (to his orthodox friends, on the Bible), No. 3, by A. B. Bradford; "Modern Thought," by H. Clay Luse; "Beecher on Evolution," by William F. Lyon; "The Edmunds Bill," by Helen H. Gardner; and "Theodore Parker," an editorial. Salamanca, N.Y.: H. L. Green, publisher and editor.

DON'T flatter yourself that friendship authorizes you to say disagreeable things to your intimates. On the contrary, the nearer you come into relation with a person, the more necessary do tact and courtesy become.—O. W. Holmes.

"Who doubts," says the Boston Herald, "that it is a wise and salutary legislation that protects the property of minors against thieves and sharks, by refusing to let girls be held responsible for contracts till of legal age, and so presumably old enough to know what they are about? But is not this question of bodily purity a still more momentous one? The dollar sacredly guarded by law till the age of eighteen, but the body left free to be flung into the gutter at twelve. This time, let the women of Massachusetts press home upon every legislator the indignant question why he does not vote to raise the legal 'age of consent' to shame and degradation at least as high as it stands for marriage or for dollars and cents! Or, at any rate, to show clear reason why a discrimination should be made between the two cases."

THE Women's Educational and Industrial Union of Boston, Mass., cautions all women to be wary of advertisements and circulars promising—on receipt of a certain sum—work at home, with large earnings. Those desiring information regarding circulars and advertisements offering to women work at home should address Mrs. A. M. Diaz, President of the Women's Educational and Industrial Union, 74 Boylston Street, Boston.

WATSON GRIFFIN, of Montreal, will publish an article in the *Magazine of American History* for April, entitled "The Consolidation of Canada," in reply to Dr. Bender's article in the February number, "The Disintegration of Canada," which appears to have created a great commotion in the Dominion.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. *Full of Figures, Facts, and Interesting Extracts.* Price 5 cents; 30 copies, \$1.00.

No. 5.—*"God in the Constitution,"* by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—*"The Sabbath,"* by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—*"Compulsory Education,"* by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 3 cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B. Frothingham, treats of a subject that interests everybody. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 10.—*The Impeachment of Christianity*, by F. E. Abbot. 5 cents a doz.

No. 11.—*The God of Science*, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 12.—*Is Romanism Real Christianity?* Two essays by Francis W. Newman and F. E. Abbot. Price 5 cents; 30 copies, \$1.00.

No. 13.—*On the Vision of Heaven*, by Prof. F. W. Newman, of England, analyzes the Christian conception of Heaven. Price 3 cents; 30 copies, 50 cents.

No. 14.—*A Study of Religion: The Name and the Thing*, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 15.—*The Battle of Syracuse*. Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 5 cents; 30 copies, \$1.00.

**THE ABSENCE OF DESIGN IN
NATURE.** By Prof. H. D. GARRISON.
A Lecture delivered before the Philo-
sophical Society of Chicago. Price 10
cts. For sale at THE INDEX office.

In the *Critic* of March 20, the first place is given to an account of a collection of manuscript books and poems, autograph letters from famous writers, etc., which includes most of the literary treasures belonging to Mr. James R. Osgood, the publisher, now shortly to be sold. The manuscripts of Emerson's *Representative Men* and Dr. Holmes' *Autocrat and Professor* are described; and a long and interesting letter from Jean Jacques Rousseau is printed in both the original French and a free English translation. A sonnet by Keats is also published for the first time.

THE April number of the *Popular Science Monthly* will contain an important original article by Herbert Spencer on the limits and interpretation of the doctrine of natural selection, and the position of Mr. Charles Darwin in respect to the theory of evolution. There have been so much confusion and exaggeration upon this subject as to make desirable an authoritative statement of Mr. Darwin's just claims in connection with the doctrine of evolution, and no man is so capable of making this estimate as Herbert Spencer. The paper will be elaborate and striking, and is certain to be very widely read.

MR. JOHN B. MORLEY, of Painesville, Ohio, writes: "It is perhaps needless for me to say that I consider *The Index* at the present time the equal, if not the superior, of any journal now published in the country; but as long as the columns of our metropolitan journals, responsive to a public demand, are weekly filled with the vaporings of such men as the Revs. Cook, Talmage, Moody, Sam Jones, and Small, the general recognition of *The Index's* superiority must of necessity be a question of time. But that that recognition will come I feel as well assured as I do that, in the end, true knowledge will overcome charlatanism or light dissipate darkness."

HUSBAND'S CALORIED MAGNESIA.—Four First Premium Medals awarded. More agreeable to the taste and smaller dose than other Magnesia. For sale in bottles only, with U.S. Government Registered Label attached, without which none is genuine, at druggists and country stores, and by Thomas J. Husband, Jr., Philadelphia, Pa.

**FOR
COLD
COUGHS** and Consumption use Cutler Bros. & Co.'s celebrated *Vegetable Pulmonary Balsam*. "Best medicine in the world." In use 60 years. Price \$1.50, and 35c. \$1 bottle the cheapest. Be sure and get the genuine.

CURRENT TOPICS.

BY B. F. U.

MISS LOUISA HOWARD, who died last week at Burlington, Vt., aged seventy-eight, and among whose public gifts are mentioned large contributions to the Howard Relief Society, Home for Destitute Children, and Young Women's Christian Association, did not believe in funeral displays. Her last words were, "Let no money be wasted on my funeral, but save it for the poor."

COMMENTING ON Rev. Joseph Cook's recent exclamation, "I am for Christian socialism and against atheistic socialism; I am for the institutions of Lassalle and against those of Karl Marx," John Swinton's paper remarks: "Let him [Mr. Cook] ask of the first woolly-headed pickaninny he may happen to meet, and he will have a chance of learning the fact, unknown to him, that Lassalle was a Jewish disciple of the Hebrew Karl Marx."

THERE is a William Carlyle at Ecclefechan who does not believe in the best-known member of the Carlyle family. William is the beadle of the United Presbyterian church in the village; and to a pilgrim, who recently visited the grave of Thomas Carlyle, the beadle said: "Heaps of people from foreign parts come to see the grave; but, although I am a Carlyle myself, he is no prophet with me. I ken better. In fact, the folk here do not think meikle of him. His books are not read hereaway at all." The pilgrim was the Rev. J. H. Thomson, of Hightae Free Church.

DR. JANE CULVER read a most instructive paper last Sunday before the Parker Memorial Science Class, on "Philosophical Old Age." Next Sunday, the address will be by Prof. Edward S. Morse, on one of his favorite scientific subjects. The class is in a most prosperous condition, and is doing excellent work. The lectures and discussions at all its sessions this season have been of a high character, and they have been listened to by quite large as well as appreciative audiences. This class, so called, has grown to be a large and flourishing society, of wide and continually increasing influence; and, as an agency for awakening and sus-

taining interest in scientific subjects and diffusing the best scientific thought of the day, its value cannot be estimated.

DR. J. R. MONROE published last week the first number of the thirty-first volume of his *Iron-clad Age*. It was started at Rockford, Ind., and named the *Rockford Herald* in 1855; removed in 1857 to Seymour, Ind., and called the *Seymour Times*; and three or four years ago it was removed to Indianapolis, and given its present name. The *Age* is independent, radical, and witty, is the organ of no party or clique, but of its editor, and has a way of its own in combating superstition. We congratulate our friend on the publication of a free-thought journal under his ownership and management for thirty years.

THIS paragraph from a letter in the *Pittsburg, Pa., Despatch* is of interest: "Mrs. Annie Besant, who is probably the cleverest woman in England, is associated with Mr. Bradlaugh in the publication of a free-thought newspaper. A few years ago, they hoped to solve the labor problem by teaching the doctrine of Malthus. They saw the labor market overstocked, men competing with each other for the privilege of working, wives and children forced into competition with husbands and fathers, and fancied that if fewer children were born of the working classes there soon would be fewer working people and, consequently, higher wages. Possibly, they reasoned well; but, while they taught, the children kept on coming in droves, all the same. Mrs. Besant has recognized the futility of the plan, and now looks to socialism rather than to Malthusianism for the relief of the workers. Mr. Bradlaugh stands still. He is brave enough to fight Gabriel and all his hosts; but he knows there is not a constituency in all the United Kingdom so far advanced as to elect a socialist to Parliament, and is therefore an intense 'individualist,' whatever that may mean. When pushed to explain by what other method a wage slave can become anything else than a wage slave, he resorts to his clever lawyer's tricks, and of course fails to answer."

REV. GEORGE J. LOW, rector of St. Peter's, Brockville, Ont., in a recent sermon, after saying that "not only our Lord Jesus Christ, but the whole Word of God, from beginning to end, countenances and makes provision for the drinking of intoxicating liquor," that "therefore either the consumption of such liquor is lawful and right or the word of God is wrong," and, after disposing of the claim sometimes made that "two kinds of wine" are mentioned in the Bible, the reverend gentleman continued thus: "The third answer to this dilemma is that of the infidel prohibitionists; and their reply is, 'It is true that the Bible allows the use of intoxicants; and so much the worse for the Bible.' Well, this answer has the merit, at all events, of being straightforward and logical. But you see to what it leads. Perhaps you may be surprised to hear of infidel prohibitionists, yet there are very many of them in the United States. They have a very extensive

literature of their own,—newspapers, novels, etc.,—all inculcating total abstinence and atheism." The town of Liberal, Mo., this preacher says, has been advertised "in terms to this effect: that in said town there were 'no churches, no devil, no Christ, no God!'" It has been common, hitherto, for the pulpit to represent drunkenness as the legitimate result of "infidelity"; but now a preacher associates with it, in order to make them odious to his hearers, total abstinence and prohibition. "Times change, and men change with them."

ACCORDING to the *Chicago Herald*, Sam Jones has a very poor opinion of many of his profession: "I tell you," cried Brother Jones, "that the worst enemies God has got to-day are in the pulpits of this world." The audience was with Sam in his low estimate of the pulpit. It applauded; but its greatest demonstration, its heartiest approval, followed Jones' declaration, "I believe as many preachers go to hell in proportion to their numbers as any class of people in God Almighty's world." That brought down the house. There was no qualification, no limitation." The *Herald* says that this itinerant from Georgia "seems to gather his opinion of ministers from the very Uriah Heepish manner in which such of them as are puppets in his hands receive his bastings. They are so very humble under his lash and the storm of derision he raises against them." The same paper states that the revivalist has declared his purpose to reform his speech; but alas for the frailty of human nature! "The jargon of the swamp, the debasing lingo of the irreclaimable progressive euchre player, the abounding epithet of tap-room frequenters, the colloquialisms of the unregenerate and impolite, will come trippingly from the tongue of the revivalist. But a few more weeks of the bracing and enlightening environment of Chicago may be trusted to improve the preacher's speech."

AMONG the despatches published in the daily papers last week was the following: "A prominent Pennsylvania railroad manager said to-night: 'The advance of twenty-five cents a ton on coal announced by all companies to-day is expected to be confirmed by the meetings of the Pennsylvania coal companies next week. Strictly speaking, no coal combination has yet been formed; for no papers have been signed and no binding action taken. It is simply an understanding between gentlemen.'" When members of the coal ring combine and carry out a plan to enrich themselves by raising the price of coal, they make the consumers pay a higher price than would be charged under free competition, and they limit production in many manufacturing industries. Yet their compact is simply "an understanding among gentlemen." When their employes combine for the purpose of increasing their pay by preventing production until their demands are complied with, these wealthy coal producers regard the action of the miners as lawless, an invasion of the rights of capital, and destructive of social order as well as of business prosperity.

A FACTIONAL REACTION AMONG UNITARIANS.

We have spoken of late of the good signs of progress among Unitarians, as, notably, the publication of a volume of the writings of Theodore Parker by the American Unitarian Association. We have also referred to the outbreak of a new conflict in the denomination, particularly in the West, over the question who are to be counted Unitarians. This question has been raised by Mr. Sunderland, the Secretary of the Western Unitarian Conference, who thinks that that Conference has allowed altogether too much latitude in the direction of the Free Religious platform. He would have a rule established by which both societies and ministers should subscribe to certain beliefs before being admitted to Unitarian fellowship. These beliefs, perhaps, may be accurately summed up under the phrase "Christian Theism." This required creed—for a creed it is—would not have been regarded as very exacting a generation ago. Indeed, probably at that time all recognized Unitarian ministers and societies would have readily assented to the proposition that this statement, or something with even more of Christian dogma, was the basis of their fellowship; and, if any had demurred to making it, the demur would have been on the ground that there was no need for them to express such a belief any more than to assert that the sun shines, or probably, too, in some cases on the ground that to make such a statement of belief together, however true, would be contrary to fundamental Unitarian principles. But, to-day, even the simplest doctrines of "Christian Theism" cannot be drawn into a formal statement as condition of Unitarian fellowship without cutting off a number of societies and ministers already recognized as within the denomination.

How far this reactionary movement is to proceed and what effect it is to have, it is impossible to say. But it seems likely that it will delay the inauguration of that era of liberty and reconciliation among Unitarians which, it has been prophesied, was soon to come. It has even been said that their next National Conference would follow up the reconciling work which the Unitarian Association has been doing, and remove from its Constitution the long debated theological Preamble. But this can hardly now be expected. True, this movement appears to represent only a faction of the denomination. But it is a faction that is showing a good deal of vigor and zeal. Its leaders are respected for their personal character and denominational loyalty; and all the conservative elements of the Unitarian household—some of them have been in a condition of hopeless quietude of late—will naturally rally around them. If, with such advantages, they do not make a better fight than Mr. George H. Hepworth did for a limiting creed several years ago, it will be proof that the rank and file of the denomination have, indeed, since then made a long advance.

The new monthly publication, the *Unitarian*, of which Mr. Sunderland is the managing editor, is, it is now clear, the organ of this reactionary faction; though it seems strange, with this bias of the magazine so marked, to see Messrs. Robert Collyer and Charles G. Ames announced among the editorial contributors. They have not usually given the influence of their names to any narrow and exclusive denominational policy. In truth, it was difficult at first to believe that Mr. Brooke Herford, who is joint editor with Mr. Sunderland and does much of the editorial writing in the paper, could agree with the latter that Unitarian societies and ministers ought to be bounded by a creed. It has been understood that Mr. Herford,

though well known to be conservative in his own beliefs, was in favor of striking out the objectionable Preamble of the National Conference, and putting no words there that could offend the consciences of any part of the members; and he has done some things since he came to Boston that indicate a disposition to a large and inclusive fellowship. But it would seem now that either he has been misunderstood or has changed his views; for, certainly, his present course is inconsistent with such a position. From some of his utterances and doings of late, it looks as if he felt himself specially called to resist the influence which Emerson has had upon Unitarianism, and to throw himself particularly against the advance of Free Religious ideas in the denomination. One can but respect his earnestness and admire his vigorous activity; but, when it comes to Herford against Emerson, one can but see that it is an ecclesiastic against a prophet, and it needs no great skill to foretell on which side the victory will finally be.

The animus of the *Unitarian* is shown not only by its leading editorial articles, but quite as much by its brief notes. For instance, the old historical church at Northborough, Mass., where Dr. Allen ministered for a lifetime in the spirit of the old-fashioned Unitarian liberty, is called to account, because, in a recently adopted covenant, it omits not only all theology, but the word "worship." In the March number, one of the editors—presumably Mr. Herford—pointedly tells those who cannot come to the work of the denomination with certain beliefs that they are not wanted. This is quite in the spirit of the short-sighted leaders of thirty years ago, who told the young men sympathizing with Theodore Parker's views that the denomination did not want them. But the climax of narrow prejudice and sectarian zeal is reached in a news-note concerning the recent exercises of dedication in the new Unitarian church at Philadelphia. Whoever writes these notes, the editors assume responsibility for them. This is what the one in question says: "The only drawback to the occasion was the part put down on the programme of the opening evening for 'Scripture reading,' which turned out to be a long patchwork of snippets, partly from the Bible, partly from all sorts of authors, ancient and modern. Probably, there were not ten Unitarians in the church who were not ashamed of it." These selections were made and read by Mr. J. H. Clifford, minister of the Unitarian church at Germantown. *Unity*, in view of the *Unitarian's* severe criticism, has published them. They prove to be, as *Unity* says, a "noble" scripture; possibly, too long, but excellent in sentiment, spiritual in tone, and every way appropriate to the occasion. We indorse Mr. Gannett's judgment in *Unity*, when he says: "We should hang our heads in sorrow, if we believed there were ten Unitarians in that church who, listening to this reading, were 'ashamed of it.'" No unprejudiced reader of the selections can have much doubt that it was not the sentiment of any of the passages that caused this outburst of criticism, but the fact that they were not all from the Bible. We are pretty sure that the critic who could thus write of these passages uses the Bible as a fetish. If Mr. Clifford had only read entirely from between the covers of that book, no matter how unfitting or unspiritual the selections might have been, would this critic have said that the congregation was "ashamed of it"? Doubtless, not; for he plainly shows that it is the *book*, and not *ideas*, that he reverences.

While the *Unitarian* inside is thus vigorously applying itself to the brakes, that it may stop the denominational advance, on the outside of its

cover there is a suggestive advertisement headed "New Books, by Unitarian Authors," and subscribed "For sale by the American Unitarian Association, Boston." Presumably, this was prepared by the secretary of that Association. Not only does the list contain the recently published volume of Parker, but the first-named book upon it is Francis E. Abbot's *Scientific Theism*; another is F. L. Hosmer's and W. C. Gannett's volume of Poems; and another is the present writer's *Twenty-five Sermons of Twenty-five Years*. Now, Mr. Abbot has always held the theistic views which he holds to-day; but his "Impeachment of Christianity" he has never withdrawn from circulation. As to Mr. Hosmer, we are not sure, but Mr. Gannett does not call himself a Christian, nor does the author of the *Twenty-five Sermons of Twenty-five Years*; and all of them have been in the habit for years of selecting their "Scripture reading" "from all sorts of [good] authors, ancient and modern." Yet, somehow, the American Unitarian Association has come up to the point of classifying them, Mr. Abbot and the rest, as "Unitarian writers," notwithstanding their non-Christian position. But, if Mr. Herford and Mr. Sunderland are right, these men do not belong in the Unitarian ranks at all. There are, evidently, Unitarians and Unitarians,—some *outside* and some *in*. In this conflict between the *inside Unitarian* and the *outside Unitarian*, which will win? The former is making just now the more stir; but the latter has the larger circumference and, we judge, the greater staying power.

WM. J. POTTER.

THEOSOPHY AS A CULT IN INDIA.

I.

The pictures fabricated in our youthful minds, with infinite care by missionary zeal, regarding India, are fast fading away. And, as the unreal image dissolves into the nebulous recesses of the missionary head-quarters, the outlines of things as they really are in that country come into view. What reasons these paid servants of the Church had for thus beginning a deception, and for now keeping it up, we need not inquire into. It is sufficient to know that they do so.

The other day, in Brooklyn, N.Y., a returned missionary said, in a public meeting, that the poor Hindus need and are asking for the gospel of the Christians; that the condition of their women is deplorable; and lastly, to cap the climax, that Buddhism never could satisfy the intellectual needs of the people there, that it is fast losing ground, and that now is the time for the good Christian here to step in, pay out his money, and send more men—like the speaker—to bring these poor people into the true fold. Such is the constant cry at every missionary meeting.

In order intelligently to consider the question of Theosophy as a cult in India, it is necessary first to see how much truth there is in the statements we have just quoted.

They are undoubtedly false, and flow either from ignorance or from wilful tergiversation. The proposition that Buddhism will not satisfy the needs of the people is a species of trick, because the Hindus do not, except in some few cases, hold to Buddhism. They are of the Brahmanical and Mohammedan faiths, and of course do not pay any attention to Buddhism. But those who are Buddhists—in Ceylon nearly all the people, and many in India—could never accept Christianity, because the latter is based on as much faith, suppression of intelligence, and miracle as the most corrupt form of Buddhism; while it is well known and accepted among students and thinkers

that pure Buddhism is of the highest metaphysical and intellectual character. The experiment only succeeds in cases where, as has been done in Ceylon, the Roman Catholic Church makes converts by adopting and adapting later and popular Buddhist practices and legends as a part of the religion offered to the people, just as was done in the early part of our era, when pagan feasts, fasts, and saints were incorporated into the new religion.

For about the last fifty years, the English government has been giving to the Hindus free education in the colleges which confer degrees; and, if there is anything a Hindu of the better class likes, it is a degree given by a competent college. But these colleges are absolutely unsectarian; while those schools and colleges which the missionaries established are, of course, sectarian, according to the particular sect to which the missionaries belong. Previous to the establishment of these governmental institutions, almost the only way in which Hindus could learn English—absolutely necessary to them from the ever-growing English influences with which so much trade had to be done—was by going to the schools of the missionaries, in which English was taught. Several Hindu merchants have said to me, in India, that that was their only reason for attending those schools, and that they had a feeling of gratitude to the missionaries for the service thus rendered, but that they never did and never could accept their religion. Since the spreading of the governmental colleges, the natives attend there, to the sorrow of the missionaries. But the natives like it better for two reasons: first, because they give degrees under government auspices; and, second, because they are let completely alone in their religious convictions. To all this, the missionaries have made and are now making violent objection; and each issue of the *Epiphany* in Calcutta, and other organs in their interest, are full of the matter. They have even gone so far as to try to influence the British government.

Having understood this, let us now pass to another branch of the subject. The young Hindus of whom we have been speaking are, by nature, in possession of metaphysical faculties of the highest order, transmitted to them by heredity, and necessarily cultivated not only by the system of religious teaching, but also by the very structure of the language in which they have to study their religious and philosophical tenets. In Madras, I have given out prizes at Sanskrit schools to little boys of from four to five years of age, as well as to those older. The Sanskrit is not, properly speaking, a dead language; for it is in constant use at any gathering of pundits met for religious or sociologic discussion, and of these there occur many. I remember one which was held at Madras in 1884, to consider the subject of child marriages. The Deputy Collector of Madras, Mr. Ragonath Row, who is also a prominent member of the Theosophical Society in India, came from the meeting to see me, and told me about the discussion, and that it was conducted altogether in Sanskrit. I have also numerous young and old Hindu friends who all read, and can, if needed, speak in Sanskrit.

At the same time, with these changes in the matter of education, there was also going on another change among the young men of India, in that they were beginning to run after and follow English manners and style of thought. They were giving up all hope of reviving Aryan literature, morals, or manners, adopting as much as they might of Western scientific thought in its most materialistic phase. Some of them, deluded by Huxley, Tyndall, Mill, Bain, and others, began to hold to such negations that they believed there was no such thing as Aryan literature or thought. And one of the learned Hindu founders (behind the

scenes) of the Theosophical Society said "he went down to Calcutta, and there saw some of the descendants of ancient Aryavarta wearing the philosophical and mental garb of Western pessimism and Western materialism, boldly asserting that Patargali was an ancient fool." All the older Hindus deplored this state of things, and vainly longed for a revival of pure Hindu thought and philosophy. The hope seemed indeed vain.

At the same time, here in the West, it was thought by some that Christianity had turned out a failure, leaving the people floundering into agnosticism and all forms of materialism.

At this point, in 1875, the Theosophical Society was formed in New York, with the distinct design in view of benefiting India and the whole of the Western world at the same time. This was its main object, and is expressed in its first declaration, "Universal Brotherhood." The means for accomplishing that were only to be found in India; and, therefore, after it had acquired some corporeal form, its head-quarters were transferred to Bombay.

At first, it was viewed by the government with suspicion; for, as Madame Blavatsky was at its head, and she being a Russian, the ridiculous rumor was spread that she was a spy in the pay of the Russian emperor. After a time, that was given up; and the English officials declared that it was no longer tenable, resulting in a real triumph; for many of those high in authority declared that the society was an instrument of great good for India.

As soon as this spy theory was abandoned, the Hindus, heretofore deterred from affiliating, began to join in large numbers; for they saw that it really was determined to unearth all that is good in the philosophy, in the religions, and in the sciences of ancient India.

Instead of being engaged, as so many self-styled scientists in England so often declared, in exploiting phenomena or in getting up a new kind of Spiritualism, it was really organizing Buddhist schools in Ceylon, Sanskrit schools in Hindustan, encouraging Mohammedans to see what, if anything, was to be found of truth in the philosophy of the Sufis, and in bringing together, on one platform men of the most widely divergent creeds for the purpose of finding out the one truth which must underlie all religion.

WILLIAM Q. JUDGE.

DUALISTIC AND MONISTIC CONCEPTIONS OF NATURE.

II.

Huxley's eulogium on Descartes and his doctrine of Animal Automatism seems to be extravagant. Descartes, it appears, two hundred and fifty years ago, taught that Body and Spirit, or Matter and Mind, were two such heterogeneous substances that they could not interact on each other without the *concursus divinus*. He explained the relation of human and other animals to the world of matter on mechanical principles, and asserted that all animals are machines and have no souls. He ascribed all living phenomena to acts of pressure and impulsion or intermittent force, and that the order and motion in the parts of animals are the sole cause of vegetation and growth, and that they must be pushed to what they do by the concurrence of God; or, as Peter Bayle logically put it, God is the prime mover in all acts of generation.

Huxley announced Descartes' conclusion that all animals are machines, in his address at Belfast, in 1874, "to the great scandal of the general public." Lewes says, in *The Physical Basis of Mind*, 1877, "I suspect that the scandal was not owing to Des-

cartes' conclusion, but to the lashing which Huxley gave 'the drums in the pulpit.'" Huxley is not disposed to accept Descartes' hypothesis, though it cannot be refuted. The conclusion which Huxley deduces from the study of brutes is applicable to man, and the argumentation he applies to brutes holds equally good of men. Like the brutes, we are conscious automata, but none the less "parts of that great series of causes and effects which, in unbroken continuity, compose that which is and has been and shall be,—that is, the sum of existence." Huxley said that he would close his argument if the ecclesiastics would go no further. But they will assert that the logical consequences of such argument are fatalism, materialism, and atheism. Logical consequences are the scarecrows of fools and the beacons of wise men. As to whether animals are machines, the only question is the fact of its being true or false. If the conclusion that animals are machines did really and logically lead to fatalism, materialism, or atheism, Huxley says that he would admit that he was a fatalist, materialist, or an atheist; but he says: "I have not any claim to rank myself among such philosophers. Not among fatalists, for the conception of necessity has a logical and not a physical foundation; not among materialists, for I am utterly incapable of conceiving the existence of matter, if there is no mind in which to picture that existence; not among atheists, for the problem of the ultimate cause of existence is one which seems to be hopelessly out of the reach of my poor powers. Of all the senseless babble I have ever had occasion to read, the demonstrations of those philosophers who undertake to tell us all about the nature of God would be the worst, if it were not surpassed by the still greater absurdities of the philosophers who try to prove that there is no God."

Huxley offered these remarks for the consideration of thoughtful persons, who are anxious to know the true bearing of the physiological questions connected with Descartes' doctrine of Animal Automatism, and also to meet the clamor raised against it by ecclesiastical persons of this or that sect. It would be well, he said, if these persons would reflect that, whatever deep-seated graces may confer, they have not been followed with any visible increase in learning or logic. Whatever may be the intrinsic value of men's opinions, ordination does not augment their title to respect. And, when an ordained man presumes on an authority conferred for other purposes than to sit in judgment upon physiological matters which he is evidently incompetent to discuss, then it is permissible to ignore his sacerdotal pretensions. The performance of the ordinary duties of life is burdensome enough; and a man need not, unless he chooses, occupy himself with the grave problems of fatalism, materialism, and atheism. But if a man elect to become a judge of these problems, and to praise or blame his fellow-men for arriving at different conclusions respecting them, he will commit a sin more grievous than most breaches of the decalogue, unless he avoids a lazy reliance upon information gathered by prejudice and filtered through passion, and goes back to the prime sources of knowledge,—the facts of Nature and the thoughts of those wise men who for generations past have been her best interpreters. The "tattoo of the drum ecclesiastic" justifies Huxley in giving utterance to such galling words. How is it, Huxley asks, that Descartes' competency as a physiologist is now overlooked? Because, he answers, the growth of physical science is now so rapid that those who are engaged in observing the present progress have not time to refer to the past, and because they forget what were the results of

the science in the past. This is detrimental to intellectual growth; for the most effectual method of clearing up the mind on any subject is that of talking it over, so to speak, with men of great power, who have considered the subject from a totally different point of view. It is detrimental, also, to the moral nature. It is well to turn from the fretful stir of the present, and to dwell with gratitude and respect upon the services of those mighty men of old, who have gone down to the grave with their weapons, but, while they lived, won splendid victories over ignorance. Descartes' fame and his authority in philosophy overshadowed all other authority for a century. Now, he is known as a person who had some preposterous notions about vortices and of a vicious method of deductive speculation. But, Huxley says, the chatter of shifting opinion and the forgetfulness of his great merits have not affected the growth of the great ideas of which he was the instrument and mouthpiece.

I do not see what splendid victories Descartes has won over ignorance, nor the great ideas which are to be dwelt on with gratitude and respect. He does not deserve the high eulogium which Huxley bestows upon him, if the following extract from the *Concepts of Modern Physics* is reasonable: "Descartes has been called the father of modern philosophy. With equal propriety, he might also be designated as the father of modern physical science. His title to the honors of paternity in philosophy no less than in physics must find other muniments than the discovery or even exact statement of permanently valuable truths. Few of his philosophical tenets endure, at least in the form in which he held them; and some of the truths which he rejected are now counted among our most indispensable possessions. As a physicist, he broached a number of theories that have proved to be wholly unfounded; and he ignored or misconceived almost all the laws of mechanical action, whose discovery constituted the distinction of his older contemporary, Galileo. . . . In physics, his vagaries obscured the field of investigation to such a degree that the shadows have not wholly vanished to this day. Though professing to emancipate himself from the metaphysical traditions of the period, which was then near its close, he was thoroughly imbued with their spirit. But, precisely for this reason, his writings influenced the thought of the seventeenth century more extensively than the researches of those who resorted to the scientific methods of experiment and observation,—methods that were wholly at variance with the mental habits of the age. He was essentially a metaphysician, an ontologist of the mediæval type; but he discussed nearly all the problems whose solution was the task devolving upon the physicists and mathematicians of the two centuries which have elapsed since his day."

The foregoing extract shows that Huxley's extreme praise of Descartes and his philosophy is injudicious; and it indicates that that philosophy has hindered the spreading of the monistic conception of nature in England, and from having much influence on modern thought. What does the monistic doctrine mean, which Tyndall says is now so rapidly spreading? According to Prof. Haeckel, the monistic conception of nature is the doctrine of Dysteleology, or the doctrine that "purposiveness" no more exists in nature than the much-talked-of "beneficence of nature." These optimistic views have as little foundation as the favorite phrase, the "moral order of the universe." If we contemplate, he says, the common life of plants and animals, including men, we shall find the very opposite of that kindly and peaceful social life which the goodness of the Creator ought to have

prepared for his creatures. Instead, Haeckel finds everywhere a pitiless and most embittered *struggle of all against all*. Everywhere, he finds a struggle and a striving to annihilate neighbors and competitors.

The monism which he maintains is often considered identical with materialism; but two different things are confounded with this "word of many meanings,"—namely, scientific and moral materialism, which have nothing to do with each other. Monism, or scientific materialism, affirms that everything in the world goes on naturally according to causal law, or the necessary connection between cause and effect; and, at the same time, it rejects every conception of miraculous or supernatural powers. But moral materialism is something quite different: it has nothing in common with causal monism. Moral materialism is real materialism: it is based on the delusion that purely material enjoyment can alone give satisfaction to man. But naturalists and philosophers, whose highest happiness is the intellectual enjoyment of Nature and whose highest aim is the knowledge of her laws, find that true happiness does not depend upon external possessions, but only on a virtuous course of life, is unknown to moral materialism. Instead of scientific, Haeckel finds moral materialism in the palaces of ecclesiastical princes, and in those hypocrites who, under the outward mask of a pious worship of God, solely aim at hierarchical tyranny and material spoliation of their fellow-men. But, in future, to avoid the confusion of this objectionable moral materialism with our scientific materialism, he calls the latter Monism. The principle of this Monism is the same as what Kant termed "the principle of mechanism," without which, he said, there "can be no natural science at all." The pious opponents of evolution are fond of branding the monistic philosophy founded upon evolution as materialism, thus confusing philosophical materialism with the different and censurable moral materialism.

Monism, or scientific materialism, might as accurately be called Spiritualism as Materialism. The real materialistic philosophy asserted that all the vital phenomena of motion are the products of matter. The spiritualistic philosophy asserted that matter is the product of motive force, and that all material forms are produced by free forces which exist independent of matter itself. Both views are dualistic and false. From a strictly scientific standpoint, matter cannot be represented without mind. Goethe says, "No matter without spirit, no spirit without matter."

The feelings of those persons who cannot help clinging to the design argument, and who believe that it cannot be refuted, may be wounded by this presentation of the monistic doctrine. But the facts cannot be explained away. Truth, and not likes or dislikes, should be the aim of the rational mind. Prejudices of early education will assert a predominating influence, and foster the belief in the existence of a Creator. There are other persons who are convinced that, in the nature of things, the struggle for life, the preying of every form of life on other forms, and that there are rudimentary and other organs that are mischievous and useless,—that these all show that unnecessary evil exists. Hegel says, "If evil exists, shall God not have done it?" So there may be minds like that of Von Hartmann who, rather than attribute the evils to a Supreme Intelligence, prefer to consider the Supreme Mind to be unconscious; for the existence of evil would be an inexcusable cruelty, and its continuance a useless absurdity.

JOHN CHAPPELLSMITH.

NOTES ON BOOKS.

I.

M. Jules Lemaitre, the rising young critic, has just published a volume* of contemporary biography that is attracting considerable attention in literary circles here. At least two of the chapters of this book come within the scope of *The Index*. I refer to those devoted to Mme. Adam and Renan.

M. Lemaitre considers Mme. Adam the most typical representative of what he calls the "Neo-Hellenism" of modern France, that worship of Greek politics, art, letters, and religion which still characterizes many of the best French minds. "Her greatest originality," says M. Lemaitre, referring to Mme. Adam, "is the ardor of her Pagan faith. . . . She believes that, if a well-endowed nature be allowed to develop in full liberty, it will turn of its own free will to Paganism." If you ask Mme. Adam—I speak from experience—what her religious views are, she invariably replies, "I am a Pagan."

In Ernest Renan, M. Lemaitre finds gaiety to be the predominant characteristic. "M. Renan," says our critic, "is gay, very gay: more than this, he is funny." M. Lemaitre surprises one somewhat by calling attention to the rather slipshod manner in which Renan delivers his lectures at the College of France. But it is only a French ear that is shocked by his careless elocution and inelegant colloquialisms. Imagine a professor in Harvard or Yale or Cornell dropping his "h's" or clipping his final "g's," or constantly employing "you know" or "you see," and the like. And yet these are the English equivalents of the blemishes that M. Lemaitre signals in Renan's spoken French. How different from the polished style of his writings!

Mme. Edgar Quinet has just published the third volume of her husband's letters.† The noble character of this broad-minded philosopher appears in the same clear light as in the former volumes. The close bond of union between husband and wife, the one supporting the other in their long and dreary exile, gives a tenderness to these letters that is seldom seen in similar collections. For example, in making his excuses to a correspondent who complained, probably, that Mme. Quinet's letter was not enough, the husband writes, "We are so united that what one does the other thinks he has done, too." Quinet's religious liberalism is constantly showing itself. Writing to an Italian friend who had prepared an introduction to the translation of Quinet's *Genius of Religions*, he says, "All that you have had to suffer from the sacerdotal spirit has furnished you the experience necessary to acquaint you with its vices and frauds through all time." When M. Charles Boysset, the anti-clerical deputy, published a remarkable book in 1868, Quinet wrote to him about it: "I have received with gratitude and read with deep interest your *Catechism of the Nineteenth Century*. Would that your volume could replace the church catechism!"

It has often been said that the women are superior to the men of Russia. The volume‡ of the writings of the late Barbe Gendre (Mme. Nikitine) that has just appeared here is another proof of the truth of this assertion. Barbe Gendre was one of those wonderful Slaves that have cast a glamour over the history of modern Russia. Abandoning wealth and social position, she threw herself, soul and body, into the revolutionary party, and, in spite of the remonstrances of a loving but

* *Les Contemporains*. Paris: Lecène et Oudin, 17 Rue Bonaparte.

† *Lettres d'Exil*. Paris: Calmann Lévy, 3 Rue Auber.

conservative father, devoted all of her wonderful talents and sacrificed her delicate constitution to the cause next her heart. Pierre Lavroff, the close friend of Turguénief, and a highly cultivated, scholarly Nihilist, said at the grave of Barbe Gendre, in December, 1884: "She belonged, like her elders, to those generations of women—the glory of Russian history—who stand in the front rank in that struggle which is still going on, and which is every day becoming more arduous and terrible. . . . A free thinker from her youth, she early broke away from worn-out creeds, and went over to scientific materialism."

The essays contained in this volume appeared originally in free-thinking, scientific, and republican reviews and daily newspapers. M. Clemenceau's *Justice* and Mme. Adam's *Nouvelle Revue* often published articles from the pen of Barbe Gendre. She gives us new and valuable information concerning Russian Nihilism, German Socialism, and other European agitations, and strikes off admirable biographical sketches of Turguénief, Garibaldi, Diderot, Pierre Lavroff, and others.

Mr. H. L. Brækstad, a Norwegian writer and republican, living in London, has just brought out in English dress a very striking play by Björnsterne Björnson, entitled *A Gauntlet*.^{*} It is exactly the counterpart of Dumas' recent play, *Demise*. In the Frenchman's drama, a *fiancé* forgives his *fiancée* for a false step in her youth, and marries her, notwithstanding her error. In the Norwegian's piece, it is the latter who at first revolts from the former; but here, too, love conquers everything, and the young woman finally pardons the early sins of the young man of her choice. But, before this happy *dénouement* is reached, Björnson has laid bare the rottenness of our present social system in all that concerns marriage and the relations of the sexes. The great Scandinavian poets—Björnson, Ibsen, Høstrup—have done a great deal to awaken liberal thought on the Woman Question; and *A Gauntlet*, whether read in the closet or seen on the stage, must do a grand work in breaking down old prejudices and building up honest views of home life.

I have said that *A Gauntlet* is a counterpart of *Demise*. But the former was not suggested by the latter, nor probably *vice versa*. Mr. Björnson told me a few days ago—for the sturdy Norse Republican leader and poet is now residing in Paris—that his piece was written before Dumas'.

Another presentation of the Woman Question—this time not a single phase of it, but a general consideration of the whole subject—has been sent me from Switzerland.† In *The Index* of September 24 last, I mentioned, at some length, Prof. Charles Secrétan's able essay, entitled "Woman and Right," which appeared originally in a Paris monthly. M. Secrétan has revised his study, and brought it out in a neat little pamphlet. This radical treatment of this irrepressible problem has not passed unnoticed on this side of the Atlantic. Among others who have replied to it is a Catholic ecclesiastic, Bishop Bourguignon, who of course disagrees with the Protestant professor. Rome cannot afford to let anything go unanswered that would tend to open the eyes and minds of its too faithful women.

I would call attention to still another publication on the Woman Question. In the last number of the *Westminster Review* is a very bold paper, that examines this subject from a socialist point of view.

PARIS, January.

THEODORE STANTON.

EDITORIAL NOTES.

BY B. F. U.

THE Worcester *Spy* says that "Fast Day is, if not a valuable, at least a harmless institution." Hypocrisy and dishonesty are not often considered "harmless"; and, if appointing a solemn fast, knowing it will only be used for ordinary purposes of business or pleasure, is not dishonesty, what is it?—*Boston Herald*.

THE Concord School of Philosophy will hold its sessions next summer from July 14 to July 31. Dante and his Divine Comedy, and Plato's Philosophy, are the topics to be considered. Prof. Thomas Davidson, Mrs. E. D. Cheney, Prof. Vincenzo Botta, Rev. C. A. Bartol, Dr. W. T. Harris, Mr. F. B. Sanborn, Mrs. Julia Ward Howe, Rev. R. A. Holland, Prof. G. H. Howison, Rev. A. P. Peabody, Mr. S. H. Emery, Mr. John Albee, Rev. W. R. Alger, and Rev. F. H. Hedge are among those who will read essays.

THE Springfield *Republican* has this to say:—

There has been no time, since Christianity conquered the western world and its old religions, when the masses of the people in nominally Christian lands have been so indifferent to the teachings of the churches, so estranged and apart from them, as the present. This is so all over Europe, and it is so in this country. The universal place that religion held in the early years of the settlement of the United States is well known. It has lost that place by the very qualities which gave it character; the free thought, the untrammelled reason, which made Protestantism; the spread of popular intelligence which has resulted from that unshackling of the mind,—these have discovered and exhibited the faults and the weaknesses of sectarian religion; and thousands, sitting in judgment on the churches, no longer accept the estimate these bodies put upon themselves, no longer regard them as possessing claims upon their confidence. The old infidelity that attacked Jesus as a myth is not the enemy that the churches have to fear now. Jesus himself is not disputed, but the bodies that call themselves after his name. The things the churches disagree about, the beliefs and practices which they make so important, are plainly seen to be unimportant, having no essential relation to life, nothing to do with the real good of humanity and the health of communities.

THE wide difference that may exist as to the value of a philosophical essay is shown by two extracts from letters which came to us recently. A Canadian reader of *The Index* writes: "I do not like to see so much matter in *The Index* that I do not understand, and I hope you will give us a synopsis of Dr. Montgomery's views. I would rather not retain my present estimate of his articles, which is that they are the most unmitigated, unmeaning, hair-splitting balderdash that I ever read." The other opinion is by Mr. D. A. Wasson, who writes: "Dr. Montgomery's paper is a very striking one, and the readers of *The Index* owe you thanks for procuring such a distinguished contribution. Some day, if I hold together long enough, I may offer you some comment upon a single point in it, and in that connection make a kind of confession of belief." We hope that Mr. Wasson will "hold together long enough," not only to make this "comment" and "confession," but to favor the thoughtful reading public with many other productions from his pen.

THE committee appointed by the Connecticut Legislature to consider the matter of granting to Prudence Crandall Philleo some tardy award for the injustice and persecution she underwent in that State many years ago concluded, last week, to recommend that she be granted a pension of \$400 per year from the State treasury for the remainder of her life. In connection with this

subject, we would call the attention of our readers to a sermon recently preached by Rev. J. C. Kimball, of Hartford, which has been put into pamphlet form, under the title "Connecticut's Canterbury Tale: Its Heroine Prudence Crandall, and its Moral for To-day," in which is given a graphic account of her philanthropic endeavors and the persecutions she endured for a principle. The pamphlet reproduces the excellent pictures of her in youth and old age which accompanied the *Century* article concerning her. It is for sale at the American Unitarian Association Rooms, 7 Tremont Place, at ten cents a copy, and may be ordered directly from Mr. Kimball by mail.

SAYS the *Christian Register*:—

Are not our Ethical Culture friends a little late in making the ethical idea and a practical philanthropy the emphatic thing in a movement which they are careful to distinguish from Unitarianism? Some fifty years ago, Channing said: "The time is come when religious bodies will be estimated by the good they do, when creeds are to be less and less the test of a Christian, and when they who labor most effectually for their fellow-beings will be acknowledged to give the best proof of having found the truth. . . . May it not be the leading trait of a Unitarian that he is a man who sympathizes with and respects the less favored classes of society, and that he is pledged to use all his powers for their elevation?"

Without doubt, the Unitarians place as much emphasis upon ethics as does any Christian sect, and in practical philanthropy Unitarians are probably behind none; but it is their denominational origin and history and their theological doctrines as a sect, and not their ethics, not their philanthropy, which distinguish them from other Christians and non-Christians. May it not be that people generally, not only Unitarians, but Trinitarians, not only Christians, but non-Christians,—Jews, Buddhists, Theists, Agnostics, Atheists,—will more and more make character, and not belief, the supreme test, and become more and more sympathetic and philanthropic? Why may not any sect or class, ignoring all genetic relationships, all historic connections, and all theological and speculative differences, insist with as much propriety as can Unitarianism upon giving its own particular name to the moral and philanthropic adherents of all religious and philosophical systems? The Ethical movement emphasizes that in which all these systems substantially agree and to which they give greater prominence as they advance, while it teaches none of the theological dogmas by which the sects are distinguished from one another. The supporters of this movement do right, therefore, in distinguishing it from Unitarianism and other forms of Christianity as well as from Judaism. So it seems to us.

FOR *The Index*.

DIVINE PRESIDENCE.

REMEMBERING MRS. ANAGNOS, LATE PRESIDENT OF THE METAPHYSICAL CLUB.

We who seek out the mysteries of mind,
We who believe in wonders of the soul,
Feel that her asking eyes have seen the goal,
While we are following, not far behind.
With what soft solace is Grief's garment lined!
For, at the breaking of life's golden bowl,
Time's baffling fractions are a perfect whole
Seen in clear splendor, where no soul is blind.
Beautiful spirit! that wast wont to Night
That world of hearing, full of darkened eyes:
Our souls, dim-visioned, reaching for the day,
Bid thee preside here in new-risen might.
Ripe is that leader whom the Heavens make wise!
Lead us to light! thou that hast found the way.

The Index.

BOSTON, APRIL 1, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }

NO WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

PERSONAL MORALITY.

Lecture before Society for Ethical Culture of Chicago,
Feb. 7, 1886.

BY W. M. SALTER.

The religion of the future will be in no way, I believe, more strongly contrasted with Christianity than in the increased attention it will give to public questions. Operating powerfully on private life, Christianity has done little to introduce ethics into the world's affairs. To the great social questions of to-day, it is strangely indifferent. But a new religion, with a fresh sense of the principles of justice, will demand their recognition and triumph everywhere. Wherever men have dealings with men,—whether it be between peoples or individuals, and whatever the dealings may be,—there morality has application; and its ideals should be held up.

But it would be a sad mistake to ignore questions relating to the private life of men. There is a social ethics and a private ethics. Often has it been said on this platform that self-reform must go hand in hand with efforts to reform society. We can agitate for religious justice in England and for political and social justice in Ireland; but those reforms are to be effected elsewhere, not here,—by Englishmen and Irishmen, not by ourselves. By personal morality, I mean so much of the good as is to be realized by ourselves and in our own private and interior lives.

A special solemnity gathers about this branch of ethics. It is something, indeed, to think justly and to call for justice, while the many are indifferent to it; but it is a graver thing to feel that we must ourselves do what we demand, that we are responsible for the result. In social ethics, we view ourselves as parts of a whole: in private ethics, each one is himself a whole; and the law he conceives no one else but himself can obey. There is no more wonderful or more moving thought than this of personal responsibility. It strikes home to the centre of ourselves, which is

not the mind or the conscience or the heart, but the will. A voice seems to say: To thee, individually, O man, is given a task. Thou art not one of a mass merely: thou countest by thyself. Thou art what no one else in the world is. Thou hast a duty that no one else in the world can do. Sacred art thou in the plan of the world. Revere thyself, then, and fill out thy arc of the great circle of duty. Without thee, that circle must remain forever incomplete.

The first lesson of personal ethics is self-reverence. Morality is sometimes resolved into sympathy and regard for others. It is not so. There is something due ourselves as truly as to father or mother or wife or sister or friend. The same reason that exists for respecting them exists for respecting ourselves. I want no one to show signs of respect to me who does not stand on his or her own ground, and in their bearing and demeanor show that they have an equal sense of what is due themselves. I cannot conceive anything more lamentable than that one should think that obligation first arises when we think of the claims of others, and that, in his personal and private life, he may do this or that, and just as he pleases, because it concerns himself alone. He who questions that there is a duty to himself is liable to question, sooner or later, whether there be any real duty to others; for the others are only human beings like himself. And, if he feels no obligation toward himself, why should he to them? But the truth is, all are sacred,—others and himself. To all is given a task, to each one particularly and individually, as though no one else were in existence; and the task must, to a certain extent, be accomplished by each one, separately and alone.

What are the things for which we are thus personally responsible? What are the things over which we ourselves have control? First, certainly, our private habits. These may be known by no one but ourselves, but we are as responsible for them as if they were known to all the world. We are responsible, not because of their effect upon others, but because we ought to have pure habits, because these alone are worthy of human beings. Every one should have a certain jealousy over himself, an honest pride in himself, in ruling his own impulses, in never indulging himself to excess, in avoiding all temptations that he knows may be too strong for him, in keeping his body as well as his soul—what is unseen and what is seen—sweet and clean. Tell me, if it were possible, what a man's private and most solitary habits are, and I will tell you whether he really respects himself, whether whatever decency and respectability he has are for show or are a part of his very fibre and make-up as a man. I have read of some one who, when alone, sat down to dinner with the same regard for form and ceremony as if he were entertaining a company of friends. His instinct, at least, was right. For whatever measure of form and ceremony is proper on such an occasion is so because human beings sit down to the table, and not because of their number. All our private habits should reveal our sense of what is due to the humanity in us. Therefore, we should not drink to excess or eat to excess; for this is brutish. Therefore, we should control all our appetites; otherwise there is the abdication of the reason, which makes the truly human part of us. Therefore, the body should be treated with reverence, because it is the abode and tabernacle of our humanity. Therefore, neglect of the person and slovenliness are disgusting, because they reveal the lack of a sense of what is becoming to a man. Never let us think that our private habits are of no consequence; that, if they do not

harm others, they do no harm. They harm us. We know of them, and we are lowered in our own esteem by the knowledge of them. By every unchaste act, by every surrender of reason to passion, by all excess and by all meanness in our manner of life, and neglect of the body as well, the fair humanity that is in us and ought to be reflected in our person and behavior is dishonored; and we sink to the animal instead of rising to the stature of the man. Oh that I could awaken a new self-reverence, a new sense of the sanctity of the individual, so that, though we were cast alone on a desert isle, we should feel that we must keep ourselves erect there, and hate all secret vices and abhor all excess; so that, though we were the one human being left on the face of the earth, we should keep his body sound and pure and his soul supreme!

And who else will control these habits of ours but ourselves? I know heredity counts for something, that our associations count for something; but there is a power that can fight heredity, and we can withdraw ourselves from associations that are corrupting. The will of man is free. It can choose what is best, it can put itself on the side of what is pure and good, and aim for it and struggle for it; and the aim and struggle will not be without their effect, though the perfect result may not be reached at once. I believe, for example, it is possible for every one before me to lead a pure, private life. Whatever may have been the fact in the past, whatever may be the habits now, I believe that, with one triumphant act of will, one may break with all sin of this sort and never relapse. I believe one can control his acts when he cannot his thoughts, and can his thoughts more and more, so that, after a while, what he once loved he shall hate, and shall never think of save with pain and contrition. But nothing can take the place of our own energy. In no way can we shirk our own responsibility. However we won these habits, we won them, we consented to them, and are to blame ourselves for them; and, if we will have habits of purity, virtue, and self-control, we must will to have them, we must set our hearts upon them, chastising ourselves if we sin against them, and resolving to give ourselves no peace till they are ours.

Another field wherein we alone have control, and where we are personally responsible, is that of our personal aims in life. An aim is nowise set save by the person whose aim it is. An aim is simply the direction of our own will. A good aim cannot be given to a man save by himself. He may hear of it, but it is not his own till he makes it so. Our outward acts may be constrained, they may not express us; but the will is the centre and citadel of our personality, and no power in heaven nor in earth is master there but ourselves. With this magnificent power, we can choose higher or lower aims, we can direct the channel of our life in this or that direction; or, if we will, we can refuse to aim at anything at all, and simply drift, and become waifs and ignoble wanderers on the earth. Now, any aim is better than none; but the highest aim is alone worthy of a man. What is the highest aim? I will venture to reply that it is to contribute to an ideal order of human life. The other answers commonly given are either ignoble or unreal to us. To save one's soul,—who of us can consider that the noblest aim we can have? To glorify God and enjoy him forever,—how far away and unreal and unpractical does that seem to us! To seek the kingdom of God,—ah, but what is the kingdom of God? To do the will of God,—but who will tell us what the will of God means? For that sanction has, in the course of man's religious history, covered almost

every conceivable aim of man, high and low, devilish and divine. But to contribute to an ideal order of human life seems an aim we can lay hold of, and something noble, too. For we love this human life of ours, and wish to see it lifted to its ideal. We love it most truly,—not for what it is, but for what it ought to be and might be. We are in love with its ideal. And, extravagant as it may seem, I propose this aim, seriously, as the true one for every one of us. I believe it is a legitimate one for the merchant, for the lawyer, for the physician, for the mother, for the child, for the workingman,—yes, and for him who can get no regular work to do. One may accomplish little, yet he can have the aim; and the aim is that for which alone we are responsible, and may give significance to our smallest actions and a priceless value to even our ineffectual strivings. Once in a while, we need to turn back on these busy lives of ours, and ask how far this aim is really regulative of them. Are the actions we are doing, the sort of lives we are leading, tending toward an ideal form of human life? Are they such as, if they were general in the community, would bring that ideal form of life nearer to the earth? Let the merchant ask himself this question: what are the customs, the maxims of his trade? and, if they are not what they should be, is he, by consenting to them, helping to perpetuate them, or is he protesting against them, and struggling to lift them to the form demanded by the ideal? Let the lawyer and the physician ask themselves this question: What is the morality of their professions, is the supreme aim keeping them from aught that is dishonorable, and does it constrain them to seek to elevate the tone and practice of their professions in every possible way? Let the mother ask herself: Am I training my child so that he or she will be a new factor in the world, or simply a perpetuator of old-time prejudices and hatreds and shams? Let the child, too, have its solemn hour, when it shall nurse its growing soul on deeds of heroism and faithfulness, and ask itself whether it, too, could venture for an idea, and be patient under adversity and the world's contempt. Let the workingman ask himself: What is my motive? and would it, if it were general, tend to an ideal form of life? Do I work merely for hire, or with the thought of doing my work well? Do I take pride in a piece of honest, thorough work, or do I only do what I must do to get my pay? In my demand for changes, perhaps revolutions, in the industrial world, am I actuated by revenge or by justice, even though the instinct for revenge rises most naturally in my heart? Yes, the very laborer who can get no steady labor may feel the pressure of that supreme aim upon him, and, in his sorest misfortune, may will to commit no crime, and, though he be insulted, not to insult again, and to bear even to the death rather than do a wrong to others. Everywhere does this supreme aim hold good. Everywhere may it take from the pride of those who are great, and give dignity to those who are humble. How quickly does it recall us from those aims in which it is so easy to settle down! To earn a comfortable living, perhaps to provide for wife and children (though this by no means necessarily in these days),—how many seem to have this practically as their aim in life! But there is nothing peculiarly human about this. Beavers and the whole tribe of animals aim at the same; and they never omit to seek to provide for wife and children, too. Man has intelligence, man has imagination, he has a moral nature, he has dreams of universal justice; yet, sometimes, he forgets all his dignity and glory, turns his back on his dreams, perverts his conscience, loses his imagination, and uses his godlike intelligence

only so far as to provide for himself a comfortable living, perhaps in his selfishness and hardness leaving even wife and children out. O friend, lift up thy thoughts, think of what thou art called to be! Light up thy heart, thy imagination, and thy life with a great aim. Do it, because, with all thy hoarding and saving, thou art wasting thyself, becoming little while thou shouldst be becoming great, growing old while thou shouldst be keeping ever young, turning life into a game of profit and loss while it should be an opportunity for all noble action and the service of all good causes.

The old religion contains a subtle word,—“Thou must be born again.” Strange and unmeaning to us as is the theological dogma that has been based upon it, it hides a vital truth. ‘Tis not the mending of our actions that is first needed, ‘tis not the forming of this or that habit, ‘tis not any outward change. It is the renovation of the fountains of our life; it is the making victorious a new aim in life; it is the changing our thoughts and experiencing the transforming power of a new purpose. This does not alone help us in one particular, but in all: it involves an advance along the whole line of duty. And the difference from the old religion is simply that, while it seems to say that such a purpose must come from God, we say that it must be formed by ourselves. We do not fall on our knees and pray: we arise, and summon our energies, and resolve. And, though the old nature in us may not yield at once, though old faults may persist and old habits be stubborn, yet we can gradually win the victory over them; and our connection with that Supreme Power, which upholds the world and supports the human soul, is simply in the belief that he is behind us and beneath us and above us, and pours his all-mightiness into us, so that we can ourselves do all that in our nature we are summoned to do.

But not only the supreme dominant aim of our lives, but the motives in all our actions, are under our control; and for purifying them we are responsible. It is here that the ethics based on the results of our actions altogether fails. An action may have exactly the same results, yet at one time have moral worth and at another have none. A quarter of a dollar given to a poor man will go just so far, provide so much bread, and so much in the way of a lodging; but it may be given either to rid one's self of an annoyance or out of love for the man. An act of the former sort is not a moral act at all: it may be better to do it, but for the poor man's sake, and not because it adds any moral worth to ourselves. It is wonderful how completely our moral value is hidden from all the world but ourselves, and yet how in importance it transcends all else we can think of. I would not ignore the question of results in the theory of ethics. Our acts must not only be moral: they must be right, they must correspond with an objective standard; and, with the determination of that, the results of our actions have a great deal to do. An action is right which tends to the good of humanity, whose results are actually beneficial to humanity. A moral action is one that *aims* at the good of humanity. It is not enough to be perfectly righteous: we must mean to be righteous; and, in our so meaning, wanting, purposing, our whole moral worth consists. The real life of man is not the seen, but the unseen one. What we see are but effects: the causes are hidden away. The world is satisfied with a certain decorousness, with correctness and propriety of conduct; and we ourselves all too easily incline to take the world's standard. But, in our graver moments, we know what a surface thing it is, and that our unclean thoughts, our jealousies and envies and spites, and all our

littlenesses and uncharitablenesses, though no one else knows of them, are the things that defile us. Oh for a clean heart! who does not sometimes cry? Oh to be holy within! Oh to be as pure in our own eyes as we would be in the eyes of the world without! Oh to banish all selfishness, and to look on others only with love, so that, if we chide or are severe toward them, it shall not be in anger; so that, if they wrong us, we shall not hate them; and, if we are injured, we shall not injure again! The highest care, after all, of each one should be for himself, and for that which is most personal to himself. There, in that inner realm, no one else can help him. Each morning, I conceive, a man might well arise, and say: This day I welcome to my heart all good thoughts, and will that they should prompt and guide all my actions. I banish hate, I banish spite, I banish all low cunning and greed; and I will not let a word escape my lips or an act be done, that truth and honor and love could not sanction. It is easier, I know, to control our actions than our motives. It takes great watchfulness, it may involve a long discipline, and mean many a struggle to be able to banish an unworthy thought as soon as it appears, to check an unholy impulse as soon as it arises. It implies that we have ourselves well in hand, that the will is strong. Ah! but this is our task, this is that to which we are called. There were no honor in easy victories. To contend against odds, to hold to the fight after defeat once and twice,—yes, though the body is weak and the heart is faint, to keep the purpose strong,—there is glory in that; and into the secrets of such a strife the angels might well look with wonder and awe. ‘Twas Hesiod of old who said that before the temple of virtue the immortal gods had placed labor, and the way to it was long and steep. ‘Tis hard to know, indeed, what good thing in life is to be had for the asking. The whole significance of our being is that we are made imperfect and called to be perfect.

“And, oh, if Nature sinks, as oft she may,
‘Neath long-lived pressure of obscure distress,
Still to be strenuous for the bright reward,
Still in the soul to admit of no decay,
Brook no continuance of weak-mindedness,
Great is the glory, for the strife is hard.”

It is wonderful how every great religious movement in the past has been marked by a new sense of the need of personal righteousness. ‘Twas thus when real religion arose among the ancient Hebrews, and a cry arose from the prophetic heart: “Create in me a clean heart, and renew a right spirit within me.” ‘Twas so when Jesus called for a deeper righteousness than even the most religious of his day practised. ‘Twas so when Luther threw off the bondage of dead works, and wrote and spoke to the conscience, and said that an act in itself good becomes sinful, if its motive is sinful. And, if I ever have a doubt of the possibility of a religion arising out of Liberalism to-day, it is because Liberalism speaks more of the rights of men than of their duties; because it talks more of the reform of society than of the reform of ourselves; because its ideal is philanthropy rather than justice; because it forgets that “society gains nothing,” as Emerson says, “while a man not himself renovated attempts to renovate things about him,” or, as another,* that those “who are in the wrong cannot cure evils.” Let us purify ourselves, let us leave the world's standards behind us, and ask what manner of men we ourselves are; and, if we find ourselves unholy, unchaste, passionate, envious, ready to take advantage, petty in spirit and narrow in sympathy, oh, let us leave the ills of the world, and first cure ourselves!

* Rev. J. C. Learned, of St. Louis.

Then the promise of a brighter day will dawn upon the world.

One further aspect of private life I wish to consider, and I am done to-day. Life is not all in doing. Duty is not all in striving and battling: it is sometimes in waiting, in enduring, in bearing what we cannot remove. Perhaps our sharpest battles are with our impatience and with what seems a cruel fate that assigns us burdens heavier than we can bear. Often, sympathy we cannot have; often, we cannot tell our griefs. The tragedies of our life are in secret, and this is what makes them tragedies.

My friends, the first conviction I have on this subject is that nothing is given us in life greater than we can bear. It may seem as if the adversity which gathers thick and threatening over our heads is beyond our power to endure, but we can endure it. We cannot always control our bodily health, but we can our spirits. We can bear the death of friends; we can bear the ingratitude of friends, their unfaithfulness; we can bear to have our hopes defeated; we can bear to have light and joy vanish out of our skies, bear it without bitterness, bear it with a sense that, in some mysterious way, it is all right. The deep purpose of our being is not in anything that can be taken from us. 'Tis not in our prosperity, and it may be accomplished in spite of adversity. 'Tis not in the relationships of home, in tender companionship with friends, in public honor or regard. Thy worth, O fellow-man or woman, is in thyself, in thy patient soul, in thine incorruptible will, in thy readiness to accept whatever post the universe assigns thee, in thy quiet faithfulness there, whether amid sunshine or the dark, amid joy or sorrow. We know not any more than Socrates what we ought to wish for ourselves. We know not, in truth, what is best for us. We know not what will bring out that which is most truly divine and godlike within us. The lamented President Garfield said we could not know any one perfectly well "while he was in perfect health; and, as the ebb-tide discloses the real lines of the shore and the bed of the sea, so feebleness, sickness, and pain bring out the real character of a man." Matthew Arnold says, beautifully and with rare insight, of a friend:—

"I saw him sensitive in frame,
I knew his spirits low,
And wished him health, success, and fame,—
I do not wish it now.

"For these are all their own reward,
And leave no good behind;
They try us, oftenest make us hard,
Less modest, pure, and kind."

Emerson even says, "Adversity is the prosperity of the great." And, if this seems strained, yet we do not feel it so, when we see some heroic man or woman bearing up under great ills with godlike equanimity and patience. O friend, think not thyself off the track of destiny, because things are awry, and fortune does not smile upon thee, and thou hast not, perhaps, a thing that thou cravest; think not that the World-Spirit has not any path marked out for thee to follow. The path of duty is still the predestined path; and, though it be no longer to do, but to bear, bear that as bravely as thou wouldst do, and never was there better soldier of duty than thou.

Such are some features of the personal morality to which, I conceive, we should give earnest attention. The common bond uniting them is that they all relate to our private and even our hidden life. Duty goes with us everywhere. Obligation exists, not only to the public, but to ourselves. Oh, let us feel the sacredness of ourselves, and have as

sensitive a conscience about our private habits, our secret aims, our hidden motives, and our bearing under adversity when alone, as about that side of our life which is known to all the world!

CORRESPONDENCE.

CHILD MARRIAGES IN INDIA.

Editors of The Index:—

I have never attempted to rub shoulders with my superiors, much less with literary men. They are generally hard of conviction, and apt to stick to their points with more tenacity than reason. But I am forced to write to you against my will. I was shown a paragraph in your issue of March 4, concerning an alleged "intelligent Hindu heiress," who is said to have been sustained in her refusal to go to her husband, to whom she was wedded in childhood. I was amused by it, and I told my friend who had brought it to my notice that no such case could occur in India. I, however, said that there was a case of similar nature decided by Judge Pinkey, of the Bombay High Court; but she was not an heiress. The whole matter was got up by designing people, like the editors of sensational papers, who live on circulating fabricated stories in America. My friend rebuked me for such aspersions against such an eminent paper as you conduct. I still maintained that I was sure that there was no such case in high circles in India, and that *The Index* had copied it from some English rabid news-monger (1). This made him write you a letter, which, I am sorry to say, resulted in still more absurd statements being made, in defiance of truth and facts. I do not believe it to be possible for any nation which has once been engulfed in the abyss of false religion and philosophy to know and tell truths. It is a national defect over which we have no control. It is in vain to suppose that those who are trying to tear to pieces old theology are the fit persons to enlighten the world; for, if they demolish one institution, they accumulate rubbish and make a heap elsewhere (2).

In your issue of the 11th inst., child marriages are put forth as abominations. Why? Because they are simple and innocent. Child marriages are abominations, because of our abhorrence of lottery in love. If people would be satisfied with late or choice marriages, I should not condemn them. But there is a system whereby marriages are made and unmade according to the demands of lust. India abounds in civilized people who adopt this substitute for early and permanent marriage. We do not want that cheap commodity from Europe. Let England and America preserve it as an emblem of independence and liberty. But what has astonished and struck me most is that you give us to understand as gospel truth that "these abominations were prohibited in the British Provinces in 1872." Dear editors, allow me to contradict this statement, as it is entirely inaccurate and incorrect. In every part of India, not to speak of the native States, child marriages are performed and celebrated by hundreds and thousands every year, under the very noses of the men who rule over us (3). I am telling but a fact. The native Marriage Act which you speak of was sought for by so-called reformers, headed by Keshub Chunder Sen, who would not number more than one or two thousands as rank and file throughout the length and breadth of India. There are only two Brahmo churches in Calcutta where the average Sunday attendance does not exceed more than one hundred. There is only one church in Bombay where the same paucity of attendance is observable. The Keshub Chunder Sen Movement shines on paper just as well as the reports of several meetings of charity, prisons, and asylums, where the presidents generally speak to empty benches and chairs. Wherever the child marriage does not prevail, there prostitution is carried on on an extensive scale. The child marriages are, indeed, "abominations," as they are not registered in courts of justice and confirmed by the Supreme Court (4). But the pair, when they come of age, live so peacefully and harmoniously that they are never separated. We have no such divorce system as you have in the United States. What a miserable and wretched people are the Hindus, because of their slow progress in corruption and crimes, be-

cause of their abhorrence of falsehood, because of their simplicity of manners and habits, because of their backwardness in speculation!

In conclusion, I beg you, dear editors, never to say a word against my country. We have no confidence in your careless press, unprincipled missionaries, crafty politicians, and cunning presidents. The Americans have no shining character to boast of to other nations (5). Why do you go to India for "abominations"? Look at your deeds, ignominious as they are. "Save us from such people," is my constant prayer to myself. We don't want your marriage system. We don't want your divorces. We don't want your swindles and frauds. Keep them all to yourselves. We don't envy you. But don't condemn our child marriage system and call us by hard names.

GOPAL VENAYAK JOSHEE.

PHILADELPHIA, March 14.

(1) Perhaps the person whose refusal to go to an immoral and profligate man to whom she was wedded in infancy was sustained by a judicial decision was, as our Brahminic friend says, not an "heiress"; but it is admitted that such a decision was made, and it is certain that the person whose refusal was sustained by the judge, if not an heiress, was, what is more important, a woman. The decision of the court was most sensible and just; and we mentioned it, not to disparage Mr. Joshee's country, but to indicate that there were signs of progress in India as well as in the Western world.

(2) Of "false religion and philosophy" there is, unfortunately, still a large amount in even the most enlightened portions of Christendom,—an inheritance mainly from the past,—from that same remote past from which, with much that is good, has come much that is bad to India as well as to America. The myths and superstitions of India, its priestly mummeries, its slavish reverence for the past, its injurious customs and social evils, no more admit of defence than do the "old theology" and other "rubbish" which the keen eye of our Hindu friend discovers in this country.

(3) The native Marriage Act, which, we believe, fixes the minimum of age for boys eighteen and for girls fourteen, seems to have been introduced very gradually into the tributary provinces. That it is evaded and disregarded, even in the British Empire proper, only shows how far the law is in advance of public sentiment.

(4) The child marriages ought not to be "registered in courts of justice and confirmed by the Supreme Court." It is, doubtless, true that, in many cases, such marriages are happy, but because of mutual suitability, and not because of the unreasonable custom of marriage in infancy. Among the evils of these early marriages, careful observers mention ill health, the birth of sickly children, poverty, and overpopulation, on a large scale. But the chief reason for condemning infant marriage is the fact that young girls whose husbands die between betrothal and marriage are classed among widows, and compelled to live a single, often a joyless, life. To the wrong and evil of enforced or compulsory widowhood, many of Mr. Joshee's countrymen and countrywomen are no longer indifferent; but customs long established are not easily uprooted. The abolition of infant marriage in India is probably only a question of time; and, without it, woman's position must be one of hardship, and great progress impossible. Our divorce laws admit, no doubt, of much improvement; but laws making the marriage tie indissoluble under all circumstances are not to be thought of among progressive nations in this age. Divorce affords a means of escape from that wretchedness which, in many cases, makes marriage, when legally indissoluble, a curse, and not a blessing. Rome had no divorces for five hundred and twenty years; but that period was one in which woman was virtually the slave of her husband, and in which a temple dedicated to a goddess named Viriplaca, whose mission it was to appease husbands, was worshipped by women on the Palatine.

(5) May we not, while honoring the great and good men of India and of other countries, point with just pride to our own Washington, Franklin, Jefferson, Lincoln, Garrison, Sumner, Parker, Phillips, Emerson, among other distinguished American statesmen and philanthropists?—B. F. U.

EXCESSIVE ATHLETICS.

Editors of *The Index* :—

Will you call attention to the evils of excessive "athletics," so called, which are becoming fashionable, and, as such, unreasonable?

The hurdle racing, so recently imported here, has already given ample proofs of its ability to maim and kill young men riders. It is utterly reckless, and a cruel strain on the animals forced into the contests.

Sparring matches between members of colleges, schools, clubs, and so forth, are fast degenerating into fighting, with considerably more than less anger displayed. The wicked blow under the ear, on the neck, is considered "desirable" and "proper": whereas, it should be forever excluded from all trials of skill, unless the avowed intent of such trials is to kill or injure. It is exceedingly dangerous, has killed and seriously injured, is seldom given fully without some symptoms showing interfering with the brain or circulation for a longer or shorter time, according to the force of the blow and the constitution of the assaulted party. It is the blow used by many professional prize fighters of the lowest grade, and is meant to be effective.

The technicalities indulged in by the modern admirers of prize fighting to make such fights "exhibitions," "testimonials," and what not, are not entered into; nor do they affect the facts above given.

Again, lawn tennis is much overdone by our ladies, older and younger. It is a game not at all adapted to the female organization; and case after case of uterine troubles is met with, directly traced to this cause. It calls for great activity, violent exertion, and straining of all the muscles at short notice. Frequent mishaps occur,—as collisions, falls, in attempting to drive the ball toward the adversaries,—all this under the full sunlight, in the heat of summer, in a costume poorly fitted to protect from the sun or violence.

I am a believer in muscular Christianity, when that means the attention to the proper development of the bodily strength in all its parts; but this extreme and injurious over-activity in some one direction, often of doubtful use, is what I would desire combated. It does not lead to the best health or happiness in the majority.

JOHN DIXWELL, M.D.

Boston, March 19, 1886.

The following, which appeared in a Boston paper last week, headed "Inferential Intelligibility," with the name of Joseph Cook attached, reads very much like an extract from one of Mr. Cook's revised lectures, although it may have been intended only as a take-off: "Dorner somewhere says, 'The axiomatic, when reduced to the prosaic, seldom fails to counteract the probationary.' The same thought appears in my Monday Lectures (vol. 1, pp. 89-91, *passim*). This thought will bear expansion. 1. If the axiomatic be looked at historically, what do we see? (a) Chaos. (b) Slight luminosity. (c) Inclusiveness. But, 2. Intrinsically, these are substantially the same; for (a) polarized light strikes both alike, and (b) neither is injured. [Propositions from 2 to 56, both inclusive, are necessarily omitted here.] Again, when I (we, it should be said) was (were, rather) in Rome, we and I investigated this whole matter (see my Dover and Oil City Lectures). It then was found: 57. That the subscription view of denominational perturbation is less copious than the Andover. 58 to 63. Therefore, the axiomatic cannot be the telescopic or the terrific. [Applause.] Beg pardon: we meant to say that this view would make a sensation."

You have a disagreeable duty to do at twelve o'clock. Do not blacken nine and ten and eleven and all between with the color of twelve. Do the work of each, and reap your reward in peace.—George MacDonald.

BOOK NOTICES.

VICTOR HUGO. By Algernon Charles Swinburne. New York: Worthington Co., 747 Broadway. 1886. Price \$1.25.

This work must, we think, remain forever unique as the most extravagantly written homage ever paid by one poet to another. Swinburne evidently wrote it in a state of frenzied admiration of the elder poet, whom he calls, among other things, "the spiritual

sovereign of the nineteenth century," "the greatest poet of the century," "the greatest Frenchman of all time," "this incomparable master," "the greatest prose-writer of his generation," "the most tender-hearted of all great poets," "among the foremost in the front rank of the greatest poets of all time," "the master of modern poets," with many other phrases equally admiring and, indeed, worshipful; while the tone of humble, awe-inspired adoration in which he expresses his opinion of certain of Hugo's works seems to unprejudiced and less enthusiastic readers almost ludicrous,—as, for instance, when he says on page 19, "With all possible reverence, and all possible reluctance, but remembering that without perfect straightforwardness and absolute sincerity I should be even unworthier than I am to speak of Victor Hugo at all, I must say," etc.; and on page 69, "I must pause to dwell for a moment on so famous and so great a poem as *L'Expiation*, but not to pronounce or presume to endeavor to decide which of its several pictures is the most powerful"; on page 83, "And then comes a poem so great that I hardly dare venture to attempt a word in its praise"; on page 143, "No man can know so well or feel so deeply as myself with what imperfection of utterance and inadequacy of insight I have spoken." Such sentences as these, selected at haphazard from the pages before us, sufficiently indicate the whole tenor of what some of the page headings declare to be "A Study of Victor Hugo," but which is, instead, a rhapsodic panegyric and glowing eulogium in which Swinburne has apparently wrought himself up to a state of delirious incense-offering. Of Hugo's youth, he remarks, "There was never a more brilliant boy than Victor Hugo, but there has never been a greater man." And, of his old age, he says, "There was fire as well as music on the lips of the young man, but the ardor of the old man's song seems even deeper and keener than the passion of the past." Mr. Swinburne quotes profusely from Hugo's poems, but his fit of reverence for the author probably prevented him from venturing upon their desecration by translation for the benefit of those who do not understand French; while the French readers of his book will be deprived of a proper understanding of the high measure of passionate praise heaped upon their own poet by his English follower, who, in his closing paragraph, caps the climax of his long-drawn-out encomium by declaring him "the man by whose name our century will be known forever to all ages and nations that keep any record or memory of what was highest and most memorable in the spiritual history of our past."

S. A. U.

THE BOOK OF THE FOUNDATION OF ST. BARTHOLOMEW'S CHURCH IN LONDON. Some time belonging to the Priory of the same in West Smithfield. Edited from the original manuscript. By Norman Moore, M.D., Fellow of the Royal College of Physicians, Assistant Physician to St. Bartholomew's Hospital. 1886.

This curious little volume is the introduction to a history of one of the great hospitals of London, but is complete and interesting in itself. It is a reproduction of an English translation, made about the year 1400, of a Latin history of the early foundation of St. Bartholomew's Church and Hospital. The Latin text was written about 1180. The quaint old English is quite readable, the editor interpreting a few of the more difficult words by reference to the Latin text. The records are entirely of saint-cures. There is no account of any other method of treatment, and the stories of many sicknesses healed by simple faith in the apostle are very simple and circumstantial. We see not why the evidence for these miracles is not as good as that which we have recorded in any religious books. Still, strange to say, the hospital has given up this cheap and easy method of cure; and, instead of one all-sufficient saint, now employs a medical and surgical staff of more than forty physicians and surgeons. Besides this, we have a college, with a vast array of lecturers and apparatus, to teach the science of medicine. Would it not be well to inquire into these facts; and, if we find the city of London in the twelfth century to have been more healthy and disease less fatal than now, might we not learn of our Mormon neighbors to trust in new revelations and miracles instead of old ones, and so save all this expense of medical schools and hospitals? Seriously, this is an interesting presentation of the beliefs and practices of that age; and Dr. Moore has done good service in giving it to us in such a compact and readable form. The cases are not related with sufficient

detail to show how far they may have been genuine cures from mental impressions: they seem to be simply marvellous stories of cures, without much discrimination in regard to the proofs. The book will interest the lover of old traditions, and we hope for matter of still greater scientific interest in the later history of the rise and progress of this great hospital.

E. D. C.

HARPER'S YOUNG PEOPLE, 1885. New York: Harper & Brothers, publishers, Franklin Square. PEPPER AND SALT, or Seasoning for Young Folk. Prepared by Howard Pyle. Harper & Brothers. 1885.

Harper's Young People for 1885 maintains the reputation it has acquired in the preceding volumes. Its general features are the same. The separate weekly numbers are not imposing in their appearance, but the fifty-two together make a lordly volume of 832 pages. There are two serial stories, by favorite authors, running through many numbers; and several that are continued through three or four. For natural history there is generous provision. Each number has its Post-office Box well stuffed with correspondence and charades and puzzles of all sorts. The illustrations are so good that an aesthetic eye might do much worse than rest upon their various beauty. It is decidedly advisable that so big a treat as this should be taken in fifty-two instalments, but those who get it all at once will find that it will furnish entertainment and instruction for many quiet evenings and rainy days. Mr. Howard Pyle's "Pepper and Salt" is one of the most attractive features of *Harper's Young People*, being well sprinkled through the volume. But it has also been published in a separate volume, a large quarto, with beautiful type and paper, and in a very unique and tasteful binding. The illustrations, which are very quaint, and prove that Mr. Pyle's invention is as fertile as it has always been delightful, are, in some instances, much enlarged from those in the magazine. The text in prose and verse is an original redaction, for the most part, of familiar themes. The making-over is extremely happy, and well judged for the object it is meant to serve. Occasionally there is a phrase that will not assist the endeavor of the fond parent to discourage a tendency in the child to extravagant and obsequious expression. Young people who have the magazine containing these delightful stories and extravaganzas will hardly need the separate book containing them, but some of the less fortunate may prefer the part *de luxe* to the more bulky whole.

J. W. C.

YOUNG PEOPLE'S HISTORY OF ENGLAND. By George Makepeace Towle. Boston: Lee & Shepard. 1886. pp. 388.

We have here a concise, well-written, unbiassed rehearsal, suited to the needs and capacities of young readers, of the principal events in the history of England from the Roman invasion, more than half a century before the Christian era, up to the present time. This book, with its easily consulted chronicle of dates, events, and reigns, will be of as great service to adults as to those for whose information it is specially designed; for elderly people, as well as impatient youngsters, are often glad to find information in a pleasant, graphic, and easily remembered guise. Over thirty full-page illustrations emphasize some of the more remarkable or romantic events in the history of Great Britain. Mr. Towle brings out as clearly as is possible in such a condensation of history the gradual development of English institutions, explanations of the changes in social conditions, the advance of art and literature, and the growth of political liberty. Each successive step is indicated with due regard to the importance of the period of which it was an outcome. There are twelve pages of chronological annals, and lists of the sovereigns and prime ministers of England, with the dates of their reign or service; also, a very comprehensive index of contents. Altogether, it forms an admirable book of reference as well as a succinct *résumé* of English history.

THE ORDER OF CREATION: The Conflict between Genesis and Geology. A Controversy between the Hon. W. E. Gladstone, Prof. T. H. Huxley, Prof. Max Müller, M. Réville, E. Lynn Linton. New York: The Truth-seeker Company, 33 Clinton Place. pp. 178. Price 75 cts.

These essays, which attracted wide attention and were read with deep interest when they first appeared, collected and reprinted in a neat volume, are now in a form convenient for reference and suitable for the library. They are of great value to all who

would know the latest word contributed by eminent writers to the discussion of the old question whether the order of Genesis and the order of geology are in harmony or in conflict, and other cognate subjects suggested by the controversy between Mr. Gladstone and Prof. Huxley. We do not believe that the defenders of Genesis will care to assist in the circulation of this volume, although the religious press of the country have quoted freely from Mr. Gladstone's article presented in the same volume with the replies and criticisms here reproduced.

They make a work which, so far as read by intelligent minds, must be effective in destroying the faith still surviving in the inspired and authoritative character of the so-called Mosaic account of the creation.

THE GLASSE OF TIME: In the First Age. Divinely Handled by Thomas Peyton of Lincolnes Inne, Gent. New York: John B. Alden. 1886.

This is a reprint of a curious poem first published in 1620, forty years previous to the appearance of Milton's *Paradise Lost*, which it is now believed to have suggested, though far inferior in poetic merit. Only one copy of the original work is known to be in existence, a copy elaborately bound in vellum, quaintly printed, ornamented with gold, with coat-of-arms and regal device, which is now kept in the British Museum. The author, as a vignette on the title-page informs us, was only thirty-one when he died; but the poem contained promise of greater things, had he lived. In the introduction, the similarity of theme and treatment of this poem and John Milton's later *Paradise Lost* is very clearly shown.

WITHIN THE SHADOW. By Dorothy Holroyd. Household Library Edition. Boston: D. Lothrop & Co., Franklin Street. Price 50 cents.

This is a charmingly romantic yet pure-toned story for girl readers, treating of the friendships, trials, and triumphs of an innocent, independent, virtuous, truthful, and self-reliant girl under very peculiar and uncommon circumstances. We have submitted our copy to the criticisms of girl-readers of the ages described in the book; and they, one and all, declare it to be "splendid," "delightful," and the heroine, Cecil Chester, to be "just too lovely for anything."

THE Art Amateur for March appears to be in rather a caustic humor, as befitting the season. "My Notebook" is severe on the managers of the sale of Mrs. Morgan's art treasures, and not over-complimentary in remarks upon Mrs. Morgan herself. But the writer is impartial at least, since he remarks of the country generally that "ignorance and gullibility go hand in hand." The Metropolitan Museum gets the whip at second-hand from Mr. Theodore Child, and Baron Rothschild and the manager of the Bartholdi Pedestal Fund each receive a keen stroke. Greta treats somewhat flippantly the subject of "Art Education in Boston." Without being an ardent admirer of Mr. Walter Smith or his system of teaching doctrine, we think justice requires us to consider the difficulties of the case. It was better to have any system introduced and carried out for a time, but freely open to criticism, than to have nothing done. And the result is by no means so despicable as Greta represents. Drawing is well established as a regular branch of instruction in all the schools of the Commonwealth; and, if the system first established is not satisfactory, the school committees and teachers are free to improve their plans. As the circular of the Lowell School of Design acknowledges, the result is apparent in the preparation for their work. It is sheer nonsense to talk about "parents finding that the artistic taste and talents sometimes discovered in children of tender years have been killed out completely by the tasks of reproducing geometric forms," etc. Parents are very keen in discovering artistic talents in their children; but, if these will not outlive a course of geometric drawing, their destruction will entail no great loss on the community. Some of the greatest artists have served their apprenticeship in very dry and mechanical work. Greta is not one-sided, however, but casts a fling also at the Hunt School. The object of teaching drawing in the schools is not to make artists, but to train the eye and hand to represent accurately what the mind indicates. The result will be artistic or mechanical, according to the quality of the mind behind eye and hand. Real artistic teaching comes later in life, and more from life than schools. We have not space to

speaking fully of the illustrations, which are varied and interesting as usual, including a portrait of a French artist, Roybet, and a colored print of a "head of a steer," by James M. Hart. Miss Scannell has a sheet of outline drawings. They are pleasing; but why does she not select more interesting subjects, and tell some of the thousand stories of child-life which are constantly presenting themselves to the artist's eye? Mr. Ives has many good thoughts, which, for one, we should prefer to take directly, without the machinery of the dialogue.

E. D. C

THE Atlantic Monthly for April opens with a paper on Gouverneur Morris, by Henry Cabot Lodge, which will be found of much interest. A short story by Sarah Orne Jewett, entitled "The Dulham Ladies," is also a pleasant feature of the number, and, with Mr. James' and Miss Murfree's serials, furnishes its fiction. Two important papers, one on "Responsible Government under the Constitution," by Woodrow Wilson, author of "Congressional Government," the other, "Reformation of Charity," by D. O. Kellogg, will be of interest to thoughtful readers. Julian Hawthorne contributes a paper on the "Problems of the *Scarlet Letter*," and this, with an article on "Children, Past and Present," by Agnes Repplier, and "Shylock vs. Antonio, A Brief for Plaintiff on Appeal," by Charles Henry Phelps, comprises the chief contents of the number. There is a poem by Mr. Whittier, called "Revelation," and some other verses by Andrew Helbrook and A. M. Libby; also, criticisms of recent historical works under the title of "Historical Methods," and of some new French books of illustrations. The usual departments close a most agreeable instalment of this standard magazine. Houghton, Mifflin & Co., Boston.

THE Catholic World for March devotes more than usual space to light literature of an entertaining character. There is a long instalment of Christian Reid's story of "The Doctor's Fee." "Answered at Last" is a charming short story, by A. M. Clarke. William D. Kelly has a pleasant poem, "By Summer Seas." R. M. Johnson discourses interestingly on "Celebrated and Common Friendships." "Dick Doyle's Diary," by Helen Atteridge, gives a peep into a popular artist's life. Some of the more thoughtful and earnest papers of this number are C. Gayarre's "Normans on the Banks of the Mississippi," and Rev. John Gmeiner's on "The Emperor Julian the Apostate,—the Great Spiritist of the Fourth Century." Under the sensational title, "English Hobbes! Irish Dogges!" Charles De Kay treats of some Irish surnames. Other papers are entitled "A Plea for the Indians," by H. V. R.; and "The Venerable Mary of Agreda and Philip IV., King of Spain," by Helen Atteridge.

THE Magazine of American History for March has the following articles: "Van Cortlandt Manor House," by the editress, Mrs. Martha J. Lamb; "Shall We have Colonies and a Navy? Our Attempts to Colonize," by Hon. J. W. Johnston; "Champlain's American Experiences in 1613," by Arthur Harvey; "Girty, the White Indian: A Study in Early Western History," by George W. Ranck; "The Trent Affair," by Hon. Horatio King; "Shiloh," by Gen. W. F. Smith; "One Night's Work, April 20, 1862," by George B. Bacon; and a "Memorial Tribute to Chief Justice John Meredith Read," by Charles Reade. The articles by Mrs. Lamb, Mr. Ranck, and Gen. Smith are handsomely illustrated, and a vigorous-looking portrait of Gen. W. T. Sherman is given as the frontispiece. The departments of "Notes," "Queries," "Replies," "Book-notices," and "Societies," each contain a variety of interesting pertinent matter. 30 Lafayette Place, New York City.

The leading article in the *Unitarian Review* for March is by Rev. M. J. Savage, on "The Debt of Religion to Science." Carroll D. Wright writes of "The Pulpit and Social Reform." "The Reaction against Individualism" is by Rev. N. P. Gilman; "The Present Aspect of Religion and Theology in Germany," by Rev. J. T. Bixby. R. Schramm gives an interesting account of "The Jumping Procession at Echter-nach, in the Month of May, 1885." In the "Review of Current Literature," Dr. Abbot's *Scientific Theism* is reviewed at some length. Other reviews are "Parker's Views of Religion," "Grimm's Essays," "Mr. Story's Poems," "Italian Popular Tales," etc.

Mr. WILLIAM GANNETT has written an admirable sermon, "The Blessing of Drudgery," which is, indeed, a treat especially adapted to the times. It is printed in *Unity*; and the Women's Western Unitarian Conference wish to publish it for general circulation, and solicit orders or subscription for this purpose. They may be sent to Miss F. Le Baron, 133 Wabash Avenue, Chicago, Ill.

HOTEL FOR SALE in the County Seat of a fertile county. On Air Line Railway. In good repair and in first-rate location. Doing a good business. Price \$4,000, on easy terms. Address J. H. SHERWOOD, Wauseon, Ohio.

The Religion of Philosophy; OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERLIN.

For sale at THE INDEX Office. Price \$3.00.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, Ph.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOOSMIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTO SPIRITUAL THEISM which will satisfy both "the head" and "the heart." 1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1883 (Vol. XVI.), inclusive, will be furnished at special rates.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 30 cents; 40 copies for \$1.00.

Address THE INDEX, 44 Boylston Street, Boston, Mass.

THE RISE OF INTELLECTUAL LIBERTY FROM THALES TO COPERNICUS.

By FREDERICK MAY HOLLAND,

Author of *The Reign of the Stoics*. Price \$3.50.

For sale at THE INDEX office, 44 Boylston Street, Boston, Mass.

A NEW work is about to appear in Chicago, which will attract considerable attention among scientists and will prove of great interest to the general reader. It combats the generally accepted beliefs in regard to the solar forces, and presents a new theory to explain solar phenomena. The book will be called *Solar Heat, Gravitation, and Sun Spots*. It is written by an author who has given long thought and study to the work, and will be published this spring by S. C. Griggs & Co.

TWENTY women, Lucy Stone, Lucy Larrow, Miss Alcott, Harriet Prescott Spofford, Mrs. Henry Ward Beecher, Mary L. Booth, and Mrs. Admiral Dahlgren among them, are to discuss in the *Brooklyn Magazine* the question, "When should our Young Women marry?" If an opinion in advance of the discussion, by an outsider, is not out of place, we suggest that the young women should marry when they get a chance, in this State.

HUSBAND'S CALCINED MAGNESIA.—Four First Premium Medals awarded. More agreeable to the taste and smaller dose than other Magnesia. For sale in bottles only, with U.S. Government Registered Label attached, without which none is genuine, at druggists and country stores, and by Thomas J. Husband, Jr., Philadelphia, Pa.

are for sale at The Index Office. Price 10 cents each.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. Full of Figures, Facts, and Interesting Extractions. Price 5 cents; 30 copies, \$1.00.

No. 5.—*God in the Constitution*, by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—*The Sabbath*, by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—*Compulsory Education*, by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 3 cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B. Frothingham, treats of a subject that interests everybody. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 10.—*The Impeachment of Christianity*, by F. E. Abbot. 5 cents a doz.

No. 11.—*The God of Science*, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 12.—*Is Romanism Real Christianity?* Two essays by Francis W. Newman and F. E. Abbot. Price 5 cents; 30 copies, \$1.00.

No. 13.—*On the Vision of Heaven*, by Prof. F. W. Newman, of England, analyzes the Christian conception of Heaven. Price 3 cents; 30 copies, 50 cents.

No. 14.—*A Study of Religion: The Name and the Thing*, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 15.—*The Battle of Syracuse*. Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 5 cents; 30 copies, \$1.00.

Address **THE INDEX,**
44 Boylston Street, Boston, Mass.

The Secret of the East;

OR,

The Origin of the Christian Religion and the Significance of its Rise and Decline.

31 270 F K L. OSWALD, M.D.

Handsomely bound in cloth. Price \$1.00.

"The work covers a great amount of critical and historical ground independently of the Buddhistic analogies; it is in fact a vigorous, uncompromising outline of Christian history, with all the weakness and wickedness mercilessly dragged into daylight. . . . The case against the Christian Church is a marvellously strong one. The superstitions and miseries of mediævalism, the woes, tortures, burnings, rackings, and brutalities accomplished in the name of Christianity, are set in blackest array. The Nature-worship of the pagan Greeks and Romans is set in contrast. Nor is Dr. Oswald very generous in admission of improvement in contemporary Christianity. To him, it is a hurtful supernaturalism, impeding science, diffusing pessimism, promoting hypocrisy, and repressing the physical nature. His book is remarkably well written, brilliantly concise in style, and, aside from its special theories, of considerable scientific and historic value."—*Boston Evening Transcript*.

CURRENT TOPICS.

BY B. F. U.

HUXLEY seems to be as much of a Bourbon in English politics as Gladstone is in scientific and religious thought.

JOHN H. OBERLY, a Democratic politician by profession and an office-seeker by instinct, is the last person whom those acquainted with him and who believe in civil service reform would think of recommending as a civil service commissioner.

SAYS the Woonsocket Reporter: "The Knights of Labor are progressive men, not capital wreckers, and purpose to conduct their issues in a manly way, through organization. They want both capital and labor respected, and placed on an equal footing, as nearly as possible. This cannot be brought about when one is organized and the other disorganized. Labor asks only a fair field, and is chivalrous enough to accord the same privilege to capital. Both well balanced and respected, no injustice can be done."

MRS. MARY BAYARD CLARK, whose recent political contributions to these columns will be remembered by our readers, died lately at New Berne, N.C., at the age of fifty-eight. Among the works she wrote and by which she is best known are: *Mosses from a Rolling Stone*; *Wood Notes*, or *Carolina Carols*; *Clytie and Zenobia*, or *the Lily of the Palm*; a biography of George E. Badger and a sketch of Gov. Vance. She wrote reviews, and did other literary work for a number of leading journals. She was radical in her religious views, and we have several letters from her expressing deep interest in *The Index* and the thought it represents.

SAYS the *Religio-Philosophical Journal*: "The *New Dispensation*, one of the Brahmo-Somaj journals in Hindustan, says that porcelain images of the Hindu gods are made largely in England, and sold in India, but are failures as works of art. They lack expression. Mahadeva is represented as carrying the corpse of Sati; but no righteous anger, no solemn fury, marks the face. The figure seems to be that of a hireling coolie carrying on

his shoulders a woman in a fit. Greek art spiritualized mythology. English art renders Hindu mythology simply ridiculous. With the Chinese opium trade largely in English hands, and an added profit from this trade in 'graven images' (which the Bible forbids), Christian England makes money from its pagan traffic. Mogovardal, the eloquent Bramo-Somaj preacher, said in Boston that Christianity needed Christianizing."

In an excellent article on the "Evils of Journalism," the *Public Good* has this to say: "We cannot expect the leading dailies, which devote a large portion of their valuable space to polo games and slugging matches, to be in any respect a teacher of morals or a moulder of the right kind of public opinion. One of the two 'rivals' in Boston lately devoted five and a half columns of its most prominent page to a prize-fight, while the other contented itself in narrowing down its report to about two columns, probably to make way for its advertisements. It seems to be the order of things with them that prize-fights, murders, and scandals should take the place of reforms and morality, because it 'sells the paper.' Catering to the demand for degrading items and information, they weaken the moral forces of society. Should not well-disposed citizens make some effort to have the tone and influence of our daily journals improved?"

A WESTERN subscriber writes: "In a recent discussion with a devout Catholic, I made the assertion that a bill was passed through both Houses, in the State of New York, to appropriate \$50,000 for Catholic school or charitable purposes, and that Gov. Cleveland vetoed the bill, on which account he lost the Irish vote to a certain extent. Will you have the kindness to give your decision, and state the facts of the case?" The facts bearing on the above inquiry, as far as we can state them, are these: In the appropriation bill passed at the session of 1883 was an item of \$20,000 (not \$50,000) for the Catholic Protectory. Gov. Cleveland disapproved it, on the ground that it was for a sectarian purpose, and would be a bad precedent. The fact was used against him in the canvass, and probably caused him the loss of some votes, though some of the friends of the Protectory declared that they exonerated him from any motive of "bigotry" in the matter.

In the *Journal of the National Indian Association* (published in London) for September, 1883, we find the following personal reference to Mr. Joshee, from whom a letter was printed in *The Index* last week, and to his talented and accomplished wife, who, we may add, graduated lately from the Woman's Medical College at Philadelphia, with exceptional credit for her attainments, and is now an M.D.: "One of the visitors to Philadelphia on the occasion of the opening of a Woman's Medical Congress was Mrs. Anandaibai Joshee, a Hindu lady studying medicine in America. Mrs. Joshee is eighteen years of age, the wife of a Brahmin. It was supposed that she would lose caste in crossing the sea; but, in a recent letter, she stated to a friend that she had as yet retained it, arrangements having been made for her so that

she could prepare her own food. She also kept her national dress. She is spoken of as a young woman of remarkably fine intellect, and as determined to devote her life to the interests of her fellow-women in India."

ONE interested in recent philosophical articles in *The Index* writes, "Would it not be a good idea to get the various professors of 'philosophy' in colleges interested in this discussion, so that they will contribute to *The Index*, and you thereby enlarge your constituency?" Contributions from "professors of philosophy" in colleges in this country would not improve the quality of *The Index*. They are mostly theologians, and are evidently chosen for the positions more with reference to their conservatism and Orthodoxy than because of any great philosophical ability. If they were profound, original, radical, independent, and courageous thinkers, they would not, generally speaking, be professors of philosophy in American colleges. It is notorious that, as a rule, such men cannot get professorships here. The positions are for those who can repeat the platitudes of text-books, and can be relied upon to guard the minds of students against philosophical and religious heresies. A few exceptions can be named, and but a few. We may add that "the various professors of philosophy" in American colleges could not be induced to write for a radical, heterodox journal like *The Index*, even if their contributions were especially desired. To do so would be to endanger their positions.

We learn by the *People*, a paper published at Providence in the interests of labor, that Mr. F. A. Hinckley was recently the recipient of a handsome testimonial from Industrial Assembly No. 2085, Knights of Labor, as a mark of appreciation of his "disinterested and manly efforts in the behalf of oppressed humanity at a time when friends were few and far between." Says the *People*: "Mr. Hinckley has done able, conscientious work for the cause of the worker, and has been, for years past, the only man in the pulpit, in this city, who has had the courage, and at the same time the ability, to discuss industrial questions in an ethical manner. This he has done in the course of his duties as preacher of the Free Religious Society in Blackstone Hall." Our readers need not be told that Mr. Hinckley speaks not from a Christian pulpit, but from a free platform,—that of a Free Religious society, a free-thought society, which received recognition from none of the churches of the city, whose pastors ignored the Labor Movement when it was unpopular and in especial need of encouragement, but who are now forced to notice it since it has grown strong. Workingmen of Providence—as we learned personally, during a recent visit to that city, when we addressed the Free Religious Society and conversed with many of its members—respect and honor Mr. Hinckley, because he earnestly espoused their cause in its weakness, and discussed the subject on its own merits before it had received attention from the pulpit or the press of the city.

HUMANITY'S SOCIAL DREAM.

There is pathos in the persistency with which, in spite of repeated disappointments and failures, men and women of noble aspirations return to the experiment of some kind of "community life" for the solution of the social problem. The latest attempt of this sort that has come to our knowledge appears in an organization under the name of "The Fellowship of the New Life." A branch of this organization has, we understand, been formed in New York,—or at least a germ of it has been planted there, and with signs that seem promising to those most interested. Our friend and occasional *Index* contributor, Thomas Davidson, is one who has been specially engaged in promoting the enterprise. The society, we believe, has not yet advanced beyond the stage of framing a constitution and instituting parlor gatherings for lectures and discussions. Nor are we informed whether anywhere the organization has progressed beyond this stage, nor how many branches there are which are at this stage of germination. There is, however, before us a circular which came to us from New York, but which was printed in behalf of a "Branch" in London. This circular presents an interesting statement of the "Principles and Purposes" of the society. The first two paragraphs are as follows:—

The Fellowship of the New Life is a body of men and women who, lamenting the many wrongs and evils from which society is suffering, will strive, in united effort, to establish their lives upon a basis of love, truth, and freedom, and to induce and help others to do the same. It is initiated with the belief that the cause of human progress may be most surely and worthily advanced by the fullest possible realization, among such as desire the renovation of society, of those higher relations which they would see universally prevail.

Although it is generally admitted that the end for which a community should exist is the greatest good of all its members, society is at present by no means organized so as to secure this, but subsists mainly on the sub-human basis of struggle, involving the subjection of the weak and unfortunate by the strong and fortunate, and, as a consequence, widespread misery, suffering, and degradation. We, the members of the Fellowship, believe that it is only by the definite adoption and persistent following of a right social ideal that a lasting and continuous improvement of our condition is possible. It is this conviction that furnishes the starting-point of our movement, and distinguishes it from existing movements for social amelioration.

In a subsequent paragraph, the object of the "Fellowship" is more closely defined as "the cultivation of a perfect character," or the attainment of "man's true vocation." The "ideal of a perfect life, a life lived 'resolutely in the noble, the good, the beautiful,'" is what the members of this society set before themselves, and wish by practice and precept to urge and recommend for acceptance by all." For reaching this end, "social equality" is affirmed as a necessary condition. Care is taken to say that neither equality in faculty nor equality in kind of work is possible, but it is urged that this necessary inequality should not be allowed to result in detriment to any persons in attaining the true life-object. There may be equality in social relations, just as already under democratic forms of government equality in respect to civil rights is recognized. Of course, in "The Fellowship of the New Life," woman's equality with man is affirmed, and in industrial matters the principle of competition yields to that of co-operation. All worthy work is to be invested with dignity and done joyously. One other suggestive paragraph relating to modes of daily living we must quote in full:—

There are many important consequences of the

principle of Social Equality, one of which, the most far-reaching, calls for special notice. As the principle forbids all servitude, it follows that each one's wants must be such as can be met without preventing a like satisfaction of the wants of others. This involves simplicity of living,—simplicity in all the relations of life. For example, as all household needs must be attended to by the members of the household, domestic arrangements and modes of living must be of such simplicity as will allow of this. A greater simplicity should likewise rule in eating and drinking, rendering advisable, it may be, a vegetarian or fruit diet, as being clean and not requiring the complicated, offensive, and shameful processes involved in the preparation of animal food; in dress, striking at the vagaries of fashion; in house-furnishing and decoration, banishing all furniture that cannot be kept clean and orderly without undue care and attention; in social intercourse, demanding thorough sincerity and frankness in speech and behavior. As in these, so in other respects, the implications of the rule of simplicity will become sufficiently obvious.

The religious character of the new society is distinctly asserted. Work is to be regarded in it as having a "religious function." The Fellowship is to be a "religious society or church." "This church will have its basis in the moral sentiment, and will be free from admixture of superstition." At first, it will be mainly "a society for moral culture," aiming at "the edification of its members in the spiritual life and the formation of character." In this respect and in the stress laid upon the moral education of youth, it is to work on the lines of the Ethical Culture Movement. But it looks forward to creating some more special institution in the future. The circular says: "As soon as any of the members are in a position to do so, they will make arrangements to live near one another or together, constituting the beginning of a model settlement that may develop into a self-contained and autonomous community."

Such is a brief abstract of the four closely printed pages of the prospectus of this latest society that has published its social dream. A reader of it who is acquainted with the hopes and views of those who founded the famous Brook Farm Community can easily imagine himself put back forty-five years, and reading the prospectus of that society. The intervening years have in no respect diminished the need of urgent efforts to solve the problem of social regeneration. Indeed, the perturbed industrial condition of this country at this moment, the chronic struggle between capital and labor, the vast increase of crime in the last twenty years, the growing wealth and luxury on one side and the misery of pauperism on the other,—these are facts that can but set thoughtful and earnestly moral people to inquiring whether no remedy can be found. Any experiments in the direction of a juster and more harmonious social order ought to be cordially welcomed. We certainly wish those men and women who may be drawn into "The Fellowship of the New Life" the highest success in the realization of their beautiful vision. But the conditions of success for such an effort seem to us no more favorable than when Brook Farm Community was born and died,—if, indeed, they are so favorable as then. The failures, too, of similar organizations at Florence, Hopedale, New Harmony, and we know not how many others, appear to indicate that the cure of the social trouble lies not that way. Perhaps, generations or centuries hence, when the stage of convalescence is reached, this method may be applicable; but we fear that, for some time yet, more robust remedies will be required.

It is, however, a significant fact that, after so many failures of this kind of social experiment, there are yet earnest hearts that continue to revert to this old ideal of human society as a harmonious

brotherhood. Christianity began in just such a social dream, temporarily aided by a national religious dogma of great vigor. Now, after eighteen centuries, it is precisely the Christian nations of the earth that are the farthest from the realization of that vision. Yet the ideal contains a truth that will not own itself conquered, however violently it may be resisted or however long its triumph may be deferred. Civilized man knows that he ought to live in brotherhood with his fellow-man. How to translate this *ought* into act is the problem. It is especially the problem that is agitating civilized society at this hour.

WM. J. POTTER.

A SUGGESTION IN EDUCATION.

Believing with Herbert Spencer that we cannot get golden conduct out of leaden instincts, I regard agitation and organization among workmen as valuable almost only as means of education. The specific ends had in view by world-cobblers are generally impossible of realization; for, where they are not opposed to the principles of social science, they are quite sure to be practicable only among men of higher average intelligence than are the rank and file of this or any other country. Education, then, first; and, to spread education, the friend of humanity will scarcely withhold his aid from the promulgation of even the most revolutionary ideas.

But this education should be, above all things, of the kind that teaches man to think. To give to men and women grown this fashion of education is almost impossible. In addition to the obstacle offered by the natural conservatism of the race, there are the other obstacles of accepted ideas and self-interest. To change the former, so the vast majority think, is always to imperil the latter. True, by the preaching of radical ideas to the mature, much can be done; but progress in that line of action is slow,—the more slow and the more nearly hopeless, because each new generation coming into practical life from out our educational institutions is imbued with the same ancient conservatism, the same conventional ideas, the same respect for authority, and the same incapacity for independent thought. But cannot these new generations be reached while they are yet occupied in their studies? Are we compelled to suffer schools, academies, colleges, and seminaries to turn out upon the world an unending stream of young men and women whose only thought is imitation, whose only desire is to conform? Cannot this zeal for likeness and dependence be changed, in at least some instances, to a zeal for originality and independence? Now that the time has passed when the spirit of conservatism is of value to the world and the time come when it is a hindrance to its progress, would we not be justified in making every effort to eradicate it?

The field of education is already occupied, and efforts to establish schools of free thought have met and will meet with as little encouragement as do like religious movements. But, if present educational methods cannot be opposed by other methods, at least the whole field of education can be invaded. We can borrow a hint from the religious enthusiasts, and establish a tract society of ideas,—a new propaganda.

Leaflets, extracts from books, small pamphlets, brief arguments directed against the studies in which this or that particular class may be engaged,—these might be distributed judiciously in educational institutions of every kind. My own college was Dartmouth. When there, I had an awakening which was anything but spiritual, in

my friends' view; and I am confident that, had the proper kind of "tracts" been placed in our hands during the course, that awakening would have been more complete with me, and would have extended to many more of my classmates. Take such a hot-bed of conservatism as Oberlin College, and imagine the effect on it of the distribution within a year of four or five sets of judiciously chosen tracts.

Work of this kind would be easy, so far as the distribution is concerned; for, in catalogues, we have at hand lists of students, their addresses, and a statement of the studies and even of the books in which they are engaged.

Were the tracts printed in uniform style, say of the shape of Ph. Reclam's (of Leipzig) little Universal Bibliothek, and sold at a low price to those who wished to buy, the society would in time be made nearly self-sustaining. It would be a help to its becoming so, if the matter of the publications were in some instances sufficiently radical and shocking to encourage the free advertisement of newspaper opposition.

Has the plan any of the virtue of things practical?

JOHN COTTON DANA.

NEO-CHRISTIANITY.

A late issue of *The Week* (Toronto, Ont.) contains a remarkable paper on "The Evolution of American Christianity." The writer, Rev. G. J. Low, author of two brochures, "Eschatology" and "The Corporate Unity of the Church," takes a broad and liberal view of the question from an ecclesiastical and theological stand-point. Indeed, Mr. Low, in the works noted above as well as in the paper about to be considered, not only manifests an unusual catholicity and breadth in treating these burning questions, but shows an intimate acquaintance with the foremost relevant thought of the times, and a spirit of fairness toward the heresies and heretics of the age, which is as rare as it is laudable.

As this forecast of Christianity from the theological side has thus been made (and made by a worthy representative of modern liberal Christian thought), a forecast from the agnostic side may, perchance, be not quite intolerable, though possibly open to the suspicion of prejudice. The agnostic will, however, endeavor to treat an outgrown creed and those who still cling to it with the same fairness and justice he discerns with so much pleasure in a friendly and just opponent.

Mr. Low frankly admits that Christianity is now in a state of "transition," and shows how "unsatisfactory and shifting" its condition is to-day, how it is divided up into a thousand and one sects, how it is "neither coherent nor homogeneous," but rather "a sort of conglomerate." This is all quite true, and admitted by all, both in the Church and out, who are competent to judge, and denied only by those whose zeal and affection for a time-honored creed far outrun their knowledge of the progress of modern science and modern thought.

The serious question of course is how this evolutionary movement, which has now so vigorously taken hold of the religions of the world, and especially Christianity, is to issue. What will be the end of this tremendous trend? Whither is religion drifting, or rather whither are the creeds called religious drifting? That the agnostic's answer to these questions should be wide—very wide—from that of the theist, especially the Christian theist, is, of course, to be expected. That he ought to give any answer at all many will deny. Nevertheless, his mere appellation debars him not from this right; for, although the agnostic does

acknowledge his ignorance as to a personal God and personal immortality,—these metaphysical speculations being without the purview of history or science,—he at the same time claims to examine and decide as to the truth or falsity of all creeds, all religions, these coming fairly within the province of historical research and scientific investigation.

"Is Christianity emerging from chaos to order, or is it undergoing the process of decomposition and decay?" The answer which Mr. Low and Prof. Shields, of Princeton, whom the former quotes, give to this grave question, is what we would naturally expect from all earnest and devout Christian theists, though most of those who are now attempting to cast this horoscope of their future faith (and Mr. Low must be counted in here) betray sad misgivings as to the ultimate issue. And a remarkable fact to be noted here—though not a surprising one—is that, as a rule, the more cultured the apologist, the better acquainted with modern science and modern thought, the more misgiving he betrays and the less confidence in his heroic prognosis, the sincere wish being father to the dubious though honest thought.

But Christianity is not going irremediably to pieces. It is rather evolving toward "Order, Strength, and Beauty, and not toward further decay." So hopes and so says Mr. Low. But how is this "Order, Strength, and Beauty" to be born of the conglomerate Disorder, Weakness, and positive Ugliness of sectarian strife now prostrate in the throes of abortive travail? We shall see. The remedial palladium is "Organic Unity." Prof. Shields and Mr. Low see in Organic Unity the ultimate salvation of Christianity from its present perilous position, and the "unifying tendencies" are already apparent. On the three grand bases, "Doctrine, Polity, and Worship," there is to be an assimilation of all the sects except the Roman Catholics, who "must be left out of the question," and the Unitarian Protestants.

As to Doctrine, Prof. Shields has little hope that unity is near; and Mr. Low suggests that the *Nicene Creed* would perhaps be more acceptable as a basis of doctrinal unity than any other creedal formula.

As to Polity, the assimilation is now said to be progressing favorably. The desideratum of unity of Worship is to be achieved by the general adoption of the Church of England Prayer Book in its entirety.

Such is the scheme for "Organic Unity" of the Churches of Christendom (or rather the Christian Churches of America), with the exception of the Church of Rome and the Protestant Unitarians. And organic union, bear in mind, is "absolutely necessary" for the preservation of Christianity from total collapse and decay! In reckoning up the probabilities of a consummation of this organic union, so devoutly to be wished, the less sanguine Christian prognosticator will, it is to be feared, exclaim, "*Forlorn hope!*" While the agnostic, who has studied history, human nature, and the drift of modern thought to some purpose, will exclaim, "*Absolutely impossible!*" The rationalist's prognosis must be about like this: Every vestige of the supernatural part of Christianity *must go*, and that comparatively soon; while the natural or moral part—that is, Christianity in its rational aspects—will remain. In view of the recent rapid progress of Naturalism (for which Science is but another name) and the correspondingly rapid decline of Supernaturalism (for which Dogmatic Creed is but another name), no unification of conflicting creeds or assimilation of diverse sects will be possible on any basis which retains one vestige of the supernatural part of Christianity. True,

an esoteric belief in God and immortality and even the divinity of Christ might be retained in the individual, but it could never be successfully made obligatory or enjoined authoritatively. Mr. Low, if he lives long, will see that there must be a much wider doctrinal basis than the *Nicene Creed*, to carry with it any prospect of even the partial exoteric assimilation which he hopes for.

But let us for a moment look at the idea of a scheme of unity and affiliation for the different sects of a great system of religion like Christianity, professing to be a divine system and essentially monistic, which necessarily excludes one great sect of that religion and another lesser sect! The great Church of Rome,—the oldest Christian Church,—forming so large an integrant part of Christendom, must imperatively "be left out of the question" of Christian affiliation and confraternity, as there can be "no compromise with her, no parleying!" What a spectacle is this for the heathen and the agnostic (which, by the way, in the opinion of some excellent people, mean about the same thing)! Here is, at least, *prima facie* evidence against the moral integrity of the whole system, including all of its sects. But this internecine lance-sting, turning upon its own body, penetrates deeper than the surface and probes the festering vitals. On the broadest principles of reason as well as the highest moral sense of a purely secular humanity, this incongruity of members and mutual deadly antagonism of parts must vitiate the parent body. Yet, in this proposed confraternity of Christian sects, compassed to preserve Christianity from destruction, the Romish Christians must be left out, and the Unitarian Christians must be left out!

Now, if Prof. John Fiske, the author of the *Cosmic Philosophy* and the foremost exponent of evolution and the philosophy of Herbert Spencer in America, can be properly classed as a Unitarian (and Mr. Low so classes him), then we certainly cannot wonder that Unitarians are to be ruled out of the coming family compact; for 'I should say Mr. Fiske stands distinctly and unequivocally outside of doctrinal Christianity. But then "there are Unitarians and Unitarians." Mr. Low recognizes the gulf between Channing Unitarianism and Parker Unitarianism. But it is hoped in certain quarters that Mr. Fiske is growing more conservative; and Prof. F. L. Patten, in the *Christian at Work*, claims that there is a positive difference in Mr. Fiske's theistic attitude as manifested in his two works, his *Cosmic Philosophy* and his *Idea of God*. In the latter, it must be confessed, the great evolutionist appears to defend a belief in God on teleological grounds, but at the same time reaffirms what he has said in the *Cosmic Philosophy* against teleology as "a means of investigation." Prof. Patten thinks Fiske inconsistent in throwing the design argument completely overboard, while at the same time admitting that there is "a dramatic tendency" in the universe, and that this dramatic tendency "is the objective aspect of that which, when regarded from its subjective side, we call Purpose." We have yet, however, to hear from Prof. Fiske, when the alleged inconsistency may be quite resolved. The author of the *Cosmic Philosophy* may be a Unitarian in a broad, theistic sense; but he is certainly not a Christian Unitarian in any doctrinal sense whatever.

"No doubt, if this multiplication of sects were to go on much longer, the end would be that Rome and Agnosticism would divide the prey between them." Very likely, Mr. Low has here given us a correct predicate, so far as it goes, for it will soon be between Rome and Reason, between Authority and Science; and the end will

be that Reason will disintegrate Rome, and Science triumph over Authority. And this present "transition" and disintegration which Mr. Low speaks of are the beginning of that end. That the Anglican Catholic Church will, however, be the last of the Protestant sects to succumb to the inevitable is more than likely, since no other Christian sect is so broad and liberal, and "meddles so little with politics and religion"; no other shows a spirit at once so accommodating and conciliatory toward the heretical developments of recent science. There is really no logical "halting place" at all in Protestantism on the whole road leading from Rome to Rationalism and Atheism. Once admit the right of private judgment and liberty of conscience in religion (and this is the first principle of Protestantism), and no Christian sect this side of Rome can consistently call "halt" to the heretical member or the free thinker. The rationalist or atheist is as truly and consistently a Protestant as the Episcopalian, Presbyterian, Methodist, or Quaker. He has only taken a step or two further than they,—a step which they also, as adherents to the Protestantism of Martin Luther, have a perfect right to take.

It is, therefore, clear that no "organic union" of Protestant sects with the *Nicene* or any other dogmatic creed, arbitrarily enjoined as a doctrinal basis, could possibly hold together long enough hardly to complete the preliminaries of organization. Those who can rest content with mere machinery and authority will seek and find anchorage in Rome. Those who refuse to be comforted in such a straight pocket (and they will presently be the overwhelming majority) will still continue to go off from the sects in heretical tangents to all points of the religious compass. Thus will end all Protestantism. How long after that will Rome stand intact? Could the Romish Church get control of the education of the young, for which she is insidiously striving in every civilized country, and could the progress of science be stayed by a papal encyclical or by a *Bull* from the Vatican, Roman Christianity might linger in life for considerable time to come. But secular and moral education, with the rapid progress of science, will, in the end,—not very distant,—speedily reduce the last stronghold of superstition.

"The evolution of Christianity!" This unfortunate admission looks very much like a fatal blow at the divinity of the whole system. What is evolution but progress,—gradual change from the homogeneous to the heterogeneous, from the crude and imperfect toward the mature and perfect? Was Christianity, then, crude and imperfect, that it must come under the law of evolution for proper development? A divine and perfect system subject to the same law of change and progress as the crude and imperfect institutions of man! It would, I should think, be just as reasonable to bring mathematics or exact science under the law of progress as so to bring theology or what claims to be a divine revelation. One would naturally think that a divine and hence perfect system could no more be improved or affected in any way by evolution than the multiplication table. That the whole of anything is equal to all of its parts, or that the angles of a triangle are equal to two right angles, may not have been grasped by primitive man for ages and ages; yet, when he did discover or comprehend for the first time these simple truisms, they were as mature, as perfect, as they are to-day, being forever truths and incapable of change or improvement. It would seem to stand to reason that, had an omnipotent and omniscient Being given a religion to man for his acceptance and guidance, it would necessarily have been perfect, and hence no more

subject to the law of evolution than the axioms of Euclid. Therefore, when the Christian admits that Christianity is subject to improvement and development, he places his religion in the same category with all the other religions of the world and all other human systems and institutions.

In reply to this, it may be said that, under the action of the law of progress, Christianity is simply getting rid of foreign accretions and exotic excrescences, for the acquisition of which the religion itself is in no wise responsible, and that its essential doctrines remain *intact* and unchanged. But this plea will not do. The fact is that the very fundamental doctrines of Christianity are in that state of "transition" frankly conceded by Mr. Low. Even some of the practical precepts ascribed to Christ in the New Testament have been a dead letter for centuries,—such, for instance, as the treatment of the sick, the community of goods, the non-resentment of insult, etc. Christians might as well be candid with themselves and with the facts. When the so-called "accretions" and "excrescences" of Christianity are all gone,—and they are rapidly going,—there will be nothing left but the moral and rational part; and that is all that has been, is, or will be, useful to mankind.

The question, What will be the moral and social outcome of so great a revolution of religious thought and doctrine? is a very perplexing and disturbing one to many devout and philanthropic minds; and they are led to take an extremely pessimistic view of the future. As a consequence of the approaching wreck of creeds, they see morality a wreck, the whole social fabric a wreck. This dismal prognosis is, however, just what we might expect from the devout *doctrinaire*, who religiously believes that man by nature is "utterly depraved," with a heart "deceitful above all things and desperately wicked"; who steadfastly believes that belief and morality are one and the same thing, or, at least, inseparably bound up together, and that it takes the "fear o' hell," which is "a hangman's whip," to "haud" human wretches in order. His sombre forecast is a perfectly logical conclusion from his premises. But these being utterly erroneous,—each and every one of them,—the "blackness of darkness" looming up before his vision in the future may well disappear. There is some good in human nature, after all, independent of all religious beliefs. There is a genuine altruism of humanity, which will survive the merely incidental wreck of tentative creeds, confessions, and faiths. The good has been evolved, along with the bad, by the ever-upward-acting law of progress; and we may confidently predicate its continued upward progress, in spite of the timely—possibly, premature—decay of time-worn beliefs, which themselves, no doubt, play a necessary part in the evolution of humanity from a lower to a higher plane. The altruist and philanthropist, no less than the scientist, the iconoclast, and the reformer, may look to the future with confidence and without misgiving.

ALLEN PRINGLE.

DOGS' LANGUAGE.

A sad story of the sea has circulated for years among the sailors and "those that go down to the sea in ships" about a great Newfoundland dog. There never seems to be a name attached to the dog or to the story, but it is as simple as touching.

A captain used to call every day at the office of his brother, in a large seaport town; and his dog would stop at the office, too, making it headquarters. If the dog was missed during the day, he was sure to turn up at the office, sooner or later.

But the captain sailed away, taking his dog with him; and no word ever came back concerning his fate. The vessel was one day posted as "missing," and the insurance was paid. The crew were mourned as dead; and all hope had departed, save from the hearts of the hopeful few who ever cherish the faith that some day the missing ones will come again.

More than a year had passed away, when the Newfoundland dog presented itself at the office door. Not the sleek, well-kept animal it once was, but a poor, ragged, half-starved dog, with hungry eyes and a wistful look. Where the dog came from or how it came, nobody ever knew; for the poor dog could not tell his story. Nobody knew his language; and so the dread mystery of the vessel's fate has never been unravelled, and no word of relief has ever come to the sad hearts who mourn for the loved ones lost.

Everybody who has learned to love a dog—and who has not?—must have felt that the dogs have a language of their own. The amount of emotion a dog can express by the wag of his tail is quite wonderful. Some dogs seem able to express their views in the most decided manner, with the help of voice, eyes, and tail; and their masters can often tell what they mean just as well as if they spoke in the most grammatical English. The wild dogs of many lands are voiceless; while others, like the coyote of Lower California, make night hideous with a yelp that has no more music in it than a cat's wail. The dogs of civilization have acquired a very definite mode of expression in their bark; but there is as much variety in their language as in the human language, for dogs are born to different lives, as well as men,—

"Some wake to the world's wine, honey, and corn;
While others, like Colchester natives, are born
To its vinegar only, and pepper."

The dogs of Constantinople are famous for their plenitude and their general meanness. They are of a reddish tawny color, of no particular breed, with a marked tendency to lie in the roadway and make strangers feel uncomfortable. This dog, mean and despicable as he is, has got a language of his own, and a very strict code of laws. The city is divided into wards and districts by these curs, and the limits of each district are more carefully marked than any ever marked by a heelless Turk. In each district there is a large number of dogs which belong to nobody. They are public property, public scavengers, public pests. The views of the Moslem on the dog question are of the most peculiar character. He despises a dog,—all Eastern people do; but he believes it will go to heaven. The strongest term of reproach he can use to a human being is to call him a "Jew's dog." Yet to feed the homeless dogs of his city is a religious duty. The only animals to go to heaven are three,—the camel on which Mohammed rode, Balaam's ass, and Kitmer, the dog of the Seven Sleepers. Yet a more badly used animal than the dog it is almost impossible to find, unless it be a poor Turk himself. These outcast yet revered dogs have organized themselves into communities; and woe be unto the dog which leaves its own ward and wanders in another! As soon as he is observed, there rises a dog's call, which cannot be mistaken. It says, "Here's a stranger: kill him"; and the sleeping curs wake up to activity, and fly at the rover. If caught, his shrill is short,—the cowardly dogs worry him to death. But, if he is too fleet of foot, and runs the gauntlet in safety, he finds the inhabitants of the next ward ready to receive him; for the dog language is a loud and distinct one, and the wandering canine falls a victim to the curs of the next ward.

On Friday, which is the Moslem Sunday, some

old hadjis—a "hadji" is a Moslem who has performed his pilgrimage to Mecca—may be seen feeding the dogs. Every Moslem who has visited the tomb of the Prophet at Mecca is entitled to wear a green turban; and that denotes a certain amount of religious fervor, like the S.S. on the red collars of the Salvation Army. The green-turbaned old hadji takes a bag of bread with him on Friday, and walks solemnly through the narrow streets, distributing bread and kicks with unerring alternation; and the dogs watch for both with hunger-sharpened eyes. As the hadji reaches the end of the district, a new set is waiting for him; for the dogs of the adjoining ward have heard the cry of "Bread," and they are waiting at the boundary line for their turn. They, in turn, raise the cry of "Bread" before they reach the next district; and so the old Moslem has a continuous following of dogs. And it is a strange sight to watch them halt at the invisible boundary line drawn by canine law.

How distinct and intelligible is the dog language among these homeless curs may be gathered from the fact that a few days' residence in an Eastern city will enable a stranger to tell what is going on among the dogs from their tones. Sitting at dinner sometimes, in a quiet hotel, there can be heard the sudden barking of a dog in the street, and several people will ejaculate, "There's a stranger"; and, sure enough, the sight of the dogs of the ward flying wildly after an interloper will be visible from the window. So with many another movement among the dogs: their language is clear and distinct. An inarticulate, if noisy, manner of communicating ideas they surely have; and it is a pity that some man or woman who loves dogs does not try to write a grammar of dog-talk, and reduce the language to a system, just as the missionaries do with the heathen. Of course, the dogs would hardly be able to buy calico or drink rum, even if we knew their language, but it is worth while trying it; and it is very gratifying to learn that students, like Sir John Lubbock, are trying to teach animals our language, which is a step in the direction of learning the dogs' language. For, in the mutual interchange of ideas which would ensue, it might prove that the dog had many things to teach us; and, as in the case of the captain's great Newfoundland dog, it might be that dogs would be able to tell strange stories.

How much dogs think, we know not; but, when a dog howls in the still hour of the night, it strikes terror to many a heart, for all nations have agreed in attributing supernatural powers to the dog. The Arabs say that, when the death angel, Azrael, hovers round a house, the dog can see him, and so raises his melancholy howl to tell it to the sons of men. This belief still lingers with many a one in our own land, and that is almost the only phrase they understand in dog language.

B. McMILLAN.

EDITORIAL NOTES.

BY B. F. U.

In a recent lecture in Providence, R.I., on "Memory," Mr. John Fretwell said: "Many instances of so-called death-bed conversions were, no doubt, the result of an unconscious act of the memory, which, under the weakness of approaching dissolution, fails to call up the impressions or convictions of mature life, while those of childhood and youth unconsciously influence the weakened mind; and not only does the reprobate Sir John Falstaff, in his dying hours, 'babble of green fields,' but also the philosophic poet, Goethe, writ-

ing at the close of his great work, *Faust*, can say, alluding to his childhood's faith,—

'What I possess, I see far distant lying;
And what I lost grows real and undying.'

We should all train our memories so as to retain what is worth remembering and forget what might be a burden to the memory, lest we be like the Bourbons, who learned nothing and forgot nothing."

"If a man pretends to raise spirits from the dead," says *London Truth*, "or to read the thoughts of the living, he cannot only do so with impunity, but he may mix in the best society, and make money out of those he victimizes. On the other hand, should a poor woman, when importuned by a lot of foolish members of her own sex, shuffle a pack of cards and pretend to tell them their fortunes, the law comes down upon her with a sentence of three months' imprisonment with hard labor."

MR. JOSEPH COOK never heard of Mr. Schindler, although all the Boston newspapers have printed lots of the rabbi's sermons. Mr. Cook knows so little about what is so that it is not surprising that doubts are occasionally thrown upon the accuracy of his information upon the many things which ain't so, and with which he is admittedly familiar.—*Boston Evening Transcript*.

MR. ALLEN PRINGLE writes from Selby, Ont.: "When I read your 'open letter' to Col. Ingersoll, I was certainly somewhat startled; but I cannot say that I was much surprised. I looked for the President's response; but it came not,—at any rate, publicly. Sometimes, I think you are a little too inflexible and severe in your attitude toward them; but, again, when I reflect that your positions are justly taken and your impeachment unanswerable, you are, perhaps, quite right in your course. No doubt, Ingersoll felt the moral force of your arraignment, but thought best to make no public defence. Besides, the altruistic emotional element is so strong in the Colonel as to disqualify him, morally and intellectually, from seeing the points in the controversy just as you see them." "The altruistic, emotional element" did not prevent Col. Ingersoll's seeing the "points." The statements we made were strictly true and called for, and they accomplished the purpose for which they were written.

"SUBSCRIBER" inquires, "Is there any truth in the statement, made by Joseph Cook, in one of his recent lectures, that Strauss abandoned his theory concerning the mythical origin of the gospel story?" Strauss never abandoned his mythical theory, but adhered to it to the end of his life, although, on some points, his views underwent slight modification after the first edition of his *Life of Jesus* was published. Strauss' theory, it should be remembered, never, as is so commonly represented, involved the denial of a man and teacher named Jesus.

THE Chicago *Inter-Ocean* says that the pastor of one of the fashionable boulevard churches of that city in a recent sermon applied, "in an expectorant way," the word "fool" to men who hold agnostic views; and that journal is moved to remark that "coarse and insolent treatment of the nescience of those who candidly admit their inability to fathom the mystery of first cause is so common as to deserve rebuke." To those who excuse the discourtesy by referring to words of the Psalmist, the *Inter-Ocean* says:—

The word translated "fool" is nabal, which was in the vernacular of that royal writer both a proper name and a class distinction. It may be recalled that this same king, while he was a hunted outlaw,

had an experience with a nabal which was not at all to his credit, to say the least. Whether that episode in his life had any connection with the remark quoted or not is a question in exegesis which it is not worth while to discuss here. Be that as it may, the temptation to stigmatize anybody as a fool on account of his intellectual convictions on this or any other subject ought to be resisted, especially in the pulpit; for, besides being bad form, it is in express violation of a precept taught by a greater than David, who said, "Whosoever shall say thou fool shall be in danger of hell,"—not the hades or sheol of the new version, but the Gehenna of fire. It is true that the term fool is found no less than one hundred and ten times in the King James Bible, the translators having used that term in rendering at least a dozen different words or phrases of the Hebrew and Greek of the original text; but no inferential sanction can break the force of the prohibition placed upon the epithet by him "who spake as never man spake."

IN his recent memorial discourse on Dr. Mulford, Prof. Allen spoke as follows: "I sometimes fancied that the tone of his thought was changing in his last years. Not that he had abandoned the convictions which had inspired his earlier teaching: he had nothing to take back of what he had written. But I think he felt the necessity of setting forth more strongly the nature and the claims of that humanity to whose perfection the divine institutions of life, the family, the Church, and the State, were appointed to minister. Society and humanity,—these were uppermost in his last thoughts. He realized that the danger to institutions springs from an exaggerated sense of their importance, making them to be ends in themselves instead of means to a larger end, as if man existed for the institution instead of the institution for man. Only by keeping in view the goal of history could this belittling tendency be overcome. Hence, he welcomed every movement which promised to enlarge the institution or better adapt it to its purpose. And so his thoughts rested more and more upon humanity, upon society, as the redeemed form of man. He was beginning to accumulate the books that bore upon sociology and political economy. He was studying socialistic theories. He was projecting in his mind the same large treatment of the subject which his other works display."

A FRIEND writes: "I wish to inquire as to Herbert Spencer's attitude on the question of the correlation of extra-organic and intra-organic phenomena. Dr. Montgomery says, 'This new and sweeping generalization [law of correlation] induced Mr. Spencer to bridge the chasm between motion and sensation by boldly declaring that the sundry motions reaching the brain become actually converted into their corresponding sensations.' Now, I do not so understand Spencer. On the contrary, I understand him to say that here the law of correlation, in the sense of conversion, does not hold; and that the law is only one of concomitance; and that Fiske elaborates this law of concomitance at length. What say you? I understand Spencer and Fiske to affirm an underlying unity of the Unknowable only, a transphenomenal unity." Our friend is correct in his criticism. Mr. Spencer, far from holding that motion is converted into feeling, declares that the metamorphosis of one into the other is neither provable nor conceivable; that the relation between nerve-motion and feeling we know only as a relation of concomitance; that neither is convertible into the other, as motion, for instance, is convertible into heat or heat into light; and that it is idle therefore to look for the cause or explanation of mental phenomena in physical processes to which they stand parallel. Nerve-motion and feeling are regarded rather as the objective and subjective manifestations of the

same reality. Dr. Montgomery's mistake was due, probably, to a slip of the pen or to some inadvertence.

MR. GEORGE JACOB HOLYOAKE, in his paper, the *Present Day*, relates the following incident: "At that time, Major B.—Bicknell, I think, was the name—asked me if I would object to be prayed for by the Catholic Church. I said I had no objection, if he thought any good would come of it. He said that, if £15 pounds were paid in my name, ten thousand masses would be said on my behalf. I thought they must be very short masses, considering the number and the price; but, for all I knew, there might be a reduction in the charge on account of the quantity. I was told that it was necessary I should give my consent, and that some of my Catholic friends would send the money to Rome for that purpose. My answer was that, in my opinion, the money might be put to a better use; but, if they thought good would come of it, I did not object. I was in want of some good, as not much had fallen to my share up to that time. Of the result of the prayers, which, for all I know, may not yet be ended, I have no direct evidence. Since, however, that period, I have acquired many new friends, quite beyond any expectations of mine. As a reading-room and large gallery have since been open in my native town, Birmingham, on Sundays; as the Affirmation Act was passed nine years later, enabling me to give evidence in courts of laws; and as two million additional voters have been enfranchised, fulfilling in that respect the claims of the Chartist Executive, of which I was a member,—all may have been owing to aforesaid prayers; and I am not prepared to make oath that they have not so come to pass in consequence."

A. L. LEUBUSCHER writes from Water Mills, N.Y.: "Will you please put among your editorial notes the following inquiry to Mr. Gill, which I think would tend to elucidate the matter? *Brown*: (1) What is the definition of and distinction between 'lexical correspondence' and 'identity'? (2) If the sensic moon is 'all in my eye,' how do I get to the scientific moon that is 'not at all in my eye'? (3) How do I rise from experience which is 'me' to existence which is 'not me'? (4) Do I understand Mr. Gill to imply that he 'eats himself'?"

REFERRED to Mr. Gill, these questions elicited the following response: "To *Brown's* question, I answer as follows: (1) The difference between lexical correspondence and identity is the difference between likeness and sameness. *Brown's* sensation is like mine, but it is not mine; and the objects of sight are to *Brown* and *Smith* like to each other, but not the same; and they follow the same laws,—that is, they occur and recur and vary relative to both organisms in the same ways. (2) There is no 'moon' which is not a visual phenomenon. That is what the word 'moon' means, a particular object of sight, which is only a visual sensation; and this is 'the scientific moon' as well as the moon of the common people. What is the supersensible cause of this sensation or visible moon remains to be determined. (3) We never know directly the 'not me.' It is not an object of sense, is not a phenomenon at all. How we are to justify our assumption of its existence is yet an obscure and difficult question in psychology and metaphysics. (4) Yes, *Brown* and *Smith* both 'eat themselves,' especially when in these days they ask such questions. Eating, like every other act or experience, is a subjective process. It is a correlated transmutation of certain phenomena into other phenomena,—the lower into the higher. Man is his own universe and self-subsistent."

The Index.

BOSTON, APRIL 8, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, : : : : : } Editors.
BENJAMIN F. UNDERWOOD, : : : : : }

NO WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

GEORGE JACOB HOLYOAKE.

BY GEORGE ILES.

I.

George Jacob Holyoake was born in Birmingham in 1817. His father was for forty years a foreman whitesmith; and, as early as six years of age, George worked at making horn buttons, a business conducted by his mother. Afterward, when still very young, the little fellow busied himself when school hours were over in making lanterns. From twelve to twenty-two, he worked at the Eagle Foundry in Birmingham, where he won repute as a good workman. To this day, Mr. Holyoake prides himself on his handicraft skill, and says that he can go back to the bench at any time and earn his livelihood. While an artisan, he invented several ingenious machines, and had the prospect of becoming a civil engineer, being for a time on George Stephenson's staff. His workshop had to be his college; and there, at meal hours, he learned the tasks prescribed for him at the Mechanics' Institution, then conducted by a teacher whose ambition was to teach his pupils to think as well as learn.

Mr. Holyoake's mother, a woman of remarkable piety, sent him to Sunday-school for several years, under the pastorate of Rev. Angell James, a Congregationalist clergyman of note in his day. From being scholar, Mr. Holyoake at length became teacher, and taught Sunday-school first in Birmingham and then in Harborne, a village near by. Afterward, he taught what he knew of mathematics and rhetoric in the Unitarian schools in Birmingham, in times when it was not held unlawful to provide working-class youths with secular instruction on Sundays. At the experimental Exhibition of Arts and Manufactures, held in Birmingham in 1839, out of which grew the first great International Exhibition of 1851 and all its successors, Mr. Holyoake was chosen from the Mechanics' Institution to select and superintend the assistants there. On the death of the teacher of the Institution, Mr. Holyoake was appointed

to succeed him. Ever since his twentieth year, when he heard Robert Owen lecture, he felt convinced of the importance and value of co-operation; and, in 1840, he was appointed Social Missionary, as the lecturers on co-operation were then called.

It is clear from all this that young Holyoake was no ordinary artisan. He was stirred by worthy ambition to improve himself, and that ambition proceeded on the sure basis of strong natural ability. His education had been scant, and he felt oppressed by his burden of ignorance. Such of his friends as he made in the days of his boyhood and youth, who are still in the land of the living, speak of his ardent use of every opportunity to hear lectures or witness scientific experiments.

All this while, he had been a Christian of more than common zeal; but a change gradually came over his religious convictions. The Christianity of to-day in England is a very different thing from the Christianity of Mr. Holyoake's youth. The progress of criticism, the resistless tide of science, both as achievement and method, and the advance of democratic practice and sentiment have all combined to change a Church which, fifty years ago, was as uncompromising as Rome itself in dogma and tax-gathering. Mr. Holyoake's withdrawal from Christianity was quite as much a matter of shocked moral sense as of offended reason. His revulsion from doctrines of miracles, verbal revelations, and atonement, went parallel with a recoil from the harsh tyrannies of the Established Church.

In his boyhood, his parents had been suddenly reduced by a commercial panic to a state of unusual privation; and, at this crisis, his little sister fell ill. While she was so, the Rev. Mr. Mosely, rector of St. Martin's, Birmingham, sent an order for his Easter due of fourpence. Poverty prevented it being paid; but, the next week, a summons came for it, and for an additional half-crown, because of the non-payment of the fourpence. The payment could no longer be evaded; for, in a few days, a warrant of distraint would have rudely dispersed the scanty household furniture, as had recently been the case with a neighbor. Dreading this, the family gathered together all the money they could by sale of some clothing, and the mother reluctantly left home to pay the "due." She was kept waiting at the court from five to six hours; and, when she returned, all was over,—her child was dead. "Will you wonder," says Mr. Holyoake, "if, after all this, I began to doubt the utility of church establishments?"

In 1840, after he began lecturing as a socialist missionary, he soon took up his residence in Worcester, where he steadily addressed a socialist society for a year. From Worcester, he went to Sheffield, where he taught a day school and lectured on Sundays. While living there, an event occurred which decided his career. In November, 1841, Mr. Charles Southwell was imprisoned and fined for publishing in his journal, the *Oracle of Reason*, an attack on the Bible. The article was coarse and crude; yet, fully recognizing this, Mr. Holyoake held Southwell's sentence to be unjust, and one which wrongfully tended to repress free utterance. He at once came forward to conduct the *Oracle* during his friend's imprisonment. Henceforth, journalism was to claim him as one of its most forcible and able sons. Toilers for the press perhaps underrate their influence, because it can be so little traced out and proved; yet that influence is none the less real for being unseen. Bakers are quite as useful in the world as stone-cutters. While editor of the *Oracle*, Mr. Holyoake's views underwent rapid change. More than its bad logic did the inhumanity of theology

repel him. Speaking of Southwell's case, he said: "I was born pious, and nursed in Orthodoxy. Until a few weeks ago, I was a believer in the humanizing tendency of Christianity; but the persecution of my friend has been the cradle of my doubts and the grave of my religion."

As with all the better sort of sceptics, he swore the popular gods, not from absence, but from excess, of reverence for the really godlike. His sympathies and sentiments were insulted by the worship paid an unworthy ideal inherited from a barbarous past. He became an iconoclast only that he might afterward put on the pedestal of human respect simple manhood, true, kind, and wise. The chief use of religion in his eyes was its aid to morals. That aid, as far as it went, seemed to him derived from considerations of human happiness carried through the indirect and distorting medium of theistic thought. The original derivation was that of a crude people in remote eras. The medium was distorted by fancies weak and wicked, by interests and fears. He would make ethics depend on a direct modern conception of happiness and the obligations necessary for it, all intermediate machinery to his mind merely absorbing power and deflecting its direction. Without the calm and the breadth of information which better fortunes might have given him, he soon passed into the violence of revolt against the established religion. In the course of a lecture delivered in Cheltenham, May 24, 1842, he made a remark held to be blasphemy, for which he was tried and sentenced to six months' imprisonment. His punishment was imbibed by the loss of his eldest child, who sickened and died in consequence of the poverty caused by his absence from home. The effect of this imprisonment was to consolidate and intensify his disbeliefs into a more distinct form than they had previously held in his mind. While in jail, he wrote a pamphlet, entitled "Paley refuted in his Own Words," which presented the main arguments afterward elaborated in his book, *The Trial of Theism accused of obstructing Secular Progress*. From that work, I will read a few extracts, in illustration of free thought nearly fifty years ago:—

"Theocracy must place an excessive power in the hands of the clergy. It appeals so instantly and so tremendously to men's hopes and fears that it must make the priest omnipotent over the people, as it always has done where it has been established. It has a great tendency to check human exertion and to prevent the employment of those secondary means of effecting an object which are at our disposal." "Science is the available Providence of Man. A general Providence is neutral in human affairs. Special Providence, if it ever acted, now sleeps. Science is the only Providence we find alive and active. As there are two Christs in the New Testament,—Christ the Gentle and Christ the Austere,—so there are two Providences in theology. One acts by general laws, and one interposes in special cases. General Providence is the discovery of philosophy. Special Providence is the ancient conception of superstition. This Special Providence, which has been by far the greatest power in popular religion, is rapidly retreating before the march of Science."

"To resolve religion into dependence is canonizing human weakness: whereas, man rather needs that which shall develop his strength. Life should be self-reliant. The light of Nature and the experience of man are anterior to clerical dogmas, and are the sources whence guidance and duty independently spring. The Priest breaks in upon the integrity of life, and diverts its course. His assumption is that he makes an addition to our

knowledge. But does he? He professes to show us the hidden things of the future: we fail to see them. He simply encumbers us, and we pray him to stand aside. The responsibility of our course is our own, and not his; and we have a right to be left free when we demand exemption from his mistaken interference. Rejecting (as in self-defence we are bound to do) the irrelevant advices of the Priest, he proclaims that we reject truth, honor, justice, love: whereas, the fact is we merely reject him. His denunciation of us is his error or the retaliation of his disappointment. We appeal, therefore, to the informed, the impartial, and the candid to judge between us. We respect theology, inasmuch as it professes to explain man's destiny, and regret that it bears no fruit for us. But this is not our fault, and we therefore attempt to solve the problem of the present and the future for ourselves."

"If Nature be God's mode of manifestation, the God whom we seek is the Nature which we know. If some Independent Being controls and animates Nature, such a Being must be self-existent and supreme, distinct from the universe, and more powerful than it,—a second self-existence governing the first and vastly more difficult to account for! This is not a doctrine that clears up difficulties."

"The orthodox Theist despises Nature, and the pure Theist ignores it. Instead of putting themselves in patient and studious relations to it, they subordinate Nature and escape from humanity, seeking to propitiate by creeds and words the God they invent instead of serving by life and works the Nature they find."

He contributes this to the discussion of the old problem of evil:—

"Some, unable to account for the presence of evil in the world, persuade themselves there is a use for it. To such, the reply is brief. Do you tell us that evil is necessary discipline, and is the condition of good? Then we ask, Why do you not take steps to increase evil, that discipline may abound and good be universal? If this doctrine be true, the hospital is an heretical institution and medicine is a blasphemous profession. The gout is a stimulus to heaven, and the toothache an unappreciated blessing. It does not matter what a theorist says. We know what he secretly feels by his practice. Do we not all combat evil? Do we not count it the triumph of humanity when we conquer misery? Does not the Idealist dream of perfection? Does not the Philanthropist toil for it? Does not the Poet paint the golden age? Does not the heart of the world yearn for the Millennium? We believe, then, the absence of evil to be possible, and know it to be desirable. Since, then, we believe universal Happiness to be possible, how dare Theism say God could not make good without evil? And, since we feel the abolition of misery to be the passion of all good men, how dare Theism say that a good God has designed the suffering which makes the breast to sigh and the earth to seem sad? There is far more reason in free thought, which confesses 'all this is not to be understood'; and far more reverence in free thought, which refuses to ascribe suffering to God; and far more modesty in the conviction which prefers to maintain silence where speech is a contradiction of itself or an imputation upon Deity."

"We no longer live in a state of society where the strong man knocks with impunity the weak man on the head. But we live in a State where Capital can be despotic, and Knowledge a monopoly. In every English town, thousands hold their lives at the caprices of commerce or are liable to be thrown out of employment by the accident of a new invention. Homes are broken up, house-

hold goods are sold off, and penniless and despairing families march away to struggle for precarious bread at the diggings of Australia or to perish in cultivating the swamps of the Mississippi. Wisdom is the perquisite of the rich. Education makes the few giants, and ignorance keeps the many dwarfs. The instructed talk in tongues the people cannot communicate in; they live in realms of thought the people can never enter; they create and control influences the people can never counteract. Wealth and Intellect will indeed bring blessings to all in due time; but who will save those who perish while the blessing is coming? No man's heart can tell him so clearly that God exists as every man's heart tells him that all human misery should be averted. We appeal to all who have felt the sharp pang of inevitable anguish and fruitless hate. What is the lot of the poor but to suffer and be impotent, and die, like quarry slaves, in the heart of civilization? Living, men give up in despair, and accept the coward's consolation of Theism. They may accept it who can. We prefer to strive. Let whoever believes in God believe that misery exists in spite of him, and continue to fight against wrong and suffering, believing that, if God exists, he stands on his side in doing so. Suffering should not teach men dependence: it should teach men to combat. There are many precepts; but there is but one virtue, and that is to work. There are many Finger-posts; but there is only one Path, the path to truth. There are many Theologies; but there is but one philosophy, and its name is Fortitude."

Mr. Holyoake, in these early years of his life, was called an atheist; and his doctrine, atheism. Now, we would call him an agnostic; that is, a thinker who holds that human reason is impotent to solve the ultimate questions of the origin, government, and destiny of the universe. Very soon, in the circuit of his thought came a reaction from extremeness and violence. His long and faithful Christian training reasserted all its best elements in him. Whatever a man has been, that he continues to be; and not in vain had this sincere spirit come of a race learning its right conduct from Christian pastor and teacher, through generations believing in a wise, divine Father, whose children, whether wicked or just, were a family of brethren. To quote from a critic of his:—

"Most of the original minds who commence active life on the side of Negation come to alter their formal creed after some years' conflict with the realities of life. Many fail for want of personal or intellectual self-reliance, and turn to the Affirmations of Orthodoxy for moral support. Others, of less impressible temperament, grow fanatic and impracticable from the inability to perceive any truths beyond those which are peculiarly constitutional to themselves. But the healthiest and happiest of the band, escaping both the Scylla of submission and the Charybdis of isolation, emerged safely into the Affirmations which were the true complements of his original Negations, and which, though long unanalyzed and but half-perceived, were really the central fountains from which that negative preaching derived all its generous life-blood."

As an evidence of the essentially right spirit of Mr. Holyoake,—a spirit not merely Christian, but simply human,—let me quote from an article written by him in 1840:—

"What I am anxious to guard against is the impression that we acknowledge, as of our party, that numerous class of persons in this country who are simply ignorant or indifferent to religion; who will cavil at a prophecy or sneer at a humble believer, but who are susceptible of no

generous inspiration of moral truth nor make any sacrifices to enlighten those whom they affect to regard as superstitious. . . . These we do not count, nor even another class, who are simply neutral and negative. We only include those whose free thought is active and fruitful; those who are free thinkers, not from reaction, but from examination and conviction, and whose rejection of Christian tenets is translatable into a clearer moral life and into systematic and patient endeavor for the benefit of others."

"Let any one look below the mere surface of pulpit declamation, and ask himself two questions: What has free thought, on the whole, meant? And what has it, on the whole, sought, even as to its negative and least favorable side? It has, in modern times, disbelieved all accounts of the origin of nature by an act of creation, and of the government of nature by a Supreme Being distinct from nature. It has felt these accounts to be unintelligible and misleading, and has suggested that human dependence and morals, in their widest sense, should be founded on a basis independent of Scriptural authority. And it has done this under the conviction, expressed or unexpressed, that greater simplicity, unanimity, and earnestness of moral effort would be the result. This is what it has meant, and this is what it has sought."

"Our particular inability to attain to the desired solution and our attempt to walk by an independent light, you describe by the term 'Atheism,'—a name which associates guilt with dissent. It is quite true that till very lately we used this priest-made term. But, when we clearly found that we were spending our time in re-educating the public in the right meaning of a negative term when we might be educating them in positive principles, we declined any longer to employ a name which, as understood by Christians, distorted and falsified our objects wherever it was heard. We therefore resolved to choose a new name,—Secularism,—which should express the practical and moral element always concealed in the term 'free thought.'"

I shall here give Mr. Holyoake's mature definition of Secularism, published in March and April, 1884, in his journal, *The Present Day*. The first suggestion of such a definition was made to him in the course of his experience as a co-operative lecturer. He could not help observing and condemning the confusion which arose in the early social movements, from theology being mixed up with them. He therefore devised a system of secular principles, equally removed from those of atheism and theism, maintaining that, wherever a moral end was sought, there was a secular as well as a religious part to it:—

"Secularism means belief in this world. It studies the laws of this world and the uses of this world, and regards the duties of this world as consisting in seeking happiness through morality; and it measures morality by its conduciveness to promote the welfare of others as well as the welfare of the individual. Secularism seeks this welfare by the employment of material means, because these means are most certain, and everybody can employ them. It does not believe in believing: it believes in working. The most ignorant and idle and unscrupulous can excel in believing, but only the intelligent and honest can or will work for the welfare of themselves and for others. But the best intentioned persons will not work with zeal unless they are certain of results, and certainty of result can only be attained by wisely chosen material effort. The distinction of a secular society is that it seeks the improvement of this world by material means,

always understanding that the means employed shall be moral. It regards Science as the available Providence of man. What other Providence there may be belongs to Theology to determine. In this world, it is clear that the regulation of human affairs, human welfare and progress, is conducted by Science. Condorcet has remarked that it took two thousand years after Archimedes and Apollonius to perfect the science of navigation by mathematics and astronomy, so as to save the sailor from shipwreck. When navigation was thus perfected, it totally superseded the efforts of the human mind to induce, through prayers and sacrifices, the Providence of the Churches to control the winds and waves with a view to the safety of ships. The Providence of Science does that, and gives Heaven no trouble. It appears to Secularism that this world is made to be self-acting, and that there are means of self-help and self-direction for those who use common sense. Secularism is the creed of self-help. There is no doubt that morality ought to be the aim of every person. There is no doubt that material means are the most certain means of increasing human welfare. There is no doubt that reason and free speech (which means fair, considerate, and relevant speech) are the surest means by which truth can be discovered and advanced. These things, about which there is no doubt, are those which a Secular Society makes the bond of agreement among its members. There are two things which have always been doubtful,—conclusive knowledge of the existence of God, and a future state. There are many people who believe they know all about these things, and have no doubt about them; while others, less wise or less confident or more modest, are less sure concerning these things. There always have been and still are great differences of opinion upon these subjects. The Secularists, therefore, leave these unprovable things to the private judgment of members, and ask for no agreement thereupon, because the proof of the existence of Deity is beyond our faculties. The proof of a Future State lies beyond the grave. The Secularist, therefore, says, "If God made this world, and I improve this world as far as my power goes, I shall be fulfilling the will of God, whether I have personal knowledge of him or not. If I promote human welfare in this life, as far as I have opportunity or discernment of it, I shall deserve another life, if there is one, and shall have fitted myself for it in the best way and the only way open to me. . . . There are persons who seem to have no faculty for anything but Atheism. They pay but little attention to the improvement of the world, they are so interested in finding out its origin. Yet the origin of the world is a very small question compared with its uses. The wise use of this world depends in no way upon the knowledge of the cause of it. A man may judge of the house he desires to live in. He can tell whether it is well situated, has a wholesome neighborhood around it, whether it is well drained, well ventilated, has light and space, and will be a pleasant, healthy habitation, although he may never know who is the architect of it. The Secularist regards this world as a habitation whose builder is unknown, and seeks to put that habitation to the wisest uses instead of devoting his whole time in trying to discover the builder, who does not choose to be found, and whose address no one seems to have."

"Other persons seem to have no faculty except for Theological discussion. They profess to consider theology a waste of time, and yet they waste their own time upon it. Instead of trying to improve men by advising the study of morality and

science, these persons enable the priests to call them 'Infidels,' which sets people against the secular truths they might teach, and sometimes try to teach. The term 'infidel' means one who disbelieves or denies what he knows to be the truth. This term cannot be applied in science or morality, because such truth can be proved in this world, while the theological truth of the Bible can only be proved in another world. So much of the Bible as is moral, and accords with the experiences of this life, the Secularist accepts. The Secularist, as such, is not under any obligation to prove the Bible is not true. His business is to prove his own principles true, which are independent of theology. There was a time when the Bible was thought to be the source of all truth. Now, Science is known to be the one fount of truth. Therefore, Secularism advocates the study of Science, and teaches that morality is the true piety. The priest preaches the usefulness of piety: Secularism preaches the piety of usefulness. Theology preaches piety to God: Secularism preaches piety to Man, which must include piety to God, and is the only way in which men can show it.

"Secularism is not a new name for an old thing, but a new name for a new thing. Secularism is that which teaches self-help by the use of Science and Morality, founded, not upon creeds, but upon experience, which shows that honesty, truth, and kindness are best for this world, and not bad things for another, if it comes to that. Therefore, the Secularist is under obligations to use fairness of speech, to avoid offence of imputations,—which set people against new truth,—to explain, and not to denounce; to speak with reason and consideration, since dogmatism and outrage are traits which betray new truths to their enemies. Some people think that they may shock people into the truth, but they make shocking converts by this method. If Secularism does not make fair speaking, pleasant-minded men, it is no better than Theology, of which honest men have grown tired because of its disagreeable fruits of bigotry, imputation, and unpleasantness of speech."

CORRESPONDENCE.

LEGISLATIVE ACTS IN 1885.

Editors of The Index:—

As there are now pending before our Massachusetts Legislature four important questions affecting the rights and privileges of women, all of which will probably be decided before many weeks, it may be well to glance back for a year, at the past action of 1885, in order to prepare ourselves for the coming action of 1886.

Quite a number of measures directly concerning women were considered by the General Court of a year ago, but only three favorable ones were actually passed; while seven or eight were rejected or decided to be inexpedient for legislation. One of these three favors granted to the "protected" class was a bill authorizing the appointment of women as assistant registers of deeds. This was the result, I believe, of a petition, the design of which was to secure that right to one woman, whose father wished to have her for his assistant. So this little loophole was made. The second matter is more important, since it provides for the punishment of husbands who do not support their families, saying that "whoever unreasonably neglects to provide for the support of his wife or minor child may be punished by fine not exceeding twenty dollars, or imprisonment not exceeding six months." By emphasis on the words "unreasonably" and "may," and by considering carefully the amount of the fine and the efficacy of imprisonment as a remedy for that particular offence, the full magnitude of this law as a protection to women may be grasped. If he unreasonably neglects his wife or child, he may be sent to prison! Yet this is better than nothing, and we should be duly grate-

ful. The third measure is very important. It gives to a widow and her children, or to the widow herself, if childless, the "possession, care, and control" of the family burial-lot. How could our law-makers dare to grant us so great a favor? The widow is also allowed to erect a monument, and to make other improvements; and, when it is remembered that a law of 1883 gave her the right to be buried in her husband's lot, this further legislation stating that, when once safely interred, she shall not be removed "without the consent of her heirs," is cause for great satisfaction and additional peace of mind.

These three mild and guarded acts are offset by a bill taking from a woman the right—granted several years ago—of depriving her husband by will of a life interest in half her real estate. By this legislation, the husband, after the death of the wife (if she has not borne him a living child) is entitled to half her real estate for life absolutely; while the wife, on the death of the husband (whether she has borne him a child or not), has a life interest in only one-third of his real estate. There are two sides to the question whether a woman should have the right of depriving her husband of his interest, and all true believers in equal rights would wish the wife to have no advantage over the husband. But there is only one side to the injustice of allowing a husband a *whole* or a *half* interest, and a wife only a *third* interest. And, while our legislators were removing an injustice to men, they should have also removed this injustice to women. The House also rejected a bill which provided that women and minors engaged in mercantile establishments should not work more than ten hours a day,—a measure which is again before the legislature this year.

The bill giving women the right to vote in municipal affairs was rejected by a vote of 61 to 130 (with seven pairs), and the petitioners for an amendment to the Constitution giving the ballot to women were given leave to withdraw.

Several minor matters were defeated. One of these was a petition for an amendment to the school-committee suffrage law; another for legislation to define and establish the legal capacity of women to hold office; a third on authorizing or requiring the election of one or more women on boards of overseers of the poor; and a fourth on amending the law relating to the registration of women, whereby it would have been less difficult and embarrassing to secure the proper qualifications for voting. It may well be observed just here that, under the present hypothesis, woman is and ought to be *protected* by man, and not trusted to exercise self-protection. These last four measures, as well as the ones relating to mercantile establishments and to the widow's right in her husband's real estate, are very illogical and unjust, since they in no sense protect the weaker sex; also, that a legislature which passes such laws has no right to refuse to grant municipal or full suffrage to women on the plea that their interests are protected already.

Still, another rejected measure was an order relative to establishing separate boxes for women's ballots, not a matter of very great importance or perhaps of expediency; and, finally, an order relative to taking the opinion of women, as to whether they wish to vote, by means of yea and nay ballots deposited in boxes provided for the purpose. The legislature probably discovered the absurdity and danger of this order, which would virtually have granted woman suffrage; and, since its provisions demanded that the question should be decided by counting the women who actually voted "yes" as affirmative and all those who voted "no," together with those who *did not vote at all* as negative, the defeat of this measure can hardly be deemed a misfortune, and perhaps should be counted among our gains. How would the men voters like it, if the license question (which each town and city decides for itself by "yes" and "no" ballots deposited in separate boxes) were decided by counting all those against license who did not vote at all? Yet the assumption in that case would be no more unfounded than in this measure which thus proposed to decide an important question, not by the votes of the voters, but by the votes of the voters *plus* the non-voters, the latter all counted on one side, whether their absence were due to opposition or merely to ignorance and indifference.

In reviewing this action of 1885, the truth is borne in upon one that our legislators are willing to grant us a very little bit of a favor, here and there and once

in a while, very carefully, step by step,—by dribblets as it were; but to give us that power which shall assure to us our rights in good, round, generous measure,—that power which, by making us man's equal before the law, shall put us in a position to protect our rights ourselves, without waiting to have them protected for us,—this idea it does not seem that our law-makers have yet quite comprehended. Let us hope that the action this year—on the hours of labor for women in mercantile establishments, on the bill making women eligible as overseers of the poor, on municipal suffrage, and on that mediæval law relating to the "age of consent"—will reveal some enlightenment as to the idea that women are no longer slaves or chattels or children, but that they are reasonable and reasoning beings, equal to man in every requirement that goes to qualify the citizen.

HARRIETTE R. SHATTUCK.

INTUITION AND RELIGION.

Editors of The Index:—

It is only with deep interest that I have followed the discourses and essays in the later editions of your paper. The writers seem to gain still more merit, if we look, not so much to what they say as to what makes them say it. The old question (as old as mankind) about the connection between mind and matter seems more agitated than ever. To me, that question represents itself in a rather unphilosophical way sometimes. I only wish to hint at the fact that we do have experiences that can be known by possession only, never by description. In such moments, our intuition makes it clear that the questioner and the question and its answer are one. I do not doubt that you have heard this before, and that you know what I mean. This intuition relieves from anxiety and curiosity, and gives a permanent security. At the same time, it shows that it would be vain to attempt gaining this result by understanding and will alone. Nobody would ever, after even the shortest light of that kind, desire to give form to the relation between soul and matter; and still less would he attempt "to build any religion upon a scientific basis." Take away the religious feeling born with man, and try so to "build up" a religion. We know there is a basis, an ultimate one. If some one say it is science, let him listen, if his heart acknowledge it.

But I have done; hope not to have delayed you. If you should publish these reflections, only let me say that I shall be utterly unable to defend them against any criticism. The words are uttered. What becomes of them can certainly be no care of mine. The meaning will take care of itself.

Sun lights the day,
And moon resplendent maketh the night;
If thou to wisdom seek the way,
Rays of thine own alone can give thee light.

L. WESTERLUND.

PROF. J. B. TURNER, in a speech at the Business Educator's Association of America, held at Jacksonville, Ill., said: "I say, ally yourselves to these common schools in the manner that I have indicated, not simply for their good, but for your own. You want to grow: attach yourselves to the common schools, and you will grow. Let the common schools know what you are about and what you are doing, and they will rally around you. But don't organize by tying to them. We have got crazy here in the United States in a great many interests about organizing. Now, since I have been out of the schools altogether, I have lost my admiration for cart-ropes organization, for binding unlike things together, and have taken matters of fact just as they are. In all our agricultural fairs, fortunately or unfortunately, they frequently have horse-races; but I never knew them to organize the racers by binding them fast to the plough-horses. The racer goes freely ahead: he don't 'organize' with anything. When you have hitched your racer to your donkey, what is he better than the donkey? Go ahead: let the donkey come along when he has a mind to. If he don't come, let him stay back till he gets ready to come. You can't afford to drag him or wait for him. I mean no reflection upon our most excellent and devoted common-school teachers. They are bound by necessity, law, and duty to patiently wait to try to bring up the slowest laggards in the republic. But why should you voluntarily take upon your necks a yoke which neither they nor their fathers were able to bear?"

In a late number of the *Revue de Belgique*, a Russian novelist is represented as relating a story which may be abridged thus: A hundred heretics had been burned at the stake the day before, when there appeared in the streets of Seville the well-known form of Jesus. Multitudes followed him, and kissed the imprint of his feet with tears. Children scattered flowers before him and sang Hosannah. A man who had been born blind received his sight. At the door of the cathedral, he met a dead girl carried in an open coffin. He spoke, and she arose. Then came the grand inquisitor, surrounded by his guards. Jesus was led to prison, while the people bowed their heads. That night, the dungeon cell was entered by the inquisitor, who stood there, still erect under his ninety years, and said: "Art thou he? Wherefore art thou come to trouble us? Art thou he, or only his image? To-morrow, I shall burn thee as the father of heretics; and the people who worshipped thee to-day will rush to heap up the coals of fire around thee. Thou hast given the apostles and their successors all power on earth. Thou didst found the Church, and she has chosen the pope to rule her children. Wherefore come to disturb her peace? She has made herself almighty on earth by the very means laid before thee when thou wert wandering alone in the wilderness. Hadst thou chosen then to let angels bear thee through the air in triumph, to turn stones into bread, to accept the kingdoms of earth and their glory, thou couldst have made thyself almighty. Thou choicest to die upon the cross, and leave men free. Their freedom has proved vanity and vexation of spirit. We, who have come after thee, have exalted ourselves above them; and they have delighted to honor us. We have given them bread in the wilderness, and their hunger is fed. We have accepted the kingdoms of earth, and it is happy under our rule. The millions labor as we direct, and delight in those childish sports which we ordain. When they sin, we promise them forgiveness. When they doubt, we teach them faith. It is their happiness to kneel at our feet. Few and wretched are they who seek freedom like thee in the wilderness. I was once among them; but I left the proud, and returned to the poor in spirit whom thou didst bless. Thus I became one of those who have corrected thy work. Thus our kingdom has established itself, and to-morrow thou shalt see its strength. Thou hast come to trouble us, and I shall burn thee at the stake. I have spoken." Then there was a long silence, which finally became terrible. At last, the prisoner advanced and kissed the pale lips of the inquisitor. The old man threw open the door, and cried, "Go hence, and return no more, never never!"

For The Index.

THE LEGEND OF TITHONOS AND THE DAWN.*

When the ship had left the current of the ocean-river, it entered the waves of the sea with its broad thoroughfares, sailing to the island Alaië, where is the abode of Dawn and also of Sunrise.—*Odyssey.*

Hour of the still unrisen Sun,
Of dewy-cool, auroral light,
Before thy star, young Phosphor, flit the shadows dun
And dreams of star-sown night.
Not yet with din of wains and tramp of feet
Innumerable the populous city roars,
But lies each long, deserted street
Silent as inland vale or lake with wood-fringed shores.

O Dawn, wou'd thou wert even now
As in the long-gone, mythic time,
When wore thy maiden brow
A chaplet sweet of rose and violet and thyme
Silvered with drops of dew or frosty rime!
In mystic isle afar of spiced, uncertain clime,
With comradeship of downy, sandalled Hours,
You dwelt, o'er-roofed by dewy, orient bowers;
While, reddening in your punctual beam,
A near your palace rolled the ocean-stream,
Which laved with current large
The earth's remotest marge.

*This fable, says Bacon, in his *Wisdom of the Ancients*, seems to contain an ingenious description of pleasure, which at first, as it were in the morning of the day, is so welcome that men pray to have it everlasting, but forget that satiety and weariness of it will, like old age, overtake them, though they think not of it; so that at length, when their appetite for pleasurable action is gone, their desires and affections often continue; whence we commonly find that aged persons delight themselves with the discourse and remembrance of the things agreeable to them in their better days. This is very remarkable in men of a loose and men of a military life, the former of whom are always talking over their amours and the latter the exploits of their youth. Like grasshoppers, they show their vigor only by their chirping.

There, as she sate upon her golden throne,
One cause of sad disquiet Eös knew alone.
The childish trouble of her age-bowed paramour
Came querulous forevermore
Through shining valve and breezy corridor.

While strength and beauty crowned her sweetheart bright,
In solitary bliss they lay
In bower of Eös, until orient day
Aroused her to her ministry of light.
How eagerly, when that was o'er,
And rippled in the Sun the ocean-floor,
Back to her chamber flew her footsteps bright!

But loathed Old Age at length
Tithonos reft of all his strength.
"Once," moaned he, "I was jealous of the hour
Which took from mine thy honeyed lips,
And left me lonely in thy bower
Here at the limits of the world,
When stars were waning in eclipse
And vapors upward from the low earth curled.
With burning tears and heavy heart,
I saw thy mist-dividing wheels depart,
While, wreathed with roses, round thee ran
The jocund Hours, and Phosphor lit the van
With torch of silver flame,
As up from vale, mead, hearthfire, came
The morning's cheerful steam,
To welcome incense-like thy roseate team.

But now thy deathless beauty mocks me with a use
Of frigid age and joyless impotence.
My fleeting mortal youth I gave to thee,
No match for thine eternal pedigree.
My flower of strength, limb, lips, and heart, was thine,
While love in strictest embrace us did join.
The wooer thou: I passive was to thee
Upon that long-past, unforgotten day
When on swift wheels you ravished me away,
And far aloof in chambers of the Morn
Me thrilled with bliss for which I was not born.
The Hours, which waste me, night by night renew
Thy bloom with rejuvenescent dew;
While I, thy paramour of mortal race,
Grow gray and shrivelled in your bright embrace.
Jove's spell reverse, that I may find the rest
Earth's children gave upon their mother's breast."

She in her inmost chamber him immured,
With bolts and bars the shining valves secured.
The tremulous graybeard had for food
Ambrosia in his odorous solitude.
Pervaded hall and breezy corridor
His piping accents evermore;
While up to Eös on her throne of gold.
From vales, seas, mountains, strains Memnonian rolled.

At length, transformed and shrunken, gradual grew
Her lover old to a gra-shopper drinking dew,
Whose bloodless limbs in summer suns rejoice;
Who from the treetops pours a shrill, incessant voice;
Whose song immortal as himself was dear
To husband new and poets old;
The advent of the cheerful spring foretold;
Whose tuneful impulse accents clear,
The loving Muses gave;
Who passionless, defiant of the grave,
At last to semblance of the gods came near.

B. W. BALL.

BOOK NOTICES.

LIGHT ON THE HIDDEN WAY. With an Introduction by James Freeman Clarke. Boston: Ticknor & Co. 1886. Price \$1.00.

A dainty, inviting-looking little book this, with its prettily designed covers of crimson and gold, its clear print and wide margins. The writer's style, too, is refined and poetic in tone; but the substance of the book is not satisfactory, since it fails to throw "light on the hidden way" or to adduce arguments which will be of much if any benefit to clear thinkers or unprejudiced investigators of the connecting links between this world wherein we find ourselves and some other possible state of existence. Rev. James Freeman Clarke says, in his short "introduction," that the work is written by a lady whose personal experience it relates, and who is "herself firmly persuaded of its reality," while she is regarded by those who know her "as sincere, truthful, and conscientious." The writer claims to know nothing whatever of Spiritualism, as such, from her own experience, "never having seen a public medium or read any spiritualistic literature," as the little she has heard of it through friends was "distasteful" to her. But her visions or experiences are so identical with many of those related by and believed in by Spiritualists that we feel sure those of that faith will not hesitate to claim her as one of themselves on reading her

book. She owns, however, that she was at one time a reader of *The Index*, of Herbert Spencer, and of scientific works, in her search for the truth, which she claims has come to her from direct communication, through sight, touch, and hearing, with those considered dead. That she believes that all the strange, grotesque, and sometimes ludicrous experiences which she relates really occurred, we have no right to doubt; but we glean from the relation that she is one who has suffered the frequent loss of dear friends, her parents, her child, etc., that she has been in failing health and often depressed in spirit, that she has dwelt long and earnestly on the problems existence offers without solution to the thinking mind. And we know that under such circumstances others have undergone similar experiences for which medical science, whether right or wrong in its conclusions, offers apparently reasonable explanatory theories. But her book is worth reading by those curious in such matters. S. A. U.

THE PRELATE: A Novel. By Isaac Henderson. Boston: Ticknor & Co. 1886. pp. 350. Price \$1.50.

To those interested in the history of the schism made in the Catholic ranks by the pope's promulgation, in 1870, of the decree of papal infallibility, this "Novel" will be welcome because of its discussion, in the guise of an entertaining story, of the causes which led to and the consequences of that schism. If it were not that the writer's name, as given on the title-page, is that of a man, we should have judged this to be the work of a woman's pen, since the principal character is a woman, albeit a somewhat strong-minded one, and most of the events of the story, even the historical portions, are portrayed from that woman's point of view, while a tone of decided femininity pervades the writer's style throughout, though it must not be inferred that such tone necessarily implies weakness, only womanliness, which is a far different thing. There is an interesting, if not exciting, plot in the story, the scene of which is laid in Rome, within the present decade. While the author is not remarkably forceful or passionate in style, several of the more dramatic episodes are graphically drawn, particularly that of a collision in mid ocean of two steamships, with the consequent wreck of one of them. The writer is evidently no friend to Catholicism, since he draws in darker colors than seem needful or truthful at this date in the history of that faith such terrible pictures of Jesuitical intrigue, deception, and criminal exercise of power as exhibited in the treatment of all who actively oppose the authority of the Church of Rome. S. A. U.

THE Popular Science Monthly for April is an exceedingly valuable one, containing among many other bright and readable contributions to the thought and knowledge of the day the first part of an article by Herbert Spencer, entitled "The Factors of Organic Evolution," which treats of the limits and interpretations of the doctrine of natural selection, and the position of Darwin in regard to the theory of evolution; also, "Mr. Gladstone and Genesis," Mr. Huxley's second reply to Mr. Gladstone. "The Dawn of Creation and Worship," which is Mr. Gladstone's first paper in this discussion, is inserted in a supplement. Prof. Robert Hartmann has an illustrated article on the "External Form of the Man-like Apes." George H. Clarke discusses "The French Problem in Canada." A striking portrait of Christian Huygens, the famous Dutch astronomer and physicist of the seventeenth century, is accompanied by a short biographical sketch.

THE New England Magazine (formerly the *Bay State Monthly*) for March opens with an illustrated article entitled "Along the Kennebec," by Henry S. Bicknell; and, among its many pertinent articles, we note the following: "Life and Character of Daniel Webster," by Hon. Edward S. Tobey; "Maple Sugar Making in Vermont," by J. M. French; "Boston University School of Law," by Benjamin R. Curtis; and "A Trip around Cape Ann," by Elizabeth Porter Gould. The frontispiece is a steel plate portrait of Judge E. H. Bennett, of whom a short biographical sketch is given. The serial story, "Elizabeth, A Romance of Colonial Times," is finished in this number.

The best literary and artistic talent of the day continues to be drawn upon by the publishers of *St.*

Nicholas for the entertainment and instruction of their young readers. The April number contains articles from E. E. Hale, Mrs. Frances H. Burnett, H. C. Bunner, "H. H.," Frank R. Stockton, E. S. Brooks, H. E. Scudder, Charles Barnard, and many others, with illustrations by Léon Moran, R. B. Birch, Alfred Brennan, Laura C. Hills, etc.

HOTEL FOR SALE in the County Seat of a fertile county. On Air Line Railway. In good repair and in first-rate location. Doing a good business. Price \$4,000, on easy terms. Address J. H. SHERWOOD, Wauseon, Ohio.

The Religion of Philosophy; OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERBIS.

For sale at THE INDEX Office. Price \$3.00.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOSMIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart." 1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 Boylston Street, Boston.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

Lectures by Rabbi Solomon Schindler.

"Are you not going to tell the Lord that you are sorry?" said a mother to her little son whose father had punished him for telling a falsehood. "Oh, bother! mamma," said the culprit, impatiently. "What's the use of telling Him? Didn't he see pa a-licking me, and didn't he know I was sorry when he heard me holler?"

PROF. DAVIDSON's lecture on "Bruno" is for sale at *The Index* office. Price 10 cent.

THE success of Prof. Alexander Winchell's elementary text-book on geology, entitled *Geological Excursions*, has induced the author to write a more advanced treatise in the same general style, for the use of high schools and colleges. This is to be called *Geological Studies*, and will be a volume of over five hundred pages, profusely illustrated. It is now in the hands of the publishers, Messrs. S. C. Griggs & Co., who will issue it as soon as it can be put through the press.

H. T. MARSHALL's Patent Adjustable Lace Congress Shoe advertised in another column is stylish, can be fitted to any foot, and has many merits to commend it to the attention of gentlemen.

HUSBAND'S CALCINED MAGNESIA.—Four First Premium Medals awarded. More agreeable to the taste and smaller dose than other Magnesia. For sale in bottles only, with U.S. Government Registered Label attached, without which none is genuine, at druggists and country stores, and by Thomas J. Husband, Jr., Philadelphia, Pa.

FOR COLDS AND CONSUMPTION use Cutler Bros. & Co.'s celebrated *Vegetable Pulmonary Balsam*. "Best medicine in the world." In use 60 years. Price \$1.50, and 35c. \$1 bottle the cheapest. Be sure and get the genuine.

BRIGGS PIANOS. Elegant stock of these reliable pianos for sale on easy terms or to rent at low prices. C. C. BRIGGS & CO., 5 Appleton St., opp. 440 Tremont.

PUBLICATIONS

OF THE

FREE RELIGIOUS ASSOCIATION.

Freedom and Fellowship in Religion.
A volume of ten essays upon speculative and practical problems of religion, by D. A. Wasson, Samuel Longfellow, Samuel Johnson, John Weiss, W. J. Potter, F. E. Abbot, O. B. Frothingham, J. W. Chadwick, T. W. Higginson, and Mrs. E. D. Cheney, and extracts from Addresses by Ralph Waldo Emerson, Lucretia Mott, Robert Dale Owen, Dr. Bartol, Wendell Phillips, Rabbi Wise, Horace Seaver, A. B. Alcott, Lucy Stone, Charles H. Malcom, Julia Ward Howe, and others,—all given on the platform of the Free Religious Association. Price (reduced) \$1.00.

Reports of Annual Conventions of Free Religious Association, from 1872 to 1879 inclusive. These contain essays and addresses by the various distinguished men and women who have spoken on the Free Religious platform, together with yearly reports of the Executive Committee. 10 cts. each.

TRACTS.

- II. *The Bible and Science*, by John Weiss.
- III. *The Sympathy of Religions*, by T. W. Higginson. Enlarged edition.
- IV. *Transcendentalism*, by Theodore Parker. Never before published.
- V. *The Public School Question*, as understood by a Catholic American citizen (Bishop McQuaid) and by a Liberal American citizen (F. E. Abbot).
- VI. *How Shall We Keep Sunday?* An Answer in Four Parts: 1. Sunday in the Bible. 2. Sunday in Church History. 3. Sunday in the Massachusetts Laws. 4. The Workingman's Sunday. By Charles K. Whipple, Minot J. Savage, Charles E. Pratt, and Wm. C. Gannett.
- VII. *Evolution and Religion*, by John Fiske. 5 cts.; ten, 35 cts.; one hundred, \$2.00.

Nos. II., III., IV., V., VI., 10 cts. or 60 cts.; one hundred, \$3.00.

Reason and Revelation, by W. 5 cts.; ten, 30 cts.; one hundred, \$1.00.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This special has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the R. v. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. *Full of Figures, Facts, and Interesting Extracts.* Price 5 cents; 30 copies, \$1.00.

No. 5.—*"God in the Constitution,"* by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—*"The Sabbath,"* by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—*"Compulsory Education,"* by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 3 cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B. Frothingham, treats of a subject that interests everybody. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 10.—*The Impeachment of Christianity*, by F. E. Abbot. 5 cents a doz.

No. 11.—*The God of Science*, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 12.—*Is Romanism Real Christianity?* Two essays by Francis W. Newman and F. E. Abbot. Price 5 cents; 30 copies, \$1.00.

No. 13.—*On the Vision of Heaven*, by Prof. F. W. Newman, of England, analyzes the Christian conception of Heaven. Price 3 cents; 30 copies, 50 cents.

No. 14.—*A Study of Religion: The Name and the Thing*, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 15.—*The Battle of Syracuse.* Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 5 cents; 30 copies, \$1.00.

The Secret of the East;

OR,

the Christian Religion
Significance of its
Rise and Decline.

By FELIX L. OSWALD, M.D.

Handsomely bound in cloth. Price \$1.00.

"The work covers a great amount of critical and historical ground independently of the Buddhist analogies; it is in fact a vigorous, uncompromising outline of Christian history, with all the weakness and wickedness mercilessly dragged into daylight. . . . The case against the Christian Church is a marvellously strong one. The superstitions and miseries of medievalism, the woes, tortures, burnings, rackings, and brutalities accomplished in the name of Christianity, are set in blackest array. The Nature-worship of the pagan Greeks and Romans is set in contrast. Nor is Dr. Oswald very generous in admission of improvement in contemporary Christianity. To him, it is a hurtful supernaturalism, impeding science, diffusing pessimism, promoting hypocrisy, and repressing the physical nature. His book is remarkably well written, brilliantly concise in style, and, aside from its special theories, of considerable scientific and historic value."—*Boston Evening Transcript.*

CURRENT TOPICS.

BY B. F. U.

MR. B. W. BALL is contributing a series of interesting articles, entitled "Reminiscences," to the *Boston Saturday Traveller*.

REFERRING to Gladstone's rising in his place in the House of Commons, and denouncing the unwise and coercive policy of a century, the *Springfield Republican* observes: "A more revolutionary spectacle has not been presented in Great Britain since Charles I. lost his head; and the nobility, the peerage, and all the artificial fabric of past privilege must look on with amazement and with alarm. It is their doom."

In an instructive address before the Parker Memorial Science Class, last Sunday, on Francis Bacon, Mr. F. M. Holland showed the splendid results of the inductive method, from Aristotle to Darwin and Spencer, and contrasted the experiential philosophy with transcendentalism, which he thought at this time reactionary, especially as taught in the Concord School, whose leading representatives are more or less conservative and orthodox in religious thought. Next Sunday, the lecture will be by Miss Isabel L. Johnson, and will relate to some crustacean forms of life.

THE *Christian Statesman* says: "We want the nation to recognize God's law for the same reason that you would recognize God's law of gravitation, if you were on the roof of a high building,—not to flatter God, but to save your own neck." The law of gravitation is a *real* law, and neither its operation nor the adjustment of our movement to its inexorable demands requires any public formal recognition of it in the legislation of the country. But what the *Statesman* calls "God's law" is simply certain beliefs in regard to the Bible, the character of Jesus, the duty of observing Sunday as a sacred day, etc., which beliefs have no foundation in reason, and are steadily growing weaker and giving way to more rational

views throughout enlightened Christendom. And yet the *Statesman* would have these decaying beliefs recognized in our national Constitution as "God's law" and as the supreme law of the land. Even if, in an hour of religious fanaticism, or by some strategy, such as the "reform" party are ever ready to employ, such a recognition should be secured, the decay of these beliefs would not be thereby arrested, although the lifeless forms and ceremonies accompanying them might be longer preserved. Let these beliefs have simply a fair chance in the conflict between truth and error; and, if they cannot, as knowledge is increased and diffused, be maintained "in a free and open encounter," it is folly to attempt to rescue them from their natural fate by incorporating them into the Constitution of the United States.

FUNDAMENTAL in our government and our social system is the principle of the right of the individual. Every man has the right to work on such terms as he may accept, and he has the right to employ others on such conditions as can be mutually agreed upon. Men have the right to combine for the promotion of their common interests. Organizations have the right to require any conditions they please for the work of their members. But an organization has no right to go beyond the boundaries of its membership, and dictate to or interfere with those who have not voluntarily submitted to its rules. It has no right to use force or threats, to prevent the filling of vacancies its action has created, nor to interfere with the property of those whose employment its members have given up. The principle here stated it is all important to keep in mind during the present labor agitations. Voluntary combination and co-operation are legitimate methods for attaining ends that individual efforts merely cannot attain; but, if they disregard and overrule the rights of those outside of them, they become despotic, and in the end will injure the cause in the supposed interests of which they are employed. Combinations of labor and combinations of capital, either of which lead to the other, are becoming general; and it looks as though some carefully considered and wisely planned system of arbitration would be absolutely necessary to settle the difficulties between these two great interests, which should not be in antagonism to each other.

WE have great admiration for Prof. Huxley's scientific genius and attainments, and for that splendid courage which he has shown the past quarter of a century in defending unpopular scientific truths, when they have been opposed by powerful representatives of conservatism; but we are not impressed with the wisdom of his recent manifesto about the Irish question, published in the *New York Tribune*. He does not bring to its consideration either the thorough knowledge or the unprejudiced spirit which are marked characteristics of his scientific papers. Why, at this time, should he take pains to express contempt for "government by average opinion," when the Irish question is one in the settlement of which "average opinion" must be kept constantly in

view, since it is one of the great facts of the problem, and of course to be taken into account in its solution? "Average opinion," on a question of geology or comparative anatomy, counts, among those acquainted with these sciences, for nothing; but "public opinion" in the United Kingdom, as to the legislation needed to put an end to discontent and crime in one of its great divisions, is of the utmost importance to Mr. Gladstone and his associates, who are elected by and derive their authority from the people who have intrusted them with the responsibilities of government. While occasional utterances, like those of Prof. Huxley, by eminent scientific men, during a time of political excitement, have but little weight among thinkers, since they relate to matters outside of the province of thought to which these men of science have given their intellectual energies, they tend somewhat to discredit their views and lessen their influence with the mass of people in regard to those subjects on which the people are wholly uninformed and on which men of science only are competent to speak.

MR. GLADSTONE's scheme to give Home Rule to Ireland is in harmony with the progressive spirit and tendency of the age. The people have a right to govern themselves; and, the more local and the less imperial or general government there is, the more will the people's will be carried out and their interests promoted. This is as true of Ireland as it is of Massachusetts or Canada. If it be objected that government by the people, "government by average opinion, is merely a circuitous method of going to the devil," our reply is that it can be no worse than the only other possible method,—government by the few, by emperors and kings, by a hereditary "nobility"—the government that has during centuries crushed the people, kept them in ignorance and poverty, devoured their substance, sacrificed their lives by millions in bloody wars for the settlement of personal disputes, taken immense tracts of land which should be made to yield bountiful harvests and reserved them for private savage sport, the destruction of life for mere pleasure, imposed heavy burdens upon the people that kings and queens, princes and princesses, and a whole army of aristocratic cormorants might live in idleness and luxury, with no interest in popular affairs except to oppose every reform designed to enlarge the privileges and influence of the people. "Government by average opinion" can do no worse. Indeed, where it has partially prevailed, it has done much better. The swiftest way to improve public opinion is to intrust the people with power and responsibility. With the power to vote, a man has an inducement to fit himself for the intelligent exercise of the right; and, moreover, his enlightenment becomes a matter of interest to all. A government "of the people, by the people, and for the people," is the only hope of the world. As Mr. Gladstone said in his great speech last Thursday, "The best and surest foundation we can find to build on is the foundation afforded by the affections and convictions and will of men."

TWO FACTS THAT ARE SOCIAL CORNER-STONES.

In commenting last week on the association which has just been organized in New York, called "The Fellowship of the New Life," we referred to the persistency with which mankind, after repeated failures of attempts at practical experiment, return to the dream of the organization of society on terms of equal brotherhood. This social dream of people living harmoniously and prosperously together on the communistic plan certainly has its significance: it implies, at least, that the present condition of human society, with its struggles, jealousies, and conflicts, does not satisfy the highest sense of justice, order, fraternity, or happiness. But there are two facts which have been so very important in the history of civilization, and occupied so fundamental a place in the progressive evolution of society hitherto, that social reformers, if they would be practical, cannot leave them out of account. We therefore return to the subject for the purpose of making a few supplementary remarks on these points.

The first of the facts here referred to is the integrity of family life. Monogamic marriage, allied with the separate domesticity of the resulting family, has been historically proved, it may be affirmed, to be a primal condition of the highest form of civilization and of social progress. By no other system of living is the mutual love which originates and vitalizes the marriage institution so well protected and fostered. None other is so well adapted to establish and maintain woman's equality with man. (And this we say, notwithstanding the glaring inequality, and despotism even, to which woman has been subjected in a monogamic home; for all this may be reformed.) No other system is so favorable to the just rights and the proper education of children; none so conducive to the general happiness and peace of society. We speak, of course, of the home as it should be, of family life as it might be and often is. It need not be said, alas! how often this ideal of the home is violated and its possible blessings turned into detriment. Yet, with all their imperfections, the homes of a country are the nurseries of social order and of public virtue. In contemplating measures of social reform, there can be no better selection of remedial instrumentalities than the purification and uplifting of home life. Social regeneration, we believe, must, in the main, begin there. The dream of the ideal home must be put into reality. No new institution is to be founded; but a very old institution is to be amended, and transformed to its proper capabilities of social service. Nor do we believe that any attempt at social reform which infringes upon the integrity of separate family life can ever make much headway in the world. Such an attempt comes into conflict with a sentiment which, after long ages of experience, has become one of the strong, self-preservative instincts of society. Not to eradicate this instinct, but to direct it to its noble ends, is the social reformer's task.

The other fact which has hitherto played a most important part in the progress of civilization and the amelioration of social life is that of an adequate stimulus to educe individual effort and systematic industry. Nature has not encouraged the idea that her creatures will be cared for, if they do not care for themselves. Faculty has been educated under the stern discipline of a necessary struggle for self-subsistence. This necessity in the lower orders of existence has produced a condition of pitiable and often cruel competition. The same kind of competition has appeared in the human race; and, though in many of its forms it

has been antagonized by reason and conscience and human sympathies, it has been one of the most powerful factors in the history of mankind. Dire evils have resulted from this excessive and gross competition. But cannot these evils be remedied by the gradual education of man's higher faculties, without removing the necessary stimulus to individual effort? What is wanted is to preserve this root of individual endeavor and acquisition, and, while severely pruning down its wild growths, to culture it to its legitimate fruits. But no system of communistic life seems capable of meeting this demand. It is all right that the strong and intelligent by their superabundance of power should help onward the ignorant and weak,—help them especially by imparting to them knowledge and strength. But where would be the justice or the benefit to either party for the industrious to support the lazy? When the millennium comes, and with it every one shall have a natural impulse to do his full share of the world's work, communism may succeed. Until that time, the spur of necessity to maintain one's self creditably at life's tasks seems to be needed, in order to educate individual faculty and character. To keep this stimulus, and so to balance it by considerations of reason, justice, and humanity that it shall not degenerate into a brutal competition for mastery, is also the social reformer's mission.

Here are two facts, then,—the integrity and separate domesticity of the family, and the necessary stimulus to educe useful individual effort and industry,—which may well be called corner-stones of whatever better social structure future generations may happily see.

WM. J. POTTER.

CIVIL SERVICE REFORM.

In literature, the successful work of women in the department of *belles lettres* is no new thing. Maria Edgeworth and Jane Austen, Charlotte Brontë and Marian Evans, Mrs. Stowe and Mrs. Browning, owe no part of their distinction and success to that enlargement of "the sphere of woman" which has been characteristic of our later history. But it is a sign of this enlargement, second to no other, that we have had now for some years a multitude of books and articles written by women upon the most engrossing topics of the time,—industrial, economical, social, moral, and religious,—which easily take their rank with the best things that men have done in these directions. It is a sign of this enlargement that Miss Lucy M. Salmon's monograph on *The Appointing Power of the President* (New York: G. P. Putnam's Sons) is a more careful and intelligent and exhaustive presentation of this subject than any man has ever given us, worth ten over all that our senators at Washington, Republican and Democratic, have spouted, fumed, and drivelled in their recent acrimonious and partisan debate.

After nearly twenty years of agitation, the civil service of the nation is still far enough from the ideal of business management: the tools to those who can handle them, and as long as they handle them well. The operation of the present law extends to only fourteen thousand of the one hundred and twenty thousand offices upon the civil list. Of this law, as I understand it, there has been no infringement whatsoever on the part of the present administration. Partisan editors and politicians are very careful to frame their editorials and speeches in such a way as to give the impression that there has been infringement of the law, and they have succeeded wonderfully well with those who wish to have it so and with others who do

not. But we have had the promise of the administration, not only that it would maintain the law inviolate, but that it would apply its spirit to the multitude of offices that are not included in its operation. It is within the limits of this voluntary sphere that there have been abundant disappointment and regret. If "offensive partisans" have been suspended, it has not always been that less offensive partisans might take their places. The prospect would be more encouraging if the opposition had manifested any genuine interest in the success of the reform. If it would abandon itself to it without reserve, and nominate in 1888 a candidate conspicuously fit to be its personal embodiment, there would be little question of the grand old party's rehabilitation. "But what does victory amount to, if there are to be no spoils?" is the implicit logic that deters the leaders from declaring openly for complete reform. Evidently, the friends and enemies of the reform do not divide as Republicans and Democrats or *vice versa*. There is good reason to believe, I am convinced, that in the rank and file of the great parties the reform has many more Republican than Democratic friends. But there is no corresponding proportion in the Senate and the House of Representatives. The reform has but few friends, and many enemies in either party and in either House. The violent opposition of the Democratic Vance, of North Carolina, has been outdone by the violent opposition of the Republican Ingalls, of Kansas, in a speech that drove the ladies from the galleries by its indecency, but which, nevertheless, his partisan associates applauded till the echoes rang again. The Republican majority in the Senate has spent all its energy in the endeavor to convict the President of failure to make good his promises. It has not had a particle left for the rejection of nominations evidently not fit to be made. The Chase and Pillsbury nominations cannot be cited as exceptions to this rule. They were rejected, not because they were unfit, but because "the courtesy of the Senate" happened to be unfavorable to them. The same courtesy of the Senate (which means that, if the senators from any State favor a particular rascal, he shall not be rejected), this same intolerable principle secured the confirmation of Rasin of Maryland (one of the worst of Gorman's tools), and of another equally bad in deference to Mr. Logan's gratitude for services he had personally received from the nominee in a great political emergency.

Such being the condition of affairs, is there any ground on which to build a reasonable hope that the civil service of the United States will ever be reformed? If there is not, then there is no ground on which to build a reasonable hope that the government of the United States will justify the hopes of those who founded it, that it can be saved from going down and down until it is a by-word and a hissing among men. Our present system (one part reform to six parts victors' spoils) does not need for its efficiency of evil to be supplemented by a system of revenue which involves the spoliation of the many (agreed upon in the lobbies of the Capitol) for the enrichment of the few: it is sufficient of itself to drag our laurels in the mire.

Over against the system, already bettered not a little, still so debasing and malign, the patriot, Republican and Democratic, sees the alluring possibility of a time "when the chief Executive can boast, like the great Premier of England, that his sole patronage is the appointment of his private secretary; when every legislator can say, with a leading member of the House of Commons, that he is without power to influence in the smallest degree the appointment of a custom-house officer

or an exciseman; when both Executive and Congress, freed from their duties of dispensing office, can turn their attention to more important questions of state; when our civil service will be, in reality, and not in the idle jest of a politician, the best in the world."* In order that this possibility may be achieved, it is necessary that the Four Years' Limitation Law, passed in 1820 to subvert a reckless politician's private ends, shall be repealed; it is necessary that the system of appointment and promotion by examination shall be indefinitely extended; it is necessary that all papers relating to appointments in the hands of the Executive should be considered public documents; it is necessary that all nominations should be considered by the Senate, and all appointments of the President confirmed, in open session; so that "the courtesy of the Senate" may no longer be the euphonious synonyme for a system of mere truck and barter, whereby the worst appointments go unchallenged, if they please well enough the senators from the State for which they are made. The necessity for attending to these things is all the more imperative because the tendency is manifest to enlarge the functions of the government. Shall we have national education, and postal savings-banks, and national telegraph service, and national railroads? In the name of all that is just and holy, in the name of common sense and common honesty, not till we have made our civil service superior to the vicissitudes of partisan politics! It is bad enough, with a hundred thousand officers trembling and shivering with inevitable apprehension at every fluctuation of the political balances this way or that. How would it be with five hundred thousand or a million in this pitiable condition? Well might we ask, in the language of a Federalist describing the triumph of Democracy in the days of Jefferson, "Can anything more dreadful be imagined this side of hell?"

JOHN W. CHADWICK.

LONGFELLOW'S LETTERS AND JOURNALS.

A serene, placid, and gentle life is that embalmed in the two Longfellow volumes recently issued by the Ticknor Company of Boston,—a life of scholarly ease from the start. The poet was patrician by birth, feeling his oats *ab initio*, refusing scornfully a tutorship in his Alma Mater, demanding and getting a full professorship to begin with, fortunate in money all his life (close-fisted, too, as is well known, leaving not a cent to any cause or person outside of his family), fortunate in his Harvard call and career, fortunate in his friends,—Freiligrath, Dickens, Thackeray, Sumner, Irving, Whitman,—and winning by the mere ebullition of his sweet soul the pick and cream of the world's society and its unlimited benisons and praise. Such was the man whose face we are glad to see in the four careful portraits of him published with the volumes of his life. There is something almost eerie in the shy glance of the drooping head of 1840; in that of 1852, the glad and buoyant strength of manhood fully ripe, the look of the loving husband and tender-hearted father and successful author in the heyday of his fame; in 1862, already signs of world-weariness and boredom; and, in 1876, the silver hair, sad, slightly pinched look, and wrinkles between the eyes, marking the advent of the age that remembers and no more longs or strives.

All through the letters and journals, I note, as most salient and characteristic, the evidences of his quiet, low-toned, sensitive nature. There is a family tradition of his boyhood to the effect that, on a certain Fourth of July, he begged the

*Lucy M. Salmon, *The Appointing Power of the President*.

maid to put cotton in his ears to deaden the sound of the cannon. He disliked everything violent. The abolitionists were disagreeable to him on account of their polemical ways. "Partisan warfare becomes too violent, too vindictive, for my taste; and I should be found but a weak and unworthy champion in debate." No violent passion in his make-up. Never wrote but one love poem, and that to his wife (i., 23, note). Sensitive of other people's feelings. "In the evening read Legaré's *Diary* at Brussels, published by his sister since his death. Inconceivable imprudence!—all the names in full." "Summer made a Free Soil speech in Cambridge; . . . but the shouts and the hisses and the vulgar interruptions grated on my ears. I was glad to get away." "I am glad that I am not a politician, nor filled with the rancor that politics engenders." "Read George Sand's little tale, *La Mare au Diable*, a very charming village story; only, here and there, her hot nature scorches the page a little too plainly." "Every evening, we read ourselves into despair in that tragic book, *Uncle Tom's Cabin*. It is too melancholy, and makes one's blood boil too hotly." "While away the morning with Thackeray's *Vanity Fair*, a clever, cutting, amusing, disagreeable book, showing too-much of the coarse lining of London life." All this is excellent commentary for us, who know the poetry and the charm of its quiet simplicity. His sunny, gentle nature drew him to children. His diary omits, time and again, the record of world-stirring events, and reveals the uppermost joy of his heart on this day and on that to have been in the happiness of his children,—playing with them in the tall grass, "riding" them in a wheelbarrow, making kites for them, casting lead flat-irons for toys, etc.

He had the Greek and the mediæval love of symmetry, extreme neatness, and order,—shown in his neat dress (how precisely his overcoat was folded over his arm, when you met him in the streets of Cambridge in his very last years!) and also in his gardening. "He laid out a small flower garden," says his biographer, "in the form of a lyre, and over the entrance set the carved pediment of a doorway rescued from an old house. He afterward designed the present larger garden, in an elaborate Gothic pattern, with borders of box." And here is an entry in his diary: "Painters at work in the house, gas-pipe layers in front of it, and gardeners behind, setting a privet hedge! To all of which I have a great aversion. I would rather see things done than doing."

He had as great a horror of the wild, intangible, formless, and savage in nature as Dante, Petrarch, and their contemporaries. Hence, his conformity to English models and inability to conceive of a national literature (since splendidly specimened by Whitman, Cable, Joaquin Miller, Bret Harte, and others). In 1844, he wrote to some one, "A national literature is the expression of national character and thought; and, as our character and modes of thought do not differ essentially from those of England, our literature cannot." How little the man who could write this knew of the infinite wealth of the South and the North and the West, with their vast range of picturesque character! and how incapable he was of deriving poetic aliment from Nature at first hand, in her grander phases! He seems to know little of the West or South by experience or travel. In vol. ii., p. 83, he is set down as noting in his diary with surprise the use of the phrase "sun-up" in North Carolina, remarking its occurrence in the Ode on the Battle of Brumaburgh in the *Saxon Chronicle*. But the word is as common in the mouths of Western farmers as the word "sun" itself. He drew his poetical inspirations from books, from solitary imaginings.

Says in his journal: "Felt more than ever to-day the difference between my ideal home-world of Poetry and the outer, actual, tangible Prose world. When I go out of the precincts of my study, down the village street to college, how the scaffoldings about the Palace of Song come rattling down!" Imagine Whitman or Joaquin Miller saying this, whose every poem is born in the open air!

When spring comes to the Cambridge man of books, it stirs his blood not with the longing for wood and meadow explorations, does not fire his heart with desire for home travel, there is in him no touch of a Thoreau or a Burroughs or a Maurice Thompson; no, but his thoughts turn, like a magnet, with deep longing to Italy, to Spain, to France, the Tyrol. 1848, June 16, "I slaked my thirst for foreign travel by driving to town in the omnibus and walking twice through the market," which reminded him of France. "On my way out, I stood awhile on the bridge, looking at the water and saying to myself that this was a portion of the same sea that washes the shores of England and of Italy. I then got into the omnibus, and found there some Spanish people,—men and girls,—and heard that sweet tongue again, and saw the well-known Spanish beauty of face and form, and imagined myself in Andalusia."

All through his journal is seen his nervousness about the charges of plagiarism that were made. And well he might be; for there is no poet so saturated with apparent imitations, nor any whose verse so constantly reminds you of some other poet's work. It is curious to note that, of the very first poem he ever wrote (as a boy), it was said by his father's friend, Judge Mellen, that it was "all borrowed, every word of it" (i., p. 23). In his youth, he once owned up to involuntary imitation of Bryant (i., p. 43).

Emerson was a constant visitor at Craigie House in his younger days. Longfellow was at first rather puzzled, though charmed, by the new sweet god. In 1841, Emerson's *Essays*, vol. i., seemed to him "full of sublime prose poetry, magnificent absurdities, and simple truths," with "no connection in the ideas." So Dr. Hedge's Phi Beta Kappa oration was to him, "in the main, good," "though rather deep and oracular!" Of Emerson's poems, he says: "Throughout the volume, through the golden mist and sublimation of fancy, gleam bright veins of purest poetry, like rivers running through meadows." And do but see the immortal picture he has drawn of Emerson, the seer:—

"Emerson is like a beautiful portico, in a lovely scene of nature. We stand expectant, waiting for the High Priest to come forth; and, lo! there comes a gentle wind from the portal, swelling and subsiding, and the blossoms and the vine leaves shake, and, far away down the green fields, the grasses bend and wave; and we ask, 'When will the High Priest come forth and reveal to us the truth?' and the disciples say, 'He has already gone forth, and is yonder in the meadows.' 'And the truth he was to reveal?' 'It is Nature; nothing more.'"

A friend no less dear than the dearest was Freiligrath, the German poet of freedom, and friend and admirer of our own chief poet of freedom, Walt Whitman. Many of the tenderest letters of comradeship in these volumes are to Freiligrath.

We are given many other pleasant glimpses of Longfellow's friends and celebrated contemporaries. One day, he meets Lexicographer Worcester jogging along on his black horse. "He says, with a jolt after every word, 'Why—don't—you—get a—horse and—ride as—I do?'" Of Irving, whom he met in Spain, he notes, "He says very pleasant things in a husky, weak, peculiar voice." William Ellery Channing, in 1841, appears wearing "a blue cam-

let wrapper, silver-bowed spectacles, a shawl round his neck, and an enormous hat, coming down over his eyes." When in London, in 1835, the American poet called, with his first wife, upon the Carlyles, and took tea with them. Mrs. Longfellow records that Carlyle had very unpolished manners! In 1842, Dickens writes to Longfellow in America, closing his epistle with a pretty incident, showing Longfellow's power to inspire affection:—

"After you left us, Charley invented and rehearsed, with his sisters, a dramatic scene in your honor, which is still occasionally enacted. It commences with expressive pantomime, and begins immediately after the ceremony of drinking healths. They look at each other very hard; then Charley cries, 'Mr. Longfellow! Hoo-ra-a-h!' The whole concludes with a violent rapping of the table, and a hideous barking from the little dog, who wakes up for the purpose." At a supper given to Thackeray in this country there were some gay stories and puns:—

"Will you take some Port?" said Lowell to Thackeray. 'I dare drink anything that becomes a man.' 'It will be a long while before that becomes a man.' 'Oh, no,' cried Felton, 'it is *fast turning into one*.'"

One cannot help wishing that Mr. Longfellow's friends had not *all* manifested their affection for him by personal visitation. Of all the bearded men, except it be E. E. Hale, he figures as the chief. Beggars, poetlings (male and female), foreign counts wanting positions in Harvard College, wild men of the West,—in they came in never-ending swarms, and seem never to have been rudely received by the patient, long-suffering, and kind-hearted poet. One specimen will serve for all:

"June 14, 1850.—This afternoon, a youth came into my study, and, throwing down with vehemence a red printed paper, exclaimed, 'There! that's what I want to do!' and then, without pause, dashing a pocket-book upon it continued, 'And that's why I can't do it, that empty purse!'" Young fellow wanted to give a reading; got nothing from H. W. L. but his supper.

There are a good many humorous bits gleaming out of the journals:—

"Sept. 20, 1836 [Switzerland].—At the *table d'hôte* to-day, we had a frog pie. Little J. asked if they were really frogs, and if 'they only pulled the stems off and put them right in whole.'"

Longfellow dining with Mr. Ticknor once in 1843, "Mrs. Ticknor recommended one of the dishes as a successful attempt of the cook,—'quite a *coup*.' Mr. —, who was eating thereof, assented, and said, 'Yes, it is what the French call a "*copper monkey*.'" All looked very wise, and no one comprehended. . . . By dint of hard study, I have made it out to be a "*coup pas manqué*!" (stroke not missed; that is, a great hit).

Besides a few sonnets and bits of poetry sprinkled here and there, and not before printed, one finds some capital *mots*,—as where he describes a west wind as "so sharp that it seems as if all the Indians beyond the Mississippi were throwing their tomahawks this way." Again: "Somebody has written a pamphlet to refute Sumner. If it be —, I fear he will be like a fly bumping his head against a window, through which the bright light streams, and exhibits the darkness and littleness of the fly." "Oct. 15, 1846. Went to Leopold de Meyer's concert. A wonderful performer, pouncing on the keys like a lion on the reeds of a jungle, and shaking the notes from his paws like drops of water."

I ought not to close without quoting the fresh word-picture of the poet's study in Brunswick, written when he had just set up housekeeping:—

"I can almost fancy myself in Spain, the morn-

ing is so soft and beautiful. The tessellated shadow of the honeysuckle lies motionless upon my study floor, as if it were a figure in the carpet; and through the open window comes the fragrance of the wild brier and the mock-orange. The birds are carolling in the trees, and their shadows flit across the window as they dart to and fro in the sunshine; while the murmur of the bee, the cooing of doves from the eaves, and the whirring of a little humming-bird that has its nest in the honeysuckle send up a shout of joy to meet the rising sun."

W. S. KENNEDY.

WEALTH.

Wealth is not riches. Primarily, it seems to be *weal*, connected with *well*, and is used so in old English, as in I. Cor. x., 24, where the revised version substitutes *good*. Whatever a man owns above immediate need is wealth, but riches is possession in excess of others' possessions. Wealth is surplus in comparison with a man's immediate consumption: riches is surplus in comparison with a man's neighbor's surplus. Wealth is an opposite of sufficiency, which is neither more nor less than present need: riches is the opposite of poverty, which is deficiency. So a man have never so little over his need, he has some wealth; but he has not riches, unless he has comparative excess of wealth.

But wealth and riches agree in this: that both are capital; for wealth, if never so little, is capital, because, not being needed for the present moment, it may be employed to provide the more abundantly for the future; and riches, which is a superabundance of wealth, of course can be no less capital than wealth is.

Now, some of those who love and reverence labor (and, of such, none, I think, more than I) complain that this operating wealth which is called capital has the power of earning perpetually, by night as well as by day, never ceasing, and that, too, without being diminished or worn out or only very slowly (which is, of course, true of money at interest or invested in buildings or in durable machinery), but that labor has no capacity corresponding, that its earning ceases with its exertion, that perforce it is idle by night, earning only by day, and hence that it is perpetually at disadvantage with capital, being unable to compete with it in power to store up, and therefore that this power of capital is not just and natural, but artificial and inequitable.

Now, what is capital concentrated in money or in durable and defective forms that wear but very slowly and earn perpetually? Capital is stored value; and, as the earth gives but little value without labor (a few berries, esculent roots, water, and salt being about its sum of such debilitating generosity), so capital is in effect stored labor. Now, since labor has not only earning power, but is especially the earning power, the sole producer of values, would it not be strange if, by being stored, labor lost operative power, capacity to earn, and all value, except as a dead matter laid up for future consumption, when by that future other matter will be provided? Now, it seems to me the truth runs this way: If, after consuming the fruits of labor up to present needs, a man possesses stored fruits over his needs, he wishes to put them into shape permanent and operative, because they are perishable; and, as he cannot consume them, having had enough, they are not wealth to him, unless he can change their perishableness to a permanency. Wherefore, he finds a fellow-man who, having some non-perishable material, and desiring the perishable for his own consuming, gladly exchanges the non-perishable for the perishable.

Now, this permanent form of value, for which the owner of the perishable excess has exchanged the same, must have three qualities, in order to preserve its character as wealth for him,—which, surely, it was, being useful material above his immediate need. These three qualities are: first, that it must be valuable in itself, which indeed is but justice, since it was exchanged for matter valuable in itself, and a necessity besides, since otherwise there could be no certainty that the owner could exchange it again at need for his own consuming; secondly, it must not be too bulky, as, for example, it might be, if it were in stone or in heavy metal like iron, which no man could transfer or exchange easily; thirdly, it must not be liable to fluctuations in value, or not to much fluctuation, since then there could be no reasonable confidence that the exchange, however fair at the moment, would be found fair and advantageous when the imperishable material should be used by and by to buy back some perishable for consuming.

Now, when we have these three qualities,—namely, value *per se*, convenience in shape, size, and weight, and as much steadiness of value as possible,—we have a good medium of exchange,—that is, good money, which means equitable money.

Now, because in money stored labor has taken a non-perishable shape, and secured also a continuous operativeness, it may be loaned and used because operative, and returned undiminished because non-perishable. And, since it is valuable in itself, it has righteously an earning power, because it may exact two sorts of payment: first, indemnity for risk of loss; and, second, a consideration for the value of its use, which being a value should not be expected gratis any more than labor or any other value. Now, this twofold payment, for risk and for use, constitutes interest, which, therefore, I think not only just and righteous, but an absolutely necessary quality and capacity of capital, if capital be stored labor and if labor have earning power. Indeed, this seems to me one of the glorious things about labor, and a blessed thing indeed for the world (for on what other terms progress could be I cannot conceive) namely, that it is not condemned to a hand-to-mouth exercise, but is transmuted, as if by the magic of a beneficent genie,—or, more reverently and happily, by the benevolent laws of nature,—into a permanent, operative, and earning power, in proportion as it surpasses the need for consumption at the moment.

But, now, is there no other form of stored labor than only money which ought to bear interest,—that is to say, which ought to be held perpetually operative by night and by day? or, to put it better, which stands operative out of all relation to days and hours, or any measures of time? It seems to me there is. Money and permanent valuable forms of material are not (and so, I know, are not held by enlightened economists) the only forms of wealth. Books, art works, the scholar's learning, the musician's skill, the teacher's knowledge and experience, the orator's power, the poet's song, the composer's creation,—these are all forms of wealth,—indeed, its most costly forms; for since, as Carey has said, the material values of a community at any instant are never worth the cost of the same,—that is, all that has been outlaid for them from the beginning,—I know not what to call the vast deficiency but the cost of the greatest; that is, the immaterial forms of wealth. In like manner, why is not the artisan's skill a form of wealth strictly analogous to capital, and having what I may call interest-bearing power as much as money, and as naturally as a house pays rent or machinery produces value? The analogy seems to me very strict. The artisan's

skill is stored experience and labor as much as money or as any material is. It operates over and over again without decrease, even with goodly gain in power, just as non-perishable forms of wealth, like money, do. Why not, then, capital? And why not, then, interest-bearing? Why not a duty of society generously to contrive how to pay the proper interest on skill?

If it be said this interest is part of the wages, I can say only it seems to me not so. The day's pay is for the day's labor; that is to say, not for the skill, but for the exertion and exercise of the skill during a certain time. So, if a man have capital, not in the shape of skill, but in the shape of money, and loans it to some company or corporation, he receives his interest for the stored value,—that is, for the stored labor; but now, if he be employed by the company in some capacity,—that is to say, in helping to use his own money,—he receives besides his interest a share of the profits after his interest is deducted. So, with strict analogy, I think the perpetual imperishable skill which is used day by day, and lies wonderfully in the artisan's hand, the same while he sleeps as when he wakes, is a form of wealth which somehow ought to be paid for in a way analogous to interest, and the exercise of the skill should have in justice a time or piece payment of its own. If this be true, it is plain enough that we are far yet from doing justice to the artisan's claim on the productive power of wealth in the world.

Now, if you ask me how to set this right,—by what expedient, device, mercantile contrivance, or other means,—I have to say simply I know not. This is only to confess that, as I might gain insight, by much and wide contact with the arts, to point a chemist to a direction for research, and yet be truly and utterly at a loss how to begin and carry on the same, so in this matter I speak but from wide truths, and must leave to those who are expert in business methods the agitation of the way. But this I am persuaded of, that the only thing lacking is the generous, just, and devoted soul. It is my experience that, when good men reason together with a pure desire for truth or justice, it is not often they differ much as to where the truth lies or the way to it. This whole subject (of which I have touched but one little part), which now so presses on us, and will press harder still until it be settled only as anything is settled,—that is, rightly,—is, I think, more a matter of heart than of intelligence; and, when that fire is lighted, the cold elements of the social machinery will begin to move harmoniously.

J. V. BLAKE.

EDITORIAL NOTES.

BY B. F. U.

"A STUDY of Primitive Christianity," by Lewis G. Jones, has just been published by The Index Association, in a handsome volume, and is for sale at this office. Price \$1.50 per copy.

ONE of our daily papers, after remarking that the Deerfield disaster, accounts of which have shocked all readers, was not due to any defect in the road-bed nor to carelessness, says, "It is what might be termed a dispensation of Providence in sending such a heavy rain." The less the world is dependent upon such a "Providence" and the greater precautions it takes to defend itself from such "dispensation," the better will it be for humanity.

MR. W. L. SHELDON is to give two lectures at South Place Chapel, London (formerly Mr. Conway's society), the last Sunday in April and the first in May, on "The Message of Prophecy to

Rationalism" and "The New Basis." He will return to this country soon after, and, by invitation of a committee of gentlemen interested in the Ethical Movement, will give a course of lectures in St. Louis in the latter part of May.

THE following burlesque was intercepted and confiscated by a teacher while it was being passed round one of our Boston school-rooms:—

DAYS OF LABOR.

Striking for four school hours a day. Home lessons not exceeding five examples. No staying after school for misconduct.

Please sign your name.

*Not (K) nights.

MR. S. B. WESTON writes from Philadelphia: "A very excellent paper on 'Commercial Ethics' was read before our Business Men's Section to-day; and Miss Helen De C. S. Abbott, who has recently been honored by being elected honorary member of a scientific society in Berlin, on account of original experimental work in chemistry, read an admirable paper before the Home Section on 'Household Management.' Miss Abbott is a member of our society. Our section meetings for the study of ethics, of business, and of home, have been very successful so far. We set apart the first Sunday in the month for these meetings."

THE "custom of having the sessions of the Houses of Congress opened with prayer by a 'chaplain,'" says the *Nation*, "needs either a serious reform or total abolition. Many of the prayers now offered are silly, and some blasphemous. One offered lately in the House was really a foolish stump speech on the strikes, which it was disgraceful to try to disguise as a petition to Almighty God. There ought to be a stop put to this sort of thing. If prayer be desirable, it had better be silent prayer, offered by the members, each for himself, and not for his neighbors. There are very few men, indeed, competent to pray for their neighbors."

ONE of the decrees enacted by the plenary council held in Baltimore, in November, 1884, and approved by the papal authorities at Rome, is in regard to marriage. It declares that, "since marriage was raised in the new law to the dignity of a sacrament, it belongs solely to the Church to whom the administration of the sacrament was intrusted to pass judgment on the validity, rights, and obligations of marriage. This being the case, and the marriage tie being indissoluble, it is obvious that there is no power on earth which can dissolve Christian marriage. Against such as infringe these laws, severe penalties are to be enforced. No legal divorce has the slightest power before God to loose the bond of marriage and make a subsequent one valid. Even adultery, though it may justify 'separation from bed and board,' cannot loose the marriage ties so that either of the parties may marry again during the life of the other; nor is the legal separation to be obtained without first conferring with the ecclesiastical authorities. Though the Church sometimes permits the marriage of a Catholic with a non-Catholic, she never does so without the deepest regret, and with the explicit understanding that the children of those parties must be brought up in the Catholic faith."

THE editor of a paper called *Problems of Nature* has some strange notions. Thus, in an article on the "Origin of the Mosquito," he says: "An origin of a mosquito is a seed of a herd's-grass (sometimes called timothy) and the husk on it. . . . A scientist is actually defeated in obtaining a knowledge of the generation of life from plants by its being performed in the dark. As certain as we are penning this article, all that has prevented a scientist from witnessing a creation of an animal

from a plant soul was the darkness in which it was done." An article on the "Origin of the Skunk" begins as follows: "This disgusting creature of every country is a production from a weed in every country called wormwood. It is shaped as a bunch of this weed is, and it is only copying the odor of the plant." In another article, this writer says: "On a plain of the Amazon, where a grass is as great as a beast of good size can get through, a most egregious insect is crawling; and it is a spear of the grass converted into a worm. It is as long as a joint of a corn stalk, and as large. The worm is only a grass stock given consciousness. A deep and warm soil under the grass is a good contrivance for creating a diamond." One more sentence must suffice: "Oxygen is a slight consolidation of the electricity of space about a world."

THE *Modern Crematist* very sensibly observes: "Public funerals, with their show of funereal paraphernalia; with their gathering in of curious, long-visaged, solemn people; with their wordy clergymen; with their doleful singers; with their crape-decked pall-bearers; with their public procession from the chamber of mourning to the carriages in waiting; with their solemn journey to the church; with more heart-rending words from the minister and more dole-begetting music; with more parading up and down the aisles of the church; with the slow journey to the burial ground; with another parade of the mourners about the open grave; with more saddening words from the men whose office is to comfort and not to torture the soul; with that barbarous, dreadful, blood-curdling, outrageous rattle of gravel upon the coffin lid, to the atrocious accompaniment of 'Earth to earth, ashes to ashes, dust to dust,' that is an almost invariable portion of the horrid ceremonial at the grave; with the conventional standing of the mourners about the pit while the diggers shovel back the earth over the form of the one just laid away,—with all this empty, useless, cruel, and damnable ceremonial, public funerals are simply schemes of human torture; and the sooner the whole system is abolished, the better."

FACTS furnished by the Audubon Society give some idea of the extent of the slaughter of birds for the milliner: "From one small district on Long Island, about seventy thousand birds were brought to New York in four months' time. In New York, one firm had on hand Feb. 1, 1886, two hundred thousand skins. The supply is not limited by domestic consumption. American bird skins are sent abroad. One New York firm had a contract to supply forty thousand skins of American birds to one Paris firm." It is said that a year's demand of birds for head gear, for home use alone, amounts to five millions, more than ten times as many as can be found in all the scientific collections of the country, which are the slow accretion of more than half a century. Besides, immense numbers are killed annually for exportation. On Cape Cod alone, forty thousand terns were killed and sent abroad in one season. Such a massacre of the innocents for their plumage, to gratify human pride and vanity, is as foolish as it is cruel; and women themselves, when they come to realize what the bright feathers in their bonnets really mean, must abstain from adornment which requires such a frightful slaughter of our gay-colored and sweet-singing birds. Indeed, already the Women's Educational Industrial Union, 74 Boylston Street, Boston, have issued a circular protesting against the destruction of birds for decorative purposes.

WITH the advance of rationalism in the religious teaching of the day, the once central and predominant thought which gave force and signifi-

cance to the observance of Easter, that of the resurrection of the body as typified by the Christian legend concerning the resurrection of Jesus, is gradually becoming less prominent in the art as well as the literature of the season. And, while the Easter holiday is perhaps now more generally observed than ever before, yet its symbols hint more and more at the mere hope of immortality which nearly all cherish than to any expression of religious faith or creedal dogma. We are reminded of this by the new Easter cards which those indefatigable caterers to the artistic tastes of this generation, Messrs. Louis Prang & Co., have just put upon the market. The swelling buds and opening flowers of early spring, the smiling faces of happy children glad in the sunshine of life's spring-time, the ecstatic attitudes of carolling birds, the brilliant coloring of the symbolic butterfly, fluffy chicks just emerged from their imprisoning shell, dainty landscapes rich in all the varying tints and suggestive of all the sounds of the season of promise,—these are gradually eliminating from the Easter tokens the more sombre and unrealistic symbols of the cross, the crown, the open tomb, or impossible looking winged angel; and rationalists can now, without any feeling of offending truth, join with the most devotional in their admiration of the beauty and their sympathetic appreciation of the meaning expressed in these works of art. As usual with the Prang Company, the best artists, both among old favorites and the newer claimants, have been employed to furnish fresh and taking designs for this year's cards, which appear in almost every conceivable form, fringed and plain, square and oblong, double and single, large and small, so that the needs of every taste and purse can be accommodated in selecting reminders of the season for one's friends.

SONG OF CONTENT.

Ask not for wealth, for earthly wealth takes wings:
In the possession of material things

There is no rest.

There is no peace in laurel-crowns of fame,
Nor in the glamour of a mighty name:
These are not best.

To wring thy peace out of the hands of fate,
Content to be thyself, in humble state,
A trusted friend

Whom neither fame nor fortune's bauble sways
To share the gifts of good and evil days,
Were better end.

Nor let the passions' rude control survive,
To mar the quiet of thy inner life:

Strong, steady, still,

Of all thy moods be thou supremest lord.
Let love nor anger flash in sudden words,
Ruled by thy will.

Allow no dark-cowled thought to lift its head
Out of the gloomy cloisters of regret,
With monkish griefs.

But welcome in the rose-encircled train,
Full of good deeds and sun and sound of rain
And rustling leaves.

Live in the present. Give no slavish heed
To whispering doubts of thy to-morrow's need:
It will provide

For all its wants in sure, unfailing way,
If thou providest for thy guest, To-day,
While at thy side.

So fortune still may pass thy humble door,
And leave thee poor and unknown as before;
Yet thou shalt know

How to extract from very depth of grief
Such joys as to each closing day shall give
A ruddy glow.

HERMAN RAVE.

The Index.

BOSTON, APRIL 15, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, } Editors.
BENJAMIN F. UNDERWOOD, }

NO WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

GEORGE JACOB HOLYOAKE.

BY GEORGE ILES.

II.

(Concluded.)

Soon after his liberation from prison, where he had served his term as a blasphemer, Mr. Holyoake removed to London, where he engaged in teaching. Excellent manuals of reading, of logic and geometry, were written by him at this period of his life. Journalism, however, had paramount attractions for him; and he established the *Reasoner*, a weekly issued for thirty years. His editorial labors were varied by a long series of debates and discussions which made him known and respected throughout the length and breadth of Great Britain. He introduced courtesy into controversy, and such of his hearers as were not convinced by his arguments were constrained to admire his fairness and sincerity. From his little book on *Public Speaking and Debate*, I will give a few extracts, setting forth his principles and methods on the platform:—

"All investigation should commence without prepossession and end without dogmatism. Each disputant should be more anxious to explain than to defend his opinion."

"As an established truth is that which is generally received after it has been generally examined in a fair field of inquiry, it is evident that, though truth may be discovered by research, it can only be established by debate. It is a mistake to suppose that it can be taught absolutely by itself. We learn truth by contrast. It is only when opposed to error that we witness truth's capabilities, and feel its full power."

"It is said that people come away from debates much as they go into them, that the same partisans shout or hiss on the same side all through. This is not always true; and what if it were? The work of conviction is often done, though the audience may not show it. They may break your head, and afterward own you were right. Human pride forbids the confession, but change is effected in spite of pride. And, if an audience remain the

same at night, they will not be the same the next morning. I rather like to contemplate that conviction which is begun in discussion, not ended there. He who hastily changes is to be suspected of weakness or carelessness. The steady and deliberate thinker, who takes time to consider, is the safest convert."

"If you invite opposition, do it with circumspection. Never debate for the sake of debating. It lowers the character of debate. The value of free speech is too great to be trifled with. Seek conflict only with sincere men. Concede to your opponent the first word and the last. Let him appoint the chairman. Let him speak double time, if he desires it. Debate is objected to, as an exhibition in which disputants try to surprise, outwit, take advantage of, and discomfit each other. To obviate this objection, explain to your opponent the outline of the course you intend to pursue, acquaint him with the books you shall quote, the authorities you shall cite, the propositions you shall endeavor to prove, and the concessions you shall demand. And do this without expecting the same at his hands. He will not now be taken by surprise. He will be pre-warned and pre-armed. He will have time to prepare; and, if the truth is in him, it ought to come out."

"If you feel that you cannot give all these advantages to your opponent, suspect yourself and suspect your side of the question. Every conscientious and decided man believes his views to be true; and, if consistent, he believes them to be impregnable. Neither in minutes, months, nor years are they to be refuted. Then a man so persuaded may despise petty advantages, and enable his opponent to arm himself beforehand."

"The victory in a debate lies, not in lowering an opponent, but in raising the subject in public estimation. Controversial wisdom lies not in destroying an opponent, but in destroying his error,—not in making him ridiculous so much as making the audience wise."

"Master as completely as you can your opponent's theories, and state his case with the greatest fairness, and, if possible, state it with more force against yourself than your opponent can. The observance of this rule will teach you two things,—your opponent's strength or weakness and your own also. If you cannot state your opponent's case, you do not know it; and, if you do not know it, you are not in a fit state to argue against it. If you dare not state your opponent's case in its greatest force, you feel it to be stronger than your own; and, in that case, you ought not to argue against it."

Very interesting is it to watch the unfolding of this able, earnest, and kindly intellect. Cramped throughout his life Mr. Holyoake has undoubtedly been, for lack of early opportunities of discipline and instruction; yet perhaps not a little of his power and influence is due to his unconventional treatment of great questions,—a treatment which formal culture might have rendered tame or mediocre. One of the compensations for an education coming late in life is that many important pieces of information come to a mind not blunted by any early and useless familiarity with them. Our great philosophers who occupy the pinnacles of thought are too remote in place and too abstract in intellect for direct popular influence. Mr. Holyoake stands forth in the front rank of those who have in this century served to convey to the masses the ideas brought to birth in the skyey eminences of philosophic criticism and reflection. This usefulness in his case is largely to be credited to his bringing a mind matured in the school of practical life and conflict to the consideration of wide human problems. In 1849,

he wrote in preface to his volume on public speaking:—

"The highest truths will one day reach the populace. Not only the standard of intellect, but that of morality, will be raised. The brief series of the Hampdens, the Cromwells, and Marvells, will be multiplied. It was once said all could not learn to read, write, and account. Now, they do learn these and other things. They will one day learn all things. Intellect will conquer all obstacles. But it will be accomplished piecemeal. Progression is a series of stages: individuals first, then groups, then classes, then nations, are raised. You can no more introduce at once the multitude to the highest results of philosophy than you can take a man to the summit of a monument without ascending the steps one by one, or reach a distant land without travelling the journey. This book is designed for the class of young thinkers to whom knowledge has given some intellectual aspiration, and fate denied the means of its satisfaction. . . . They want no new philosophy. There are more old ones which are good than they can study. There is more wisdom extant than they can master, more precepts than they can apply. Weapons innumerable surround them, of which they have to be taught the use. Their watchword is work. The scaling-ladders of the wise which they, having mounted the citadel of wisdom, have thrown down, are yet of service to those who are below. I have picked one of these ladders up, and reared it in these pages for the use of those who have yet to rise. Nations never become civilized and learned till subsistence is secure and leisure abundant. So of individuals. The populace are still engaged in the lowest battle of animal wants, and even the middle classes are in the warfare of intellectual wants. In the ancient state of society, war was the only trade, force the only teacher, and the battle-axe the only argument. A transition has indeed taken place. The time and means and ends are changed, but not the relative position of men. No longer do we struggle for the victory of conquest, but we struggle for wages and more intelligence. . . . Knowledge has reached the mass, so as to make them sensible of their ignorance without diminishing their privations; and they are now engaged in a double battle against Want and Error. The struggle, therefore, is resolute. The training wanted is practical, the weapons serviceable and ready for use. Provided the sword of education will cut, few will quarrel about the polish. If the blade has good temper, he who needs it will put up with a plain hilt. . . . When I contemplate the appliances which learning and science present to the scholar, and see how multiplied are his means of knowing the truth upon all subjects, I cannot conceive that he can be struggling, like the untaught thinker, between right and wrong. To the scholar, truth and falsehood must be apparent; and, since the learned do not penetrate to the intellect of the populace and establish intelligence among them, it must be that the learned want courage or condescension, or that common sense among them is petrified in formulas."

Mr. Holyoake gradually forsook the arena of theological discussion, he wearied of battling against beliefs held upon any grounds but those of logic, and at last concluded that there was little use in trying to reason opinions out of people that had never been reasoned into them. His purpose had from the first been to do good to his kind, and he saw that that aim could be best served in the cause of practical reforms. His work has been of incalculable value by virtue of his thorough sympathy both with the artisan class from which he came

and the class of men of leisured thought who have recognized his ability and sincerity, and given him their friendship. He has the rare genius, too, which, as Rousseau says, is able to observe and rightly value what is very near. He can make a neglected truism vivid by a flash of wit or a pointed epigram. No popular writer of our time has rescued from neglect more familiar thought to be given its due weight by impressive presentation. His epigrammatic style makes the dedications of his books particularly fine, and the sting of death would be in part soothed and softened, were he to write one's epitaph. It is not generally known that he gave the Jingoese, the ultra Tories of Britain, their name; but such is the fact.

As a leader, the very limits of his acquirements have given efficiency to his native power. He has had a large following, because he has always been plainly in sight. Some great thinkers are so far ahead of everybody as to be hidden by the curvature of the earth. Immanuel Kant expressly stated that he did not write for the general reader; and Herbert Spencer, in his *Social Statics*, refused to adapt his ideal morals to any practical improvement of this wicked world as it is. The uncounted thousands of secularists among British workmen largely owe their clearness of conviction to his clearness and simplicity of statement, and wonderful power of gaining access to men's minds by gifts of expression, tact, and patience, matured not in the closet, but in the work-a-day world.

Mr. Holyoake has been no theorizing spectator of human turmoil: he has done his duty in trying to leave the world a little better than he found it. His fellow-workers in reform have often been uncouth, sometimes unsavory, and nearly always impolite; yet he has never shrunk from giving the ear of progress a hearty push, regardless of his company in the task. Unlike Brother Rabbit in Uncle Remus' story, he doesn't do the grunting while others do the shoving. He early was active in the Chartist and Corn Law agitations. He saw, as a youth, the necessity artisans were under to organize in defence of their interests; and he has accurately defined the reasonable aims of trades-unions. Prof. Goldwin Smith once said that, if England had escaped from the friction and violence which had attended the industrial movement in other countries, it was in large measure due to workmen having much better leaders in England than elsewhere,—leaders such as Mr. Holyoake, who were not self-seekers, who were not demagogues who had nothing at heart but the real interest of the working class, and who when conflicts arose between employers and employes, were not for interminable war, to their profit, but for peace with justice. He is a free-trader, of course; and, in his efforts to abolish a petty restriction on trade, he is to-day president of the society which aims at repealing the absurd tax on British railway travel. Reforms as diverse as the ballot and the execution in private of criminals condemned to death have engaged his trusty aid.

For several years, Mr. Holyoake conducted a publishing house in Fleet Street, from which issued every kind of publication of reform,—intent, dispassionately written. In this house, the committee met which opposed the Conspiracy Bill of Lord Palmerston, and led to the overthrow of that minister. He was afterward acting secretary of the British Legion sent out to Garibaldi. In those days, Mazzini and Prof. F. W. Newman contributed to the *Reasoner*, which he edited, in testimony of the unimputative fearlessness which marked his advocacy. When, in the movement for the repeal of the Stamp Act, no one else could

be found to publish the special unstamped newspapers, Mr. Holyoake undertook to do so. His publications issued during the Crimean War involved him in fines amounting to £600,000, so he besought Mr. Gladstone, then Chancellor of the Exchequer, to take the money in weekly instalments, as he could not conveniently pay all in at once. The last warrant issued before the repeal of the Stamp Act was against Mr. Holyoake, who throughout the agitation acted upon his invariable rule,—never to put himself forward to do an aggressive work, unless it was a righteous work, and no one else would do it.

Once, his admirers endeavored to obtain him parliamentary honors; and, in 1854, he was nominated for the borough of the Tower Hamlets, his friend, Mr. John Stuart Mill, giving generously toward his election fund. Various causes, chiefly the unpopularity of his theological convictions decided him to retire in favor of Mr. Ayrton. His breadth and fairness of mind eminently fit him to serve his country in the House of Commons, and he may yet become a member of a body in which agnostics and secularists abound. His statesmanlike qualities led him to see in a series of little-read blue-books a principle capable of most valuable expansion. For many years, the British government had published reports on the state of commerce and manufacture abroad, for the use of merchants and manufacturers. Mr. Holyoake, after persistent effort, succeeded in inducing the Foreign Office, in the days of Lord Clarendon, to issue similar reports for the use of workmen from every country abroad where Her Majesty had secretaries of embassy and legation. The plan of these reports was devised and furnished Mr. Holyoake. They state what the purchasing power of money is in foreign countries compared with England, so that a workman may know, if he earns £2 a week at home or £4 a week abroad, whether he will be better or worse off; for emigrating; what the state of the labor market is in foreign countries; how workmen are hired and housed there; what kind of habitations they occupy; what difficulty a family has to exist in health; what provision as to clothing they must make; the character of workmen in countries abroad,—whether good craftsmen take pride in their work and put their character into it. Such questions were never before put and never before answered, and no books are more curious and valuable to workmen than these publications of the Foreign Office. Lord Clarendon always said in the handsomest manner, in his despatches, that these reports were issued on the suggestion of Mr. Holyoake. After endeavors extending over twenty years, he did another noteworthy public service: to him is chiefly due the passing of the Secular Affirmation Act, by which co-operative property was largely secured, many of the most influential managers objecting, like Mr. Holyoake, to take the ordinary oath, not being able to do so in the sense required by the courts. Perhaps, however, the co-operative movement is the one above all others which will chiefly embalm his memory during the years of coming time. Living, as he did in early life, in a great manufacturing town, he saw and keenly felt the hardships of artisans and factory operatives. These hardships, he became convinced, could be mitigated, not in the continental fashion of State aid or socialism, but by self-help acting on co-operative principles. These principles he now sees governing in Great Britain alone an annual retail business of over \$100,000,000, conducted at a gross expense of but five per cent. Incalculable benefit has followed from the thrift induced by the cash system of co-operation, and from the honest value in goods

obtainable when buyer and seller have not opposed but identical interests. His *History of the Rochdale Equitable Pioneers*, written in 1857, has been the means of founding hundreds of co-operative societies throughout the world. In 1879, Mr. Holyoake published the *History of Co-operation*, in two volumes. In this history, we find how steady has been the progress of co-operation as applied to buying and selling, and how very different the failure which has attended co-operative manufacturing. Yet let us hope that the art of working together in concord will in time pass from the counter to the work-bench and the factory. Good faith, good-will, the hearty recognition of leadership and superior powers when they appear, must abound more than they now do, before Capital and Labor can be true friends, and before Labor can cordially submit to the invaluable direction of the kings of business.

In 1879, Mr. Holyoake paid his first visit to America, with the intent of gathering official, trustworthy information for the guidance of emigrants seeking homes on this continent. He journeyed to Washington, to the capitals of many States, and to that of Canada, in furtherance of his mission, which was a notable step toward reducing emigration to a science, and an extension of the usefulness of the reports of workingmen compiled for years by the British Government, at his suggestion. On his return to England I had the good fortune to hear him deliver two addresses in Birmingham, on what he had seen in America. He was none the less shrewd and sensible for his brilliant eloquence, and advised such of his hearers as were being pinched out by the keen competitions in British trade that their policy should not be battle, but escape,—escape to the broad, free lands and new opportunities of the United States and Canada. In the fall of 1882, he revisited America on the same errand which had occupied him in 1879.

Such, imperfectly sketched, has been the work of one of the best and worthiest of living men. He is not one of them who put so much into what they say and write that they have nothing left for their lives. He is enjoying the Indian summer of his life with the respect and confidence of a circle of friends in England only inferior in variety of conviction and social standing to those who gather about the very foremost public men. I have never known a man more lovable than he, with more consideration, sympathy, and lightness of heart. He fairly owns his friends. I have known a railroad chieftain put aside his pressing and weighty business for weeks together that, on Mr. Holyoake's first visit to America, he might help out his imperfect vision, and tenderly guide him across streets and lift him in and out of cars and carriages. More than one Secular Hall of grace and commodiousness has been erected in his honor. Everywhere he goes, in France, Germany, or America, just as in his native kingdom, cordial hospitality sets an open door before him. Christians claim him as an excellent Christian, essentially; and he has, through all his varied growths of conviction, had no warmer friend than the superintendent of the Sunday-school he attended as a boy. But the kindness of the man was not all given to him at once. The original capital of it, of course, nature bestowed; but he has diligently improved it by assiduous self-control. In the fine art of character-making, he was long a patient student and workman before his notable success came to him. When a young man, he aspired to be a teacher, and felt it incumbent upon him to fit himself for the moral dignity of that office. As his task was to be the endeavor to reform others, he began

by reforming himself. He writes: "My original patrimony was a haughty temper, a proud spirit, and an inflexible will. During thirteen years, I stood twelve hours of every working day by the side of a man without ever forgetting or forgiving that he had insulted me; and I could boast as many trophies of ill-temper and malignant retorts as any man could be proud of. But what was my surprise when first I found that the great, whom I had so long revered in their remoteness from me, were themselves the victims of those errors which belonged to my youth, ignorance, and others' evil example. When I came in contact with those whom I had known only as models of emulation, and whose genius I worshipped as some men do the creations of theology, and found their brilliant reputation tarnished by the mildews, not, indeed, of vulgar, but of refined animosity, I resolved that, though I had no reputation to tarnish, I would not tarnish myself."

And so, through each passing year, Mr. Holyoake has grown in refinement, in delicacy of sentiment, in clearness of perception. While his attitude as a secularist has kept him pleading at the bar, he has the temperament which fits advocacy for promotion to the bench. When, in 1870, blindness overtook him for a time, he met the calamity with unwavering fortitude, and, like a lesser Milton, continued to dictate pages which he could not see. His friends, among them Darwin, Lewes, and his wife, George Eliot, Spencer, and Tyndall, contributed for an annuity, in recognition of his effective and disinterested public services. Many subscribed who differed widely from him politically, theologically, and in his social views; but all united to express their admiration of his character, and to recognize the active and useful public spirit he had displayed. In 1884, his wife was borne to the grave. His manly and tender tribute to her memory, in his journal, *The Present Day*, does the pair great credit. In all the trial which her husband's course entailed upon her, Mrs. Holyoake was a support and true friend to him.

Mr. Holyoake is now engaged writing his autobiography, in which, I have reason to believe, there will be singular records of his equanimity and of his patience with the very modest fortunes of his life. Like all other radical reformers, he has known many mean opponents and received much shabby usage. American reprinters have added insult to piracy by publishing his books without mention of his name. A reviewer in a ponderous British quarterly had to include a work of his on co-operation in the list with which he began an article. To avoid mentioning Mr. Holyoake's name, he mentioned none of the authors' names whose books he reviewed,—a solitary and significant case of anonymity. But, if some, to use an Irish phrase, have done their dirty best to belittle Mr. Holyoake, many of the great have done him honor; and wide indeed is the social gamut of his friendship, one morning breakfasting with Tennyson or Gladstone, and before the week ends the honored guest at a ninepenny Secular tea-party,—always self-respecting, kindly, and gracious, whether learner of the intellectual giants of our time or breaking up the bread of their philosophy and culture to the multitude.

We have seen him the struggling artisan, with the strong, painful consciousness of ignorance upon him. The first trammels he severed were those which he held to be the most grievous,—those of an unworthy theology. Turning his attention from heaven to earth, he has done what he could to make earth a little more heavenly than he found it. His teachableness, his faithfulness, his rare powers of expression and persuasion,

have made him the creditor of uncounted men and women. At the epoch of transition from the old metaphysical free thought to our modern free thought of science and evidence, he will stand in coming time among Englishmen as a notable link between Hobbes and Bolingbroke and such thinkers as Spencer and Stephen. As the founder of Secularism, he gave among British artisans practical aims to people of a stamp such as in higher social level float about in an agnosticism which has levelled old creeds and left their ruins desolate. As the historian of co-operation, he has stated what appear to be the only principles which can avert the threatened collision, the war between those who have and those who want, one which may be worse than conflict between Saxon and Cossack. And he has shown us the spirit of comprehension, of generous and yet self-respecting compromise, on which alone co-operation of any kind can proceed. Many heroes of loftier stature have stridden across the stage of the world,—Cromwells, Miltons, and Washingtons: it has been this man's mission chiefly to exemplify the kindly moralities which yield the daily and hourly gladness of our lives. Many a score of sermons have we heard against unbelief, but never one against common meanness, self-will, or self-indulgence. Yet these things stalk abroad, and leave wide swaths of blight and disheartenment behind them, in their grand total more dreadful than the conspicuous crimes and vices against which nations legislate and prisons rise.

As thinker, speaker, writer, reformer, our hero merits our respect and wins our admiration; more still as a man, for

"Man is his own star, and the soul that can
Render an honest and a perfect man
Commands all light, all influence, all fate.
Nothing to him falls early or too late.
Our acts our angels are, or good or ill,
Our fatal shadows that walk by us still."

CORRESPONDENCE.

SOME PHILOSOPHICAL QUESTIONS.

Editors of The Index:—

In the various reviews of Mr. Abbot's book which have appeared in *The Index*, some of the most interesting, vital, and important questions which can engage human attention have been raised. In one of these,—the question whether the universe is an organism or a machine,—the writer argues that it is neither. Probably, much difference of opinion on problems so profound results from the peculiar and various meanings given to philosophic terms by different minds. In the larger sense of the term, all organisms are machines, because all movements in space and time are necessarily mechanical: no other kind is conceivable. Chemical movements, the action of the imponderable forces, and physiological processes are too subtle for our senses to grasp the mechanism of their operations; but this fact does not make them any the less mechanical. The same reviewer quotes from some philosophic writer an argument to show that the universe cannot be an organism, because "an organism exists and lives through interaction with its medium. The cosmos has no medium. Ergo, it is no organism, and is not alive." The validity of this argument depends upon the assumption that the organic universe of material forms is absolutely infinite, and constitutes the whole. But this it cannot be; for all structures are necessarily bounded by definite outlines, and must be finite, and beyond them must extend the Germinal Essence of Being, from which all organisms were evolved by its tendencies.

The most conspicuous fact in modern scientific inquiry is that the tendency of the essential forces of the universe is toward the evolution of organisms, and in this consists the gist of the prevailing theories of evolution. If the spontaneous tendency of things is toward organization, does it not seem highly probable that the totality should possess the same ten-

dency, and that the material universe is an organism continually nourished and supported by the Germinal Essence which constitutes its environment? And, inasmuch as all structural movements must occur in space and time, the universe is both an organism and a mechanism.

Another article in the same paper criticises Mr. Abbot's argument for the objectivity of knowledge. The writer says, "The one 'modern science' which has a right to speak, and which has spoken as a science proper, is very clear and quite unanimous in asserting that the objects of sense are subjective states or modes of the *ego*." But do those who hold that all knowledge is subjective realize its implications, and would they be willing to carry their doctrine out into all its legitimate logical conclusions? It implies that all the subject-matter of our senses has no existence apart from consciousness. Not only sounds, colors, and odors have their existence solely in consciousness, but forces, forms, and motions, all structures, organisms, and all the phenomena of nature. The outstretched landscape, and all its variety of scenery, of forms, colors, and distances, are simply subjective states of my *ego*, and have no existence that we can ever know outside of it.

Another writer quoted in *The Index* says: "If there were no eyes like ours, there would be no redness in the rose, no whiteness in the lily, and no greenness in the grass, and no beautiful blue in the sky. The proof of this is color blindness. Nor is it to the eye alone, but to all the senses that the same argument applies." Let us transfer this argument to a different subject-matter, and see how it sounds. In the landscape before me, I see a huge mountain lifting its gigantic form against the sky. But this, being simply a subjective state in my conscious *ego*, has no such existence apart from it. The proof is that a blind man could not see it.

But the subjectivists further aver that, outside consciousness, sounds and colors, or the causes of them, are only waves (motion) in air or ether. But what right have they to say that our sensations are "produced by the action of waves of ether" or of anything else, when these waves are, according to their own showing, as subjective as the colors and sounds sensed? They know not, nor can know, if all knowledge is subjective, any such things as waves in external air or ether. Subjectivists are enacting a glaring contradiction, when they undertake to explain what are the external causes of any of our sense-impressions.

FRANKLIN SMITH.

FROM a letter by a Western lawyer to a friend who had sent him a copy of *The Index* containing Mrs. Elizabeth Cady Stanton's article on "Religion for Women and Children," we are permitted to print the following extract: "I am so grateful to you for *The Index* you had the kindness to send me that I want to express it. Aside from the fact that it renews the evidence that I am remembered, it brings to me the consolations of an intelligent and sensible religion. I wish to say now, and I do say, that the article by Mrs. Stanton is, in my estimation, the best one I ever read on that subject. Plain, simple, palpable, courageous, it walks on and over those monstrous theories which, through the ages, have pursued and tormented all the children of men, and 'made cowards of us all.' It adds greater interest to her paper that, for a year, she was a classmate of mine in the Johnstown Academy, and that I then thought, as I do now, that she was the brightest girl I ever knew. I attended that Scotch church to which she alludes. I was required to. It was a part of the discipline. From that high-up octagonal pulpit were thundered into our souls the anathemas of an indignant and terrible God, and we were sent away to writhe in the grasp of an offended and vindictive law. The preacher's name was Mayer, a burly Scotchman; and, dear me! with what power and seeming gratification he would iterate and reiterate the denunciations of heaven against the perishing souls of a helpless race,—'the damnation of hell'! I want to say by way of parenthesis, although hardly pertinent, that in one of his sermons he stole and appropriated entire that beautiful apostrophe of Bulwer in his *Ambitious Student*, commencing, 'Virtue, it is God's own empire; and from his throne of thrones he will defend it.' He changed the first word to 'Religion.' He was exposed by the conductor of the village paper, Phil Reynolds, and left the town soon after. Now, I beg you to understand

me. What I denounce and resent is the above underscored sentiment. It is not true. I consent that I would like to die as my good father died. But if, to do it, it is necessary to subscribe to theories which my whole soul resents, my last end cannot be like his. I feel that I must soon go into another state of existence or into a state of non-existence, I don't know which; but I suppose I shall fulfil the purposes of my existence, be they what they may. With this, I am content."

THE INDIAN MARRIAGE LAW.—Some months ago, I sent to the *Times* summaries of two striking letters on infant marriage and enforced widowhood, published under the *nom de plume* of "A Hindu Lady" in the *Times of India*. The writer of those letters has again come prominently before the public, as herself affording an example of her own pathetic description of the unhappy lot of her sex in India. Rukmibai,—for that is her name,—when eleven years old, was given in marriage to a lad of nineteen. She remained in her father's house, was well educated, and is now described as a young lady of high intelligence and refined instincts. Her husband, on the other hand, is said to be little better than a coolie, ignorant, uncultivated, and unable to earn more than ten rupees a month. The idea of going to live with such a man was utterly repulsive to her. She accordingly refused to do so. Her husband thereupon brought a suit for the restitution of conjugal rights in the Bombay high court. Mr. Justice Pinhey, who first heard the case, dismissed it without calling on the defendant. An appeal was lodged. It was argued last week before the Chief Justice and Mr. Justice Bayley, who have taken time to consider their judgment. It was evident that the sympathies of the court were entirely with the lady; but the question which they had to try was one of law, not sentiment. Should they hold—as is not unlikely—that the Hindu law affords no relief to the wife in such a case, then it may at least be hoped that Rukmibai's sad fate will have more effect than her letters have had in inducing native reformers to direct their energies less to the vague political aspirations and more to the pressing evils of their social system.—*London Times, Calcutta Correspondence, March 21.*

THE other day, a street singer,—a well-built man,—with two children by his side, was drawling out, verse by verse, "Safe in the harms of Jesus," when he was asked by a woman if he would get in a load of coals which lay in front of her house. "To hell with your coals!" was the reply; and he went on singing unctuously,—

"Safe from the world's temptations,
Sin cannot harm me there."

Were the coals too suggestive to his mind of the mythical region he richly deserved to go to?—*The Inquirer (London).*

For *The Index*.

A SUN-DAY MORNING HYMN.

[TUNE, *Missionary Chant*.]

O upward-springing Morning light!
Forth-bursting from the caves of Night
To dissipate earth's pall and gloom,
And for man's ways and work make room!

Beneath thy all-enkindling ray
Our souls expand to greet the Day,
And fain would catch, on Wisdom's road,
The light to Life's serene abode!

When shall man's act be based on Law,
Till nations show nor stain nor flaw?
Nor man from Virtue's fairer heights
Be held by ancient appetites?

O flame of ever brightening Truth!
Earth's waywardness, as of its youth,
Dispel, revealing manhood's strength,
That life diviner be at length!

JAMES H. WEST.

BOOK NOTICES.

MANUAL TRAINING. The Solution of Social and Industrial Problems. By Charles H. Ham. Illustrated. New York: Harper & Brothers, Franklin Square. 1886. pp. 403.

This handsomely printed volume urges that systematic training of hand and eye in drawing, carpen-

try, wood-turning, forging, etc., is so valuable a branch of education that it should be given to all the pupils in our schools and colleges. The question is not between manual and mental education, as it is often incorrectly stated by old-fashioned pedagogues, nor whether our public schools should fit boys for special trades. All here aimed at is to make education more actively and powerfully intellectual than it has been hitherto, and more successful in developing such mental vigor as every man and woman needs, especially in a free land. Nothing does this more surely than improving the two main avenues of knowledge, the senses of sight and touch. We all know how much the development of a boy's mind would be retarded, if he were to lose the use of his eyes or his hands. Must there not be a corresponding acceleration of mental development given by teaching him to use his hands and eyes skillfully and intelligently? What else could we expect from the closeness with which our mental powers are adapted for use in a world full of things which are to be seen and handled?

Manual training has been introduced too recently, as a branch of general education, for its full value to have yet become manifest. But Mr. Ham has collected a large amount of facts which no one interested in our public schools and colleges can afford to overlook. His first ten chapters tell how worthy the Chicago Manual Training School is of the handsome building, a view of which forms the frontispiece. Here, substantially, the same branches are taught as in any English high school; and Latin is an elective. Each boy has also at least an hour's drawing daily, and two hours in the laboratory. Then he begins with carpentry, and goes on through wood-carving, turning, moulding, forging, etc., to making tools of all sorts and learning the care of steam-engines. Special pains are taken to make the boys read, talk, and think about every part of their work; and, at the same time, the practical training is so thorough that "competent and experienced instructors declare that the student in the educational smithy gains as much skill in a day as the smith's apprentice gains in a year in the ordinary shop." What is more important as well as more probable is the conviction of the superintendent that "an hour in the shop of a well-conducted manual training school develops as much mental strength as an hour devoted to Virgil or Legendre." "Three years of a manual training school will give at least as much purely intellectual growth as three years of the ordinary high school, because, as has been said, every school hour, whether spent in the class-room, the drawing-room, or in the shop, is an hour devoted to intellectual training."

The same testimony comes from a similar school at St. Louis, as well as from one in Rotterdam, Holland, where an experience of seven years proves that "boys who are occupied one-half the day with books in the school and the remaining half with tools in the laboratories make about as rapid intellectual progress as those of equal ability who spend the whole day in study and recitation." No need to say which is the healthy and attractive plan. The Chicago and St. Louis system is also in use in the Institute of Technology in Boston, in the State University of Wisconsin, and in various colleges in Indiana, Pennsylvania, Colorado, Alabama, Iowa, Texas, Virginia, Tennessee, Michigan, Ohio, New York, Minnesota, and Louisiana. Many such particulars will be found not only at the close of this volume, but in the extracts published with some additions by the author in *Harper's Monthly* for February. It is a pity that he did not give this wide circulation to his opinion that Prof. Adler's school is "the most comprehensive educational institution in existence," or to "the fact that manual training in some form has been adopted in certain of the schools of at least twenty-four of the States of the American Union." Our Boston plan of sending the boys and girls in turn, each detachment for one half-day in every week, to the work-shop has at least the advantage of reaching ten times as many pupils at the same cost as in Chicago. This cheaper plan is described with approbation in the magazine article as well as in the volume. Both fail, however, to say much about the value of drawing, not only as an indispensable preparation for becoming a skilled workman, but as a sure way to gain just such accuracy in observation as is needed by every lawyer, physician, teacher, merchant, and scientist. An eminent botanist has declared that this is the best way to prepare school

children for studying science. Dr. Bartol says, "He that can sketch an object with a pencil understands it better than he who recites all its titles in the speech of every tribe under the sun." F. M. H.

THE HISTORY OF RUSSIA FROM THE EARLIEST TIMES TO 1877. By Alfred Rambaud. Translated by Leonora B. Lang. In two volumes. With illustrations. New York: John B. Alden. Price \$1.75.

This is one of the best of Mr. Alden's cheap reprints of originally high-priced works. The cheapest edition of Rambaud's *Russia* hitherto attainable cost \$6.00. In this translation from the original French work, the translator acknowledges her indebtedness to the author for many emendations and additions. The index and genealogical tables added by the translator also met the approval of M. Rambaud, to whom they were submitted. Besides maps and genealogical tables, the first volume contains fourteen and the second twenty-three illustrations, mostly portraits of Russian leaders and rulers. The London *Athenaeum* declares this to be, "beyond question, the best complete history of Russia which has appeared in the West." The style of M. Rambaud, as translated, is bright, terse, graphic, always interesting. He has the faculty of seizing the most telling incidents of each page in Russian history, and, by a few swift strokes of his pen in the way of word pictures, reveals to us the salient points in the character or period depicted. He dwells at considerable length on the biographies and history of Peter the Great and Catherine II., but to the fascination and not weariness of the reader. Indeed, no page of this history is at all prosy. S. A. U.

An old Turkish fireplace in the Governor's Palace at Keresoun forms a very pleasing frontispiece to the *Art Amateur* for April. It looks very rich and attractive, with its arabesque scrolls above and soft divans below, and the side cabinets for precious objects of beauty. There is a full account of the great Morgan sale of pictures and objects of *virtu* in New York, of which we have already spoken. Theodore Child gives an interesting sketch of Edvard Manet, the "King of the Impressionists." He is one of the modern painters who has departed from the traditions of the ancients, and sought to express what he has seen with his own eyes. The critic ascribes to him very great influence over modern French art, although he says, somewhat severely, "In his pictures, we must seek neither absolute beauty nor ideas: the artist paints neither history nor soul." We should hardly allow him the name of artist, if this be true, although he may be a painter of pleasing effects. Among the exhibitors at the Paris Water Color Exhibition is Maurice Bontet de Monvil, who paints, according to Edvard Villars, in the Kate Greenaway style, purified by the study of Chinese and Japanese paintings. An illustration of his work is given. We are grateful for so much improvement of the tedious mannerism of Kate Greenaway, but we think it needs reforming altogether by immediate abolition. Greta speaks appreciatively of Mr. Herkimer's fine portraits of Miss Grant and Mr. Richardson, and of the sale of Mr. Oudinot's collection. The portion devoted to Decorative Art treats principally of Oriental luxury, whose aim seems to be to cultivate the *dolce far niente* more than suits our ordinary busy American life.

THE *North American Review* for April is an exceptionally wide-awake number. The opening article is a lively account by the distinguished French woman, Madame Adam, of "Gambetta's Electoral Tour" in 1876, in which he had a thrilling adventure with a royalist mob. This is accompanied by a hitherto unpublished private letter from Gambetta in regard to the affair. Dr. Octave Pavy's "Arctic Journal," edited by his widow, Mrs. Lilla May Pavy, who contributes some interesting notes on the subject, will be read with interest by the thousands who remember that last disastrous expedition, in which the author of this journal perished. "Constitutional Reform in Rhode Island" is discussed by Abraham Payne and W. P. Sheffield. Anna Ella Carroll succinctly relates the story of her "Plan of the Tennessee Campaign." "English Rule in India" is the subject of an article by Amrita Lal Roy. There are also timely papers from Senator Ingalls, Gov. Martin of Kansas, Henry George, the editor, and others. Among "Notes and Comments," an unpublished letter from Byron to Shelley is given to the public.

THE April number of the *Century* gives a detailed account of the "Alabama" and "Kearsarge" affairs, with other war articles. Mrs. Annie Fields gives some delightful "Glimpses of Longfellow in Social Life" from her own and husband's personal knowledge and from private letters from the poet in her possession. Washington Gladden discusses "Christianity and Popular Education"; and George M. Powell has a timely article on "Strikes, Lockouts, and Arbitration." Mrs. Mary Hallock Foote's winning story, "John Bodewin's Testimony," comes to an only partially satisfactory conclusion; and Howells' story brightens up a little.

THE *Forum*, in its second number, bids fair to become a noteworthy rival of the time-honored *North American Review*. It opens with an article of the duties owed the child by the State, by David Dudley Field. Mrs. E. C. Stanton contributes one of her vigorous papers, entitled "Our Boys on Sunday." Among other writers are Andrew Carnegie, Col. Higginson, O. B. Frothingham, Prof. David Swing, Gail Hamilton, Noah K. Davis, and others. The editor of the *Forum* is Mr. Metcalf, formerly of the *North American*. Forum Publishing Company, New York City, N.Y.

"LITERARY LIFE" for March, published by the Elder Publishing Company of Chicago and New York, gives a bright illustrated sketch of "Nathaniel Hawthorne: His Home and Study," by his son-in-law, G. P. Lathrop, and an exhaustive paper on "The Century Company's Offices," with nine illustrations. Other articles treat of "International Copyright," "Tennyson at Home," etc. Lexington White, Elizabeth O. Williams, James B. Kenyon, and "Clanmorna" furnish the poetry of the number.

AMONG the instructive articles in *Treasure-trove* for April, we have space only to notice "Bridges and Bridge Building," by Alice M. Kellogg; "Battle of Crécy," by I. J. Romer; "Bats," by S. C. Wheat; "A Cooled-off World," by Cyrus M. Carter. Sketches of the lives of John B. Gough and Josiah Henson, the original of Mrs. Stowe's Uncle Tom, poems, stories, pictures, and bits of wisdom fill up the other pages. E. L. Kellogg & Co., 25 Clinton Place, New York. \$1.00 per year.

THE *Magazine of American History* for April shows how history can be made as delightful reading as fiction by wide-awake and powerful writers. "Chancellorsville," "Shiloh," and "Our First Battle" are the subjects of the Civil War papers in this number. "The Convention of North Carolina, 1788," and "The Newgate of Connecticut" treat of earlier historic times in America. A very fine steel portrait of Gen. Hancock adorns the frontispiece page.

THE most "taking" feature of *Lippincott's Magazine* for April is that entitled "Our Experience Meeting," in which Julian Hawthorne, Edgar Fawcett, and Joel Chandler Harris ("Uncle Remus") relate their experiences in authorship. These are to be followed by others in the same line. Alice W. Rollins, Dora Reade Goodale, Charlotte Fiske Bates, Grant Allen, and M. H. Catherwood are among the contributors to this number.

THE *Herald of Health* for April has an exceedingly interesting and instructive semi-autobiographic sketch, by Frances E. Willard, of her "health habits"; also, articles by John Fretwell on "How to strengthen the Memory," by Dr. Richardson on "Physiological Aptitudes for Political Labors," "A Case of Hot-water Cure," by E. A. Getchell, together with many hints and helps toward proper hygienic living.

WE have received from that indefatigable apostle of temperance, Miss Frances E. Willard, a copy of "The Minutes of the National Woman's Christian Temperance Union at the Twelfth Annual Meeting, Oct. 30 and 31 and Nov. 2 and 3, 1885." This report contains one hundred and forty-four pages of interesting temperance news and statistics, with an "appendix" of over two hundred additional pages. These lengthy "Minutes" show the amount of genuinely good work which this well-organized women's association is doing.

A STUDY OF PRIMITIVE CHRISTIANITY.

By LEWIS G. JAMES.

8vo. 320 pages. Cloth, Gilt Top. Price \$1.50.

"No fairer statement has been made of the grounds on which the anti-supernaturalist humanitarian bases his opinion of Jesus and of the origin of Christianity. . . . Its theology and Christology are of the most radical Unitarian kind; but the temper and spirit of the book are so refined, so earnest, and so fair to all opponents, that it must impress those who are compelled to disagree with its most prominent conclusions as a model of polite and generous controversial writing."—*Brooklyn Union*.

Sent, post-paid, on receipt of price. Address
THE INDEX, 44 BOYLSTON STREET, BOSTON, MASS.

HOTEL FOR SALE in the County Seat of a fertile county. On Air Line Railway. In good repair and in first-rate location. Doing a good business. Price \$4,000, on easy terms. Address J. H. SHERWOOD, Wauseon, Ohio.

The Religion of Philosophy; OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. FERRIS.

For sale at THE INDEX Office. Price \$3.00.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 BOYLSTON STREET, BOSTON.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crapo.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAH'S MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for 30 cents; 40 copies for \$1.00.

Address THE INDEX, 44 BOYLSTON STREET, BOSTON, MASS.

POPULAR BOOKS

Sent by Mail Postpaid at
PUBLISHERS' PRICES.

ANY BOOK in the subjoined List, or any other OBTAINABLE BOOK, that may be desired, will be forwarded as promptly as possible, on receipt of orders accompanied with the cash.

SPECIAL RATES will be made with persons or libraries desiring any large number of books.

In a letter to the *Providence Journal*, Mrs. Elizabeth B. Chase, President of the Rhode Island Woman's Suffrage Association, says, "On the question of the enfranchisement of foreign-born citizens, I am free to say here that for myself I should be glad to see the property qualification abolished, and substituted therefor the requirement of a residence in the State of a length of time sufficient for the acquisition of an intelligent understanding of our system of government, with no conviction during that time of any violation of the laws of the land; and this, of course, should be without distinction of sex."

THERE was rather a strange scene enacted in the House one day last week. Chaplain Milburn's invocation was devoted exclusively to a prayer that the country might be delivered from the evils of drunkenness, which he pictured in strong colors. At its close, Mr. Price, of Wisconsin, and several other members applauded Speaker Carlisle was annoyed at the idea of applauding a prayer, and brought his gavel down with unusual severity.

In New York, the age at which girls are made free moral agents in choosing between virtue and vice is fourteen years; and the White Cross League will ask the legislature to raise it to sixteen years. Massachusetts still maintains the old common law limit of ten years, for the protection of male debauchees. And yet she has the impertinence to send missionaries to "civilize heathen."—*Boston Herald*.

PROF. DAVIDSON'S lecture on "Bruno" is for sale at *The Index* office. Price 10 cents.

HUSBAND'S CALCINED MAGNESIA.—Four First Premium Medals awarded. More agreeable to the taste and smaller dose than other Magnesia. For sale in bottles only, with U.S. Government Registered Label attached, without which none is genuine, at druggists and country stores, and by Thomas J. Husband, Jr., Philadelphia, Pa.

FOR COLD COUGHS and Consumption use Cutler Bros. & Co.'s celebrated *Vegetable Pulmonary Balsam*. "Best medicine in the world." In use 60 years. Price \$1.50, and 35c. \$1 bottle the cheapest. Be sure and get the genuine.

BRIGGS PIANOS. Elegant stock of these reliable pianos for sale on easy terms or to rent at low prices. C. C. BRIGGS & CO., 5 Appleton St., opp. 440 Tremont.

J. HART & CO.,
BANKERS,
Doylestown, Pa.

Draw Bills of Exchange on England, Ireland, and other points in Europe. Agency for the American Line of Steamers.

Shipman's "Binder" for THE INDEX.

Has a flexible back which adjusts itself to any thickness. So simple in construction that any one can bind their own paper one number at a time. Serves for a temporary or permanent use equally well.

For sale at INDEX Office. Price \$1.00.

FRESH FLOWERS on every occasion.
J. NEWMAN & SONS, 7 Tremont Street.

EMERSON PIANOFORTES.

(ESTABLISHED IN 1849.)
More than 40,000 of these popular instruments now in use in various parts of the country have fully established their reputation.
A First-class Piano at a Medium Price.
Send for catalogue or call at warehouses,
146A TREMONT STREET, BOSTON.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. *Full of Figures, Facts, and Interesting Extractions.* Price 5 cents; 30 copies, \$1.00.

No. 5.—*"God in the Constitution,"* by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—*"The Sabbath,"* by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—*"Compulsory Education,"* by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 3 cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B. Frothingham, treats of a subject that interests everybody. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 10.—*The Impeachment of Christianity*, by F. E. Abbot. 5 cents a doz.

No. 11.—*The God of Science*, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 12.—*Is Romanism Real Christianity?* Two essays by Francis W. Newman and F. E. Abbot. Price 5 cents; 30 copies, \$1.00.

No. 13.—*On the Vision of Heaven*, by Prof. F. W. Newman, of England, analyzes the Christian conception of Heaven. Price 3 cents; 30 copies, 50 cents.

No. 14.—*A Study of Religion: The Name and the Thing*, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 15.—*The Battle of Synnabrook*. Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 5 cents; 30 copies, \$1.00.

THE Secret of the East;

OR,
The Origin of the Christian Religion and the Significance of its Rise and Decline.

By FELIX L. OSWALD, M.D.
Handsomely bound in cloth. Price \$1.00.

"The work covers a great amount of critical and historical ground independently of the Buddhist analogies; it is in fact a vigorous, uncompromising outline of Christian history, with all the weakness and wickedness mercilessly dragged into daylight. . . . The case against the Christian Church is a marvellously strong one. The superstitions and miseries of mediævalism, the woes, tortures, burnings, rackings, and brutalities accomplished in the name of Christianity, are set in blackest array. The Nature-worship of the pagan Greeks and Romans is set in contrast. Nor is Dr. Oswald very generous in admission of improvement in contemporary Christianity. To him, it is a hurtful supernaturalism, impeding science, diffusing pessimism, promoting hypocrisy, and repressing the physical nature. His book is remarkably well written, brilliantly concise in style, and, aside from its special theories, of considerable scientific and historic value."—*Boston Evening Transcript*.

BY B. F. U.

THE *Presbyterian* says, "We remember, years ago, in reading Mr. Darwin's books, noting with much surprise the great number of probabilities he was wont to deal in." The difference between the method of Darwin and that of theologians, generally, may be thus stated: he was "wont to deal in" a "great number of probabilities," they in a great number of improbabilities.

THE result of the Rhode Island State election, held on April 7, was a triumph for those who believe in prohibitory legislation. The prohibition amendment to the Constitution received 5,629 votes, and was adopted by the requisite three-fifths' vote, with a few hundred votes to spare. Prohibition will go into effect in Rhode Island on the 1st of July. The experiment will be watched with interest by many in other States.

THE Royal Orange Institution of England has issued a manifesto denouncing Mr. Gladstone's proposed Irish measure, and summoning the Orange brethren everywhere to remember their obligations to defend the Protestant succession, and to prepare now to prove their loyalty to Orange principles. Orangeism is one of those survivals from the past which in the social and political life of to-day can do no good, and, we hope, but very little harm.

THE coming man, according to Dr. Hammond, is to be quite bald; and, fortunately for him, women "are rapidly overcoming their prejudices, and see in the bald head an element of manly beauty." Baldness is one of the marks of an advanced stage in evolution, it seems, and not, as is so often said, an indication of early piety or of connubial difficulties. Bald-headed men, having long rested under unjust imputations, may now congratulate one another upon the fact that the time of their vindication is at hand.

MR. MENDUM, of the *Investigator*, has reprinted in pamphlet form "A Lecture on Woman's Rights," delivered by Mrs. Ernestine L. Rose in Boston, Oct. 19, 1851. It is one of the most thoughtful and sensible lectures ever given on the subject; and Mr. Mendum is entitled to the thanks of the friends of "woman's rights" for reissuing this address by the courageous and eloquent Polish lady, who spoke for their cause when its supporters

were few. Although given nearly thirty-five years ago, but few of the lectures heard from the platform of the woman suffragists to-day equal it in strength of argument or in force and felicity of diction.

It is stated that Princess Clementina, of Belgium, is being carefully educated as a Protestant, that she may be a fit wife for the eldest son of the Prince of Wales. Her sister, now wife of the crown prince of Austria, was carefully educated as a Catholic. Evidently, the crowned heads of Europe take a very conventional view of religion. It is of interest to them chiefly as a means of perpetuating hereditary distinction and honors, opposing popular government, forming alliances, and otherwise carrying out schemes in the interest of themselves and their families. There are exceptions to this statement; but, as a rule, it is true.

THE executive committee of the Florence Cosmian Society, referring in their annual report to the agitation in this State for raising the age of consent, says: "It seems that this so-called Christian Commonwealth, while it has stringent laws to protect itself against blasphemy, against Sabbath-breaking, against woman suffrage, against small-pox and informal milk-cans, leaves its sisters and daughters helpless against the seducers of their virtue. Your committee recommend that our resident speaker and the executive committee be authorized, in behalf of the society, to sign the petition now in circulation, for a more stringent and effective law for the protection of our young women."

THERE are, doubtless, cases in which what is called boycotting is justifiable in this country; but generally speaking, it is a method not to be encouraged or defended. The attempt to ruin the business of a law-abiding, industrious woman, who carries on a bakery in Hudson Street, New York, because she declined to compel her workmen to join the Workmen's Union, was not simply unjust, but was unspeakably stupid. It violated the American sense of fair play, aroused sympathy in favor of the woman, advertised her business, and increased her sales; and, furthermore, while it has injured the Workmen's Union, it has put a weapon into the hands of those who are opposed to all combinations the object of which is to keep up the wages of workmen.

SEÑOR GASTEN, the chief of the bureau of mercantile statistics in Lima, Peru, has prepared a document, in which he says that statistics show that forty-six per cent. of the births in 1884 were legitimate, while fifty-four per cent. were illegitimate. Evidently, some legislation is needed so as to include the larger part of the "fifty-four per cent." among legitimate births; in other words, to legalize those unions of which so large a proportion of the children born is the fruit. The general condition of the people is represented as deplorable. "Immense sums are subscribed to build sumptuous temples side by side with the hovels where the poor die in want and misery. Hun-

dreds of people exist in damp, narrow, and unhealthy dwellings; while in the main street of the city are extensive convents and monasteries covering acres of ground, and affording shelter to a handful of useless and idle monks and nuns. On this account there are more churches and convents than municipal schools, more children and women than men, more soldiers and Chinese than native citizens, more beggars than laborers, more priests than men of science, more illegitimate than legitimate children, more concubines than women legally married, more ignorance than enlightenment, more corruption than morality, more gunpowder than bread. From this indifference, the little good among us is gradually disappearing. It lacks support and appreciation. It is therefore necessary, in our own interest and in that of our descendants, to change the vicious order of things, to reform these dreadful abuses, to punish these offences with severity, and to afford instruction, protection, and support to these women and children, so deplorably unfortunate in their present state."

PUBLIC opinion in favor of temperance in England seems to be gradually gaining in strength and influence. The chancellor of the exchequer states that during the past ten years there has been a decrease in the imperial revenue equal to \$22,500,000; that the revenue from this source last year was \$5,000,000 below that of the previous year; and that at the same time there had been a large increase in the receipts derived from tea, tobacco, and fruits, among other articles. The inference is that the English people are more temperate than they were in the use of alcoholic liquors, and that the amount drunk is diminishing every year. An intelligent, educated public opinion is the only sure guarantee of the growth and success of the cause of temperance, with or without legislation.

IN the House of Commons, the Liberals have three hundred and thirty-five members, the Conservatives two hundred and forty-nine, the Home-rulers eighty-six. The danger to Mr. Gladstone's bill is now evidently in his own party. Assuming that the Home-rulers will stand by the Premier, he can afford to lose eighty of his own party, and yet carry the Irish bill through. Can Lord Hartington and Mr. Chamberlain, if they persist in their opposition, carry with them eighty or more Liberal members? Popular discussion of Mr. Gladstone's measure has begun; and England, Scotland, and Wales will soon be rocked by an excitement such as they have not lately experienced. Both the Liberals and the Tories will do their best to influence public opinion before the day set for the second reading of the Irish bill. The Tories are now trying to revive old prejudices, to invoke religious bigotry, and to create alarm as to the safety of the empire, if Home Rule is granted. The Liberals are circulating by hundreds of thousands the Premier's great speech, and arranging to address meetings in rural districts during the Easter recess, and leaving nothing undone to educate the public mind, and to secure popular approval of Mr. Gladstone's tentative measure of Home Rule.

THE INDUSTRIAL TROUBLE.

Between the two extremes, of Labor with its grievances, real or imagined, on one side, and of Capital with its enormous power complained of, justly or unjustly, on the other, there stands the great body of American citizens, who are both laborers and capitalists, who have no partisan interest on either side, and who will judge the issue fairly, when it is presented to them; and this class of citizens have it in their power to decide legally and peacefully the conflict which has now culminated in so much violent disturbance of the industries of the country. There are enough intelligent and honest citizens in New York City to prevent the tax-payers being fleeced by a combination between a sharp, unscrupulous speculator and a municipal government of liquor-saloon keepers, whenever those citizens shall go to the caucuses and polls, and do their duty. So, too, there are enough fair-minded and humane people in this country to settle justly and peacefully, through public opinion and constitutional legislation, all the conflicts between Labor and Capital, when they shall seriously apply themselves to the problem. And to this duty, it may reasonably be believed, these fair-minded, humane, sober people will apply themselves before anarchy arrives on the one hand, or such a desperate remedy as governmental despotism is resorted to on the other. There are anxious persons who fear that the country is drifting toward civil war. But the sober common sense and fair conscience of the great body of the people may be trusted, we believe, to avert such a catastrophe.

And there are certain signs that this large class of citizens are awakening to a proper sense of their duty in this matter. There is a growing feeling that the workingman has a story of wrong which must be listened to and considerably heeded. Public sentiment, as manifested in churches and ecclesiastical conventions, in the press, in social reform meetings, and in legislatures, is turned toward the subject as never before. A disposition is shown on both sides of the conflict, and especially on the side of Labor, to introduce the principle of arbitration in the settlement of difficulties. The substitution of arbitration for strikes would of itself be an immense gain. Many of the representatives of corporations are giving their attention to the problem, with a view of doing what is for the best interest of their workmen as well as their own. There are signs, too, that the labor organizations, particularly that which just now is the most active,—the Knights of Labor,—are realizing the necessity of clearing themselves from responsibility for some of the frenzied acts that have been done and wild speech that has been uttered in their name. So far as concerns the official declaration of Principles and Aims put forth by these organizations, there is little or nothing in them to which fair-minded men and women, generally, will not subscribe. The reprehensible deeds which have given them a bad name have been done for the most part—at least, so their intelligent leaders now aver—by local assemblies without authority, or by hot-headed allies, vicious parasites of the labor cause, who are not members of the order at all. It is reported that it was the Knights who restrained the riot at East St. Louis, and prevented that bloody retaliation which the maddened crowd was eager to inflict upon the deputy sheriffs.

But it must be admitted that the labor organizations will have to do many such deeds meet for repentance before they can win the full confidence of the great body of the citizens. The boycott is a species of despotism to which no free and

self-respecting people can be expected long to submit. It is a kind of warfare which, if extended, will inevitably fail through its own excesses. The intelligent workingman, who is subjected to it, feels the instinct of resistance to its yoke no less than the merchant or the manufacturer. There are cases where a simple refusal to trade with or to labor for persons who have committed a gross wrong may be justified; but to extend the boycott to third and innocent parties who do not choose to join in the refusal, or to attempt to dictate to an employer of labor whom he shall employ, is an act which admits of no justification. Nor will intelligent laborers long submit to a condition of things under which, though having no grievance of their own, they may be suddenly ordered by the chief of some labor organization to quit work, in order to rectify a grievance in another part of the country, or even, as has sometimes happened, without their knowing the reason at all or the man who has given the command. This is tyranny, by whatever name it may be called. It is a tyranny which not only takes away from an employer the right to engage such laborers as he may desire, but takes away from the workingman the right to dispose of his labor to whom and where he may choose. In a free country, these two rights must go together. But, in the present industrial disturbances, these rights have become disjointed; and both of them are violated. Fair and intelligent men must see that there can be no justice nor genuine liberty until the normal relation is restored. Let arbitration come, and the boycott and the strike must go.

Again, considering the special trouble in the railroad traffic at the West, the class of men who are employed in the running of railroad trains have intelligence enough to understand that they are not merely in the employ of certain corporations, but that they are paid for rendering certain services to the public, and that they are under obligation to do their part toward conveying certain passengers and freights to certain places within a stated time. This obligation of moral contract may well be made in all cases a legal contract, so that it should become a penal offence, and one of a high magnitude, as it is in the case of mail trains, for any railroad train-men to leave their posts while their trains are in transit, or to refuse to work for present wages without giving reasonable warning to the managers of the road. Such legislation is so manifestly fair that it will be sustained by all fair-minded citizens.

And, on the other hand, this same class of men deserve to be treated with special magnanimity. They occupy positions of great responsibility and trust. They should be well paid. The men who as engineers, firemen, brakemen, conductors, through all weathers, exposures, and fatigues, facing hourly peril, are taking the enormous traffic and travel of the nation safely across the country in all directions, should not be bargained with in a mean or niggardly spirit. To their fidelity, endurance, presence of mind, accurate observation and memory, people commit their lives and property; and to the general faithfulness of these men to the momentous trusts devolving upon them society owes a debt more than money can pay. Some of them are men of heroic mould, standing in moments of impending calamity unflinchingly at their posts of duty, and calmly meeting death themselves in order to save the lives committed to their keeping. Workmen of this class deserve not only just but generous consideration. Their wages should bear some correspondence to the perilous trusts they so well discharge.

Mr. Carnegie, himself a large employer of labor, in his suggestive article on "The Labor Question"

in the April number of the *Forum*, speaks of the co-operative plan of business as a solution of the problem in the distant future, but for the present doubts if the plan could be made in a majority of cases a financial success, without a larger amount of business ability than could be supplied. He is, perhaps, correct in this doubt, though possibly he does not take sufficient account of the capacity of the method to cultivate business ability. But, however this may be, the remedy of the industrial trouble, in our opinion, lies in the direction of the co-operative principle. For the full financial success of that principle, the time may not be ripe. But, if only its humane and moral features were put into effect, even this much would go a long way toward allaying the disorder. That is, Capital and Labor, corporations and their workmen, need to be organized on a plan which should make it evident that they have not antagonistic, but common interests and aims,—that they are engaged in an enterprise where the obligations and services are mutual, and the ends identical; namely, the better welfare of all. There are some large manufacturing establishments where this community of interests and aims is made at once apparent, though the pecuniary principle of co-operation may not be applied. The proprietors manifest a friendly regard for their workmen by providing for them good schools, lectures, libraries, reading-rooms, social entertainments, an artistic and sanitary arrangement of their cottages and of the factory buildings, and sometimes even the agency of a wise and benevolent woman as adviser and helper in their domestic affairs. And this proof that the proprietors and managers are not aiming simply to get the most labor at the smallest pay, but have an interest in the physical, mental, and moral welfare of the workmen and their families, develops in the laborers a corresponding regard for their employers, and a just pride in the prosperity, order, and beauty of the establishments which they help to create. It is difficult to conceive of a strike occurring in such communities. If, in depressed times, the wages of labor go down a little, the workmen yet see that they are receiving something for themselves and children that is better than gold. And there is such confidence and trust between employers and employed that the latter know that the best thing pecuniarily will be done for them that the conditions of trade will allow.

Now at the head of such enterprises as these there are, it is true, men of exceptional character,—men who combine wise philanthropy with first-class business talent; and it may be too much to expect that all great corporations can be managed by such men in the present state of the world. But it is not too much to expect and urge that such examples as these should be accepted as pointing the way in which all corporations and their managers should endeavor to follow. It is not too much to ask that all capitalists and business men whatever should strive after some measure of philanthropy, should remember at least that there is a law of justice and a Golden Rule.

And with regard to both sides of the Labor Problem, if there be any sanctions of moral law, the capitalist has no right to say, "I can use this money which I have amassed as I please, without regard to the demands of justice and benevolence"; nor has the laborer any more right to say, "I can use these physical powers which I possess as I please, without restraint from reason and conscience." A higher law—the law of duty and of social order and brotherhood—says alike to both, "You must serve the welfare of mankind." Labor must learn to recognize not only its importance and dignity, but the obligation it is under to do in

anything the best piece of work possible. And Capital should recognize its function as an appointed instrumentality for promoting industrial civilization, mental culture, and moral elevation. When the truth shall be learned and obeyed that Labor and Capital are the two strong arms, each equally necessary to the other, through which the higher faculties of brain and heart are to organize the interests and activities of human society, then the secret will have been discovered by which these old antagonists will find themselves in peaceful and productive alliance.

W. J. POTTER.

ECCELESIASTICAL AID TO THE WOMAN'S CAUSE.

"The Primrose League," composed of several hundred thousand of the *élite* of English ladies, from duchesses to the wives and daughters of squires, led by the American wife of the English Tory leader, Lord Randolph Churchill, was organized during the last political campaign in England for purely electioneering purposes,—to canvass for votes, to bring all possible influence to bear on doubtful men to cause them to vote for the political candidates of the Conservative party, and to help elect such candidates in every reputable way known to party politics. Some Catholic ladies ventured to join this league, whereupon Bishop Bagshawe of that Church forbade the women of his diocese so to "unsex themselves" as to join the league. But the women promptly appealed from his decision to the temporal head of their Church, Pope Leo XIII., who, recognizing how much more likely women would be than men to help on any future political designs of the Roman see, shrewdly and wisely refused to forbid Catholic women liberty to join such political leagues, knowing that, should he so forbid, such decision might at some future time become an undesirable subject of discussion as a precedent.

If the question had been whether these Catholic ladies might work in some such organization in furtherance of their *own* political enfranchisement instead of for the benefit of male candidates for political offices and honors, it is more than doubtful if so benign a reply had been returned from "His Holiness." And, if such had been the question, and the reply of an acquiescent tenor, although still sensational, it would not have seemed so very strangely out of place for the women suffragists of New York to send an address of thanks to the pope, as they did in this case, nor for other sympathizers with the cause in other States to follow gushingly their New York sisters' lead, and to rush into print with enthusiastic praises over so small a matter. The following is a copy of this uncalled-for address to the pope:

Reverend Sir,—The Woman Suffrage Party of New York State, an organization devoted to the promotion of virtue, justice, and civilization, and in part composed of persons not members of the Church over which you preside, desire to express to you their warmest thanks for your just and beneficent decision in the case of the Primrose League of England, sanctioning women's taking part in politics. The impression has prevailed in America, despite the noble example of many Catholics, that the Catholic Church is hostile to woman's liberty. This grand decision will go far to remove this error, and to aid the uplifting of woman, and hence of mankind, throughout the world. No act of your predecessors for many generations will bear such great and glorious fruit. With kindest wishes and grateful hearts, we are yours in sincere respect.

(Signed) CLEMENCE L. LOZIER, M.D.,
Chairman State Committee.
HAMILTON WILCOX,
Chairman Executive Committee.
IDA LONICE DELDINE,
Secretary.

A friend, enclosing this address in a private letter, comments thus upon it,—a comment which, it is to be feared, will be made by many, both friends and enemies of the woman's movement: "It seems to me as if the 'suffragists' had 'put their foot in it' badly. I should like to see how 'you-uns' justify this 'appeal to Cæsar,'—or rather to the 'Beast.' The Catholic Church is hostile to woman's liberty, and to man's also, and will always be, world without end. No good can come out of that Nazareth. The pope is fooling you; and, if the 'cause' cannot get on without thanking his holiness Pope Leo XIII., it is in a very bad way, to my thinking."

But, fortunately, despite the mistakes made by many of its real friends, the "Cause" is not in any need of such downright pandering to ecclesiasticism as this. The inherent justice of its demands is sure to be recognized at last, even in the face of such inconsistent hindering occurrences as this address, which, however sincere and enthusiastic the spirit in which it was written and sanctioned, can only awaken regret among thoughtful adherents of the cause, and contempt among the foes it seeks to propitiate. As an instance of the latter, we quote the sneering editorial comment upon it of the *Brooklyn Examiner* (late *Catholic Examiner*), one of the most fair and favorable of Catholic publications in its treatment of the woman question. It says: "His Holiness should certainly be informed of the communication addressed to him by the 'Woman Suffrage Party of New York State.' The cares of the Sovereign Pontiff would be lightened by an occasional amusing episode of this character. The woman suffragists address him as 'Reverend Sir,' and thank him for his decision in the Primrose League as 'sanctioning women's taking part in politics.' Pope Leo will doubtless be deeply moved by this address."

In view of this case, and also of the constant truckling for ecclesiastical recognition of their claims displayed by a majority of the large number of women sufficiently advanced to understand their right to political equality,—a truckling spirit which makes them welcome to their platform the veriest weakling who can attach "Rev." to his name, in preference to the strongest pleaders or most intellectual thinkers among laymen,—it is high time that more strenuous attention be given to the release of the womanly intellect from the domination of the Churches. Mrs. Stanton, Mrs. Gage, and others, have already sounded the alarm. Something definite ought to be done in this direction. Some such measures as recommended by Mrs. Stanton, in her letter to the Washington Convention of the N. W. S. A., should be adopted and carried into effect. Without intellectual and religious liberty, it seems now almost impossible to gain political liberty for women, or even to awaken among them the true inspiration of liberty in any direction.

Ecclesiasticism, for ages, in every Protean form it has assumed, while it has soothed and befooled woman with promise of mythical spiritual amends in a future world for all the hardship, injustice, and degradations incident to her earth life, has yet done nothing to make her earthly estate more desirable; has in no way strengthened her intellectual faculties; has not taught her self-dependence or self-assertion. Its primary lessons to woman have been obedience, submission, humility of spirit, self-sacrifice, and acknowledgment of inferiority to her brother man.

In spite of the delight with which many women suffragists welcome every half-way indorsement of their claims by their spiritual leaders, the number of "Reverends" whose names they can bring forward as active, public, acknowledged champions of their cause were, until the last decade, when it

became more popular, few and far between; while some of its most prominent opponents have been distinguished divines, such as Horace Bushnell, Dr. Morgan Dix, Dr. Dexter, Dr. Patton, Bishop Spaulding, and others as well known, who have taken some pains to put themselves distinctly upon record as opposed to it upon moral and Biblical grounds.

When the religious leaders of any faith or denomination take up this reform in downright earnest, and prove conclusively that there is nothing in the tenets of their religious beliefs in opposition to the broadest principles of true liberty or intellectual growth, nothing to prevent woman's advancement to her highest possible development in all directions, it will be then time enough to pour out grateful praises for the help which may, under such circumstances, be given. Until such time, let those who *have* really borne "the burden and heat" of the most needful reform of the day go on unfalteringly in their appointed work, which must be one of enlightenment as well as of liberty.

SARA A. UNDERWOOD.

THE OPEN SECRET.

Dr. Montgomery's striking criticism of *Scientific Theism* reveals a significant and attractive man, acute in thought, deep in feeling, earnest in study, sincere to the core, and withal a soulful man, who, in thinking, can never for a moment be a mere theorizing machine. Upon one point, I fully agree with him, in opposition to the author he criticises; namely, in thinking the line between life and inorganic matter a line very strongly marked to the mind, if not to the eye. Of the criticism generally, I permit myself to say nothing, save that it merits study, and that those who read it once would do well to read it more than once. But, upon a single point, I will venture to raise a question, because it touches a matter of much interest, and because it will lead me to a partial confession of belief concerning the greatest of all matters.

Dr. Montgomery maintains, in opposition to Dr. Abbot, that we know nothing concerning the "immanent relational constitution" of things. It is to us, he says, utterly unintelligible. In support of this proposition, he brings forward, first of all, the case of a living body. This body is composed of a countless number of cells, each of which, according to the best authorities, is a complete individual, with a form and vital motion quite its own. How are these numberless individuals absorbed into the unity of a larger individual life? There they are, at once complete individuals and minute parts of an individual whose being comprehends them all, and is, nevertheless, a single identical life. What is the power that unites them, and how does it operate? We cannot say. The organic principle is there, and does its work; but we can never get it 'twixt thumb and finger or under the microscope, never in any way make it an object of direct inspection. It is a mystery, a wonderful mystery. Who has not many a time pondered and wondered over it? What mind has never been fascinated by that marvellous secret of life and growth, so near to us, so hidden from us? As I ask the question, a vivid recollection recurs. While toiling and moiling in the theological mill, with little content to my soul and little enlightenment of my mind, I one day strolled out into the open country to breathe the sweet air and look upon the fresh life of nature; for it was then early summer. In crossing a hill, I came upon a single buttercup; and the question rushed upon me, Whence is that, and what is it? Ah! whence and what? I

seemed looking down into an infinite depth of mystery, no blank unknowable, but living, pregnant, significant, voiceful, and a mystery. That little plant spoke to me as the theological tomes could not; and the impression of that hour remains with me in vivid freshness now, when so much of the same or more recent date has faded from my memory forever. Dr. Montgomery's mind has been drawn to the same point. What is that principle of organic unity? he asks; and the question remains unanswered, unanswerable. He cannot analyze it, cannot get behind the scenes to see it work, can see only what it does. Accordingly, he says that the immanent relational constitution of a living body is unknown and unknowable. Did he not mean to say that the producing and sustaining principle of this constitution rather than the constitution itself is unknown?

Here is Dalton's *Human Physiology*. Upon its publication, twenty-seven years ago, it was praised by the *Westminster Review* as the best compendious treatise upon the subject which had been put forth up to that date. This treatise, praised for its union of clearness and compactness, fills an octavo volume of six hundred and odd pages. What is treated of? The system of functional relations which has been discovered in the human body. Join to this work another on human anatomy, and, in the two together, we should see described the system of structural and functional relations found in the human body. Now, this system of structural and functional relation is the constitution of that body,—we may say its relational constitution, its constitution of relations, or simply its constitution, as we choose; for any constitution whatever is necessarily a system of relations. This constitution is immanent in the body; that is, it is developed by a process of growth, not imposed from without. It appears, then, that, of the immanent relational constitution of animals, we know just so much as is comprised in the sciences of anatomy and physiology. Yet Dr. Montgomery says that we know, and can know, nothing of the matter! What does this mean? It means that he is speaking of one thing and thinking of another. He speaks of the actual and largely known system of relations; but he thinks, and supposes himself to speak, of that which causes such a system to exist. He should see that the constitution or system of relations is one thing, its producing and sustaining principle quite another thing. The Constitution of the United States is an instituted system of political relations, easily examined; but its sustaining principle is in the minds and hearts of the American people or nowhere, and is not so easily examined. Very plainly, the integrating and animating principle of an organism is to its "relational constitution" what the spirit of a nation is to the grown forms of its political life. It is not itself a relation or system of relations, but the source whence relations arise and the power by which they are maintained. So far, therefore, Dr. Montgomery's criticism fails to touch at all the statements against which it was, by the writer's intention, directed. But he has argued beside the point, only because his searching eye—that must penetrate to the ultimate mystery—has looked quite through, instead of looking at, the said relational constitution.

Meantime, the unitive principle of an organism and the so-called individual selves are by no means so much estranged as has been assumed. There is certainly a degree of rhetorical exaggeration in Schleiden's assertion that the cells are "individual beings." If they were, indeed, such, if they were severally capable of an independent

existence and had grown independently, if each had its principle of life in itself as a separate being, and if they were, nevertheless, seized upon, subordinated, and merged in the unity of a larger individuality by a principle quite external to themselves, the case would then present not only a mystery, but an impervious puzzle. The fact, however, is a very different one; and no such puzzle affronts our intelligence. The cells have been called into existence by the power they obey, and could not live apart from it. Without that principle which makes the oak to be a living whole, not one of all its component cells could have been formed. Here, then, is clear truth in the seeming paradox that the whole makes the parts of which it is composed. The subtle organic principle builds itself out into material realization. It calls the cells into existence as partially individuated vital forms, in which it is the genetic, formative, and sustaining power. In the whole there is one life,—one life as the source equally of unity and differentiation. To begin, therefore, with the cells, in trying to think the life of an organism, is to begin just where Nature does not begin, to get the cart before the horse; and when one must, moreover, set up the component parts as "individual beings" in the full sense, he blocks the wheels of the cart, besides putting it in the wrong place.

What, now, is this principle of organic unity, this principle of life? I suppose it to be a particular mode of cosmic energy. That is the light in which the fact presents itself to my mind; and I shall not offend against modesty by saying how it presents itself, though it would ill become me, could it be becoming in any man, to dogmatize on such a matter. I will therefore go on to state my conception, begging the reader to understand that I am simply making my confession of belief, not calling upon him to believe the same. I conceive, then, that the cosmos—the builded and ordered universe we behold—is the manifestation of an absolute, pure energy, self-sustained and self-active forever. This is cosmic energy. Whether we are to attribute to it a divine character, and call it God, is a question which is here left wholly aside; but it is most certainly not blind, not undirected, for it issues in a structural order that at once amazes, almost confounds us with its complexity, and awes us with the grandeur of its unity. This energy, without subdivision, without prejudice to its oneness, distributes itself into an infinite number of definitely conditioned and derivative modes, lower and higher, rising rank above rank, a vast gradation, until the highest mode is reached in conscious spiritual being. Every organism and every natural form of existence is in its essence one of these specially conditioned and specially determined modes of cosmic energy. To every vital being, this energy imparts more or less its own secret of self-activity, though only as contingent and relative; and the imparted power of self-activity arrives at its highest point in the spirit of man. Much is implied in this,—very much; but, of its implications, I can here say nothing. Enough to have stated my conception in the simplest possible outline.

Now, an energy appears, and by its very nature can appear, only in its effect. It cannot appear otherwise, for the obvious reason that it exists as energy only in the doing of work. It exists only as it acts: its being and its action are one and the same, and to conceive of it as not acting is simply to conceive of it as not in existence. Gravitation is an energy manifested in the drawing together of material masses, and it obviously exists only in this manifestation. Who could conceive of gravitation as remaining when its

action had ceased? It and its action are the same fact. Heat is said to be a commotion among the component molecules of a body. What causes the molecular motion? An energy that can be seen only in its manifestation, because it exists only in such manifestation. To suppose the motion absent is to suppose the energy not there. In short, energy is all and only a working principle, to be seen in what it does, and not to be seen otherwise, since it exists only in the doing. It can never be made a separate object of observation, since, to make it such, we should have to find it out of its work, as a thing apart; that is, we should have to find it as not energy. Accordingly, if the organic principle of a tree or other organism be, as is here supposed, a specially conditioned mode of cosmic energy, we should not say that it is unintelligible, but rather that it is invisible. Even this is but partly true; for it is always visible in its effect, always to be seen in the relations and processes it establishes and sustains. But, if one would go behind its effect, to find it there and see how it acts, he will see nothing; for the energy is not behind its work, but in its work: it is not a thing that acts, but is itself action. Here I rest. The bottom fact everywhere is energy, cosmic energy, with its infinite variety of modes. By its very nature, it can appear only in what it does. I am content to see it as it appears, and not otherwise. Therefore, I do not ask how the mind can perceive objects. From my point of view, this is an idle question. Perception is an act or manifestation of mental energy. We know of the energy by its manifestation, but shall never get behind the manifestation, to see how it can manifest itself. Have done with this futile spying! Energy is in its work, and will never be seen out of its work. The question, how the mind perceives, resolves itself into this, How can percipient energy be such an energy? And this resolves itself into the farther question, How can cosmic energy be what it is and do what it does?

Cosmic energy is the "open secret" of the universe, hourly, instantly familiar to our experience, and an unsounded sea of mystery. The universe, in the great unity of its order and course of its evolutions, is a perpetual publication of it. Nature reveals it in all her infinite variety of form and expression, in things least and things greatest, parasites and planets, singing gnats and the heaven of stars, the shadow of a passing cloud and the constitution of a solar system; and it is told not only in all that the eye beholds, but in all that the mind thinks or the heart feels. But, so published, so proclaimed, it is a secret still, nor less a secret in our own breasts, as the very substance of our being, than at the remotest distance. What do I know of my own mind, my own spirit, myself? Everything and nothing. I think, feel, will, and so on; but what is it that thus acts? I, an irresolvable unit, bodiless as a mathematical point, which acts, knows that it acts, and knows itself only in its action. As the secret of the universe is hidden from me, so am I hidden from myself; and, without as within, the hidden is revealed, not a blank unknowable, but an open secret. The conscious spirit of man is also a mode of cosmic energy, the highest derivative mode known to us, and therefore is revealed even to itself only in and through what it does. That is, the nature of our self-knowledge conforms perfectly to the hypothesis here put forth; and, indeed, I as yet discover nothing which does not conform to it.

I think, then, that the principle of the universe is a pure eternal energy, self-nourished and directed; that every form of natural being is in its

essence a derivative and specially conditioned mode of this energy; that, however, these modes are not mere linear extensions of it, like Spinoza's modes of Absolute Being, or of its attributes, but are brought forth by a creative process, and are in some valid sense *other* than their original; that, by its very nature as energy, this can appear and be known only in its action and effect; and that, however qualified to follow intelligently the processes of its manifestation, we can never in any case say how it should be able to produce such effects. Accordingly, it is idle to ask how vital energy can do the work it is seen to do, or how the energy we call mind can perceive or think. Again, any attempt to predetermine the possibilities of cosmic energy in its creative action, as when, for example, one declares it impossible that mind should be free in willing, is not merely idle, but presumptuous. What that energy can do we learn only by observation of what it does: how it should be able to do this or that we never learn at all. The secret is forever open, forever a secret, always revealed, never exposed; and the human mind has equal occasion for boldness and for modesty.

D. A. WASSON.

"THE AGE OF CONSENT."

Will you allow me, as a friend of woman and of woman suffrage, to express my utter dissent from the effort now being made to raise the so-called "age of consent" for women to eighteen or even to twenty-one years? The whole attempt is based on a theory which seems to me utterly false and reactionary; to belong to the old tradition which made of woman a perpetual child. If she is so utterly weak and irresponsible a being as not to be held responsible in the slightest degree for her action at that age, the Oriental system of subjection is vindicated. To say that on the day before she is twenty-one she shall be held wholly passive where she connives at a sin, and that the day after she is capable of being a voter and a law-maker,—this seems to me the severest logical blow yet dealt at woman suffrage. Out of such wholly helpless and negative material, a voter cannot be made. If I believed in such a law, I should cease to believe in woman suffrage.

Nor can anything be shallower, as it strikes me, than the attempted analogy between the age of contract and the "age of consent." The act in question is not a contract, but a crime; and any child is held responsible before our laws for a crime. Moreover, a boy is as incapable of a contract as a girl; but the effect of such a law, if passed, would be to throw the whole penalty upon the boy, if they sinned conjointly, and to exculpate the girl altogether. What, then, becomes of the analogy of the "age of contract"? Why is not a boy entitled to the benefits of the analogy as well as a girl?

It must never be forgotten that the majority of those of both sexes who fall into profligate habits do so before the age of twenty-one; and, if the boy is often the seducer, he is also often the seduced. It is the general testimony of policemen, confirmed by the late investigations of the Society for the Suppression of Vice, in New York, that the ranks of prostitution are largely, though not wholly, supplied from families where girls are so reared as scarcely to know what virtue means. Where a girl so reared corrupts and misleads some inexperienced boy, far more ignorant than she is of the tremendous force of his own passions, it seems to me little short of wickedness to regard her as a mere victim, and send him to the State's prison for rape. If the fact of sex is to shield absolutely and at all ages from all moral responsibility, we must revert at

once to the safeguards of the harem and the zenana. It is not on this theory that an American society has been built up.

The question of the proper age at which responsibility should be recognized as beginning is no doubt a difficult one, and it must be determined partly by practical considerations. In my own judgment, sixteen should be the very latest. But the cardinal point always to be borne in mind is that, whatever of moral responsibility we remove from the young woman, is only so much more heaped upon the young man,—who may, in point of fact, be no older than she is.

T. W. HIGGINSON.

MILK FOR BABES.

Would you like a bit of reminiscence? Well, when a child of half a dozen years, I was a reader of the Bible and Catechism; and, I am happy to say, I still reverently read the former. I recited the whole of several catechisms, and will give you a specimen of the poetry I then learned, which will not budge from memory's tablet. It was a dialogue between Christ, Youth, and the Devil, climaxed by Death, who at the last steps to the front; and the following lines are what he has to say:—

"I am come, Youth, to take thy breath,
And carry thee to the shades of Death.
No mercy on thee I can show.
Thou hast thy God offended so.
Thy soul and body I'll divide:
Thy body in the grave I'll hide,
And thy dear soul in hell must be,
With devils to eternity."

Now, Yankee children were keen little polemics, smart, if not very profound. I remember I used to recite the whole of this terrible dialogue; and, very early,—my head did not come so high as the old-fashioned balustered pew,—I entered my little protest, greatly embarrassed by an unlucky lisp, by saying,—

"That ith what ith thaid in the book, but I don't think tho."

This being carried off by Death and the devil did not much trouble me, for I persisted in declaring *I was good*. I was not afraid of the devil, because I did no "wicked thing"; but I have seen children, whom I sought in those days to bring round to a proper state of moral feeling by reciting the lines to them, with suitable emphasis, turn deadly pale and scream with terror.

I compare the children of our day with the children of the long ago,—children who now never hear the obnoxious noun mentioned to ears polite and us who were taught to think him always at our elbow, and were kept busy in ordering him into the background; and, really, we devil-trained children appear somewhat to advantage.

Children of my own age brought the difficulties that exercised their infant minds to me for solution; and one little girl once came to me, and asked, with wide, solemn eyes,—

"Does the devil ever try to pull you out of bed?"

"Pull me out of bed!" I exclaimed with a shudder. "No, indeed: I never tell lies, nor be disobedient."

"Well, he tried to pull me out last night, because I told a lie; but I screamed, and mother stopped him."

Now, I never profanely doubted the existence of such a being; but I believed my great righteousness was my protection from his power.

Dr. Potter, in an excellent mention of the tendency to crime in the modern child, very justly imputes it to the sensual, excitable stories of the dime novel kind. It is not dime literature alone: it is the kind of stuff tolerated in the leading

dailies and weekly sensational papers, the latter filled with most atrocious and demoralizing illustrations. The boy and the girl of to-day are educated to crime by these pictures of men distorted with the vilest emotions, and women in deadly peril; and all nobleness, gentleness, and manliness are scattered to the winds.

Now, the headings of our newspaper paragraphs are in the last degree atrocious, stimulating, indecent, and misleading. The advertisements, also, ought to exclude the best of the dailies from the household. The young mind questions the meaning of what it reads, and it is impossible to answer it. Our one weekly paper of a secular kind, which came to the fireside, the *Portland Argus*, still alive and alive like to be, and the *Boston Recorder*, now the *Congregationalist*, contained none of this objectionable stuff in any shape. And there were not many murders in those days, no divorces, and never a suicide; while the humbuggery of clap-trap and nostrums had not expanded into the vast proportions they have reached in this day of shams.

Everybody believed in the devil, but was trained to resist him and all his works. It was a not unwholesome check. We children never heard about him except from the Sunday-school and pulpit; and, as high moral qualities were the great specified antidote to his power, parents and teachers were apt freely to interlard their homilies with what would follow evil courses.

If I were to publish a daily paper, I should have one column devoted to "The Devil and his Works." All else should be clean and tender and hopeful; that is, human.

I read in one of the papers that a boy of nine years was lately lynched somewhere in the West; and run-away girls, suicidal infants of both sexes, and incarnated devils in the shape of boys are not infrequent.

I write, questioning is it best altogether to topple down a power, a god, a dual, a rival in evil to the divine beneficence, till we have reached a substitute, or something that shall be an equal check to the disorders of our social system.

ELIZABETH OAKES SMITH.

OUR contributor, Mr. Kennedy, in his very readable article, last week, on the biography of Longfellow, spoke of the poet, in respect to habits of pecuniary liberality, as being "close-fisted, as is well known." If this be well known,—which we did not know,—then it is all the more important that any facts to the contrary should be brought to light. One such fact came under our immediate knowledge. A number of years ago, a young woman, who had struggled up against poverty and the influences of a shiftless, wretched home to the point of appearing on the platform as a public reader, called on Mr. Longfellow, at his home, for advice and aid. She had no more claim upon him than any other of the numberless strangers who went to him for a like purpose. But, on listening to a specimen of her reading in his library, he was convinced that she had genuine talent, and deserved to be encouraged. He at once invited a company of friends to hear her at his house, secured invitations for her before other parlor audiences, and bought and distributed a considerable package of tickets to a public hall reading in Boston. After a few years, the reader's health failed. Consumption had seized her. She returned to Boston from a hard winter in the West, too sick for further work, and with little money in her pocket. She had no home; but, through the aid of friends, a place was secured for her in a hospital. Mr. Longfellow was informed of her condition, and went to see her. Learning that she

had no funds, he made himself responsible for half of her board in the hospital (\$5 a week), another friend paying the other five. This continued for several months. She was then removed to another hospital, where Mr. Longfellow paid the full board (\$10 a week) so long as the lady lived, which was four or five months. Only a very few persons knew of this generosity. May it not be that there were other cases where he was doing similar kindnesses, though they were not "well known"? W. J. P.

FREE RELIGIOUS ASSOCIATION.

The Annual Meeting of the Free Religious Association will open on Thursday evening, May 27, with a business session in Fraternity Hall, Parker Memorial Building, corner Berkeley and Appleton Streets, Boston, at 7.45, for hearing reports, electing officers, and considering any resolutions that may be offered. The executive committee authorize the presentation for rejection or adoption of an amendment to the Constitution, according to which present Article I. would be divided into two Articles, which would read thus:—

CONSTITUTION.

ARTICLE I.—This organization shall be called the Free Religious Association.

ARTICLE II.—The objects of this Association are to encourage the scientific study of religion and ethics, to advocate freedom in religion, to increase fellowship in spirit, and to emphasize the supremacy of practical morality in all the relations of life. All persons sympathizing with these aims are cordially invited to membership.

The other articles to remain as now, but to be numbered respectively III., IV., V., and VI.

The public convention will be held as usual in Parker Memorial Hall, Friday morning and afternoon, May 28, and the festival that evening in the Meionaon. Further particulars hereafter.

F. M. HOLLAND, Sec'y.

EDITORIAL NOTES.

BY B. F. U.

REFERRING to the element of danger to Judaism, a well-known rabbi says, in the *Jewish Reformer*, "When King Jannæus felt his end approaching, he advised his queen Saloma to make peace with the Pharisees. For said he (Sota 22b), Fear neither the Pharisees, nor those that are not Pharisees, but the 'dyed ones who resemble the Pharisees.' The danger lurks with the pseudo-Radicals, and, I may add, with the pretended Conservatives."

It is evident from their writings and speeches that many who, in their desire for the protection of young women from deliberate and experienced seducers, have advocated raising the so-called "age of consent" to eighteen and even to twenty-one years, have overlooked some aspects of the subject considered in Mr. Higginson's timely article printed on another page. On this subject, as on others, there is danger of going, in theory at least, from one extreme to another.

OF *A Study of Primitive Christianity*, by Lewis G. Janes, Mr. Chadwick thus writes: "A wonderfully clear and strong expression of the higher criticism of the New Testament and the origins of Christianity. . . . No mere compilation, but the outcome of an independent mind working freely upon a mass of materials to which few, except the professional scholar, can give the attention they deserve. If I am not mistaken, Dr. Janes has brought to these materials a singularly just and patient mind, which has saved him from the 'falsehood of extremes,' and enabled him 'to see things

as they are.' It is, for me, an admirable feature of this book that it does not apprehend the life of Jesus and the early Christians as any merely historical problem, but demands at every step to know what there is here to help us in the storm and stress of our own times,—philosophy and ethics, and sociology and religion."

REFERRING to a paragraph in *The Index* of April 8, which, while praising Mr. F. A. Hinckley's work in Providence, stated that it was done without the recognition of his society by the churches of the city, Mr. Hinckley writes: "When several years ago my right to join parties in marriage was questioned, it was a committee of ministers, appointed by ministers, consisting of one Unitarian, one Calvinist, and one Episcopalian, who went to the State House in my behalf and in behalf of the society I have the honor to represent, and turned the scale in our favor. That, surely, was a recognition both in spirit and letter. More than this, my relations with the ministers of our city have long been of the most cordial kind. I meet them in various reformatory and philanthropic associations; they greet me on the street as a brother. However wide apart we may be in our theological conceptions, I feel that I have their respect as an honest man, trying to do an honest, ethical work. I am not aware that my religion hurts my standing, in the least, in this community."

Most all that Mr. Hinckley says can be said by Liberals, generally, living in the larger communities. That his personal relations with the clergy are pleasant, and that much of his work—the same as they are now doing—is appreciated by them, has not been questioned. By the remark that his society was not recognized by the churches of the city was meant, of course, not that Mr. Hinckley or the members of his society were held otherwise than in respect and esteem, but that the radical principle and work of the society were not regarded by the churches with favor and as deserving encouragement and support. It was, of course, kind in the clergy to help Mr. Hinckley, as a minister, obtain the legal right to join parties in marriage; but this was no part of the work for which a free thought or free religious society stands. Indeed, it was rather a concession on the part of Mr. Hinckley to ecclesiasticism in acknowledging, contrary to the principle of State secularization, that the State can justly authorize the legalization of marriage, a civil contract, by a minister, by virtue of his religious office or profession.

At the annual meeting of the Cosmian Society at Florence this month, the old officers were re-elected, and Mrs. Elizabeth Powell Bond was rechosen resident speaker. After Mr. W. H. Spencer's term expired, the society returned to its original method of employing a resident speaker who should occupy the desk one-half of the time, leaving the remaining Sundays for other speakers, "thus combining," as the executive committee in their report say, "the transient or itinerant with the resident system, and thereby meeting the various needs of the members." This course the committee declare to be more in harmony with the spirit of the society's platform, and a return to it has been followed by the best results. "It is found that introducing different speakers from time to time, instead of disintegrating, serves to cement us in a closer unity." The report says that Mrs. Bond, as resident speaker and superintendent of the Sunday-school, "has officiated in both capacities to the entire satisfaction of the society. She has shown great devotedness to her work; and the result is a growing popularity,

prompting your committee to recommend the continuance of Mrs. Bond in the same office for another year." "It is due Mrs. Bond to say that she has done more for the society than her agreement required. In the absence of speakers, she has conducted the meetings without extra charge, saving to the society over \$100. We are happy to say that, under present arrangements, a deeper interest has been shown in supplying the necessary pecuniary aid than under our former speaker, so that the report of our treasurer will be found more buoyant than formerly." Sunday evening meetings, arranged by members of the society, the exercises consisting of music, recitations, and reading, were held during the winter. The report concludes with these ringing words of confidence and cheer: "Your committee feel that we all have cause for congratulation that at no time since our organization have we had so good reason for believing in the perpetuity of our society as at the present. Fortunately, we are organized on a basis sufficiently broad to secure the full enjoyment of all the virtues of which the churches can boast; while, at the same time, being relieved from all those clogs with which the Church is burdened, in the religious rites and dogmas borrowed from an effete paganism, we seem, as it were, to have risen into a clearer and serener sky, where, as on the wings of the morning, we have the unlimited range of the bright expanse. Let us, on this twenty-third anniversary, be baptized anew with the Cosmian spirit, and henceforth move onward, in perfect unity, with renewed zeal to accomplish all the good we can for ourselves and our fellow-beings in the inculcation of virtue and intelligence and the highest improvement of all our social relations."

JOHN HUMPHREY NOYES, who died at Niagara Falls last week at the age of seventy-five, and who was best known in connection with the Oneida Community, with its system of complex marriage, was born at Brattleboro, Vt. He studied theology at Andover Seminary, intending to enter the Congregationalist ministry; but careful study of the Scriptures satisfied him that the Christian churches had all departed from the teachings of Christ, and that it was his mission to restore the religious communistic life, as enjoined by Christ and his disciples. He began preaching at New Haven in 1834. At Putney, Vt., where he preached ten years, his disciples were known as "perfectionists." In 1845, he fully declared his scheme of religious communism, which was based on four principles,—reconciliation with God, perfect salvation from sin, equality of man and woman, community of labor and its rewards. An essential part of the plan was complex marriage,—the union of men and women for offspring only, subject to the decision of the community, and all actions and relations to be matters of public criticism, from which none should be exempt. This brought trouble upon the perfectionists at Putney, when they began their experiment in 1846; and they were forced to leave. With the history of the Oneida Community, founded in 1848, the public are somewhat familiar. About ten years ago, outside opposition and internal dissension compelled the society to abandon its system of pantagamy as a practice, although it was still adhered to as the ideal of the future social condition. Noyes went to Canada, where he found opposition too strong to be overcome, but not so strong as to prevent his planning to establish a community near his home at Niagara Falls. Mr. Noyes was undoubtedly a sincere man, of a strong religious nature and philanthropic disposition, as well as of intellectual ability and considerable organizing power and business capacity.

The Index.

BOSTON, APRIL 22, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, : : : : : } Editors.
BENJAMIN F. UNDERWOOD, : : : : : }

NO WRITERS in THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

For The Index.

THE "UNKNOWABLE POWER."

BY W. D. LIGHTHALL, M.A.

"The Earth goes on the Earth, glittering with gold;
The Earth goes to the Earth sooner than it would;
The Earth builds on the Earth castles and towers;
The Earth says to the Earth, 'All this is ours.'"

—In Melrose Abbey.

It was a terrible spectre, during the ages of monastic gloom, this fact that the body had weight and shape and limitations of strength and was simply a material object. Nor has the notion lost its force, however it may its ghastliness, to a great multitude of perplexed ones, since we have learned so much more clearly its mechanical nature in the lever-action of its bone-and-muscle adjustments, the chemical operation of the digestive juices, the voltaic-battery structure of the brain, the similarity of nervous currents to electrical, and the whole family of facts which show us that the body, from crown to heel, is, and acts as, simply an elaborate machine. But, surely, there are some differences between it and an ordinary machine? Let us examine those differences, together with their likenesses.

The principal likeness between the body and the machine is that each is an *organism*; that is, a structure consisting of parts which interwork for a common purpose or purposes. The machine may be a large printing-press: its common purpose, then, is to turn out printed sheets, and perhaps to drop them, neatly folded, into a box.

The parts of the body likewise interwork. One of their common purposes is to digest the substances we take as food. Another such purpose is locomotion. But the great general purpose, to which all subordinate ones contribute, in the uninstructed natural man, is the preservation of the type; that is, the preservation of the organism itself, and the transmission of its like.

This purpose the organism is adapted to effect mechanically. It might be done unconsciously just as well as it is done. Suppose a stone thrown at such an unconscious body. Its eye would be affected by the rays of light coming from the

stone; these would send a current to the optic centres; the effects of similar previous occurrences would have opened thence certain arcs connecting with motor nerves leading to the muscles of the legs; and the legs would leap out of the way, as those bodiless frog's legs leap in Galvani's experiment.

Thus, we have the principal likeness between the body and a "mere" machine. The principal differences are certain mental facts. One is that I am conscious of much that occurs in my body. Another is that I—or my mind—seem able to guide its special movements as I please; in other words, that, ordinarily, it acts toward my pleasures and away from my pains.

Now, how is this compatible with what was said before? If the body is a machine, will it not move where it tends? and must not the mind merely follow its tendencies, *volens volens*? Sometimes, this occurs. But take a case where it does not occur. For instance, you yourself can walk to the door if you please, or you can stay where you are if you please. There your body does not move in spite of your desires. Of that case,—and it exemplifies most cases of willing,—one of two explanations is true: either the body is governed by your pleasure or else both body and mind here work together in simple parallelism.

But pleasure is only a state of consciousness, a feeling. It is not a weight or a chair or a force or a nervous current. It is utterly unlike any of those external things, and cannot act upon them or upon what is like them,—the body. Imagine in your mind some strong pleasure, if you wish to test this. Being a simple state of consciousness, it cannot as such stir anything. This is one of the most important points in psychology to understand thoroughly, and cannot be better put than by Dr. Alexander Bain, of Aberdeen: "Mental states and bodily states are utterly contrasted: they cannot be compared, they have nothing in common except the most general of all attributes, degree and order in time. . . . When I am studying a brain and nerve community, I am engrossed with properties exclusively belonging to the object or material world: I am at that moment (except by very rapid transitions or alternations) unable to conceive a truly mental fact, my truly mental condition. Our mental experience, our feelings and thoughts, have no extension, no place, no form or outline, no mechanical division of parts; and we are incapable of attending to anything mental until we shut off the view of all that. Walking in the country in spring, our mind is occupied with the foliage, the bloom, and the grassy meads, all purely objective things. We are suddenly and strongly arrested by the odor of the May-blossom: we give way for a moment to the sensation of sweetness. For that moment the objective regards cease; we think of nothing extended; we are in a state where extension has no footing; there is to us place and space no longer. Such states are of short duration,—mere fits, glimpses; . . . but, while they last and have their full power, we are in a different world."*

We come back, therefore, to the second explanation, that matter and consciousness here work together in parallelism. But something must cause this parallelism. What is that something? It acts for man's pleasures and away from his pains. It cannot be a mere conscious state. And it cannot be a mere unconscious matter, because it acts with an understanding of his pleasures and his pains.

One thing is certain. There must be a deeper being than either the phenomena of matter or of

* Paper on "The Correlation of Nervous and Mental Forces."

mind somewhere concerned in the affair. It may be that man's own individual nature is the deeper being, and contains, unknown to him, capabilities of feeling and acting and co-ordinating the two. Or else the deeper being concerned is some greater, who knows him and knows what pleasure is, and that he can feel it, and can and does arrange for him.

As to his individual nature, so far as he is conscious of it, being the agent required, that seems unlikely, because its area of power is so limited. Many of the acts which tell for his pleasure are out of the reach of his will,—for instance, the operations of the heart and of the arterial muscles which equalize the circulation of his blood,—and most of the arrangements for him were made long before his birth.

What, then, is this power?

Let us characterize it somewhat more. We have seen that it is a something which acts in much for the individual. In his acts of conscious will, it acts in the individual. Does it not look as if mind and body—consciousness and matter—were here but different sides or phenomena of a reality which is the reality of both, and that his true self is not known to his ordinary consciousness?

But a great part of the working of the power is not directed to the individual's pleasure specially. It is directed to that of others, even in the individual himself. For one thing, in the arrangements for the continuation of species, it looks beyond him to the race that is to come after him. Secondly, take that principle running through evolutionary history which constitutes the commonest conditions of existence, those which give most natural pleasure, as the colors of the sky, the grass, the trees, the mountains, and the forms of one's own species. In intellectual altruistic action, again, the power impels the man to a voluntary self-devotion to the happiness of others, directly against his personal pleasure, and often at much individual pain.

The power, therefore, is not of the individual, but has a field of purposes including all pleasure-feeling creatures. (I am using the word "pleasure" as typical of feelings in general.) And the family of such creatures grades all the way down to simple protoplasmic masses, and carries its analogies beyond these even to colloids, as Graham* shows, and thus into the inorganic lifeless world, so that no limit can be logically fixed where the latent feeling ends.

Again, a curious conclusion can be drawn regarding all these creatures which alike possess a conscious nature. Their likeness and certain other circumstances, such as some of those above mentioned, point to a common base. Of course there is no difficulty about their having a common origin,—that is to say, what might be called a common base in time; but there are reasons, also (which, however, might be cumbersome here), why this ought to point to a common *simultaneous* base.

There is very great significance in the power's action for pleasure. In the first place, pleasure is the one thing we care about, of all things. Furthermore, it and pain are the facts of our true internal being, so far as our self-consciousness pierces. What strikes them strikes into our very core. Our powers of knowledge lead into them, our will starts out from them, and both subserve them. If the power had worked to produce some mere idea or some principle of mere matter, there would have been no special significance. We care nothing for those things except as they produce pleasures or pains. We can see no real design in them except as they do so.

The only thing that will show a budding of the

* See appendices to Spencer's *Biology*.

physical and the mental together in one united plan for one united purpose, as apart from a mere accidental principle of union, is the action of the physical for something mental; and this can only be thought of pleasures and pains.

Furthermore, to act so persistently for pleasure, the power must understand pleasure. It does act persistently so. All the laws of feeling look toward a continuation of pleasure, the law of pleasurable activity, for example, which is the arrangement that pleasure is associated with the most frequently recurring conditions of our activities and those which tend to permanence of the material organism, as also the laws of the withdrawal of consciousness from an injured frame.

I use the word "understand" at once as part of the theory I am about to state. We find in the world a tendency of the unknown to resemble the known in broad characteristics. Mill, the great logician, shows in fact that this is the basis of reasoning by inference.* We are more and more every day finding out that the universe known and unknown is a unity. The probability is, therefore, in favor of the power knowing pleasure in somewhat the way we know it rather than in some totally unlike way. Why should not this power fall into a place in the unity of the universe? If our body and our consciousness are but outer shows of our deeper individual self, that which wills through and in all matter and in and for all consciousness will be a being uniting the whole of these in its essence, they and ourselves being but parts and outer shows of it. If it acts so distinctly for the pleasure of all, just as the individual tends to will for his own pleasure, then, on the same analogy, the inner fact of the whole universe, so far as our consciousness can conceive it, should be feeling. And the rule of action of the whole universe, by a law as wide-spread as matter, must be toward pleasure. And if men are but parts of the general universe, so considered, they obey the biological laws of parts. Their individual consciousness will be to that of the whole as the consciousness, say, of the individual cells in their own brain substance. Mankind and all flesh upon this globe must obey, united, simply the laws of development and function of an organ of the great Organism; and the function of this organ is evidently ethical. And, finally, we have the important deduction that man, so far as he goes, is an *expression* of the universe; that the universe, therefore, is intelligent and fatherly. Has not anthropomorphism, then, some truth, after all?

Our leading quest—next to the performance of our function, duty—ought surely to be the study of this Great One. That it can be clearly and simply seen and proved is a great step in religion. Clearest of all is it to be discovered in the parallelisms of states of physique with states of feeling, —a large field for exploration. This field leads on to all associations of states of physique with states of consciousness of every kind, and wherever there is a different state of consciousness there is a different phase of matter. Thence, the call is onward to a study of the organic structures of the universe, and also of the phenomena of objective existence. Everything, in fact, will contribute something. There is no lack of material.

The theologian theists have done much good work in the pleasure field, mostly on the questions of Order and Design. They have followed, however, rather instincts than any deep-reaching system, because hampered by traditional doctrines. On the other hand, recent scientific thinkers, while they neglect this field, reach the conclusion from other directions. Herbert Spencer arrives at his "Unknowable Energy" by recognizing a single

Source behind all the phenomena of force, matter, and consciousness,—infinite, eternal, and either personal or higher than a personality, and unknowable in the sense of being "no more representable in terms of human consciousness than human consciousness is representable in terms of a plant's functions."* Huxley has lately followed him.† Fiske, the author of the *Cosmic Philosophy*, concludes the same: "There exists a Power to which no limit in time or space is conceivable; to which all phenomena, as represented in consciousness, are manifestations, but which we can know only through the manifestations." Schopenhauer ascribes all to Will permeating the universe. Schelling reached the idea as a common reality including both Subject and Object in one. Hartmann and those from whom he draws his chief ideas approach it from an examination of unconscious and instinctive acts. Even John Stuart Mill, just before the development of our evolutionary methods, was led to see some kind of such a power crudely given by ordinary induction, of which he was *par excellence* the master. "A Being of great but limited power, how or by what limited we cannot even conjecture; of great and perhaps unlimited intelligence, but, perhaps, also more narrowly limited than his power, who desires and pays some regard to the happiness of his creatures, but who seems to have other motives of action which he cares more for, and who can hardly be supposed to have created the universe for that purpose alone." A learned German-American ‡ has just given to the world a system, starting from the dualism found in Kant's writings, which evolves the idea from still a different point of view. Spencer and his fellows, though on the simplest track, have been properly criticised for laying too much stress on the "unknowable" aspect. They would not have been so likely to do this, had they started from the tendency to act toward pleasure instead of that of the large quantities and more mysterious forces of physics. It is in the hope of calling attention to the neglect of this department that the present paper is written. Research in it may yet reveal as striking facts and fruitful laws as physical research has done. We cannot, it is true, know the power directly, just as we cannot know things in themselves; but we can follow much of its effects among phenomena. Inference leads us as legitimately into that world beyond sense as into the unexplored regions of the world of sense itself. Far in their *extent* beyond our power to grasp as are the attributes of the Great One, still science is demonstrating the *directions* of lines that lead to it; and the fact that we may never comprehend more than a part of it is no sound reason for restraining our researches in those directions for partial knowledge.

Why, for example, may I not ask such a question as this: "If the Universal Spirit be my true self and that of all my fellows, is not exact justice a necessary law of existence? for, if I injure my neighbor, do I not hurt myself precisely so much?" "On the same basis, What are rights?" Or why may I not ponder on the apparent truth that different phenomena, when traced into the realm outside of consciousness, do not become confused at once into one homogeneous ultimate? A fact which the constancy of the parallel associations between given states of mind and matter, and the reappearance into consciousness in accordance with regular conditions of states which had disappeared from it, amply prove. Besides its unseen unities, that world is a world of differences corresponding largely to the differences of this.

* *Essays. First Principles.* Controversy with Harrison.
† Controversy with Mr. Gladstone.

‡ Dr. Paul Carus, *Monism and Metiorism*, New York, 1885.

How like are the suggestions of the whole subject to the (unscientific, however) doctrine of the Tao-te-king, the mystic Foist book contemporary with Confucius! "Immaterial, unchangeable, all-pervading, unwearied, I have no name for it. If I would speak of it, I call it the Tao. . . . All things are born of Tao; by its power upheld, by its substance formed, by its forces perfected. . . . "The origin of the world is the mother of all. Whoso has found his mother knows himself to be a child, and knowing this and returning to his mother, though the body perish shall not be harmed."*

CORRESPONDENCE.

TWO VIEWS OF CHRISTIANITY.

My dear Mr. Perrin:—

My weekly *Index* came to hand yesterday, with extra numbers containing your very interesting article pertinent to my book. I thank you most heartily for the warmth of your commendations and the terms of estimation in which you rank me and my work. And yet I beg you will not think me *cranky* and unreasonable, if I tell you in what respect such a notice as yours is not serviceable. You have done, in the same friendly spirit and from the same point of view, just what my good friend, the late Elizur Wright of Boston, did. He hailed my book as the *coup de grâce* of all religion and all theism, and taunted all believers with cowardice for not daring to read or being able to answer it. Of course, this was tying a tin kettle to the tail of this poor dog, and sending the whole kennel after him down the street. What I wanted was a candid hearing among the orthodox, by whom I had been trained; and such a notice only warned them to avoid my book as they would a mad dog.

Nor do I think your taunt of illiteracy any more effective, and that, too, mainly because it is not quite just. I think you are right in concluding, as I do, that a man who keeps a corner of his mind darkened, and allows it to become the depository of all kinds of obsolete and dilapidated superstitions, which, with some not wholly unenviable sentiment, he continues to cherish, as an old girl sometimes does the dolls of her childhood, is not a completely enlightened man and not wholly free in the range of his critical inquiry. But, on the other hand, we have known many fine and even fair minds who, controlled, as we must allow, by a sentiment of faith and reverence that we respect, interpose a *thus far and no further* to all investigation into the grounds of beliefs they have come to consider ethically sanitary and wholesome. So we have been obliged to acknowledge that high and even critical intelligence is quite compatible in certain persons with a superstition that to us seems quite puerile. Then, too, while such men continue to instruct our youth, and make the books that mould the opinions of our age, and wear the titles and distinctions that are awarded, or are presumed to be, only to the best scholarship, it is no use for a small squad of us to cry out, "Dunce!" in any average assembly of their admiring disciples; for we shall only be drowned by the overwhelming plaudits of the faithful, and might be justly kicked out for the indiscretion of our ill manners.

No: we are pretty shabby fellows not to receive with open-eyed, open-mouthed docility the spoon-victuals of doctrine from those who have been ordained to instruct our ignorance; but hitherto, as a class, we have behaved well, and not made ourselves the subjects of discipline for the offensive or ruffianly manner in which we have made confession of our heresies.

You speak of my book as an attack upon Christianity and an irrefutable proof that it is a false religion. This proposition cannot be assented to, unless you greatly restrict the definition of Christianity. If you mean by Christianity the narrow dogmatism of the Catholic *propaganda* of to-day or the unmodified Orthodoxy of Old and New England, as expressed in the Monday lectureship of Joseph Cook, then I have attacked it, and shown the falsity of its fundamental teachings. But, to me, Christianity is a genuine historical development, and embraces the whole mental

* S. Johnson, *Oriental Religions: China*, pp. 873, 874, Boston, 1877.

movement from Jesus and Paul through Augustine, Luther, Knox, and Wesley to Channing, Emerson, Parker, Martineau, Strauss, and Renan. As, when we speak of chemistry or astronomy or geology, we have in mind the whole progress of those sciences, from the first tentative experiments and imperfect speculations to the most recent discoveries of our own times, but always mean chiefly the best accredited theories and the best verified generalizations of the latest investigators, so, when we speak of Christianity, we embrace the doctrines of illiterate monks and scholastic logicians and metaphysicians, indeed; but we mean chiefly Christianity in its best and broadest expression in the most capacious and cultivated modern minds. So I think my own poor speculations and studies are not to be charged as antagonistic to Christianity, but as a part of its own natural growth and modification.

Coming from the orthodox into the Unitarian ideas, I naturally went to the extreme left, as most recruits from that quarter do. I found the Unitarians borne along everywhere by the all-involving sweep of scientific inquiry,—the young, generally, joyfully giving themselves up to the current, and saying that the movement was jolly, the old paddling for the eddies, and with genuine fright clinging to every bush or stone that gave them a holding place. As a whole, their position seemed to me woefully illogical. They affirmed the humanity of Jesus, and yet they deferred to him as God. He was a man, but without the limitations of humanity and without its infirmities. If this man is my exemplar, my master, the sovereign of my soul, why stickle with the orthodox about his rank? Better be the servant of God than of a man. Since I do not regain my liberty, what have I profited by my liberal creed? Just so about the Bible. It was neither written nor dictated by God taught Channing; but it is infallibly true, nevertheless, and the process of painfully consulting it at every emergency of conduct or duty went on just as it did before. We continued to make a fetish of it. We read it as an act of devotion and merit. We solemnly droned its obsolete texts, and put into phraseology—sometimes serious and sententious, sometimes wise and weighty, but sometimes political, sometimes poetical, sometimes cynical, sometimes cabalistic, sometimes sophistical, sometimes even indelicate—the better meanings of our own better thoughts, and called it the Word of God.

Now, what I wanted to do was this,—to ascertain what is the genuine tradition concerning the origin of our religion. What, as near as it can be now ascertained, is what the world received from Jesus, from Paul, and his collaborators? These inquiries naturally led out to the investigation of these questions: What was Jesus? What were his great life purposes, as disclosed by his words and acts? What opinions did he hold and teach, and how far has the "consensus of the competent" accepted them, how far modified or repudiated them? He belonged to a peculiar people, in whom the religious instinct was marvellously developed, as was the art instinct among the Greeks and the political instinct among the Romans. From them, he derived the idea of a regeneration, a restoration, a convulsion, which was to establish a reign of righteousness in the world. This idea we now see to have no other basis than the contrast between conditions of misery, nearly universal, with hopes and aspirations that the sanguine imagination has ever busied itself in stimulating; but we also see how natural was its development in the minds of disappointed patriots, like the prophets, whose ideal of earthly good was so contrasted with the unusually sad fortunes of their own race. This idea Jesus accepted, and ultimately surrendered himself to it; and its legitimate result was, just as he foresaw and intended, his own violent death. Now, all the thaumaturgic, the prophetic, the world-destroying part of the work of Jesus, not being in the plan of God, came to a complete end and failure. But, inasmuch as Jesus himself belonged to the high order of men, of whom are Zoroaster, Moses, Confucius, Socrates, Buddha, and Mohammed, and as he had taught and exemplified a system of ethics, a philosophy of living, of universal and everlasting validity, all that, being in the plan of God, survived, and, though not original with Jesus, received from him a new codification and a new emphasis, and is now to be regarded as the kernel and substance of Christianity, or rather of that universal religion of which Christianity is one of the forms and expressions. Historically, though the kingdom of heaven, as held in the strong

hope of Jesus, has not been realized, his marvellous courage in enduring his crucifixion, which resulted from his assumption of the office of the Messiah, and the belief in his resurrection were the two wings upon which the enthusiasm of the Christian faith has been uplifted and has been borne down the ages.

The enterprise and fate of old John Brown are an admirable illustration of the work and relation of Jesus. Brown's scheme of a slave insurrection, a righting, in bloody vengeance, of the long wrongs of slavery, was all fanatical, impractical, and even criminal. It all came to naught, and ended in his execution. But Brown's devotion to his wicked project, the love of man that prompted it, the high sense of duty that inspired it, the sublime courage of his suffering,—become thus a martyrdom,—the ages will admire, and at the same time see in his scheme and its defeat the bringing on of that judicial trial by battle for which the insolent slave system was waiting, and by which it was condemned and punished.

Now, you see all that mythologic conception of a Messiah, a kingdom of heaven, a separation of righteous and wicked, may be disregarded,—cancelled from perfected Christianity just as alchemy is cancelled from chemistry, astrology, and the Ptolemaic and Platonic theories from astronomy,—and we shall have left a purely ethical religion, none the less valuable in that a part of the ethics of Jesus his own followers have set aside as impractical. This puts Christianity upon the same basis as the other great world religions, as a genuine product of the universal religious sentiment, an aspiration of man toward God rather than a revelation or inspiration of God toward man.

I hope I have fairly vindicated my claim to be not an antagonist to Christianity, but a worker within the pale of its large ideas. Believing, as I do, that it is a purely human and historical development, and that the sentiment that created it is greater than it, I strive still further to study and develop this sentiment. While I believe that Christianity is a human work, I do not shut my eyes to its incompleteness and deficiencies. But, with all these, I think it is better than any other religion, at least for all these Western peoples. For Asia and Africa, I can but think, if Christianity—native to one, and first offered to the other—had been better, it would have held its place, as it did not. I love my religion, as, on the whole, the best we have been able to devise, just as I love my form of government and my constitution,—not that they are ideally perfect nor capable of immense improvement, but because they are better than other forms of government and constitutions, at least for free and enlightened men.

More than this, I do not think it is wise or safe either for individuals or peoples to try to live without the sanctions and the authority of religion; and the experiment will be sure to end disastrously. I see signs everywhere of the weakening of the sanctions of the Christian religion, and tokens of its giving way before very long to some higher cultus. I have hope that the succession of Messiahs and Saviours has not closed, and that somewhere, among some people, soon another man sent from God will speak to us all with (finally) the authority of Jesus and Moses, though, like them, in his own day he may be disregarded and derided. The change of cult is a terribly sad trial for the world, and I look upon it only with apprehension; for it has ever been accompanied with the outbreak of terrible crimes and the experience of terrible social and personal suffering. To change from the Olympian gods and the old Greek philosophy to the Trinity and metaphysics of Scholasticism cost the world a thousand years of eclipse and arrested civilization. Let us hope the next *salvus* will not cost so much. Meantime, let us cling to Christianity with tooth and nail, till God sends us, if he may, a nobler faith. Let us stretch its meagre vestments all we can, to cover all the exigencies of human thought, all the bold askings of the aroused human spirit. They will be in the best mood of mind to welcome the larger faith of the future, who have given the broadest interpretation to the faith which it succeeds.

A religion is to be judged by its results, by its efficacy to redeem men from their bestialities and vices, and make them noble and wise. I am willing to admit that the myths and marvels that hang like draperies around the cradles of faith are not to be too rudely plucked away. They, too, did some good office in their time. Nor am I shocked if the too

shrewd historic critic discovers even palpable traces of charlatanry and imposture. It is quite obvious these latter were controlling factors in the production of Mormonism in our own time; and yet I can understand how for thousands of honest, narrow-minded men and women its poor, second-hand faiths and obsolete, sanctimonious phraseology may have all the sanctions of genuine religion in keeping them devout, pious, truthful, just, upright, and charitable.

GEORGE F. TALBOT.

PORTLAND, ME., March 19, 1886.

My dear Mr. Talbot:—

I have greatly enjoyed your letter, as well as profited by it. I envy the calm and the kindness of your attitude toward Christianity. Had I been in a state of mind more fully to appreciate this side of your book, I should perhaps have paid less attention to what might be called its destructive qualities in my brief mention of it. The trouble is, I am undergoing a course of training for another assault upon the Church; and I am naturally prone to look upon the dark side of the picture until the undertaking is accomplished. I suppose that, when it is over, a reaction will set in; and I will gain by degrees a more amiable feeling for the faith. As it is, I have a deep and passionate resentment toward the religion which has tyrannized over reason for so many centuries. I cannot forget the infamous despotism of the Christian empire, and the long and sickening list of its crimes against humanity,—crimes which would have been impossible, had its principles been true; and I shall never rest until I have burned into the forehead of the Christian Church the brand of these false principles and the crimes which they have engendered.

One cannot love and hate at the same moment. All art is an exaggeration. If I am to paint this picture of Christianity with the strength which it deserves, I must feel the horror which the history of the Church must inspire in every human heart.

I do not see any sense in the word "Christian," unless it means one who worships Jesus, or in the word "Christianity," unless it means the religion which teaches that Jesus was a perfect or divine being. If Jesus was perfect, his teachings should have been perfect; and I find them full of error,—error of thought, error of feeling, error of conduct. To say that Christianity is a synonyme for the intellectual and moral development of Europe and America is to give the religion credit for what it has relentlessly and bitterly opposed throughout the past, and still opposes. If we do not discriminate between Christianity and the natural impulse toward a higher life in man, we may as well give up all effort to understand life and to establish definite and clear religious conceptions. I believe that the time has passed for temporizing with Christianity. The time has come for every earnest and true man and woman, who is able to understand the conditions and meaning of moral life, to take a firm stand against a religion which distinctly teaches that unreasoning faith is superior to upright conduct and that sin can be cancelled by a Supernatural Power. For these doctrines, I have a deep abhorrence; and I can conceive of no higher aim than to consecrate one's life to the destruction of a religion which upholds such principles and renders them holy in the eyes of our fellow-men.

If there is an axiom in ethics, it is that the worship of an individual destroys morality, because it establishes a despotism over thought and feeling. The universe is a republic, not a despotism. God is a principle, not a sovereign. There is no superior will other than that of humanity; for morality is the adjustment of the individual to society, not abasement to a Superior Being. All this undermines Christianity, and marks it as false; and there is no tincture of it so mild that, when analyzed, it is not found to be both an intellectual and a moral poison. Years ago, I became discouraged with what seemed to me a hopeless opposition to a great faith; and I withdrew from religious discussions into the study of philosophy. From this pursuit, I emerged to find a religion dominating my country which taught positively immoral doctrines. I had become indifferent to its historic, its scientific, and its philosophic errors; but, when I fully realized that this great organization was actually corrupting the mind and weakening the character by sanctifying false principles of thought and feeling, I determined, for the remainder of my life, to resist its influence to the uttermost.

If, therefore, you have found me too vehement in

my opposition to a faith for which, with all its faults, you still have an affection, you see at least that my course is consistent, and that it has a definite aim. Also, when I assure you that my dearest friends are devout Christians, and that I am the trusted associate of staunch churchmen,—both official and unofficial,—you will believe that my hatred is for ideas and principles alone, and that it has no personal rancor.

I hope that some day we may join hands as to the proper method of attacking Christianity, for I know that in your heart you must deplore its teachings almost as much as I do.

Sincerely yours, R. S. PERRIN.
NEW YORK, March 28, 1886.

NOTE.—It should be said that Mr. Perrin wrote this letter with no thought of its publication, to which he has no objection, however.

A GENTLEMAN, who was a prominent New York publisher and bookseller a generation or two ago, thus writes us:—

"It is surprising to me that the name of Frances Wright is never mentioned, so far as I have noticed, by writers of either sex, by the women more especially; for her work, in connection with R. D. Owen, on the rostrum and in the columns of the *Free Enquirer*, made thousands of Liberals all through the country. They broke up the ground, and planted the seed. Later speakers and writers harvested the crop. At the time she came upon the stage, Orthodoxy, as it is called, was rampant. In the city of New York, chains used to be stretched across the streets during the time of service in the churches, to prevent the passage of vehicles. Hell and damnation were the staple pulpit themes. The people were at the same time deluging Congress with petitions to stop the Sunday mails, and they came mighty nigh carrying the measure. If they had succeeded, we should next, probably, have had a batch of Puritanical law enacted. It was due in great measure to the labors of Frances Wright that this scheme came to grief. Her themes were political as well as religious; and it was one of the results of her work that the 'workingmen's' party was organized in 1830, in New York City, which, with only a few months' preparation, elected one of the six members of the Assembly the city was then entitled to. I have heard most of the celebrated readers and speakers who have figured on the stage or rostrum during the last fifty years, and never listened to a more brilliant reader and speaker than Frances Wright. I have often been in the old Park Theatre when it has been crowded from pit to dome to hear her, and seen as much excitement produced by her eloquence as I ever saw there when Fanny Kemble or Ellen Tree have made their favorite points. She was, in short, a remarkable woman, who did meritorious service for free thought,—in fact, set the ball in motion,—for which she gets no credit in these later days. She wielded a powerful pen, and what has been said of another may be truly said of her,—that, 'in thought, no blade was more trenchant; in feeling, no heart more human.' The only work of hers of a purely literary character, as far as I know, is a *Few Days in Athens*, which she calls a fragment, and which any one who reads will only regret that she did no more. Some publisher ought to reprint it. It is a charming sketch, and couldn't fail to meet with a large sale."

THIS extract is from a letter received lately from a well-known writer on economic questions:—

"I was writing for the daily — here, and incidentally had to discuss the labor question. I wrote a paragraph indicating that a laborer had no natural right to demand wages at the hands of any employer, but that his economic right to wages was at all times dependent on his employer's ability to profit by hiring him, and on his own ability to do work out of which a profit could be made. The editor Ganiel said: 'Why, we can never teach this. I never could sell the —, if I published in it that a workman's right to be hired depended on his employer's ability to sell the product of his work at a profit.' 'Thanks,' I responded. 'If that is so, I have the same right to be employed by you if my articles cause a loss on your paper as if they cause a profit!' He could not see it in that light. So he stopped my services, because he was angry at my desire to teach, through his editorial columns, that he had the perfect right to stop my services, if he did not find them profitable. What he wanted to teach was that he was bound to hire me,

whether I pleased him or not; and he discharged me because I would not teach that he had no right to discharge me."

BOOK NOTICES.

SIGNS AND SEASONS. By John Burroughs. Boston and New York: Houghton, Mifflin & Co. 1886. pp. 269. Price \$1.50.

It seems very appropriate and reasonable that a new book from this careful and sympathetic observer of nature should appear with the very first "flowers that bloom in the spring." This volume is published simultaneously in England and this country. In the opening paper of this volume, "A Sharp Look-out," he says, "The student and lover of nature has this advantage over people who gad up and down the world, seeking some novelty or excitement: he has only to stay at home and see the procession pass"; but, despite this assertion, Mr. Burroughs seems to have "gadded" somewhat in the course of writing these papers, some of which appear to be the result of peregrinations made in the pursuit of this study of nature. "A Taste of Maine Birch" gives us the result of observations made during a hunting and fishing excursion to that State, "A Salt Breeze" tells us of some of the experiences gained in a visit to some watering-place, while "A River View" is taken from altogether different environments. There are "a baker's dozen" of these essays; and those not before named are entitled as follows: "A Spray of Pine," which deals with the peculiarities of the pine trees which Emerson was peculiarly attached to; and, in this essay, Burroughs remarks: "The real white pine among our poets is Emerson. Against that rustling, deciduous background of the New England poets, he shows dark and aspiring"; "Hard Fare" treats of the food habits of birds and the smaller wood animals; "The Tragedies of the Nests," giving anecdotes and observations in regard to the nest-building of different sorts of birds; "A Snow-storm," in observing which, he remarks, "We are admitted into Nature's oldest laboratory, and see the working of the law by which the foundations of the material universe were laid,—the law or mystery of crystallization"; "Winter Neighbors," showing the friendliness of various birds in winter, when their necessities are greatest; "A Spring Relish" treats of various indicative sights and sounds of early spring; "Bird Enemies" gives some idea of the hazards of bird-life; in "Phases of Farm-life," he declares that "the farmer should be the true naturalist: the book in which it is all written is open before him night and day, and how sweet and wholesome all his knowledge is!" which brings a smile as we remember some New England farmers whom we know; a return to "The Roof-tree" appropriately closes the volume, which, as a whole, is full of wholesome, healthful, thought-inspiring pictures of nature in a guise which few of us have time to cultivate acquaintance with.

S. A. U.

THE *Revue de Belgique* for March contains a powerful protest in the name of the believers in the triumph of liberty, who expect everything from the development of individuality and the abandonment of old-fashioned shackles against longer union with the socialists, who would stop independent activity, and sink all individuality in the motion of the social organism. Socialism is creating a new church, which says to men: "For you, liberty is misery. In the name of your own interests, which only a reorganized society can preserve, I command you to follow its law." Other articles show how communal property has flourished in Java and Sumatra, how wars and standing armies impoverish Europe, and how Arbor Day has been transplanted to Belgium.

"WIDE AWAKE" for April opens with a lovely Easter picture "On Easter Day," by W. L. Taylor. The poems of this number are exceptionally good, by Kate Putnam Osgood, Lucy Larcom, Mary A. Lathbury, M. E. B., and others. Stories by A. M. Griffin, F. L. Stealey, Harriet Prescott Spofford, Caro Lloyd, and Margaret Sidney. Short sketches are given of Alice and Phoebe Cary, by Amanda B. Harris; of Carmen Sylvia, Queen of Roumania, by Mrs. Sherwood; the poet Juvenal, by G. E. Vincent; and Madame Récamier, by Mrs. Fremont. Mrs. Power tells "What to do in Emergencies," and Mrs. Treat chats about "Cave Spiders." Nearly every page is rich with beautiful illustrations. D. Lothrop & Co.

HE who can at all times sacrifice pleasure to duty approaches sublimity.—*Lavater*.

THE grand essentials of happiness are something to do, something to love, and something to hope for.—*Anon.*

A STUDY OF PRIMITIVE CHRISTIANITY.

By LEWIS G. JONES.

8vo. 320 pages. Cloth, Gilt Top. Price \$1.50.

"No fairer statement has been made of the grounds on which the anti-supernaturalist humanitarian bases his opinion of Jesus and of the origin of Christianity. . . . Its theology and Christology are of the most radical Unitarian kind; but the temper and spirit of the book are so refined, so earnest, and so fair to all opponents, that it must impress those who are compelled to disagree with its most prominent conclusions as a model of polite and generous controversial writing."—*Brooklyn Union*.

The Religion of Philosophy;

OR, THE UNIFICATION OF KNOWLEDGE:

A comparison of the chief philosophical and religious systems of the world, made with a view to reducing the categories of thought, or the most general terms of existence, to a single principle, thereby establishing a true conception of God. By RAYMOND S. PERKINS.

For sale at THE INDEX Office. Price \$3.00.

SCIENTIFIC THEISM.

By FRANCIS ELLINGWOOD ABBOT, PH.D.

This work includes the substance of a lecture delivered last July at the Concord School of Philosophy. It is part of a new philosophy of Evolution, vitalized by the principle of UNIVERSAL ENDOGENIC TELEOLOGY and by the substitution of the ORGANIC THEORY OF EVOLUTION for the MECHANICAL THEORY advocated by Spencer and Haeckel. Its purpose is to philosophize the scientific method, and to show that modern science, interpreted by its philosophized method rather than by its non-philosophic special results, leads, not to Atheism, not to Agnosticism, not to Idealism, but to a REALISTIC SPIRITUAL THEISM which will satisfy both "the head" and "the heart."

1 vol., 12mo. Price \$2.00.

For sale at THE INDEX office, 44 BOYLSTON STREET, Boston.

TWENTY-FIVE SERMONS OF TWENTY-FIVE YEARS.

By WM. J. POTTER.

This volume, published by request of Mr. Potter's Society at New Bedford, serves as a memorial record of his twenty-five years' ministry. It contains the first discourse and the last of the quarter-century, and one from each of the years between. In respect to subjects, the selection is miscellaneous; but, in general, the discourses are such as concern the permanent problems of moral and religious life and the special problems of modern religious thought. An Appendix contains an account of the Parish celebration of the Twenty-fifth Anniversary of Mr. Potter's settlement, with the addresses on that occasion by Thomas M. Stetson, Esq., and Hon. William W. Crago.

PRICE \$2.00.

For sale at the bookstores. Also sent, postpaid, on receipt of price by

THE INDEX,
44 BOYLSTON STREET, BOSTON.

Bound Volumes of The Index For 1871 and 1872

For sale at THE INDEX office, at \$2.00 per volume. A few complete sets of bound volumes of THE INDEX, from 1870 (Vol. I.) to 1885 (Vol. XVI.), inclusive, will be furnished at special rates.

Lectures by Rabbi Solomon Schindler.

1. INTRODUCTORY.
2. TWO THOUSAND YEARS AGO.
3. THE CARPENTER'S SON.
4. JUDAISM THE MOTHER, AND CHRISTIANITY THE DAUGHTER.
5. A GENUINE MESSIAH.

As a special inducement to Liberals to distribute these lectures, which are full of radical thought presented in the plainest language, they are now offered at 5 cents each; 10 copies for \$0.40; 40 copies for \$1.00.

Address THE INDEX, 44 BOYLSTON STREET, Boston, Mass.

Shipman's "Binder" for THE INDEX.

Has a flexible back which adjusts itself to any thickness. So simple in construction that any one can bind their own paper one number at a time. Serves for a temporary or permanent use equally well.

For sale at INDEX Office. Price \$1.00.

The Secret of the East;

OR,

The Origin of the Christian Religion and the Significance of its Rise and Decline.

By FELIX L. OSWALD, M.D.

Handsomely bound in cloth. Price \$1.00.

"The work covers a great amount of critical and historical ground independently of the Buddhistic analogies; it is in fact a vigorous, uncompromising outline of Christian history, with all the weakness and wickedness mercilessly dragged into daylight. . . . The case against the Christian Church is a marvellously strong one. The superstitions and miseries of mediævalism, the woes, tortures, burnings, rackings, and brutalities accomplished in the name of Christianity, are set in blackest array. The Nature-worship of the pagan Greeks and Romans is set in contrast. Nor is Dr. Oswald very generous in admission of improvement in contemporary Christianity. To him, it is a hurtful supernaturalism, impeding science, diffusing pessimism, promoting hypocrisy, and repressing the physical nature. His book is remarkably well written, brilliantly concise in style, and, aside from its special theories, of considerable scientific and historic value."—*Boston Evening Transcript*.

Sent by mail, postpaid, on receipt of price by the INDEX ASSOCIATION, 44 Boylston Street, Boston, Mass.

MORTGAGES

On improved farms in Nebraska; property worth three times the amount of the loan; principal and interest guaranteed on a basis of 6 per cent.; interest guaranteed on basis of 7 per cent.; property and title in every case personally inspected from our office. are for sale at *The Index* Office. Price 10 cents each.

AFTER quoting some words from *The Index* in regard to the late W. S. Bailey, the Nashville *Liberal*, now edited by a daughter of the deceased, says: "Yes, our father suffered many hardships in that terrible struggle to liberate the colored race. How vividly we can look back on the faces of that large mob who broke the panels of our office doors with a large plank-board, and rushed in on father, mother, and us four girls (all that were present at the time), in the dead hour of night, went upstairs and plied our type, carried it and the presses and threw in the river! Not being satisfied, come the next day and demolished everything. While the leader of the mob, Al. Berry, was breaking our door open, sister Ella (now in Chicago) lifted up a keg of yellow paint, and from the third story window poured it all over him. He rushed upstairs, and said, 'Where's the man that threw the paint?' She said, 'I am the man.' He said, 'It's a good thing for you that you're not a man.' She replied, 'And it's a good thing for you that I am not a man!' Kind friends from Boston and other cities replaced father's office and started him up again. He got about \$2,700 out of the mobsters for destroying his office, which placed him squarely on his feet again."

FRESH FLOWERS on every occasion.
J. NEWMAN & SONS, 7 Tremont Street.

CHEAP RADICAL TRACTS!

No. 1.—*Truths for the Times*, by F. E. Abbot, contains the "Fifty Affirmations" and "Modern Principles." This especially has received great commendation from most distinguished men for the logical clearness of its statements. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 2.—*Fear of the Living God*, by O. B. Frothingham, exposes the debasing character of the popular notions of God, and presents conceptions of him that are worthy of the nineteenth century. New edition. Price 3 cents; 20 copies, 50 cents.

No. 3.—*Lecture on the Bible*, by the Rev. Charles Voysey, of England, is an overwhelming demonstration of the imperfections and errors of the Bible, both in the Old and the New Testaments. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 4.—*Christian Propagandism*, by F. E. Abbot, is an exposure of the weakness, costliness, and inefficiency of the System of Foreign Missions. Full of figures, facts, and interesting extracts. Price 5 cents; 30 copies, \$1.00.

No. 5.—*"God in the Constitution,"* by Rev. Arthur B. Bradford, opposes the proposed Theological Amendment to the United States Constitution. Price 5 cents; 30 copies, \$1.00.

No. 6.—*"The Sabbath,"* by Parker Pillsbury, denounces Sabbatarian superstition. New Edition. Price 5 cents; 30 copies, \$1.00.

No. 7.—*"Compulsory Education,"* by F. E. Abbot, maintains the right of every child to be educated, and the duty of the State to ensure it an education. Price 3 cents; 20 copies, 50 cents.

No. 8.—*The Present Heaven*, by O. B. Frothingham, treats of a subject that interests all. New Edition. Price 3 cents; 20 copies, 50 cents.

No. 10.—*Impeachment of Christianity*, by F. E. Abbot. 5 cents a doz.

No. 11.—*The God of Science*, by F. E. Abbot, attempts to show the real influence of modern science upon the idea of God. Price 5 cents; 30 copies, \$1.00.

No. 12.—*Is Romanism Real Christianity?* Two essays by Francis W. Newman and F. E. Abbot. Price 5 cents; 30 copies, \$1.00.

No. 13.—*On the Vision of Heaven*, by Prof. F. W. Newman, of England, analyzes the Christian conception of Heaven. Price 3 cents; 30 copies, 50 cents.

No. 14.—*A Study of Religion: The Name and the Thing*, by F. E. Abbot, attempts to show that the popular derivation of the word Religion is incorrect; that the popular conceptions of Religion itself are inadequate; and that a new conception of it, based on the Law of Evolution, consistent with absolute Freedom of Thought, and independent even of belief in God, is the necessary condition of the perpetuity of Religion among men. Price 5 cents; 30 copies, \$1.00.

No. 15.—*The Battle of Syracuse*. Two Essays by Rev. James Freeman Clarke, D.D., and F. E. Abbot discussing the Authority of Christianity. Price 5 cents; 30 copies, \$1.00.

CURRENT TOPICS.

BY B. F. U.

THE Massachusetts House Judiciary Committee have presented a bill to amend Sec. 17, chap. 160 of Public Statutes, by striking out these words: "And the evidence of such person's disbelief in the existence of God may be received to affect his credibility as a witness."

SAYS the Boston Transcript: "The Connecticut clergymen have declared war against the Sunday papers. Let the ministers boycott the newspapers, and refuse to preach to anybody who reads them! Not that we care anything about the matter one way or the other, only we should really like to see how the thing would work."

MRS. WENDELL PHILLIPS, widow of the distinguished abolitionist and orator, died in this city last Saturday. She joined the anti-slavery movement in 1834, when she was young and beautiful. She was subsequently united in marriage to Mr. Phillips, whom she sustained from a sick-bed during all the years of the anti-slavery struggle with her sympathy, courage, and self-denial, expending liberally from her fortune, too, in the cause of the oppressed.

IN his recent lecture before the Parker Memorial Science Class on "Bacon," Mr. F. M. Holland said: "The Transcendentalism of Concord is decidedly orthodox. While there may be many crowns of honor resting on the heads of the Transcendentalists of to-day, they are crowns on the brows of the old, not on the young. The work of the Concord School may be judged of by the reply of one of them to the question, 'Why don't you hear both sides?' who said, 'Why hear anything but the truth?'"

IN a paper read before the Liberal Union Club, last Saturday evening, Mr. Richard P. Hallowell, in defending the Quakers, said that the sect was originally organized not for religious propaganda, but to relieve people in prison, and generally to promote purity and virtue; that, although they had their period of fanaticism, the offences of the

Quakers against social order were very few. They were received in New England, officially designated as the "cursed set of heretics," and subjected to the severest persecution and oppression; but they finally triumphed, said the speaker, and to them Massachusetts was under heavy obligations. Mr. Hallowell's acquaintance with this subject is thorough, he having given to it much careful study; and the lecture was pronounced by those present very interesting and instructive.

A FELLOW named Breeze, in a letter which somehow got into the Nevada papers, wrote from Ulidia, in Montana, to a friend: "I presume the folks are somehow surprised at my leaving so suddenly. I wish you would tell the folks that I couldn't help it: the preaching and looking out for that flock didn't pay. I am doing very fair here. I am keeping a saloon in connection with a gambling saloon. A man by the name of Vaugh and myself are in partnership. Vaugh is an old-timer from California. He and I used to deal faro together for Irish Charlie and Big Mouth Lize in Colorado, in 1875. He was sent up for burglary to the Kansas penitentiary; and, after his time was up, he came to Montana. He is a good gambling man. There is no use talking, gambling and selling whiskey pay much better than preaching, besides it's no harder work. I have been in all kinds of business, from preaching to stealing horses; and I know what I talk of. My respects to," etc.

WHEN the banking business conducted by the Augustinian Fathers at Lawrence collapsed, some of the confiding depositors thought that, as under ecclesiastical law priests have such powers only as are delegated to them by the bishop, they might recover from him the money they had lost. Two years ago, a test suit was begun against Archbishop Williams of the Roman Catholic diocese of Boston. The plaintiff, Miss Ellen Labey, gained a verdict in the superior court for the full amount she had deposited. The case went up on exceptions; and, now, Judge William Allen has delivered the decision of the Supreme Court of Massachusetts, sustaining one of the exceptions. The judge in the lower court had refused to rule that the evidence was insufficient to make the archbishop responsible. That the money deposited with the pastors of the Church of the Immaculate Conception at Lawrence had gone into the common fund used to meet the debts and expenses of the church, and that the title of all the church's real estate was vested in the archbishop, were unquestioned. But the court is of the opinion that the supervision by the bishop of the debts contracted by his subordinates "does not appear to be the supervision of a legal principal over his agents, and the debts which a bishop is forbidden to allow a priest to contract without written permission do not appear to be the debts of the bishop himself." And, although the bishop may procure money to pay such debts by mortgaging church real estate of which he has the legal title, and although he receives, according to church customs, from a dying pastor funds of the church which

he hands over to a successor in the pastorate, he is not in either case made liable for the debts of his subordinates. When they come to understand this decision, Catholic servant girls and others may be less ready to intrust their hard-earned money with priests who go into the banking business for the benefit of the Church.

THE Sunday newspaper continues to be a source of great trouble and anxiety to the orthodox ministers. One hundred and eighty-two of them in Rhode Island, all Protestants, and chiefly Baptists and Methodists, have signed and published a declaration to the effect that the Sunday newspaper is a hindrance to the proper observance of the Sabbath, and calling the attention of all Christian people to its alleged injurious influence. Many of the Sunday newspapers are not in all respects what they should be; but they reflect public sentiment and taste, and these must be elevated before there can be permanent improvement in the character of Sunday papers or of the press generally. If the clergy would use their influence in favor of better Sunday newspapers, their efforts would be well directed. What they object to, however, is not simply the low tone of the Sunday papers, but the publication and sale of any papers on Sunday, whatever be their intellectual or moral quality. They seem to think that the people should be satisfied to attend church and hear their preaching, and to confine their reading on that day to the Bible and theological books and papers. It is the "desecration of the Sabbath" by publishing, selling, and buying papers on a day the observance of which is nowhere commanded in the Bible, that so disturbs the clergy that they must combine their influence to put a stop to this great sin. The discussion of secular subjects, exhibitions of sectarian narrowness and bitterness, sensationalism, and all sorts of mountebank performances in the pulpit, repulsive to cultivated and refined minds, call forth no such protest from the clergy; and, while religious papers devoted largely to secular matter, and whose columns in many cases contain advertisements coarse and indecent, and puffs of all kinds of nostrums and humbugs, printed as reading matter, may be read on "Sunday" without incurring the charge of "desecrating the Sabbath," the publication and sale on that day of the New York Sunday Tribune, the Boston Sunday Herald, the Springfield Sunday Republican, or the Providence Sunday Journal, are great sins, and the clergy want an end put to them, lest the Creator and Governor of millions of worlds be displeased, and the people suffer for disregarding the divine will. Nevertheless, the Sunday newspaper has come to stay; and the efforts of the clergy to stop it are too late in the century, even in New England, to be successful. The orthodox pulpit evidently wants "protection." Backed by ages of superstition and bigotry, it is yet unable to compete with the liberal and progressive tendencies of the age. But it must, to succeed in securing a protective measure in its favor, use methods a little less direct and less in conflict with the requirements of the times than that of trying to stop Sunday newspapers.

"FREE FOR WHAT?"

The *Unitarian* magazine, of which Messrs. Brooke Herford and J. T. Sunderland are editors, says that the important matter to be considered by Unitarians now is not whether they shall have freedom, but what they shall do with their freedom now that they have got it. It affirms that they "certainly have got it, complete and perfect," and asseverates emphatically, "We are free, and we shall remain free." "But," it asks, "free for what?" It adds the opinion that, if the denomination would "take a rest of about ten years from talk about liberty, and set to work all together to see how it can use liberty nobly, Unitarianism will go forward to new life."

This is very good. Liberty, certainly, is not an end in itself: it is only a necessary condition to the proper development and use of the human faculties, in order that they may do their best service for truth and right and human welfare. Yet we doubt whether the time has quite come, even among Unitarians, to stop talking about liberty. What to do with liberty is, indeed, always the most important question. But most persons who are striving within religious denominations for a greater measure of freedom know precisely what they want to do with it. They want it for inculcating different religious views than those which may be most widely accepted in the denomination, or for amending certain traditional ecclesiastical practices; and they want opportunity for these reforms, because they believe that the interests of truth and human welfare require them. Messrs. Herford and Sunderland's idea of religious liberty and its uses does not appear broad enough to cover the whole of this want, even as it manifests itself in some of the most earnest preachers and workers of the Unitarian name. And it is precisely the position these editors have taken in their magazine that has excited in us the present doubt whether the Unitarians have as yet earned the right to take a rest from talking about liberty, and that their only duty now is to consider how they can use their liberty. To us, an outsider, it looks as if what Messrs. Herford and Sunderland, and the reactionary faction which they are leading, have in mind as the proper use of Unitarian liberty, is to organize societies and denominational work and ordain preachers on the basis of about the beliefs and practices which they think to be true and requisite. And this may be "Unitarian" liberty. But is it liberty "complete and perfect"? Let us test this question.

There are many persons connected with the Unitarian denomination, especially in the Western States, who, hearing the long and loud claim which that denomination has made for liberty, have within recent years said to themselves: "Yes, at last, we have got freedom; and now we propose to use it for building societies and organizing conferences on freedom, fellowship, and character in religion. We will have no dogmatic restrictions whatever, not even any expression of belief in God, but will admit to full membership and co-operative work all who will aid in the advancement of truth and righteousness." And, on this basis, Unitarian conferences and societies have actually been organized in Michigan, Illinois, Iowa, Kansas, Wisconsin, and other States. But now the editors of the *Unitarian*, if we rightly understand their position, say to all such conferences and societies: "Oh, but we didn't mean that you should use your liberty in that large, all-out-of-doors way. You ought, at least, to have said in your articles of association that you believed in God and met together in the spirit of Christ. Without such

a bond of union, we do not believe you can build up Unitarianism, and much doubt your right to the Unitarian name."

A few years ago, Mr. Rowland Connor, having been discarded by the Universalists because of his connection with the Free Religious Association, and having served a term of years as resident speaker of the Florence Free Congregational Society, heard of the wide breadth of liberty offered by Unitarianism in the West, and decided to seek service under its auspices. He went to East Saginaw, Mich., organized a society essentially on the Free Religious basis, though under the Unitarian name. He treated Christianity simply as one of the great natural religions of mankind, and Jesus as one in a line of natural prophets. He has been successful in his work. The society has prospered under him, and has built a church, which has been criticised for being too secular in its appearance,—looking, that is, as if it were made for this world's uses; and Mr. Connor was criticised because at the opening services he spoke of it as dedicated to humanity rather than to God. It has been said, also, that he has given up prayer; and, if he has substituted anything in its place, it is only an expression of aspiration. Yet the society appears to be entirely satisfied with him and his work, and he and it form an influential part of the Michigan Unitarian Conference. "This," Mr. Connor may say, then, to Unitarianism, "is what I have done with the liberty you offered me; and I propose to continue working on the same lines in the future." But the editors of the *Unitarian* reply that this is not at all the use to which they expected him to put his liberty, and they insinuate that they even think him rather dishonest in doing such things and still calling himself a Unitarian.

Further West are Messrs. Gannett and Blake, who have done zealous service with and for Unitarian societies for many years. They have been especially effective in Sunday-school work and in the preparation of Sunday-school lesson and service books. But they do not take the Christian name. They draw religious lessons from all Scriptures, ancient and modern, and from all the great prophets as well as from Jesus. They compile Easter services, in which they do not celebrate Jesus alone, and call the story of his resurrection a legend. More distinctly theistic and emotionally religious than Mr. Connor, they yet speak and work for no dogmatic basis whatever in Unitarian organization. "Freedom, Fellowship, and Character in Religion" is their special motto; and this is what they are trying to make Unitarianism mean. With profound faith in the permanent significance of religion and with the utmost earnestness of purpose, they have labored to emancipate Unitarianism from all traditional limitations, and to identify it with the noblest, highest, grandest efforts in behalf of social and personal righteousness, irrespective of sectarian names and doctrines or historic faiths. When asked, "Free for what?" "Free to do this," is their answer. "But do you not see," cry the *Unitarian's* editors, "that thus to use your freedom is to take you beyond the established denominational boundaries? Unitarianism,—yes, it has always stood for righteousness, and it has always stood for freedom; but, then, it is righteousness attained in connection with certain beliefs and through certain forms of worship. And beyond that line—well—it isn't Unitarian liberty,—it is a dangerous kind of liberty: it is *Free Religion*."

Now there are many men and women in the Unitarian ranks, both East and West, who are using their liberty in the same direction as those here named. There, for instance, is Mr. Clifford

of the Germantown church, who used his liberty at the Philadelphia dedication to read an appropriate and noble scripture from various writings instead of a chapter wholly from the Bible; of which reading the *Unitarian* said—we have reason to believe that it was Mr. Herford who wrote the paragraph—that it was "a patchwork of snippets," and that "probably there were not ten Unitarians in the church who were not ashamed of it." All this class of radical Unitarians, when the query is raised how they are going to use their liberty, are ready with their answer. They frankly say that they are going to use it, are using it, to make Unitarianism include non-Christian as well as Christian; all inspiring writings as well as Hebrew and Christian Scripture; all great prophets as well as Jesus of Nazareth; all true thought from whatever faith it come; and all aspiring souls who wish to do good and to get good, irrespective of the doctrines they may believe or disbelieve. These Unitarians, when told that the denomination is "perfectly free and will remain so, and that the important point now to be considered is, Free for what?" can reply: "Very well, that is precisely the point we are considering and acting upon. We are using our liberty for this work which reason and conscience require at our hands; and we have no disposition or occasion to talk much about the liberty so long as we are left free, but have only to keep at the work. Others may use their liberty in other ways, but this is the work given us to do."

And, to this reply, what response can the editors of the *Unitarian* make? No question is here raised of the right of a society, whether conservative or radical, to have a preacher sufficiently near to its own views to give satisfaction both to intellect and heart. But these men are able to satisfy their congregations in both of these respects. They are using their freedom for doing constructive work. If the claim were true that the denomination "has got freedom, complete and perfect," then the only logical response would be a *God-speed* to these workers at their tasks. But the editors of the *Unitarian* appear in the plight of making this claim, and then, in the next breath, of reproaching these gentlemen for using their freedom to do a work which they have no right to do under the Unitarian name! A little more "talk about liberty" would seem, therefore, still to be needed in the Unitarian ranks. Some brains among them have, evidently, not yet caught the "complete and perfect" idea of it.

WM. J. POTTER.

LABOR REFORM.

It would not be easy to exaggerate the amount of irritation and unrest that characterize the interests of labor at the present time. These elements confront us, turn whichever way we will: strikes East and West here in America; in Belgium, more and worse; Ireland waiting in agonized suspense for the response of England to her cry for justice; a multitude of books and pamphlets, hundreds of articles, thousands of editorials, devoted to the discussion of this question of questions; writers of every grade, good, bad, indifferent, jostling each other with their rival panaceas; men of enormous force and genius, like Lassalle and Marx, giving their splendid energies to the most daring speculations; such brilliant theorists as George and Gronlund bringing fresh fuel to the dancing flame; every variety of socialism, communism, and co-operation advocated with passionate enthusiasm and supreme self-confidence; the Nihilist and Anarchist hopeless for any polity that is not built upon the levelled ruins of the present structure.

ure of industrial and social life. It is impossible for us to accept the diagnoses and the remedies that are proposed by all this writing, talking, theorizing multitude of spirits, genial or morose. We may not accept the diagnosis or the theory of any one of them. But, where there is so much smoke, there is certainly some fire. Where there is so much restlessness and fever, there is surely something wrong. There is something wrong. A million men out of employment in the United States for the year 1885! A loss of wages equal to \$300,000,000! Is this the "unexampled prosperity" for which protection is to be praised? If it is so, then, certainly, we ought to have a great deal more protection or a great deal less. But no. It is as little warrantable to hold any single economic cause, protection or another, responsible for this condition as it is to credit to this or any other single cause all the prosperity we have enjoyed since the war tariff entered on its memorable career. But the "something wrong" is not merely a few years of depression and collapse succeeding to a few of generous expansion. Prosperity may come again after five years of depression, as it came in 1879, after the much more gloomy period from 1873. And with prosperity there may come some temporary abatement of the stress of labor agitation. But it will not wholly cease, because the principal cause of it is a great deal deeper than the immediate depression and collapse. It is the immense and steadily increasing disproportion that exists between the condition of the rich and poor. If it is not true, as frequently insisted, that the rich are growing richer and the poor are growing poorer all the time, it is true that the rich are growing relatively richer and the poor are growing relatively poorer. Here is the dreadful fact that, corresponding to the enormous increase of the general wealth, there has been no corresponding increase of the wage-earner's wages. From 1850 to 1880, the net product of American manufactures increased four hundred per cent., the wages of labor forty per cent. That is to say, the advantage which the manufacturer has derived from the improvement of machinery and other methods of production has been ten times as great as that derived from this improvement by the wage-earner. The industrial statistics of every European country show a similar result, and it is this result which is the efficient cause of all that is most fundamental to the industrial agitation of to-day.

The merchants, the manufacturers, the capitalists, are not consciously responsible for this enormous and increasing incongruity between their opulence and others' indigence. Other men had labored; and they entered into their labors, with this lamentable result. But there is none of all the poorest that decry it who would have acted differently in their position. Nevertheless, the time has come when rich men's dainties are to be bitter in their mouths and their luxurious surroundings hateful in their eyes (I speak of men of natural goodness, and the great majority are such), unless they can devise some scheme that will make possible a more equitable division of the profits of industry.

But it is easier to know the trouble than to prescribe for it aright. If the Nihilist and Anarchist could have their way, we may be sure that they would unwittingly do more grievous injury to those who have little than to those who have much. If the communist or socialist could have his way, there are those of us who would prefer annihilation here and hereafter to endurance of his horrible régime of hard, mechanical arrangements, making no allowance for the difference be-

tween men and things. But the régime of socialist or communist, if it could be established, would not be for long. Nothing is surer than that a mechanical *a priori* system that is superinduced on an organic civilization will soon go to pieces, while the organic life again asserts itself. "Revolutions never roll back," said Victor Hugo. Is it not truer that they always roll back; that it is only evolution that maintains the ground that it has slowly won?

In England there has been less of wild-cat speculation in industrial ideas than elsewhere, and more of genuine reform; thanks to the work done by the trades-unions in discouraging strikes, in encouraging arbitration, in fostering providence and mutual aid. For the nineteenth century, so far, the history of trades-unionism is the most satisfying chapter in the history of Great Britain. Here is one mighty instrument for self-protection which our own wage-earners have in their hands. If they do not always use it wisely, patience, give them a little time. As the English unions have worked through some grosser phases, we may hope that ours will do as well. If only our wage-earners knew the virtues of frugality and self-denial, how wonderful would be the rate of their advance! But, while they earn—these figures are for Massachusetts only—forty per cent. more than the English laborer, they save only four per cent. more! Do you say, "God knows they have little enough of comfort or enjoyment"? But the comfort and enjoyment would not be less, but more, if the \$700,000,000 yearly spent for spirituous liquors were reduced to \$700,000, or to many thousands less.

But it cannot, must not, be that all the amelioration is to come from the wage-earning side of our industrial civilization. The capitalist must do his part. And he must do it by co-operation. Co-operation, in the strictest sense, is only possible under the most favorable conditions. There must be "captains of labor," and these can generally do better for themselves alone than as the managers of co-operative schemes. The cooperation of labor and capital, the laborer depending on the chances of successful production, is manifestly too precarious for him. But a system of profit-sharing superinduced upon a basis of wage-earning has in it the promise and the potency of more amelioration for wages-industry than any other system that has yet been devised. It has had many illustrations. (An excellent summary of them will be found in the Massachusetts Report on the Statistics of Labor, Part II., "Profit Sharing.") It will have many more if those who are employers of labor know the things that belong to their peace. And yet it may be doubted whether even here there is so much remedial power for the industrial sickness of the time as in the possible apprehension of the capitalist that the men whom he employs are *men*, and, as such, are to be treated not only with justice, but with generosity and with the manliest consideration.

JOHN W. CHADWICK.

STATE CHAPLAINS.

The Chaplain of Congress has been furnishing more prayers to the members than they bargained for, and they have requested him to be a little less personal in his remarks to the Deity. When that unpleasant body-snatcher, mentioned by Dickens, used to come home at daylight in the morning to rest from the labors of the previous night, he generally found his wife on her knees, praying that he might be converted from such a wicked business to some respectable employment. Throwing a sack at her, he would remark: "Praying agin' me, are you? Haven't I told you that I won't

be prayed agin'?" The Rev. Mr. Milburn, the "blind preacher," is not so blind that he cannot see the favorite vices of congressmen; and he makes them the theme of his prayers. The "members of the House" do not like to be "prayed agin'"; and they will probably take good care that the next chaplain shall be not only blind, but also deaf and dumb.

Among the luxuries to which our members of Congress treat themselves at the public expense, one of the most useless, at the price, is a chaplain. According to the theory of our government, a State chaplain is as much an unlawful indulgence as a State archbishop. The connection between Church and State, in this country, is illegitimate and immoral. Congress has no right to build synagogues, make pilgrimages to Mecca, hire masses for the dead, buy indulgences, or pay for prayers out of the public money. The public taxes are paid by believers and unbelievers alike. To buy prayers with them is to misuse the power of taxation. It is a dishonest appropriation of the general fund. A State chaplain is unconstitutional and void. His worship is wasted; for prayers that spring from selfishness, extortion, and wrong, never reach the throne. They are rejected like the burnt offering of Cain.

Although these "chaplains" are extravagantly paid, their prayers are not worth as much as calico. Most of them would be dear at five cents a yard. Here is a specimen that has excited considerable notoriety, which is probably all it was intended to do. The flippant way in which advice, instruction, and information are given to the Almighty is like the childish idolatry of the poor heathen, arguing and remonstrating with his wooden god. In this effort, the chaplain "prayed agin'" the rich, and carelessly addressed his invocation to the God of Jacob, which is very much like praying for peace to the God of war. Jacob is the patron saint of avarice. He made great wealth by very successful cheating. Every honest man should sympathize with Mr. Holyoake in the pious wish that his parents had named him Esau, and not Jacob. The chaplain said, "Give ear, O God of Jacob, and awaken us to see the danger which threatens the civilized world,—a revolution more tremendous than any of which history tells, in which the scenes of the reign of terror may be enacted in every capital of Europe and America."

There is a fine quality of what the boys call "nerve" in this call upon God to "give ear" to the warnings of a State chaplain that a revolution is impending over us, and that the reign of terror is to be re-enacted. Is the "all-seeing eye" blind? Is the all-hearing ear deaf? Is the Supreme Ruler of the universe off duty that it is necessary for the State chaplain to inform him that "for long the few have mastered the many, because they understood the open secret,—the tools to those who can use them"? Was it necessary to instruct the Almighty that "now the many have learned the secret of organization, drill, and dynamite"? The suggestion of "dynamite" in an official prayer to God is dark and subtle. It is a covert appeal, not to God, but to the vindictive and ignorant passions of men. It is a hint to bad men to begin "the reign of terror."

It is curious that theological men have so little faith in God's moral wisdom, while they have no doubt at all as to his physical ability. They think that he is not able to govern the moral universe without their assistance and advice; but they never think of telling him how to keep the stars in their places, and prevent a disastrous collision of the planets. They never suggest to him an improved scheme of their own for the better regulation of the seasons and the tides. They have no

* Carroll D. Wright's statistics, National Labor Bureau.

faith in God's moral government, and yet they put absolute reliance on a shilling almanac. When they read there that the sun will rise to-morrow morning at six o'clock, they believe it; and never think of praying to God to change the time to half-past five. When the almanac tells them that there will be an eclipse of the moon on the 30th of September, they know that the eclipse will occur at the appointed time exactly. So they never think of dictating to the Creator, and advising him by prayer that October would be a better time for it, or that it would be still better to postpone it indefinitely. Forgetting that the laws of the moral world are as immutable as those of the material world, they presume to instruct the Creator, and direct him how to govern it. In this vain spirit, the State chaplain directs God to "teach the rich men of this country that great fortunes are lent them by thee for other purposes than to build and decorate palaces, to found private collections of art, to stock wine cellars, to keep racing studs and yachts, and to find better company than hostlers, grooms, and jockeys, pool-sellers, and book-makers."

There is much theological confusion in the above direction to the Deity. In the first place, very few "rich men" use their wealth in the way complained of; and, if their wealth is really "lent" them by the Creator, the manner of using it must be the purpose of the loan, or the loan would never have been made. Does not God himself know better than the State chaplain who constitute the best company? Perhaps the "rich men" might keep better company than hostlers and grooms; and, perhaps, hostlers and grooms might keep better company than their masters. It is entirely a question of character; and, besides, if God made the "rich men," he made grooms and hostlers, too. In fact, he made neither of them. They "grewed." Neither did he "lend" the rich their money any more than he lent the poor their poverty.

In the cavalry, we used to be furnished with a couple of superfluities for which we could never find any practical use whatever. One was a veterinary surgeon to cure the bodies of the horses, the other was a chaplain to cure the souls of the men. We could transpose these officers and put each in the place of the other without doing any injury to the service, or any good. Taking the prayers of the "blind preacher" as a specimen of their quality, is it not almost time that this religious usurpation, the State chaplain, should be abolished altogether?

M. M. TRUMBULL.

THE CHURCH, SCIENCE, AND WOMAN.

The Talmud appoints to every pious Jew as a daily prayer these words: "Blessed art thou, O Lord, that thou hast not made me a Gentile, an idiot, or a woman"; and, while enjoining the instruction of sons in the law, prohibits that of daughters, on the ground that women are accursed. Men alone can pray. God created man in his image, but this does not refer to woman. No Jewish youth was anciently allowed to read the first chapter of Genesis, whose account of the creation represents woman as man's peer, endowed with equal dominion over nature, until he was twenty-five. By this period, his views of woman had been irrevocably based upon the account in the second chapter, which no longer speaks of her as an integral part of creation, but as inferior and secondary,—a being brought into existence solely for the benefit of man.

The doctrine of woman's secondary creation and subordination was a part of Judaism engrafted upon Christianity, soon becoming a component

part of the new religion, in fact its corner-stone; for, without the doctrine of the fall, and the consequent need of a Saviour, the whole Christian superstructure drops into nothingness. The belief that woman is a being made solely for man has rendered it possible for the present century to witness the formation of a church whose chief corner-stone is polygamy, in a nation where more boys than girls are born, and whose every census shows a preponderant male population. Mormonism and Perfectionism, of which last Oneida Community was the ripened fruit, are ultimates of that debasing sex theory upon which the Christian religion is founded.

Paul, a converted Jew, educated at the feet of Gamaliel, a member of the Great Sanhedrim, which was a combined civil and ecclesiastical court, shortly became the ruler of Christendom, engrafting his belief and polity upon the nascent Church. Through the centuries, his doctrines have corrupted the truths of nature, crushed the efforts of science, and made of the Church a male theocracy.

To Paul is Christianity indebted for the dogma of original sin, and woman as the original sinner. He says, "Woman, not first created, was first in sin." Nothing bearing on this question is more remarkable than the fact that the worshippers of a God spoken of as the Perfect One, the Unchangeable, etc., should represent him as learning through experience, finding his second thought best. "Seeing it was not good for man to be alone, God created woman." So unscrupulous were the writers of the Scriptures they hesitated not at blasphemy, if, in so doing, their point of enslaving woman could the better be gained.

Blackstone says the general preference given by the laws of England to males over females is because they are the worthier of blood. This is Christianity condensed into law, a combination of Paul and Aristotle running down to the nineteenth century. Aristotle, whose philosophy was accepted by the Church as authoritative, maintained that nature did not form woman except when by some imperfection of material, she could not attain the sex which is perfect. Under authority of Paul and Aristotle, religion and law suppressed woman's spiritual and physical claims of equality until even her very humanity was in doubt, grave councils debating this important question. That of Macon, 585 A.D., is celebrated in history for its discussion of this question. The Italians long maintained that women had no souls, quoting several passages of Scripture in proof, and it was a general belief throughout Christendom that women either possessed no souls or had borrowed those of inferior animals, as horses, dogs, asses. For centuries, such religion and such philosophy ruled Christendom.

Mediaeval Christian writings show many discussions upon this point. Grave doctors, philosophers, and divines in great numbers asserted their disbelief in woman's humanity. Nor has this question as yet been fully settled in the minds of orthodox believers. Catholic, Greek, and Protestant alike are to be found imbued with the same contemptuous opinion. Until the time of Peter the Great, woman was not counted in the census of the Russian Empire. That great division of the world, professing the Greek form of Christianity, counted so many souls, no woman named. Nor is our nineteenth-century, Protestant Republic quite free from this same insolent belief. At the Woman's Rights Convention of Philadelphia, 1854, a man cried from the audience, "Let woman first prove she has a soul: both the Church and the State deny it."

But the investigations of modern science prove the falsehood of church hypothesis and teachings,

showing the feminine everywhere to hold higher rank in nature, and female life to be the result of a higher physical condition than male life, the latter being due to impoverished or less worthy blood.

Environment and nutrition are the two great factors in determining sex; a broad, generous environment, with abundant nutrition, developing the female, a contracted environment, with scanty or innutritious food, the male, and these results as far as investigated seem uniform throughout nature. The battle of science, which is culminating in facts proving the inherent right of woman to an equal share in the world's opportunities, began centuries ago in the combat between the Heliocentric theory promulgated by Pythagoras, 550 B.C., and the Geocentric theory of Ptolemy, 150 A.D. The Church sustained the latter as in accordance with the Biblical account of creation; and, for many hundred years, it was looked upon as great a heresy to deny that the earth was the centre of the solar and stellar systems around which the universe revolved as it was to deny the created inferiority of woman. But the discovery of America by Columbus, really the result of Mohammedan learning at a period when Christendom was buried in midnight darkness, together with the circumnavigation of the globe by Magellan twenty years later, settled the question of the earth's rotundity. The astronomical and geographical battle, which had lasted more than twelve centuries, was won, and the first scientific step toward the enfranchisement of woman taken.

In order fully to comprehend the aid here given by science, it is necessary to remember the old theologic belief that the earth was flat, the centre of the universe, around which the sun and stars revolved,—was but part of one great theologic theory that all things animate and inanimate were created for man alone, so that a science which proved the falsity of any one of these conceptions aided in the overthrow of them all. When the earth sank to its place as a small and insignificant part of creation, woman began to rise toward a position of natural equality with man. All the sciences have rendered aid; but the seven most important have been geography, astronomy, chemistry, geology, botany, philology, and biology. Chemistry, long pursued under the name of alchemy, attacked the old theologic conception of the creation by teaching the once fluid condition of the rocks; geology farther aided the destruction of the six days' theory by proving the immense periods of creation; botany investigated the deeply buried fields of coal, finding evidence in them of long and slow ages of growth, the subsidence and upheaval of forests, and by aid of chemistry restored to us, in the beautiful aniline colors, the hues of the ancient world; philology takes us to the birth of nations, and through it we learn the domestic habits and scientific knowledge of peoples so long extinct as to have left no other monuments behind them; while, in biology, we find the science of life itself, and through it ascend to the dawn of creation.

Before tracing the teachings of science farther, we must again refer to old theologic ideas concerning woman and the feminine principle. Not only was God termed masculine, but all inanimate things were also deemed masculine. When Linnaeus, of whom it has been said, "He woke the fields of Lapland from their sleep of centuries, and made their frozen wastes to blossom like fairy fields," first promulgated his sexual system of plants, he was shunned and persecuted as one who had degraded nature by his assertion of a feminine principle in the vegetable world. Before it became thus possible to ignore the feminine in crea-

tion, God had been robbed of the feminine principle recognized everywhere in Pagandom as inhering in the supreme power, and even in the Hebrew, where the "us" creates in its own image man and woman. The words *El Shaddai*, translated in the Old Testament the Almighty, are used when the feminine principle is indicated, as also "Holy Spirit" in the New Testament. The Church, having robbed the creative power of its feminine principle, next declared it created in its own image only males, the more ardent theologians affirming the present form of reproduction to date from the fall, and, had this not taken place, God would have found some other way of peopling the world. Old Jacob Boehm and other mystics declared that Adam in his first estate possessed the power of "virgin propagation."

While modern science proves that reproduction is not possible for the male alone, it also proves this power largely to inhere in the female. Huxley declares agamogenesis, or virgin propagation (by the female), to be one of the most ordinary facts in nature, extending "throughout almost the whole series of living beings." Whole species exist in which no male is found. The celebrated Dr. M. Joly, of the Paris University, examined several thousand of the little crustaceæ known as *Artemia salina*, without discovering a single well-developed male. The experiments of Carl Vogt, the distinguished German naturalist, were of the same character.

The experiments of our countrymen and countrywomen, Profs. Meehan and Gentry, of the Philadelphia Academy, in regard to vegetable life; of Mary Treat and Sophia Herrick upon insect life; also of Drs. Wallace, Combe, Walker, Lord Falmouth, and innumerable others, in reference to animal life,—all tend to prove that when a tree, plant, insect, or animal is in highest physical condition, well fed upon nutritious food, under proper environment, the products will largely be feminine; while, on the contrary, if poorly nurtured and in general bad condition, the products will be male.

It is a well-known scientific and statistical fact that, when a nation is in highest vigor, rapidly increasing in population, the larger proportion of births are feminine; but a nation or tribe retrograding or dying out will produce more males, in some cases male births reaching the enormous rate of seventy-five per cent.

Nature, when at her best, seems constantly striving for the production of the feminine. Protoplasm, that primal organic life from which all other life has evolved, that simplest organism known, "an organism without organs," which moves by floating now in one direction, now in another, which possesses neither mouth nor stomach, but feeds by incorporating its prey,—this albuminous protoplasm, lying in silent darkness on the bottom of the sea, is nevertheless feminine, as it is endowed with the creative function. At a certain age, by an act entirely spontaneous, it breaks apart, each part immediately independent, and from the very first resembling the mother animal. These new animals, like the original one, are also feminine, possessing the power of reproducing from themselves. This unnnucleated jelly-like substance possesses all the rudiments of the highest physical life, as shown by its sensation, its power of motion, of nutrition, of reproduction.

While the Church has opposed every demand of woman for higher opportunities, on the ground of feminine inferiority and secondary creation, the more recent biological discoveries, prove exactly the contrary. All forms of primal life, whether known as bathybius, protoplasm, moner, or amœba, are feminine. Not only are the primal forms of

life feminine, but, as far as has been discovered, the great underlying creative principle is solely and distinctively feminine.

MATILDA JOSLYN GAGE.

FREE RELIGIOUS ASSOCIATION.

The Annual Meeting of the Free Religious Association will open on Thursday evening, May 27, with a business session in Fraternity Hall, Parker Memorial Building, corner Berkeley and Appleton Streets, Boston, at 7.45, for hearing reports, electing officers, and considering any resolutions that may be offered. The executive committee authorize the presentation for rejection or adoption of an amendment to the Constitution, according to which present Article I. would be divided into two Articles, which would read thus:—

CONSTITUTION.

ARTICLE I.—This organization shall be called the Free Religious Association.

ARTICLE II.—The objects of this Association are to encourage the scientific study of religion and ethics, to advocate freedom in religion, to increase fellowship in spirit, and to emphasize the supremacy of practical morality in all the relations of life. All persons sympathizing with these aims are cordially invited to membership.

The other articles to remain as now, but to be numbered respectively III., IV., V., and VI.

The public convention will be held as usual in Parker Memorial Hall, Friday morning and afternoon, May 28, and the festival that evening in the Meionaon. Further particulars hereafter.

F. M. HOLLAND, Sec'y.

EDITORIAL NOTES.

BY B. F. U.

SUBSCRIBERS of *The Index* who are in arrears on their subscriptions will confer a favor by sending to this office the amounts due, which they can readily ascertain by referring to the address tag on their papers.

At the annual meeting of the Free Religious Association, Mr. M. D. Conway is to give the essay at the morning session, and has given his subject the interesting title of "The Coming Cosmic Calvinism." The essayist of the afternoon is to be Mr. J. G. Brooks, of Brockton, whose topic is "Sympathy and Science,"—a discussion of the Social Problem.

ACCORDING to the *Presbyterian*, "the very latest writer on the evolution theory, in his exposition and defence of it, says that, 'while evolution is everywhere accepted, Darwinism proper is largely given up.' The difficulties which he could only solve by a 'probability,' a 'maybe,' have increased in force, until it is recognized that all his proposed explanations were worthless." We were not aware of this. Indeed, it is not true.

THE following complimentary reference to women as earnest and effective workers is from the annual report of the executive committee of the Florence Cosmian Society: "As in the churches, so in our society, wherever there is work to be done, whether in the material, the educational, or the moral sphere, the women always take the laboring oar, and pull us to port. During the past year, the Ladies' Industrial Union have contributed to our treasury the generous sum of \$322.01."

In a notice of *A Study of Primitive Christianity*, the *Brooklyn Times* says: "Dr. Janes' book is carefully and thoughtfully written, and contains food for abundant study and thought. The author will find many to differ from his views, but many also to admire the just and patient mind that weighs each fact carefully and tries to see

things as they are. His book is no mere compilation, but, as Mr. Chadwick has said in the preface, the outcome of an independent mind working fully upon a great mass of materials to which few except the professional scholar can give the attention they deserve."

THE *Ottawa Free Press* observes: "A learned bishop of the Church of England has recently, in an article which was given wide publicity in Great Britain, shown most conclusively that the whole scope and original intention of the administration of oaths have been misunderstood and misapplied in popular practice. The oath was never intended, as applied of late years, to be a means of disqualifying evidence, but simply used as a ready means whereby, in the eyes of a majority of witnesses, its use would give testimony a greater sanctity. But the practice has gradually grown, so that, instead of the oath being simply a means of lending weight to the testimony, it is actually being used to exclude the testimony of those who could not conscientiously take the precise form of oath in common use in courts of justice."

WE welcome Mrs. Matilda Joslyn Gage to the columns of *The Index* this week. Her article is spicy, and will be read with interest; but we must say that it contains some extravagant statements in its references to science and sex. For instance, it is hardly correct to say that nature strives for the feminine. In the forms of life which Mrs. Gage calls "feminine," the cells are differentiated, and sperm-cell and germ-cell unite by conjugation, or, if in different individuals, two individuals unite by conjugation. It cannot be said that, in the plant kingdom, better conditions lead to the feminine and lower conditions to the masculine. The facts at command warrant us in saying only that higher nutrition may lead to differentiation. The corn was once hermaphrodite, each flower being staminate and pistillate; but we have lifted the male blossom to the top, leaving the feminine silk below. A study of embryology does not sustain the idea that sex is a question of more or less brain or heart. Man is of more importance than Mrs. Gage imagines.

HON. SAMUEL E. SEWALL writes to Mrs. R. B. Wolfe, who succeeds her father, the late W. S. Bailey, as editor of the *Nashville Liberal*, as follows: "You have my sympathy in the grief you must feel in the loss you have sustained. He was an old and esteemed friend, whom I honored for his labors, sufferings, and dangers which he endured so heroically in the anti-slavery cause in a slave State. Few of the martyrs in the anti-slavery service met with so many losses, and none were more brave and constant than he was to the end. His long life seems to have been devoted to the service of his fellow-man. I did not agree with his opinions about God and immortality, but I admired the fearlessness with which he dared to express unpopular opinions. I agreed with him in some of his views, that the Bible is no more sacred than any other book, and that much in most religious creeds is mere error and foolish superstition."

HENRY PHIPPS, Jr., of Allegheny, Pa., has given \$25,000 for the purpose of building plant-houses, to be constructed of iron and glass, on the ground formerly occupied by the Western Penitentiary, the plant-houses, when completed, to become the property of Allegheny City. One of the conditions of Mr. Phipps' gift is that the plant-houses shall be open to the public every day, including Sundays, during such hours and subject to such restrictions as the Park Committee may deem necessary for the protection of the property and plants. At a special meeting of the Allegheny Park Committee called to take action in regard to Mr. Phipps' generous

proposition, one member said: "I have been requested to enter the protest of the United Presbyterian Presbytery of Allegheny against the acceptance of Mr. Phipps' offer, with the specifications contained in it. I now enter the protest." Another member made a long speech about "all sorts of Sabbath desecration," and placing that community "on a par with the cities of France and Germany, where the Sabbath is mainly recognizable by the increased number of amusements, etc. Several outsiders who were present spoke. One said that Christians were opposed to the acceptance of the gift, on the conditions named, because the boys and girls would desert the churches and go to the park. Another said that he "would favor the proposition, if a pulpit and a good preacher were put into the plant-house on Sundays." The churches seemed to be well represented as to numbers. Mr. Langfitt of the committee said: "The objections offered are trivial, but it has always been the case. Whenever any one has made a generous offer to the city, somebody has always been ready with hindrances. This clause does not change existing conditions." The committee, by a vote of twelve to two, adopted a resolution to accept the gift. At a meeting of the Reformed Presbyterian Presbytery, a resolution was adopted: "That this Presbytery heartily indorses the action of our United Presbyterian brethren, and will co-operate in their efforts to maintain the sanctity of the Sabbath." A committee of three were appointed to "wait on Mr. Phipps, the donor, to obtain, if possible, a modification of the condition connected with the gift." Mr. Phipps says: "I am, with all respect for the Presbyteries, determined to have the conservatory opened on Sunday or not at all. In New York, they have music in Central Park. In London, which is the quietest city in the world on the Sabbath day, nearly all the parks and museums are opened to the public. This is simply because it is a recognized fact that it is the means of much good, and not only keeps a certain class from spending their hours in gin-mills and places of evil resort, but educates them to a higher standard of thought and morals. The idea of this gift came to me after reading an article by Elizabeth Cady Stanton, entitled 'Our Boys on Sunday.' I wish this matter had not achieved so much notoriety, but I suppose it cannot be helped now."

THE BEST THING IN LIFE.

Far back, in galleries olden,
A Roman Emperor stood,
And, looking upon the nations,
Proclaimed that the highest good
Was to be at one with Nature,—
A part of the Life sublime,
A note in the spherical music
Of the everlasting chime.

The world has gained in splendor
Since Antoninus slept,
And over its primal darkness
Has the light of science crept;
Religion has raised her banners,
And within the homes of men
Have art and affection gathered
The trophies of sword and pen.

But again, as athwart the dawning,
Is the "world-wide whisper" heard,
And to deathless love and longing
Is given the priceless word
That to be at one with Nature—
To abide in the union blest
With God's universal order—
Is in human life the best.

The Index.

BOSTON, APRIL 29, 1886.

THE INDEX is published every Thursday, at No. 44 Boylston Street, Boston, by an incorporated Board of Trustees nominated by the Free Religious Association. Terms: Three dollars per year, in advance.

THE objects of THE INDEX may be defined by the objects of the Free Religious Association; namely, "To promote the practical interests of pure religion, to increase fellowship in the spirit, and to encourage the scientific study of man's religious nature and history"; in other words, Righteousness, Brotherhood, and Truth. And it seeks these ends by the method of perfect Liberty of Thought. It would subject the traditional authority of all special religions and alleged revelations—the Christian no less than others—to the judgment of scientific criticism and impartial reason. It would thus seek to emancipate Religion from bondage to ecclesiastical dogmatism and sectarianism, in order that the practical power of religion may be put more effectually to the service of a higher Morality and an improved Social Welfare.

WILLIAM J. POTTER, ; Editors.
BENJAMIN F. UNDERWOOD, ;

NO WRITERS IN THE INDEX, editorial or other, are to be regarded as speaking in behalf of the Free Religious Association as a whole; nor is any writer to be held responsible for any opinions expressed in its columns except his own. For all unsigned editorial matter, B. F. UNDERWOOD, the office editor, is responsible.

ALL communications intended for the paper and all business letters should be addressed to B. F. UNDERWOOD, the Business Manager, 44 Boylston Street, Boston, to whose order all checks and drafts for THE INDEX should be made payable. Letters for Mr. POTTER should be addressed to him, at New Bedford, Mass.

PAPERS are forwarded until an explicit order is received by the publishers to discontinue, and until payment of all arrearages is made. The change of date on the address label is a receipt for renewal, and no other receipt will be sent unless specially requested.

NOISM.

BY THOMAS DAVIDSON.

A Lecture read to the New York Branch of the Fellowship of the New Life.

All periods are, more or less, periods of transition. They must be so, for the very word *period* means a going round. Whatever is in time is subject to passing or transition. But some periods are more distinctly transitional than others. Our own time is one of these. We, more distinctly than almost any former generation, are passing from an old order of things to a new. Not only is the change we are passing through very great, it is also very fundamental. It is not a change of details or of mere practice, as the Protestant Reformation was. It is a change of ideal. We may, perhaps, even go further than this, and say that it is a change to the ideal, to the purely ideal. But it will be asked: If we are changing to the ideal, what are we changing from? Is not that also an ideal, though a different one? To this last question, we must answer distinctly: No. We are changing, not away from one ideal to another, but from something that was not ideal at all to the ideal.

This will require some explanation; and I may begin by saying that, in the progress of thought, which is also, in the strictest sense, the progress of religion, there are three distinct stages,—the sensual or fetichistic, the imaginary, animistic or theistic, and the intellectual or ideal. The first of these stages is that of savage peoples, the second that of semi-civilized peoples, the third that of fully civilized peoples. It is from the second to the third of these that we are now passing. We are, in one word, passing from imagination, which is the basis of theism in all its forms,—monotheism, polytheism, pantheism,—to intelligence and the ideal, from semi-civilization to entire civilization. Possibly, you will say: Are we, then, to give up theism altogether, and become atheists, godless?

That depends altogether upon the meaning you attach to the words "theism" and "atheism." For my own part, if theism means a belief in the existence of a Supreme Being made in the image of man, and acting consciously after the manner of man, conceiving purposes and then carrying them out, sometimes successfully, sometimes not, then I am certainly not a theist, but an atheist. I know that the word "atheist," in these mainly stupid times of ours, is a term of reproach, something which acts upon the half-bovine multitude very much as a red rag acts upon the wholly bovine bull. But no sincere and courageous man or woman will heed the reproach of the multitude, so long as he or she is conscious of being on the side of truth and progress. In the very nature of things, the man who arrives at a higher truth than that of the multitude must be regarded by the multitude with suspicion and hate. Of all the jealous powers that ever were, the multitude is the most so,—just because it is the multitude. If, then, we are sure that we have arrived at something higher, truer, more inspiring than theism, than belief in a god of the imagination, then we ought to rejoice in being called atheists, just as we rejoice in being called non-fetichists or non-idolaters. Nor ought we to forget that he who worships an idol of the imagination, called god or anything else, is just as truly an idolater as the man who worships the same or a similar image after it has been outwardly realized in wood, bronze, or stone. If, on the other hand, we agree to call the highest principle in the universe, howsoever reached, God, then those who cast away the god of the imagination for the pure idea of the intellect, which no imagination can reach,—because the Infinite and Absolute cannot be reached,—may justly style themselves theists, and the only true theists, calling the theists of the imagination idolaters. But I think less confusion will arise, less disingenuousness and unworthy compromise, if we allow those who worship an idol of the imagination to retain the much coveted and popular term *theist*, and call those who have risen to the higher ground of pure intelligence by a term correctly designating their true position. Such a term would be *noist*, derived from the Greek term *νόος* or *νοῖς*, which means the objective, ordering principle of the world,—that principle which, when it becomes self-conscious, is intelligence. If I were to designate my own position in one word, I should prefer to call myself a noist. But I shall speak of this further on. At present, let us trace the history of religion rapidly through its three stages, and show that the highest of these is what I have sought to designate as *noism*.

I have called the oldest form of religion *fetichism*. The term is defined by Max Müller as "superstitious veneration felt and testified for mere rubbish." It really means veneration for the material and phenomenal as such, without any regard to, or even consciousness of, the existence of anything behind the phenomenal. It is the worship of matter. Now, this is not only the oldest form of human religion, but it is the form in which religion exists among the lower animals. When a lion runs away from an umbrella suddenly opened, or when a horse shies at an approaching train, this is fetich worship. In man, pure fetich-worship is possible only in the very lowest phases of intelligence, such as are met with in some tribes on this continent and in Asia. Such tribes are said to be utterly without religion or god; and this, in a certain sense, is true. Their religion is pure superstition, and their god matter, in the form of amulets, talismans, and so forth. Of these, some are personal, others tribal. Fetichism is the religion of the senses, and of men liv-

ing a purely, or almost purely, sensuous and material life.

The second phase of religion is what I would call animism, or the worship of life. It is rudely divided into two parts, which, for convenience' sake, we may call idolatry and theism. I am using the term animism here in a very wide acceptance, as including not only plant and animal life, but also those movements of nature that in some degree resemble life,—the motion of the heavenly bodies, of the wind, of fire, and so on. Indeed, the word *animus*, from which *animism* is derived, means properly the wind (Greek *ἀνεμος*). Motion and life were less carefully distinguished by the ancients than they are by us. Aristotle, for example, distinguishes three kinds of motion,—local, quantitative, and qualitative,—whose subdivisions are locomotion, increase, diminution, birth, decay, and change. If the most primitive form of religion was worship of material, of matter, the next was the worship of the dynamic, of force. During the prevalence of this form, men worshipped the wandering sun and moon, the stars, flowing streams, the winds, ever-changing mountains and clouds; later on, trees and animals. This is the religion that we find in India, Persia, and Egypt in the old times.

But, when the new religion—animism—came, it did not at once displace fetichism. The two existed for a long time together, and deeply influenced each other. In fact, their union produced idolatry. For what is an idol but an attempt to put some aspect of motion or life into the form of a fetich? The earliest idols we know were small images of wood or clay that could be carried about the person as amulets or talismans. Thousands of these may still be found in the tombs of Greece, at Mykenai, Tiryns, Argos, and elsewhere. It was long before public idols made their appearance. There is only one or, at most, two such mentioned in Homer. The effects of this union of the material and the dynamic, which we call idolatry, were curious. The most important of these was the gradual introduction of gods proper, a series of imagined beings, neither material nor dynamic, but lying behind both matter and force and causing them. We are in the habit of supposing that idols are mere representations of gods already conceived; but this is not so. The idols come first, the gods afterward. It was the very impossibility of embodying forces in fetiches that made people feel the need of adding in imagination something to the fetich; and this something was a spirit, a god. We are apt to despise idolatry; but, in doing so, we fail to reflect how much we owe to it. It was the powerlessness of idols to express the activities in nature and life that forced men to think pure forces or spirits, and, in imagination, to connect some such force or spirit with every idol. The idols at first were very rude, and, except where they represented the different forms of animal life, had no particular shape. The fetiches of the Greek gods were, in many cases, mere rude, shapeless blocks of wood or stone; and, even after noble images were introduced, these blocks were still regarded as by far more sacred than they. Of course, where different forms of animal life were worshipped, as in Egypt, images of animals appeared early. Among the Eastern Aryans, on the contrary, where the forces of nature, the heavenly bodies, the winds, mountains, and rivers were especially worshipped, images appeared comparatively late in the history of idolatry. I mean that the idols were not images, but rude fetiches, connected by the imagination with these forces of nature. Idolatry thus contains two elements: a fetich, which tends more and more to cease being a mere fetich and to be-

come a symbol; and an imagined force or spirit, of which the fetich is, in the main, the symbol. As time advanced, the fetich came to be more and more regarded as representative only, and so tended to become more and more an image. At the same time, the forces of nature, being thus disengaged from symbols and conceived apart from them, came to be more and more regarded as spirits, the only form in which distinct and separate forces can be conceived. But, as these forces came to be regarded as spirits, they tended to react upon the symbols and fetiches, and to give these the shape in which those spirits most familiar to man appear. In this way, the forces of nature were personified; and the first result of this personification; was the introduction of idols in human shape. When this took place, polytheism, in the proper sense, began. It is generally held that idolatry is the result of polytheism. The contrary is true. It is also held that idol-making is the result of personification. The contrary is true. Image-making is the result of polytheism and personification; but idolatry is much older than image worship. One of the most curious results of idolatry and the separation of the symbol from the power symbolized is the belief in the existence—the separate existence—and consequent immortality, of the human soul. This belief was the source of that very ancient form of religion—ancestor worship—which not only prevails among many barbarous and half-barbarous tribes, but formed a considerable element in the religion of the Greeks and Romans even down to late times. It will, I think, be found a uniform law that rude peoples that have no idols and do not worship the *lares* of their ancestors, have no belief in the immortality of the soul. Indeed, it is utterly impossible that they should have any such belief, not having the concept of spirit or soul apart from matter. It is related that one of the early missionaries to the Indians of this country could find no other way of saying to these Indians that they had immortal souls than by telling them (I hope the rudeness of the expression will be excused) that each had in him a gut that would never rot.

I cannot go through all the steps by which men rise from simple idolatry to ancestor-worship and polytheism, and thence to monotheism or pantheism; but these steps are not at all obscure. They can all be traced. When idolatry begins, the gods are as numerous as the idols, and the idols as numerous as the forces worshipped. As time goes on, two processes advance simultaneously. The forces of nature tend more and more to arrange themselves in classes; and, as this is done, idols tend to represent such classes. At the same time, they tend to represent forces more and more approaching intelligence. Consequently, the idols tend more and more to assume human shape. These are really only two aspects of the same process. As men are able to classify natural forces, they themselves become more intelligent, and so tend to represent the complex unity of forces as intelligent. In one word, as the gods grow less numerous, they more and more tend to assume human attributes. The last step in this process is taken, when men rise to a concept of the universe as a whole, and of its forces as all combined in one great complex. This is wont to take place when men begin really carefully to study the forces of nature, especially the movements of the heavenly bodies. They are then apt to look upon the world as a single great organism or animal, animated by a single soul or spirit. This stage seems to have been reached in comparatively early times by the Egyptians, the Hindus, and the Persians, and, later on, by the Greeks also. In all cases, however, it, of course, struggled long with polythe-

ism, and, indeed, perhaps never, in any case, got entirely rid of it. Moses, apparently, tried to hold to the pure monotheism of the more advanced Egyptians; but, as we know, the Israelites were continually falling back into polytheism. To prevent them from so doing, he forbade the making of images, these being always a temptation to polytheism. Indeed, they did not arrive at a consistent monotheism until after the Babylonish captivity. The Greeks got no further than subordinating all their gods to one chief god,—to Zeus. Christianity borrowed the monotheism of the later Jews, but could not keep it pure. Christianity, though claiming to be monotheistic, is in reality tritheistic, that is, polytheistic. Moham. medanism was a revolt against the polytheism of Christianity in favor of a pure monotheism. Mohammedanism is, therefore, strictly monotheistic.

The second stage in religious development begins with idolatry and ends with monotheism. The idolatrous symbols are first made images; and then, as men come more and more to be able to conceive spiritual things, the symbols are dropped altogether.

But in all forms of religion publicly professed at the present day, there are not only polytheistic and idolatrous elements, but even fetichistic elements. Trinitarian Christianity, as I have said, is polytheistic. The worship paid to Jesus and, in Roman churches, to the Virgin, is pure idolatry. Very many of the ceremonies in all the churches—baptism and that strange ceremony called blessing or consecration—are purely fetichistic. But we may go even farther than this. Theism is itself, for the most part, a form of idolatry. The supreme power in theism is still conceived as an *είδωλον*, a spiritual being of the nature of man. It is true that man is generally said to be made in His image; but, as Voltaire and, long before him, Aristotle said, the truth is just the other way. God is a creature of the human imagination, and is therefore made, in the image of man, the highest *είδωλον* that man really knows.

Idolatry does not cease to be idolatry, because its *είδωλα* are not presented in material form. The essence of idolatry, and of theism as much as of any other form of it, is that it takes a mere product of the imagination for the supreme principle of the universe. Now, the religious problem with which we are struggling at the present day is, how to get rid of this imaginary product and replace it by a higher,—how to pass from theism to noism.

This transition is greater than any previous transition in the history of religion, except that from fetichism to theism, which marks the transition from barbarism to civilization. The transitions within theism itself—e.g., that from polytheism to monotheism—are much less momentous. The transition before us marks the transition from civilization, or State culture, to humanity, or pure culture. The nature and supreme momentousness of this change are apparent to but a very few persons,—the prophets and seers and those who loyally follow these. Nevertheless, a very large number of persons are working, in a more or less unconscious way, to bring it about,—some negatively, by merely combating theism; others positively, by trying to find a substitute for theism.

Indeed, the change to which I refer, though now by no means complete or to any great extent consciously striven for, began more than two thousand three hundred years ago, and has been slowly struggling with the various forms of theism, as well as with mere negative atheism, ever since. Some of the most remarkable men that the world has ever seen have taken part in the strife. The first was Anaxagoras, who used the

term *vovs* to replace the old *θεός*, or God. He was a friend of Periklēs, and was expelled from Athens for atheism. Proceeding onward, we may name Sokratēs, whose fate was due to his atheism, so called; Aristotle, who came near sharing the same fate; Jesus, who suffered because he denied that God was different from himself; Giordano Bruno, burnt in 1600 for atheism; Lucilio Vanini, who shared the same fate; Spinoza, Kant, Goethe, and not a few men of the present day, including many scientific men, who labor earnestly and nobly, but do not know the meaning of their own movement.

Let us now see whether we can fully grasp the true nature of this great transition which began two thousand three hundred years ago, and is still going on. What does it mean to pass from theism to noism? (1) what does it mean in thought? (2) what does it mean in life?

In thought, it means a great deal. In cosmogony, it means a passing from creation to evolution. It means that we are no longer to believe that anything ever came out of nothing, but that whatever is, is necessarily and eternally. It means that whatever takes place in the universe is due to a passing from latency to activity of powers that eternally exist. It means that no being is altogether dependent and none altogether independent. It means that being is at the foundation of all things; that even thought obeys the laws of being, and not being the laws of thought. Perhaps this is the most important of all the changes involved in the passage from theism to noism. Theism, conceiving its first principle in the image of man, whose essential characteristic is thought, tried to place thought at the foundation of things, and to make being its product. This is what is meant by creation. Noism, on the contrary, holds that being is more fundamental than thought, and that thought is but an act or phase of being. It holds that nothing can think before it is, that thought and the thinker are not identical, and that the thinker must precede thought. It holds, moreover, that thought is, intrinsically, a seizing of things and laws that are, and is what it is on account of the nature of the things known. Were the things different, the thoughts about them would be different, whereas any change in our thought would make no difference to the things thought. When I mistake a bush in a fog for a man, that in no way affects the bush. The importance of this difference cannot be well overestimated. It is the difference between faith and science, imagination and positive knowledge. Perhaps you will be inclined to ask me, Does the conscious arise out of the unconscious? And some may be inclined to think this question equivalent to this other, Does thought arise out of matter? To both questions, the answer must be, No. The conscious does not arise out of the unconscious, except in the sense that growth arises out of a seed. Whatever at any time becomes conscious must always have been latently conscious. Thought does not arise out of matter, any more than matter out of thought. Matter and thought are both manifestations of something that underlies both. Matter is, after all, only a form of motion.

But this is not all that the passage from theism to noism means in thought. It means further that, instead of looking, as theists do, for a divine revelation outside of nature, in the so-called supernatural, we are to study nature, study that which is, and seek for our revelation in a knowledge of its laws. By nature, however, we must be careful not to mean merely physical or material nature, as many scientific men are apt to do, but to include under the term also spiritual nature—the nature of thought, feeling, and will. These are manifes-

tations of the *vovs*, quite as much as are the phenomena of material nature. All laws whatsoever, whether of matter or thought, are expressions of the manner in which the *nous* acts. This is only another way of saying that being, as such, has certain essential and fundamental laws, which govern all its actions, and that these laws are what we find displayed in nature and thought.

There is, still further, an important result of the change from theism to noism. Theism makes man a created and dependent being, having a beginning in time, and possibly an end in it also; for not all theists believe in the immortality of the soul, and even those who do make that immortality dependent upon the will of God. Noism, on the contrary, recognizes that man, like everything else that is, is eternally; that he is not dependent upon any outside will for his being, but is an integral, necessary part of the universe; that while certain actions of his, including thought, may begin and cease intermittently, the power to perform them cannot perish.

Such are some of the more important effects of the change to noism upon thought. The effects upon life are even greater. The simple sense of personal eternity and independence, replacing the sense of transitoriness and dependence, gives altogether a new color and meaning to conscious existence. The sense of dependence, which theism fosters, has been one of the most baneful influences that ever checked civilization and humanity. I think it is Hegel who says that, if the essence of religion consisted in the sense of dependence, as some claim, the dog would be the most religious of animals. This sense taught men to fold their hands and to depend upon the grace of God for their highest good, instead of working for it themselves. It made them pray, instead of acting, be idle, when they ought to have been diligent, made them despise and hold apart from the world, when they ought to have been using it for their highest good. Protestantism originally taught, and, in some denominations, still teaches, that a moral life is in no degree the way to salvation, that faith alone and the grace of God can save. Noism teaches men that no real good can come to them save through their own efforts, directed to ascertaining and following the laws of being. It commands them, accordingly, to use their intellects to the utmost, in order to attain to a knowledge of these laws, and to exert their wills to the utmost, in order to conform to them. Instead of teaching them that sin gives offence to another Being who will punish them, probably in a way out of all proportion to their offence, it warns them that certain actions and courses of action are offences against their own being, degrading it and causing it to miss true peace and happiness. It says to every man, "Let thy chief terror be of thine own soul." Above all, it tells them that their true end, which is blessedness, lies in their own complete development in knowledge, love, and power, and that this development is possible only through harmonious interaction with all the beings that are in the universe. Instead of teaching, as all theists do and must teach, that some men may reach happiness while others still suffer, it teaches that no one person can attain his highest end or true blessedness until all have attained it. It tells men that mere material well-being which does not contribute to advancement in spiritual power, knowledge, and love, is a curse, and not a blessing. It makes the end of life being, and not having.

The truth is, the transition from theism to noism is a revolution in the entire purpose and method of life,—a revolution the equal of which the world has never known. Under theism, which

separated God from the world, men were encouraged to abandon the world and cling to God,—to save themselves from the wrecked world and seek to rise to heaven. Noism, recognizing that the world is the expression of the Supreme Power, and at every moment the completest expression possible at that moment, teaches men, instead of abandoning the world, to transform it. It says to each and every man, "Thou art a distinct expression of the Absolute Power. All the might of the universe is potentially in thee. Thou hast only to believe this, and thy faith, translated into love and energy, will be as fruitful as a grain of mustard seed. Not by feeling and praying and supplicating wilt thou task and the task of humanity be accomplished, but by vigorous action of head, heart, and hand. Not by humbling thyself in the dust and calling thyself a worm—a poor compliment, at best, to an omnipotent God—canst thou perform the duty which the law of thy being imposes upon thee, but by earnestly and reverently claiming thy dignity as an expression of the Absolute, as a revelation of the Supreme Power, and by comporting thyself as befits such dignity. All that thou hast ever dreamed of the divine perfections, all the knowledge, all the love, all the patience, all the self-diffusion, thou must realize in thyself, and be, as far as in thee lies, a very present, revealed God."

To the theist, who does not recognize the limits of his own creed, or know that he is only a refined idolater, this, of course, will sound like blasphemy. But what is blasphemy? It is a mere relative thing. It is the denial of the gods that any one else happens to believe in. Sokratēs was a blasphemer, Jesus was a blasphemer, Giordano Bruno was a blasphemer. We can well afford to be blasphemers and to undergo the obloquy that comes to blasphemy. The day will come when it will be recognized that our blasphemy is the highest religion. For it is surely the highest religion to be the most perfect man or woman, to realize in one's self the greatest amount of the Absolute Power. For religion does not consist in worshipping the Absolute as something outside of us, but in realizing it as something in us, as our own deepest and inmost nature.

But I would not conceal from you that noism calls for an amount of sacrifice and energy that theism never called for. Indeed, it calls upon us to do all that, under theism, God was expected to do. It is the cowardly fear of this that makes men so willing to be theists. Men wish to believe that things will be done for them, and that they may fold their hands and plead with that Power to do what they would wish to have done. Noism tells them that the divine work which moves the world must be done through their brains, their hearts, and their hands; that they must be up and doing; that they must understand the world and love it, in order that they may transform it.

The fables of theism differ in no essential way from the stories in the *Arabian Nights*. Both tell us about help afforded to man by supernatural powers: both are childish and unworthy of grown men.

Two thousand—yea, three thousand—years of theism, in all its forms, have shown us what it can do for the human race. I do not mean to say that it has not done a great deal. It has carried men a great way farther than ever fetichism could have carried them; but it has still left them very far from their goal. The world of the present day is just what theism has made it, and we all know what its condition is. Has it in any great degree made men and women unselfish, self-sacrificing? Is the world governed by love? Is the dignity of man as man, and of woman as woman,

recognized? Do the strong and rich toil and expend their riches for the benefit of the weak and the poor? Is all dishonest gain scouted? Are those who gather wealth careful to see whether, by so doing, they are oppressing any of their fellow-men? Are men and women generally using every means to discover and to understand their own nature and the nature of the world around them? Are they enthusiastically eager to find out what is their highest duty and to do it? Are they pure, modest, earnest? These questions need no answer. The world of the present day is, in the main, unspiritual, ignorant, blind, and selfish, each man and each woman struggling in the general *mêlée* for himself or herself. I do not mean to say that there are not exceptions, but I think tolerably few of them will be found among theists.

Perhaps you will say to me: But theism cannot be held accountable for this state of things. If men had but taken the doctrines of theism seriously, the world might have been a paradise. Perhaps so; but what does this prove? Simply that theism has been powerless to influence men sufficiently to induce them to reform the world. But more than this is true. Theism, even if taken with the utmost seriousness, is utterly and necessarily powerless to inspire men to do their proper work. In the first place, it makes them believe that a great deal of the world's work will be done by God, and that they need not trouble themselves about it. In the second place, it flatters them with the belief that they can be saved without salvation's coming to the whole world, since their relation to the Supreme Power is utterly independent of their relation to the world.

Such a view, such a creed as this, is altogether powerless to inspire men to perform their duty, however seriously they may take it. Nay: the more seriously they take it, the less will it inspire them to do their duty. The more they exalt God and debase themselves, the more will they expect and fear from God and the less from themselves.

There is no escape from the state of things induced by theism but to pass on from it to the higher noism,—to that system of thought which finds the Supreme Power manifested in the universe, and, above all, in the conscious spirit of man,—that system which makes man responsible for his own welfare and the welfare of the world, which calls upon him to do what God was formerly expected to do.

And there is no doubt that the world generally is preparing to make the transition in question. A thousand efforts are unconsciously tending in that way. Physical science, the study of which is now threatening to supplant all other studies, has no place for theism. It finds the powers that cause evolution to be in things, not outside of them. It deals with these powers only in so far as it finds them manifested in things. It looks for the explanation of things in universal laws, not in the will of God; and laws are simply the essential attributes of being. Many of the more current philosophies tend in the same direction,—Comtism, Hegelianism, Darwinianism, Spencerianism, the system of Von Hartmann, and, above all, the doctrines of the Spiritualists. These systems are, one and all, imperfect attempts at noism. They all look away from theism, even when they do not condemn it; and they all look for truth in the right direction,—to the natural, not to the supernatural; to science, not to revelation or faith. But not one of them, so far as I knew, has recognized the truth which is required to give these systems meaning, and make them satisfy man's thirst for truth and clearness with regard to himself and his

destiny. Not one of them recognizes that the Absolute is an essence and not a thing. Every one of them makes it a thing, or else declares it to be unknowable. Comte, Darwin, and Spencer declare it to be Unknowable; Hegel calls it an Idea; Von Hartmann calls it the Unconscious; the Spiritualists give it no particular name.

Perhaps it does not mean much to some of you, when I say that the Absolute, the Supreme, Divine Power, is an essence, and not a thing or substance. I am always sorry when I am compelled to introduce philosophical or metaphysical terms; but, in some cases, this cannot be avoided. What I mean I may perhaps best explain by a particular instance. Wine is a thing, a substance: the essence of wine is not. Wine may be divided up into drops smaller and ever smaller, without limit, so far as we know. The essence of wine is in the smallest drop, just as truly as it is in a butt. It is totally in every particle of the wine. Now, I maintain that the Absolute is an essence, and exists totally in every being, the smallest as well as the largest, that everything that truly is contains the total Absolute. You will perhaps say to me that this is pure pantheism. Well, if pantheism were the truth, I should not at all object to holding it; but it is not the truth, and noism is not pantheism. Pantheism, as we all know, considers the Absolute a substance, and not an essence. Herein lies its error, and hence come all its baneful results. According to pantheism, the Absolute is scattered through the universe, one part of it here, another there; one part in one thing, another in another, so that the total Absolute exists only in the sum of things taken together. The result of such a doctrine is this: that no individual thing in the universe has absolute existence; that all individuals are parts and only parts of the Absolute, and vanish in its totality, as waves vanish in the boundless expanse of the ocean. It is pantheism, making inconceivable the absoluteness and eternity of the individual spirit, that has been the curse of the Orient, and, now that Oriental thought is invading the West, threatens to become the curse of it also. Science is in its nature pantheistic. All forms of monism, the systems of Spinoza, Hegel, Schopenhauer, Comte, Spencer, etc., are pantheistic, and contain the germ of destruction to all the hopes, inspirations, and energies of man.

You will say: "There surely cannot be much difference between an essence and a substance. Essence and substance mean the same thing." In ordinary speech, they often do; but, in philosophical diction, they are wide as the poles asunder. The difference between essence and substance constitutes the difference between noism and pantheism; between a philosophy and a religion which tell man that he is a mere will-less, helpless worm in the grasp of a great, self-evolving Power, and a philosophy and religion which assure him that he is of infinite power, that his will is free, that he is potentially absolute, capable of infinite progress, secure of eternal life. Often before now, the fate of whole races has hung upon a metaphysical distinction, and upon none oftener than upon the distinction between essence and substance. Had the early thinkers of India correctly grasped this distinction, India might have been to-day the leading nation of the world. Nay, more, it is not too much to say that, if Oriental thought were to strike deep root among us in the form of Hegelianism, Darwinianism, or of Esoteric Buddhism, we should, in the course of a few ages, sink down into the condition of India or China.

I am afraid that, after I have done my best, the distinction for thought and life between theism, pantheism, and noism will not be entirely clear. All I can hope to do is to direct your attention to

the distinction, trusting, as I most firmly do, that reflection will make it clear to you. When it becomes so, then you will see the momentousness of the religious change through which we are about to pass, and will cling with enthusiasm to the movement which attempts to embody the truth toward which the change is. You will then utterly break away from theism and the whole narrow, selfish system of things founded upon it, and devote yourselves to the system of noism, which forbids all narrowness, all selfishness, all worldliness and other-worldliness, and makes it the highest of duties to know, to love, and to act according to knowledge and love.

In these practical days, the question will doubtless be put to me: What is going to be the practical result of noism? What will be its influence upon human institutions,—upon politics, society, economics, education?

It would take a long time to answer this manifold question in detail; but I think we may say that, if the one thought that there is no true salvation or good for any, without the salvation and good of all, were once thoroughly impressed, all human institutions would assume a different aspect. Men and women would then use all their efforts to discover by what means all could be saved, and to apply these means. Their success in these efforts would be the crown of their ambition and the measure of their worth. They would cease to covet wealth, ease, preferment for themselves; they would abstain from vice, as a cruelty and a wrong to the whole world. Again, the other thought—that they are the means, and the only means, by which the redemption of man can be brought about, that there is no known power but that which works in things—would nerve men to exert energy, instead of remaining passive and waiting for evolution to do things.

The welfare of the future depends upon men's being inspired with a new religious fervor; and this fervor must be one of earnest desire to know, to appreciate lovingly, to labor. What nature has been doing blindly and painfully for ages, men, feeling themselves the highest expression of the objective intelligence that lies in nature, must continue intelligently, and lead it to its perfect result. Ceasing to complain of the evils of the world, they will ask themselves whether they, simply and collectively, are doing all that in them lies to better it. Until they are sure that they are doing so in all singleness and unselfishness of purpose, they have no right to complain about anything except themselves.

Let us then, instead of complaining, make ourselves strong in the conviction that the secret of the future is ours, and then proceed, with all our might, to understand ourselves and the universe we live in, in order that, understanding it, we may, as nature's vicegerents and highest powers, bring it more and more near to that supreme harmony toward which all things are struggling.

CORRESPONDENCE.

A NOTE FROM DR. MONTGOMERY.

Editors of The Index:—

In an editorial note of April 8, I find that Mr. Underwood and a friend believe *concomitance* to be the relation taught by Mr. Spencer as obtaining between the "extra-organic and intra-organic." It seems to me that it is rather difficult to tell what Mr. Spencer's view really is regarding this central problem of philosophy. I wonder whether he himself knows! In my paper on "Scientific Theism," I chose *correlation* among half a dozen equally available views, merely to have a telling contrast to Lewes' two-sided theory, which Mr. Spencer does not omit at times likewise to propound.

I willingly admit that Mr. Underwood and his friend have correctly pointed out *concomitance* as a doctrine taught by Mr. Spencer; and, I am sure, they, on their part, will admit with equal willingness that I have been no less correct in asserting that *correlation* is also one of Mr. Spencer's doctrines. To bring about this satisfactory agreement,—not between Mr. Spencer's views, but between Mr. Underwood, his friend, and myself,—nothing more is needed than the perusal of § 71, *First Principles*, from which I will quote the following passage:—

"Various classes of facts thus unite to prove that the law of metamorphosis, which holds among the physical forces, holds equally between them and the mental forces. These modes of the Unknowable which we call motion, heat, light, chemical affinity, etc., are alike transformable into each other and into those modes of the Unknowable which we distinguish as sensation, emotion, thought; these, in their turns being directly or indirectly retransformable into the original shapes. That no idea or feeling arises, save as a result of some physical force expended in producing it, is fast becoming a commonplace of science; and whoever duly weighs the evidence will see that nothing but an overwhelming bias in favor of a preconceived theory can explain its non-acceptance. How this metamorphosis takes place, how a force existing as motion, heat, or light, can become a mode of consciousness, how it is possible for aerial vibrations to generate the sensation we call sound, or for the forces liberated by chemical changes in the brain to give rise to emotion,—these are mysteries which it is impossible to fathom."

It is delightful to be able to express one's self so unmistakably as Mr. Spencer has done in the above passage. And thus it will be readily granted that it is not due "to a slip of the pen or to some inadvertence" on my part that Mr. Spencer stands committed to the opinion that extra-mental forces are convertible into mental states, and *vice versa*. In this philosophical dilemma, we may console ourselves by contemplating that less voluminous and far more authoritative works than the *Synthetic Philosophy* are affording to bewildered humanity equally good evidence for various sides of one and the same vital question.

Yours respectfully,

EDMUND MONTGOMERY.

INDUSTRIAL TRAINING FOR THE RICH.

Editors of *The Index*:—

It has become very popular of late to laud highly the industrial training of the poor. It has struck the writer that such industrial manual training for the rich would be a great good in diminishing the strong tendency in that class to insanity, suicide, and morbid mental states generally. Undoubtedly, such method of attempting to prevent such diseases would not be any more tentative than is the present method of attempting a cure, when the diseased mental state is well marked. Moreover, the object aimed at in such manual training is never to be avowed to be the prevention of any disease, but simply to learn the way to perform well such labor as is under consideration. Hence, no possible disgust at a proposed remedy would exist in the patient's mind,—a most important item, by the way, to be considered in weighing the chances for success in such cases. Because a child never has been taught in early years of life such matters is no bar to the undertaking of such education at any time, even after manhood or womanhood. Nothing so contributes to the relief of the strain on the mind and nervous system as a careful employment of the body in some useful pursuit, in producing, or attempting at least to produce, some valuable or ornamental result. It distinctly is opposed to introspection and overexcited imagination or dreads. Let there be no hurry, no course, no specified or approved method to be strictly followed in all cases in such instruction: simply let one who knows teach the rudiments and make suggestions to those who do not know, encouraging to exertion as a fellow laborer. This would apply to carpentering, tinkering, gardening, photographing, as well as to more delicate mechanical works. As soon as some originality is developed, and a sign of interest in the work on the part of the one taught, the foundation for success is fairly laid; and, with care, the desired result can be obtained for the individual taught, that of securing for him or her a mental counterbalance which will be permanent.
