## PREFACE

Ir to releted If Epimenides, one of the anges: If antiquity, that ho foll eloop in a cave and remsined in that atate some years. When he awoke, everything was altered around him, and he acaroely knew where he wee Daring his absence be affirmed that he had familiar intercourse with apis ita, and obtained the gift of prophecy, oto. He wea roported able to diamias his soul from his body, end recall it at plessure. So high was his repatation for eanctity, that during a plague in Attica, 596 B. C., the Atheuians sent for him to perform a lustration; in consequence of which the plague ceesed.

Some German studenta in the last oentury, wiahing to raiso the devil, oerried a pan of burning charcoal into a olon room, and throwing in it various prescribed substances, danced around it, chanting a magic formala Ooe of them fell deed, and the rest, upon seeing his fate, fled with diff calty; the incantation, they thought, bed ovidently been too powerful A professor in the mame aniversity sccounted for the fects by the poison $\infty 0$ influence of fixed air (carbonic soid gas) generatod by the Ignited aerbon ; and offored to produce the gas at pleasuro. He was instantly scoused from this of having interoourse with familiar apirits.

Bcience has long since endorved the profeesor's solution, and to doubt it at the prosent day would betray groen ignorance. Not mo fortanate, however, whes Epimenides, for it in ouly fo our own times that his clairne have been acknowledged; and from the want of more extended information, many are even now incredalous. Incressing light will induce belief, and it is my earnest wish that the following pages msy tend to that result,

Man besides soul and matter, possosses an intermediate principlo distmet from and between both, called the lifo power : or in the words of Bonard, "he is an intelligence served by organs"-these organs being the eorvante of the life power, by which it operstes upon the materiel world, and is in turn operated upon by it. A proper knowledge of the life power is a key to explain all the phenomena of fascination; and this it ia the ob lect of the present work to cemmanicate. A very concise bat perfectly lear idea of plys:ology is given, and in this the foundation la laid.

Tho Dolphic priesteme inhaled fixed air to act on the life power in anch - manner as to cause the apiritwal in the ayatem to propnnderato over the material, that she might the better give her responses. In some casea so grest was the proponderance as to caune death; the priestese sharing the fate of the German student (who accomplished his desirn), and by the eame means. When the wighed-for change is induced, new powers or instincts, previously dormant, become suddenly developed; and like the lower animala, who, when aick, run and devour the herb suited to their case, a like faculty of properly prescribing remedies is perceived-the spiritual world is often beheld, and ite denizens sometimes give the sleep wakers information of events that will abortly happen. History tells us that the coming of Cortez, and his conquest of their nation, had been told the Mexicans long before a Spaniard was over heard of; and the journale of the missionaries stationed at the Pacific isles will pressat similer facts.

We can now see why the brazier was used in the incantation of the stadent, and the probability of Epimenides undergoing a change upon ontering a certain cavern (likely by accident the first time) wherein fixed air wes generated. His powers of curing disease, having intercrurse with spirits, and predicting events, are thus explained. It should be remarkod here, that none but those predisposed to the change, can experience it; all artificial ellorts to induce it exoept in such, resulting in almost certain insanity or death.

Like many others in my profemsion, I was a bittor esemy to fasoination till accidentally led to examine it; but having done so, found the phe nomens it presented, though new and starting, in atrict sconrdance with the laws of life, In explaining my views, I have written for the people, sutirely dispensing with tochnical terms except in one or two instances. That their perusal may clear up in the minds of others as many obscure and mysterious points as they did in his own, and thas subserve the inter asta of truth is the eincere deaire of the

## FASCINATION

## conversation i.

charming.
Lary. My dear doctor, I can never sufficiently thank you for the relief you have afforded me by your treat ment. I had been for years on the verge of the grave and without the expectation of ever being, even for one day, free from pain. The first time you fascinated me I experienced an incredible change-my pains ceased the heart beat regularly, and my appetite returned, and what is better still, my improvement has been rapia and thorough since thęn. I confess this freely, as it will preface what I am afraid will give you some pain. My friends attribute my recovery to imagination, and seem to think 1 was not really ill, but only nervous; and they suppose that a sufficient degree of irritation would make me as bad as I was at first.

Doctor. They mentioned, no doubt, many wonderful cases of the effects of imagination on the body.
lady. Yes, and some as strange as my own The cases that had the most effect on my mind were that of Joe, the Scottish drover, who was persuaded to believe himself sick, and in consequence really became so-and would have died had not the joke been discovered to him-and that of the criminal whom the physicians
pretended to bleed to death, and who actually died from the fancied loss of blood.

Doctor. That imagination exercises a powerful influence upon our bodies, is an undoubted fact; but it is equally a fact that it has full credit for all it performs. Jussieu, one of the commissioners appointed to examine this subject by the French Academy in 1784, states, as the result of a series of assiduous and attentive investigations, that he had observed some facts that admitted of physiological explanations; others which seemed to militate against animal magnetism; a third series of facts which he attributed to the imagination; and. lastly, those which could lead to no other conclusion than that of admitting a particular agent in their production.

Lady. I had no idea the subject was known as far back as 1784; I thought it a new discovery of the present day.

Doctor. We have authentic records showing its existence for upward of three thousand years. I have been examining some authorities, and, if you are sufficiently interested in the matter, will take considerable pleasure in submitting the result of my labors to you; and also explaining the connection of fascination with the laws of life.

Lany. I am very much obliged to you for the offer, and will hold you to your promise. To tell the trath, I was on the point many times of asking the same thing; for 1 find it to be the universal opinion of every one I am acquainted with, that, if true, it is something allied to witcheraft, and if not true, the greatest humbug of the age; and, despite my own experience, I often feel very unersy about it.

Doctoz. . do not wonder at your feelings ; but, is relation to its effect on the imagination, I would ask $\mathbf{f}$ you believed in fascination before I saw you?

Lady. I had never heard anything abou it. One day, when you came in and found the medicine had as usual produced no effect, after some conversation on ordinary matters, you directed me to sit down and look attentively in your eyes, at the same time taking hold of my hands. In a little time a rather uneasy feeling stole over me, which soon became pleasant and exhilarating; before long I felt sleepy, a dreamy and triumphant sensation succeeded, and my eyelids closed without the power to open them. My pains vanished, and when you opened my eyes, I felt better than I had done for years; and to the surprise of all my acquaintances, who predicted a speedy relapse, my recovery has been rapid und permanent.
Doctor. Well, then, your case cannot surely be attributed to imagination.

Lady. I never thought it could; but why do you name your new science Fascination? Others call it Mesmerism, or Animal Magnetism.

Doctor. You are mistaken in supposing it to be a separate science; it is only a part of medicine. And besides the names you have mentioned, Mental Electricity, Neurology, Pathetism, Sychodunamy, and many others, are in turn used to signify it. The forces of life, as I shall explain in another place, brook no interference from those of Chemistry or Mechanics, so that such terms as Magnetism and Electricity are inapplicabla Mesmer did not discover anything new. Neurology treats only of the nerves. Pathetism is a term derived from the Greek, meaning suffering and Sychodunam>
is another word from the same language, meaning the force of the soul. Now, as we have a word in our language already expressive $o$. the power in the lower animals, I saw no necessity to add another, especially as Fascination is universally acknowledged.

Lady. You surely do not mean the charming of snakes?

Doctor. You have exactly expressed my idea; for the power in man and the lower animals is exerte: through the same medium, and produces, to a certari extent, the same results. Do you remember any case I of the fascination of snakes?

Lady. Quite a number. Professor Silliman mentior 1 that in June, 1823, he crossed the Hudson at Cattskill, is company with a friend, and was proceeding in a ca riage by the river along the road, which is there ver, narrow, with the water on one side, and a steep banl, covered by bushes, on the other. His attention at that place was arrested by observing the number of small birds, of different species, flying across the road and then back again, and turning and wheeling in manifold gyrations, and with much chirping, yet making no progress from the particular place over which they fluttered. His own and his friend's curiosity was much excited, but was soon satisfied by observing a black snake of considerable size, partly coiled and partly erect from the ground, with the appearance of great animation, his eyes brilliant, and his tongue rapidly and incessantly brandishing. This reptile they perceived to be the carse and centre of the wild motions of the birds. The excitement, however, ceased as soon as the snake alarmed by the approach of the carriage, retired into the bushes; the birds did not escape, but, alighting upon
the neighboring branches, probably awaited the re-ep pearance of their cruel tormentor and enemy
I have read of a man residing in Pennsylvania who returning from a ride in warm weather, espied a blackbird, and a large blacksnake viewing the bird. The latter was describing circles, gradually growing smaller around the snake, and uttering cries of distress. The bird had almost reached the jaws of its enemy, when the man with his whip drove off the snake, and the bird changed his note to a song of joy.
A gentleman himself told me that while travelling one day, by the side of a creek, he saw a ground-squirrel running to and fro between the creek and a great tree a few yards distant. The squirrel's hair looked very rough, which showed he was much frightened; and his returns being shorter and shorter, my friend stood to observe the cause, and soon discovered the head and neck of a rattlesnake pointing directly at the squirrel through a hole of the great tree, which was hollow. The squirrel at length gave over running, and laid himself quietly down, with his head close to the snake's. The snake then opened his mouth wide, and took in the squirrel's head, when a cut of the whip across his neck caused him to draw in his head, which action, of course, released the squirrel, who quickly ran into the creek.
Docror. Dr. Good mentions the curious fascinating powel the rattlesnake, in particular, has over various amall animals, as birds, squirrels, and leverets, which. incapable of turning off their own eyes from those ot the serpent-enchanter, and overpowered with terror ana amazement, seem to struggle to get away, and yet pro gressively approach him, as though urged forward or
ettracted by a power superior to that of natura instinct till at length they enter, apparently without foreiga force, into the serpent's mouth, which had all along been open to receive them, and are instantly devoured. The larger kinds of various snakes have undoubtedly a similar power. Dr. Barrow, in his Travels into the interior of South America, asserts this to be a fact, well known to almost every peasant in that quarter of the world; and Vaillant, in his Travels into Africa, affirms that, at a place called Swortland, beholding a shrike in the very act of fascination by a large serpent at a distance, the fiery eyes and open mouth of which it was gradually approaching, with convulsive tremblings, and the most piteous shrieks of distress, he shot the serpent before the bird had reached it ; still, however, the bird did not Hy, and on taking it up, it was already dead, being killed either by fear or the fascinating influence of the serpent, although, upon measuring the ground, he found the space between them to be no less than three feet and a half. There is a case, much in point, inserted in one of the early volumes of the Philosophical Transactions, which states that a mouse, put by way of experiment into a cage in which a female viper was confined, appeared at first greatly agitated, and was afterward seen to Jraw near to the viper gradually, which continued motionless, but with fixed eyes and distended mouth, and at length entered into its jaws, and was devoured.

Lady. If any of the lower animals could be fasci pated by man, I should think that would be a certain proof, not only of the reality of the power, but that it did not exert its influence through the imagination.

Doctor. Animals of ate days have been frequently
fascinated for purposes of experiment, and a universa' rigidity of the muscles produced to such an extent as to cause them to resemble pieces of statuary, so that the animal could be taken up and its whole weight supported by one foot-and this state produced and continued at pleasure. Mr. Bruce, the great African traveller, distinctly states, from minute personal observation, that all the blacks in the kingdom of Sennaar, whether Funge or Nuba, are perfectly armed by nature against the bite of either scorpion or viper. They take the horned eerpents in their hands at all times, put them into their bosoms, and throw them at one another, as children do apples or bells; during which sport the serpents are sel dom irritated to bite, and when they do bite, no mischief ensues from the wound. The influence exerted upon them is so great that they are scarcely ever able to attempt any resistance, even when eaten up alive, as Bruce assures us he has seen them, from tail to head, ake a carrot. He also positively affirms that they constantly sicken the moment they are laid hold of, and are sometimes so exhausted by this invisible power or fascination, as to perish as effectually, though not as quickly, as though struck by lightning. "I constantly observed," says he, "that, however lively the viper was before, upon being seized by any of these barbarians, he seemed as if taken with sickness and feebleness, frequently s/iut his eyes, and never turned his mouth toward the arm of the person that held him."

This power is often used by man to disarm the fury of the most enraged or vicious quadrupeds. This is peculiarly seen at times in the case of watchdogs over whom some house-breakers have found out the secret of mercising so seductive and quieting a power as to keer
them in a profound silence while the burglary is com mittea. Linderrantz, of Sweden, tells us that the naives of Lapland and Dalarne are in possession of this secret generally, insomuch that they can instantly disarm the most furious dog, and ob ige him to fly from them, with all his usual signs of fear, such as dropping the tail, and becoming suddenly silent.

Grooms are sometimes found possessed of a similar power over horses. Mr. Townsend gives a striking anecdote to this effect in his account of James Sullivan. The man-an awkward, ignorant rustic of the lowest class-was by profession a horse-breaker, and generally nicknamed the whisperer, from its being vulgarly supposed that he obtained his influence over unruly horses by whispering to them. The actual secret of his fascinating power, it is very likely, was unknown to himself for it died with him, his son, who was in the same occupation, knowing nothing of it. It was well known to every one that, however unbroken or vicious a horse ol even a mule might be when brought to him, in the short space of half an hour he became altogether passive under his influence, and was not only entirely gentle and tractable, but in a very considerable degree continued so, though somewhat more submissive to himself than to others. There was a little mystery in his plan, but unquestionably no deceit. When sent for to tame an unruly horse, he ordered the stable-door to be shut upon himself and the animal atone, and not to be opened until a given sigual. This singular intercourse usually lasted for about half an hour; no bustle was heard, or violence seemnsly had moourse to: but when the door wras opened, on the propur sign being given, the horso was always seen lying •, and the fascinator by his
side, playing with him familiarly as a child with a puppy. Mr. Townsend once saw nis skill tried on a horse that could never be brought to stand for a smith to shoe him. The day after Sullivan's half-hour lecture, he went, not without some incredulity, to the smith's shop with many other curious spectators, who were eyewitnesses of the complete success of his art. This, too, had been a troop horse, and it was supposed, not without reason, that after regimental discipline had failed, no other would be found availing. He observed the animal seemed afraid whenever Sullivan either spoke to or looked at him. In common cases, the mysterioun preparation of a private interview was not necessary, the animal becoming tame at once.

Lady. Has no person ever attempted to explain this wonderful influence? for the facts seem to have been known a considerable time.

Doctor. Yes, though some have doubted the facts, for, as Dr. Good remarks, in the marvellous it is always far more easy to doubt than to determine. By far the best explanation, and one with which I entirely coincida, is that of Major A. Gordon, of South Carolina, the rationale of which I will enter upon after a little time. In a paper of his, he attributes the fascinating power supposed to be possessed by serpents, to a vapor which they secrete, and can throw around them to a certain distance at pleasure. He advances various facts in support of this opinion, and observes that the vapor produces a sickening and stupefying effect; and t.lludes to a negro wh, from a peculiar acuteness of smell, could discover a rattlesnake at a distance of two hundred feet, when in the exercise of this power, from hir smell boing effected by it, and who, on following such
indication, a ways found some animal drawn withun its vortex, and struggling with its influence.

Lady. Does man possess the power of throwing off a similar vapor?

Doctor. Undoubtedly; the instruments in both are the same, and these instruments I will take occasion to describe to you, and explain their mode of operation.

Lady. I should think it possible, in that case, for animals, in some instances, to fascinate man.

Docror. We have well-attested instances of their doing so. I remember reading, some time since, of a mas walking out in his garden, who accidentally saw a snake in the bushes, and, observing the eyes gleam in a peculiar manner, watched it closely, but soon found himself unable to draw his own eyes off. The snake, it appeared to him, soon began to increase immensely in size, and assume, in rapid succession, a mixture of brilliant colors He grew dizzy, and would have fallen in the direction of the snake, to which he felt himself irresistibly impelled, had not his wife come up, and, throwing her arms around him, dispelled the charm, thus saving him from certain destruction. There are too many of these stories to mention a tithe of them; so I will conclude with but one more that is very generally known. Two men in Maryland were walking together, when one found fault with his companion because he stopped to look at something by the road-side. Perceiving he did not heed him, he returned to draw him along, when he perceived the other's eyes were fixed upon a rattlesnake, which had its head raised and eyes glaring at him. The poor fellow was leaning toward the snake, and crying piteously, in a feeble $t$ ne, "He will bite mel he will bite me." "Sure enourh he will," said his friend, "if yoo
do not run off. What are you staying here for ?" Find. ing him Jumb to all entreaties, he struck down the snake with a limb of a tree, and pulled his companion violently away. The man, whose life was thus providentially saved, found himself very sick for some houra after his enchantment.

Lady. I must express my astonishment at the new light in which you have presented the whole subject to my mind. There can possibly be no cavilling at any of the positions you have assumed.

Doctor. I give you the result of my own conclusions, after considerable study, and, from what has been shown, I think we may prove four things :-

First: That man can fascinate man.
Second: That man can fascinate the lower animals.
Third: That the lower animals can fascinate one another.

Fourth: That the lower animals can fascinate man.
Townsend remarks, that if we wish to seek for a general instance of the power one human being possosses over another, with regard to the influence of fascination, we have only to look at the effects produced when young persons sleep with old. It is recorded of the Psalmist, King David, that, when he became very old, he got a young damsel to sleep with him, that, from her vigorous life, he might obtain a supply to lengthen out his days. Some painful instances of this kind came under his own observation-one in which the future wellbeing of a person very dear to him was compromised; and he was acquainted with an infirm old lady, who was so perfectly aware of the benefit she derived from sleepling with young persons, that, with a sort of horrid vam pireism, she alw ays obliged her maid to share the same
bed with her; thus successively destroying the health of several attendants.

The celebrated German physiologist, Hufeland, has remarked the longevity of schoolmasters, and attributes it to their living so constantly amid the healthy emanations of young persons.

It may be well to mention, in this connection, the fact that savage nations, generally, practice fascination. They rub or pat one another when fatigued, and it refreshes. The wife of one of the Sandwich Island missionaries, on a visit to this country, some years since, exclaimed, on returning from a long and tiresome walk, that had completely exhausted ner strength: " If I was home, the native women, by patting me, would soon give me complete relief from this weariness, and make ne feel as lively as ever." The rites and gestures of lavage magicians, the medicine-men of the wilds, over heir patients, which so much slarm travellers, are sothing more than fascinating passes to cure disease-a method, too, that very generally succeeds.

Even among animals, it has been found that the young cannot be too closely associated with the old without suffering detriment. Young horses, standing in a stable beside old ones, become less healthy, and, in tirre, weak and sickly.

Lady. And you say these wonders can all be explained, in accordance with what is already known of the lawe of life?

Dooror. With the utmost certainty.
Lady. But do you really think it possible that I can ever understand them! I am fearful that I have not strength enough of mind to pry into such mysteries.

Decros. The subiect is not difficult, by any means
and a moderate degree of perseverance is only necea sary to master the whole. If you like, we will spend a tittle time to-morrow in its examination, and, in the meanwhile, I will leave you Mrs. Abdy's lines on fascination, which prove, in a pleasing enough manner, that there can be some poetry in the subject :-
He atands before a gathered throng, strange knowledge to unfold,
Charming the dexzled fancy like the fairy-tales of old;
Yet muat he brook the idle jest, the cold and donbting eneer,
Ho buth no beaten patn to tresd, no practisod courie to atoer.
The wondrous ecience that he strives to bring to life and light,
Is softly, faintly breaking from the misty shades of night;
And acoffing prejudice upbraids the pure and genial ray,
Because it doth not burst at once to bright and bearoing day.
He tella the bealing benefits that through this power arise;
How sweet and soothing sleep may seal the weary mourner's oyes
How raging madness may be checked; how sufferers may obtaia
The boon of deep oblivion from the keenest throbs of pein.
Anon he dwells on loftier themes, and shows how mind may claia
An empire independent of the atill and slumboring frame.
Can ye doubt the proofs, ye careless throng, eubmitted to your viow
Cen ye bold them in derision, because yet untried and now?
Enow that improvemente ever wend a tardy course on earth;
And though Windom's mighty goddees gained perfection at her birti
Her children reach by slow degrees the vigor of their prime,
For the wiadom of this lower world requires the growth of time-
None wioh yo on the atatoments of a aingle voico to reat;
The marvels ye have witnemed ye are arged to prove and teat;
Sarvey them in their varied formo-inquire-observe-inspeot-
Watch-meditate-compare-delay-do all thinga but neglect ${ }^{\text {t }}$
If yo bear in mind the lessons that to-day ye have boen taught,
Yo need not lack materials for intense and stirring thonght;
And my nimple lay can little atd on orator's diveourne,
So gitted with the energy it intellecizal force.

But I ask ye if your cherisied ones sharp anguish should endere Which the atated arta of medicine had in vain essayed th cure: Would it not grieve ye to reflect ye might those panga allay, But that, jeatingly and mockingly, ye cast that means away i

## CONVERSATION II.

## DIECOVERY OF FASCINATION.

Docror. I wish to prove, in our conversation to-day that Adam was perfectly aware of the power of fascination, together with clairvoyance, and those other mysteries that astonish so much the people of the f.esen day.

Lady. Why did he not nommunicate tnis knowledge to his descendants, so that the matter might become universal and undoubted?

Doctor. I cannot answer better than in the words of that veritable historian, John Bunyan, who tells us that King Shaddai, in the sixth day of the year one, built in the country of Universe a fair and dencate town, called Mansoul, and endowed it with corporate privi-leges-a town for building so curious, for situation so advantageous, that there was not its equal on the face of the whole world. Yea, it was so goodly, when first built, that the gods, at the setting up of it, came down to sing for joy. It was so mighty as to have dominion over all the country round about it; for all were required to acknowledge it for their metropolitan, and do it homage. It had commission and power from the king to demand service of all, and also subdue those who in any way opposed it.

There were certain gates in Mansoul, by which access could be gained to the celestial country round about it, and commun on held with the nessengers who were

## TOWA UP MANSOUL

constantly coming and going from the court of Shaddai The inhabitants took full advantage of all their glorious privileges, and conversed with the gods freely, so that, all the time they continued under the dominion of its builder, nothing but sounds of joy and praise were heard; but when, as is well known, they rebelled against his government, and swore allegiance to Diabolus, his enemy, a dreadful change came over them, and; among the other enjoyments of which they were bereft, the gates were closed that opened to the celestial country, and no communication through them, unless under extraordinary circumstances, ever allowed. As the gates became disused, they were gradually forgotten by the many, and, for thousands of years, all remembrance of them lost.

Ladv. Why, you do not surely think that heaven is around us, and that, if we could see through those gates, we would behold its glories at once? I have always entertained the idea that the celestial country was an - nmense distance off, and, when we died, there was a ong journey to travel before it could be reached.

Dooror. That the material world is contained in the spiritual, admits of direct proof, and a little reflection will convince us at once of the fact. You know we are told, that the angels thai encamp round about them that sear the Lord, do always behold the face of our Father which is in heaven. And were our senses not holden until the cime when we shall be caught up to meet the Lord in the air, we might see the cloud of witnesses surveying our heavenward race, and hehold, as Stephen did when he was martyred. heaven opened, anc Jesus s:tting at the right hand of God.

Lady. I must confess it would please me better to

Ind some certain proof of this in the Bible, and also of wme one who had seen it, that would be immediately ;onvincing.
Doctor. You will be surprised, then, by an attentive examination of the sixth chapter of 2 Kings. When Elisha's servant perceived his master's house surroundal by the warriors of the king of Syria, who evidently came with a hostile intent, he was extremely frigltened, and cried, "Alas, my master! how shall we do ?" And Elisha answered and said, "Fear not; for they that be with us are more than they that be with them." Bu: as this did not quiet him, Elisha prayed, and said, "Lord. I pray thee, open his eyes, that he may see." And the Lord opened the eyes of the young man, and he saw; ind, behold, the mountain was full of horses and chariots of fire round about Elisha.

Lady. I am satisfied, but cannot help expressing my qstonishment at the clearness of all the proofs you bring forward to sustain your positions. Do you suppose they practised fascination before the deluge?

Docror. Though they might be aware of the exintence of the celestial gates, yet that the mode of opening them, and also producing curative influence, was known before the flood, it is, of course, out of our power to determine; but that it was soon manifest after that pe riod, is undoubted.

Though the immediate descendants of Noah were aware of the being, and some of the attributes, of Jehovah, yet their knowledge, handed down to posterity only by tradition, became corrupt, and the invisible and eternal One was lost sight of in the homage paid to things of wood and stone; the charge of which, involv ing, as it did in their eyes, communion with superio*
powers, was the most important office in the nation, and one, too, which it was the earnest endeavor of all to obtain. Now, who so likely to obtain it as those who pretended to be especial favorites of the gods themselves, proving their assertions in the most satisfactory manner by the cure of diseases. Accordingly, we fina the heathen priests were the first fascinators.

Lady. But how did they discover the mode of doing it ?

Docror. An attentive examination of the subject has brought me to a conclusion that, most likely, will very much surprise you. I think the requisite knowledge was imparted by Satan himself, either in a direct manner, or by prompting the mind to a series of experiments that led to the discovery. He did this to increase his influence, so that a chosen few, on whom he could depend, might guide the many in the ways of destruction Proof of this, I think, can be found in the fact, naturally abhorrent to humanity - for man has been defined to be a religious animal-that all barbarous nations pay more homage to the Spirit of Evil than they do to the Spirit of Good. And, as a matter of course, their rites of worship are of the most revolting and blood-thirsty descrip tion; extreme licentiousness characterizing their devo tions, as well as suspension by hooks, etc., and the mur der of infants and adults.

Lady. If fascination is a power imparted by Satan why is it not sinful to have recourse to it?

Doctor. He did not impart the power, but merely showed the fact of its existence. It is a gift from Jeho vah, and, as stich, with all thankfulness, we make use of it to subserve his honor and glory The Lord makes be wrath of man to praise him as wel as the wrath of

Satan, who will no doubt find it in the end, like many other of his projects. one of the most efficient means of his overthrow.

Uniting, as the heathen magi did, the offices of priest and physician, as well as king, (which last office they afterwards voluntarily separated, though they kept it subordinate to their own, and the number of known remedies being then very few, they were mostly compelled to rely on fascination for giving relief in sickness. Some of them possessed this power in so extraordinary a degree, and had their fame so widely extended, as to be deified after death; having idol statues shaped in their likenesses, to which divine honors were paid, the qualities for which they were thus honored being symbolized by an additional number of arms. Proofs of this may be seen at the present day in the images of the gods of India; Vichenow, Chiven, Parachiven, Ravenna, and many others, have four, six, and twelve arms, all presenting the hands open, with the palms inclining downwards, the fingers being in the most approved fascinating positions of the present day.

It is probable that the immediate application of the hands was reserved for special purposes, curiouslyshaped rods of various kinds being mostly used to direct the influences; thus the caduceus of Mercury, it was supposed, had the power of putting any one whom it touched to sleep; with it he deepened the slumbers of Argus, after lulling him to a gentle repose by the sound of his lyre, preparatory to cutting off his head. That he sometimes dispensed with its use is evident from a passage in Plautus, which makes him say of Sosia. "What if 1 stroke him gently with the hand so as to put him to sleep ?" May no the regal sceptre have bean
nsed, before the separation of priest and king, for the same purposes as the caduceus of Mercury, and be, as well as the royal touch for the cure of scrofula, the last remains of the former union of offices?

Jadiv. Nothing can be more probable in this view of the subject.

Doctor. The magi, or wise men of India, the most ancient fascinators of whom profane history gives any account, practised mostly gestures and manipulations in curing disease, though they often prescribed herbs.

Lady. Is any particular aceount given of their curing by fascination?

Do ztor. Philostratus mentions the case of a young man, whom a lion had injured in the knee to such au extent as to keep him in constant agony, and who went to the magi to obtain relief. They rubbed him gently with their hands at intervals during a few days, when he returned home perfectly cured.

Next come the priests of Egypt, who took the great est possible advantage of the secret, and made the knowledge of it the last and holiest rite of their ancient magic, in the initiation of candidates. So celebrated were they, that many persons, taking advantage of our Saviour's temporary residence in Egypt, professed to account for his miracles, by accusing him, according to Arnobius, of being a magician ; of making things by secret means ; and of stealing, from the sanctuary of the Egyptian priests, the names of the powerful angels, and their occult disciplines.

Patients flocked to these Egyptians from all parts of the world. Their mode of proceeding was to previously prepare them by means of fasting and prayer, o.at then arap thens up in goat skins. After the proctas of
fascination hey were left to wait for sleep and pro phetic visions; in some instances these did not occur bit to provide for the emergency, there was a company ot priests who slept for them, and revealed the dreams. A record of each case, telling the name of the person, the disease and the remedy, was engraved on the temple; and these inscriptions, we are told, were, for a long while, the sole record of practical medicine. Five of these have been translated, the following two of which will give an idea of what they were:

The god, in a nocturnal apparition, ordered the son of Lucius, who was attacked with a hopeless pleurisy, to take from the altar some cinders, and, mixing them with wine, make an application to the affected side. He was saved; he thanked the god, and the people wished him happiness.

A blind soldier named Valerius, after consulting tho god, received for answer: "Go in the temple, mix tha blood of a white fowl with honey, and wash your eyea with it during three days." He recovered his sight, and thanked the god before the people.

Lady. What does it mean when it says they waited for visions ?

Doctor. I must take a rather circuitous mode of enswering your question. We must now study a little physiology, and, as I will avoid all hard names, and endeavor to simplify as much as possible, you will not find it difficult to follow me in the explanations.

Man has three perfectly distinct elements in his com position-Matter, the Life Principle, and the Soul on Immortal part.

Iady. I thought life resulted from the union of all the different organs, and that their being placed in

ןust such relations made the machine work harmont ously.

Doctor. That has been, and even now is, the opinion of a great many, but when the system is growing, and nlso in disease, some parts are always out of relation to the rest, and the proportion and balance thus utterly destroyed; and did life only result from the union of all, it must cease in such cases at once to exist. The inductive and only true method of reasoning refers the various operations going on within the body to a common cause, which source of action is called the life or vital principle.

Lady. But how is this cause discovered?
Doctor. By the phenomena it presents to us; we can perceive these phenomena only through the agency of Matter, for which purpose alone, it would seem, matter was created.

Lady. As matter is governed by laws of its own, it appears to me that, in experimenting upon it, you would only be finding out those laws.

Doctor. The laws of matter, which are known as the chemical and mechanical forces, differ entirely from those manifested by it when organized.

Lady. Still I have not a clear idea of the vital principle. When I would separate it from the soul and matter, the two last continually force themselves upon my mind, and make the whole subject very confused. If it was only possible to observe the vital principle acting with matter alone, without the soul's interference, I could easily understand it.

Doctor. Your wish can at once be gratified, by looking at the geranium on your window sill. Veget. ables have only the vital rrinciple and matter ; but
perhaps 1 cannot do better than refer you to aid article on this subject prepared by myself for a literary magazine some years ago. Will you read it aloud?

Lady It was remarked by a philosopher, some years ago, that it was scarcely possible to tell the difference between a dog and a rose. This statement, to the greater number of my teaders who have not reflected on the subject. will appear hardly probable. Anecdotes of the sagacity and faithfulness of dogs are known to all; and I doubt not many of them in our city are pos sessed of more knowledge and practical information, and are better members of society, than the swarms of idle and vicious youth who crowd our streets. How then, with such facts before him, could Bonnet make such an assertion? I will tell you. Our ideas of the intelligence of animals are derived from the proofs of design we see them exhibit. Having a certain end in view, they will choose, with the most astonishing disurimination, out of a number of means, the ones best adapted to their purposes, and contrive to use these in such a way as to be almost uniformly successful. Natural history is made up of facts in support of this position. Our next inquiry will be to find out whether plants ever show such instances of choice and foresight and a little examination will prove that most unquestionably they do.

Strawberries, planted on moist ground, give out no runners; but, on placing them in a dry soil with water at some distance, we find runners travelling around until they discover it, and then remaining-a living aque-duct-lo supply the plant. If these runners are moved round to the pther side, they will soon regain their origual postion with unerring certainty If you turn
the under surface of a rose-leaf upward, it will, in a little while, commence a return movement, gently twisting, with a kind of effort, on its peduncle, as on a sort of pivot. The Aंbbé Martin transplanted a rose-tree from one part of his garden to anuther, for the purpose of experiment. To the right of the new position, the soil was hard, dry, and sterile ; to the left, moist, rich, and tender. The roots, at first, radiated alike to the right and left. But he soon discovered that the roots, which had advanced to the right, bent backward toward the fertile and mellow earth, as if divining that their companions at the left had found better pasture. To prevent their intercepting nourishment intended for other plants, he dug a ditch to stop the farther advancement of the roots. Arrived at the ditch, they plunged perpendicularly below its bottom, ran around and advanced anew toward the point whence they had discovered the rich soil.

Instances of their foresight in guarding against ex cessive heat, wind, and rain, are equally numerous In France, the peasants train the carlina by their doors, to serve as a barometer; its open flowers show clear weather-but closed, an abundance of rain. The shepherd's weather-glass has the same property. If it does not show its face to greet the sun on his ascension, the sheep remain in the fold on that day. The four-o'clock opens its flowers regularly every afternoon at that hour, to show the laborer that, if he cannot afford a watch, nature will provide him with the means of knowing the hour without expense. Such examples certainly prove a faculty of judging according to the sense in plants.

And now the inquirer asks, "What is the nature of this pruciole, and in what does it differ from chem
ical affinity or attraction ?" A perfect exemplification of this difference is given in the history of its creation, And God made every plant of the field before it was in the earth, and every herb of the field before it grew. Dry land and seas, by this time, were divided, and the forces of the inorganic world in operation. These forces are called pullers-down of nature. Exposed to their influence, mountain and hill crumble to dust ; and it is owing to their agency that volcanoes and earthquakes destroy cities and swallow up nations. This is due, probably, to the shape of the ultimate atoms, which, fitting into each other in different weys, occasion perpetual change.

But on the third day, a controlling influence, a new set of powers, the builders-up of nature, appear-cre ated, in kind and degree, different from matter, yet only manifesting their presence to us in connectior with it. So far from allowing these atoms to unite according to their affinities, which would soon destroy nature, they exercise the most despotic sway, controling them to the last. The chemical forces are in perfect subjection while life remains; but the moment it departs, dust returns to dust, the work of destruction begins, and the body vanıshes into air

A beautiful example of this opposition is shown by seeds, which are the simplest independent forms of the union of the life power with matter. Take two of these, and, having destroyed the vitality of one of them by passng an electric spark through it, place both in warm and moist earth. The dead seed, surrounded by all the conditions favorable to its decomposition, is speedily resolved into its native elements, while the living one makes slaves of its enemies, rapidly sprouts up amid the surrounding desolation and hangs out its flowery banners as tokens
of victory. Seeds etain life, almost any length of time. I noticed, this week, an account of an abundani harvest reaped from the growth of seeds found in an Eigyptian mummy, over two thousand years old.

A seed, finding itself in a warm moist place, suddenly becomes aware that it has work to do, and sets about it without delay. The seed-case bursts, a stalk and leaves appear above, while the root, sending off filaments, remains below; at the end of each of these little filaments is a spongiole, or bundle of leech-like mouths. These suck from the soil whatever they require, and then act the part of a stomach in instantly digesting it. A series of ascending vessels, or veins, are ready to carry it to the leaves, to be further elaborated; when it arrives there, its oxygen is given off, and a supply of carbonic acid, obtained from the air, is combined with it ; and the pure blood, or sap, is carried by the arteries to every part, to supply its necessities and form compounds.

Plants are manufacturing establishments; some make the essential oils-as the cinnamon, sassafras, and rose; others salts-as the sorrel, oxalic acid; the Peruvian 1.,rk-tree, quinine; and the willow, salacine. Nany o ds oised shrub has powers more deadly and dangerous that: a powder magazine; the laurel and peach yield pruss 'acid, one drop of which will destroy life; and travell, $s$ tell us that the atmosphere of the upas-tree is fatal for miles around it.

The vital principle of each plant, being separate and independent in itself, explains the reason why two of them-the one a virulent poison, the other a table vege-table-will grow side by side, and draw their nourish ment from the same source. It also shows the error of
our modern agricultu ists, who treat these living exist snces, endowed with a power of choice and foresight, as if they were tubes, imbibing whatever was placed near them by capillary attraction.

Man resembles a torch, in requiring oxygen to keep him burning or alive; in return for this he throws out carbonic acid, which to him is a virulent poison. Now what prevents this gas accumulating in the air, and destroying the animal kingdom; and from what source shall the supply of oxygen be derived to answer our continual demand? Only from the respiration of plants; which we may now see not only supply us with food, but are absolutely necessary for our daily existence.

When the new Custom House and Merchant's Ex change were erecting, they were the daily resort of thousands who flocked to witness their gradual progress; yet how much more wonderful is the building of a vegetable palace! Unseen workmen are urging it forward with untiring industry; column after column forms; story after story rises; staircase and hall and gallery are soon fixed in their positions. We think it a great thing to have the Croton water brought into our houses; yet in every ond of these little chambers, there are pipes to carry food and water and take away the residue. The vegetable house is made of the finest wood, is elastic, and capable of bending to the breeze; and, to defend it from the rain, covered either with wa-ter-proof varnish, or stuccoed over with the rares porcelain. And all this time the spectator is not dis' urbed by noise or dust, the greater part of the work being carried on under ground.

When all is completed, no monarch on earth could obtain such a residence. The very paint of its walls, though
oxposed to all kinds of impurity, is of such rare quality that the king's stateliest robes cannot match it. "Consider the lilies of the field; they toil not, neither do they spin; yet Solomon, in all his glory, was not arrayed like unto one of these." Nay, kings are even glad to obtain ts essences at second hand, to perfume themselves.

The name of the inhabitant who owns the house is written on a broad door-plate of surpassing beauty, so that we can tell one from another. Books have been written on the language of these door-plates or flowers, and it is said that angels, by their means, write mysterious truths on hill and field. The poet, from the eariest ages, has held the most sweet and loving converse with them. But to the physician, the priest of natura they speak in a higher and more exalted strain. In them he reads the success of his mission. By their means he can conquer the most obstinate diseases. That nothing has ever been formed for show alone, the truly useful will always be the truly beautiful. That when their uses are perfectly understood, the fond dream of the Rosicrucian shall not want verification : the bone shall continue firm and the muscle strong; the eye of youth retain its lustre ; and century after century passes away, the lapse of time shall but witness our triumph over the pullers-down of nature, and our increase in wisdom and love. These happy children of Flora, that have retained undimmed the influence of their Creator's smile, when first he pronounced his work good in Eden, shall receive added radiance and more dazzling glory as they again behold His face in the dawning morn of the millenium

## conversation ili.

## PHSYIOLOGY.

Docror The body is the house of the soul: in an $w_{r}$ per story, confined to an inner chamber, close. y imprisoned, and having no communication with the external world, except through the medium of the life principle, resides our immortal being.

Lady. But there is no mention of a double life in the account of man's creation. Genesis ii, 7, says that the Lord God formed man out of the dust of the ground, and breathed into his nostrils the breath of life; and man become a living soul.

Doctor. The Hebrew word, in that passage, for life, is used in the plural; so that your objection but confirms the physiological view. It should read, breathed into his nostrils the breath of lives.

Lady. Is the life principle immortal as well as the soul?

Docror. I believe it is, but only in consequence of its connection with the soul, to which it is subservient. It is an intermediate between spirit and matter, presenting to us certain phenomena, by which we are enabled is recognize its possession of seven distinct properties; these are:-

Vital Appiniti<br>Vivification.<br>Mobility.<br>Ing'tability.

## Instinct. <br> Sympathy. <br> Senbibility.

The first five are common to all animated nature plants as well as animals; the last two, in consequence of requiring a nervous system for their development, be ong only to animals.

Vital affinity and vivification are used in the organiza tion of matter. Mobility is the power of originating motion, as shown in the circulation of the sap and shrinking of the mimosa. Irritability, or excitability, is the power of giving and receiving impressions-of acting upon matter, and of being, in turn, acted upon by it-and is one of the most important of all. The instinctive property of plants has been already mentioned; that of animals needs no illustration. Sympathy and sensibility possess names sufficiently explanatory of their powers.

Lady. But have not animals a separate principle of instinct besides a life power?
Docror. They have not. Coleridge, who is the best authority on this subject, remarks that instinct is the power of selecting and adapting means to proximate ends; and illustrates the point by taking the stomach of a caterpillar, which, he observes, has the power of selecting the appropriate means (that is, the assimilable part of the vegetable congesta) to the proximate endwhich is, the growth or reproduction of the insect's body. It does this by the vital power of the stomach.

From the power of the stomach, he passes to the power exerted by the whole animal; traces it, wandering from spot to spot, and plant to plant, till it finds the appropriate vegetable; and again. on this chosen vege

Lable he marks it seeking out and fixing on the part of the fiant, bark, leaf, or petal, suited to its nourishmentor (should the animal have assumed the butterfly form) to the proper place of depositing its eggs, and making provision for the sustenance of the little animals that shall emerge from them. The power, thus exhibited, of selecting and adapting means to proximate ends, according to circumstances, he considers as a higher species of adaptive power, and calls it Instinct.

Then, citing anecdotes from the writings of zoologists, he proves in the lower animals a power of selecting and adapting the proper means to the proximate ends, according to varying circumstances; and this yet higher species of adaptive power he calls Instinctive Intelligence.

In addition to these, he says that he finds one other character common to the highest and lowest; namely, that the purposes are all manifestly predetermined by the peculiar organization of the animals, and both actiona and purposes are in a necessitated reference to the preservation and continuance of the particular animal, or the progeny. There is selection, but not choice; volition, rather than will.

Lady. I suppose wild men have their instinctive faculties best developed, and that man, in proportion as he becomes civilized, or under the dominion of reason. loses those powers.

Doctor. You must remember that the manifestations of instinct depend on the peculiar organization of the animal. Man is not fitted to live in a wild state, for then he is, of all animals, the most helpless. But Coleridge speaks directly on this point, and I will give you his words, premising that he defincs understanding at
the aculty that judges by the senses. He says, hat if we suppose the adaptive power, in its highest stare, (instinctive intelligence) to co-exist with reason, free-will and self-consciousness, it instantly becomes understand ing; in other words, that understanding differs, indeed from the noblest form of unstinct-not $2 n$ itself. or in ute own essential properties, but in consequence of its coexistence with far higher powers, of a diverse kind, in one and the same subject. Instinct, in a rational, resporsible, and self-conscious animal, is understanding.

Having now reviewed the characters of the servants n the house of the soul, we will glance at their offices in the building, and at the building itself. In comparing the human frame to a self-moving house, the bones and muscles should be represented as beams and pillars ; the stomach as the kitchen; the lungs as the ventilator, etc. etc. The house must be furnished with bells and wires to convey news, receive messages, and connect all the parts together into a common whole; such offices are performed by the senses.
The skeleton of the human body is composed of two hundred and forty-eight bones; each of which is mod elled with the utmost care for the various offices it has to perform; and so close a relation does one bone bear to another, that an anatomist can tell from seeing one, or in some cases, even a part of one, with the utmost cer tainty, the general form and habits of the animal to which it belonged. A happy illustration of this fact was shown some years since in England, by Mr. Consybear, a philosopher of considerable eminence. Hav ing found a few bones of an extinct species of animal he set himself to work to construct the perfect skeleton Wittle attention was paid to his perfermance at the tima
but some years afterward, a complete skeleton of that singular animal, the Plesiosaurius, was discovered, and found almost exactly to correspond with Mr. ConnyDear's drawing!
\a a, spina' column eapped by the skull ; r $r$ ribs connected by gristhe (cartilage,) to the breast bone, $x ; y y$, collar bouses (clavicles); $b$, the erm bone fhumerua) ; $c$, the elbow; $d$, the radius ; $e$, the ulna ; $f$, the wrist joint (composed of 8 amall bones, in two rows ) ; $g$, the finger bones (phalanges, 19 bones); a s, bips or pelvic bones, joining wo, the sacrum ; $i$, the thigh bone united to the trunks of the body by the joint $h ; l$, the knee-pan (patella) ; $k$, the kees; m, the tibia, and w. the fibule, both small bones of the log; $o$, ancle, componed of 7 bones ; $p$, too bones (phalanges, 19 bones)]

The back bone and skull are by far the most imports ant anong the bones; they are the caskets in which are deposited the spinal marrow and brain-indeed, te
protect the nervous syster from injury seems, in every instance, the first intention of the formation of a skeleton.

The spine, or back bone, is composed of twenty-fous smaller bones, between the most of which is a layer of gristle, so that while the indispensable conditicn of great strength is preserved, a degree of motion is allowed. The weight of the upper parts of the body, presses down this gristle during the day, thus accounting for the singular fact that persons are always shorter at night than in the morning soon after getting up. The loss in height in different individuals varies from half an inch to one or two inches.

Lady. I know a gentleman who habitually loses in height from one-half to three-quarters of an inch every day; and, while speaking on the subject, told me an anecdote relative to the practice pursued by British recruiting sergeants, who, when they found a man willing to enlist, not more than half an inch under the requisite height, made him lie in bed and fed him well for two or three days, by which time his gristle became well swelled out, and he was almost invariably sure to pass muster when immediately presented at the station house.

Docror. Every little protuberance and ridge we see on bones give origin or hold to muscles, which attach themselves to them by means of strings or tendons. There are nearly five hundred distinct muscles named by anatomists in the human body. This is probably underrating the real number, for a caterpillar has over four thousand muscles, and there are one thousand in the proboscis of an elephant. Muscles are composed of layers of cellular tissue, the compressimin which at the ends forms tondons; while the cells in tl: - widdle are filled with fibrin

MCBCULAR BKELETOM.
[ $f \mathrm{~g}$ is the aterno mastoid; ite contraction makes tho head approach moe ahest $\boldsymbol{i}$ i $i$, sbdominal muscles, to retain the parts in their places, assiat respiration, etc.; $h$, muscles on the chest, to move the arm toward it; $l$ extende the arm on a level with the shoulder; $k$ is the muscle to raise the fore-arm; $a$ moves the fingers; $b$, the fore-leg; and $c$ is the tailor's mas cle, by which he is enabled to cross his legs.]
The mode in which the nerves act on the mobility of muscles, so as to cause them to thicken or contrach is well shown in this cut. One part of the muscle is attached to the fore-arm, and the other to the head of the
iarm; as it gradually contracts and ahortens on ifself, the fiand approaches the head

48M.
[The figure represents the bones of the arm and hand, having al the soft parts dissected off, except one muscle, O B I of which the function is to bend the arm; $O$, the origin of the muscle; $B$, the belly; $I$, the insertion ; TT, the tendons; 8 , the shoulder-joint; E , the elbow. Whea the belly contracts, the lower extremity of the muacle $I$ is brought nearer to the origin or fixed point, $O$, and by thus bending the arm at the elbow joint, raises up the weight, W, placed in the hand.]

When the human germ or embryo is first excited to action, it is not as large as a pin's head, yet, even small as it is, the life power is in vigorous exercise; it stations deputations of its properties in the proper places to form their own instruments of action out of the minute pulp. In a short time the heart and blood-vessels are formed to carry nutriment to every part, and the bones, muscles, and other organs appear in succession. Its first care is to perfect all the arrangements that are necessary for purposes of nutrition, which arrangements you will understand better in the adult than in the infant, in whom the parts are out of proportion.

When food is taken in the mouth, the saliva is poured out from manufactories of that substance; it mizes with the food, not only softening it, but also affecting on it an actual change, which is the first real act of digestion. When this fluid is deficient, its want is imperfectly supe
plied in the other processes of assimilation. This cause alone would account fer the dyspepsia, so prevalent amoug tobacco chewers and smokers, who wantonly exhaust a supply intended for other purposes than the filthy use to which they apply it.

The second act is performed by the stomach, into which the food descends from the mouth by means of a long tube cesophagus) composed of a series of muscular ringa

TEE ETOMLAE.
[The stomach is capable of contsining, generally, from one to two quar/e of liquid; cases occur, however-by want on the one side, and glattouy on the other-in which this proportion is either much diminished or tncreased. It has two openings-the cardiac, C, (from cardimm, the heart, it being noar that organ) and the pyloric, P, from the Greek for gateteeper, because it will not let anything but chyme pass it S 8, and B, are arteries surrounding it, to give it a good supply of blood for making the gantric juice.]
which, by contracting constantly above, push it before them. When there, the gastric fluid is poured out on it, completely dissolving the whole, and changing it into a greyish-looking fluid called chyme. The stomach then contracta, llosing un the opening by which it entered C

ne intestinal tube, from the mouth to its final termination, us oves thirty feet long. After leaving the stomach, it is divided into large and moall in'entines. RSSSST, are the latter, which end at T into the uarge, which are marked U U U W ; and the termination $\mathbf{X y}$ is called the rectum, clasping which last are the strong muscle, Z Z , joining in a oontinucys circular band below. MMM, shows the stomach; AAA the liver, and its depository of bile, B, the gall-bladder. 1

## VIBCERA.

TER LUTHR GALL-BLADDER, PANOREAB, AND KIDNEYB.
[I. is the liver, turned up to show its under surface; G, the gall-bladIcr; P, the pancreas: K, the kidnevs, which secrete urine from the blood which they empty into the bladder, B, by means of the tubes called areters U : S is the spleen, an organ at the present day considered merely a reservoir of blood for the stumach. The rectum. R. runs behind the bladder toward its terminating ["int; $V$ is the \#reat vein carrying up the rotuse blood to be puritied; $A$ is the artery returning the same blood purified, to meet the wants of the sy-t.m.]
and thus forcing it out through the other orifice $P$. Soon after entering the intestines, a fluid is poured out through a tube. This fluid is composed of the secretion of the iiver (bile), and another secretion from the pancteas (sweet breads); each sending a tube from itself, the tubes uniting into a common duct before opening into tho intestines. The liver has a repository for bile, called the gall-bladder, so that it is capable of performing its part in digestion at any moment. It is supposed by many that the juice from the pancreas merely dilutes the bile, but this is not very probable. This juice, when

[I I I I, portions of intestine; L, lacteals, which empty into the meesea lury giands M G; T D, thoracic duct, which conveys the elaborated fluid (which is, at thia point, of a pale pinkish color) into the reservoir in the mook The spine, 8, is shown in the back-ground. The mesentery glanda exercines a very important part in digeation; they are sometimea disensed in children, a fact which may be known by feeling on their belDies a number of little bard knota; in such casen, the child, if not curedno matter what the nourishment is-rapidly whastea away and dies. Dr Edeon, the living skeletou lately exhibited at the American museum, died In conequence of diacase cloting the thoracic duct, and tha preventing ery scoose of nourishment to his syatem.]
poured on tl s chyme, separates it is o two parts .he chyle and ex rrement. The chyle, a this stage, so much resembles milk, as to take its name from a Greek word meaning that article : it is instantly sucked up by millions of little leech-like vessels, called milk carriers, (lacteals from lactus, milk,) which convey it to the mesenteric glands to be further elaborated; leaving them, it is carried to a duct and finally mixed with a reservoir of venous blood in the neck, from whence it enters the upper cavity of the right heart, is thrown into the lower cavity, and then taken to the lungs to receive the last atage of purification.

[Man possesses twi hearts, which are only placed together for the sake of convenience. Each heart has two cavities, an upper and a lower one; tho upper cavity is called an auricle, from its resembling, in shape, an naimal'a oar; the lower cavity is called a ventricle, from its shape, reeombling a belly. The sadden expansion of the receiving chamber, or auride
r the right heart, $n$, produces a vacuum, which is directly filled by ths nixture of elaborated food and veinous blood from varions sources, $a, p q$, It instantly contracte and einpties this blood into the distr.Juting chamber, or veutricle below; the ventricle $b$ contracts upon itself, and sends the blood into the pulmonary artery, $k$, to be carried to the lunga, 27 ; aftor receiving a supply of oxygen, and throwing off its carbonic acid, it returus to the left heart by four pulmonary veins, two of which are shows at $m m$; the left auricle, $r$, expands, produces a vacuan, becomen filled, contracts, and sends the blood into the left ventricle, $a$, which also contracts in turn, aud throws the fluid into the aorth, c e from whence it in carried through all parts of the system. If the time that elapses between the contractions of the heart be divided into four parts, three of these parts will represent the period of the beart's activity, and one that of its repose; it thus rests oue-quarter of the time, or six hours in every twentyfour: it does this (in common with every part of the body that has been exhausting its atrength in working) to recruit. The artery that supplies the heart with blood is culled the coronal, s. Fach cavity of the heart holds two ounces; it commonly contracts seventy times a minute, so that over two hoashriads of blond are pumped through our hearta evory hour! That the irritation of the blood does not cause the heart tc contract, and that it possesses an inherent power of action in itself, are shown by the fact that, when taken out of the body (of course, a very short time after apparent death) and pricked, its first motion is to expand The heart of a sturgeon was hung up to dry, and continued in notion a long that ite rusting could be beard in any part of the house.]

Arrived at the lungs* it throws out carbonic acid and sakes in a supply of oxygen; it is then thrown into the upper cavity of the left heart, which contracts, sends it into the lower cavity, from whence the aorta receives it, and it then makes its rounds in the system to supply the wants of every part. Chemists tell us that an atom of pure blood is composed of eighteen different elements ; and also that the atoms resemble a spangle in shape, being thin and circular with a dot of iron in the middle, vccasioning Dr. Good's remark that the wheels of life ran on ron axles.

The arteries subdivide to an excessively minute degree, and the extreme branches terminate in little blad ders Each of these lit!l bladders or globular cells has

THE LUNGS.
[ The windpipe, a, gives passage to the air; it ramifies into exceedingey minute branches, $e \in e$, which terminate in little cells, the masses of which, in three distinct lobes, are shown at cec; this is only on the right side of the body; on the left side there are but two lobes, the space required for the third being filled by the heart. By means of the musclen purrounding the chest, the lungs are alternately expanded and contracted. It has been found that we require one hundred and forty gallons per hour of pure air for respiration. It is an error that the carbonic acid given out from the lunge poisons the atmosphere in crowded assemblies. Such air has been analyzed, and fiuud to oontain as much oxygen as that in a foreat; the ill effects are produced from pent-up human exhalations.]
three openings, one for the artery, one for a vein, and one for an absorbent. When an atom of blood arrives in one of them, the absorbent takes from it what is required, and works it up to suit its own purposes; what in oft is immediately sucked up by the vein and carried off
to be again mixed with the elaborated food, and passed through the lungs.

ABTBAYAL ETETHM
You will remember my mentioning, when speaking o the development of the embryo, the fact of deputations of the life power being stationec in different places to form their own instruments of action; these instrument are called glands and their offiee is to secrete from the
blood the different fluids required in the system; hey are merely a greater or less number of bundles of, ttle bladders, acting in the mode I have just mentioned, and endowed with specific properties to make certain substances. Thus the liver secretes bile; the lachrymal gland, tears; and the salivary gland, spittle; and the inside coat of the stomach, the gastric juice. Here is a eut showing the mode in which the blood-vessels ramify

1 wish you to carefully examine these cuts and the wo companying descriptions, as too much minuteness in describing the anatomy of the organs, while explaining the functions, would have made the subject very difficult of :omprehension.

Lady. I think I understand the nutritive functions now, and I am glad to think that nothing but the nervous system remains between us and the sleepers in the Egyptian temples, to whom I am impatient to return; but I should like to know, if anything injurious should enter in the channels of the circulation, how the blood would get rid of it.

Doctos. By means of the skin, kidneys, and lunge which are all excreting glards, or organs, that throw of effending matters. But, to pursue our subject, we

ynequot gratiac.
must examine the nervous system. This cut of it will give you an idea of the ramifications of the nerves over the surface of the system. The nerves, like every other
part of our system when forming, begin $a^{\prime}$ anc circoan ference, and grow toward the centre as dhuwa here: $\sim$

OEKSHRO-BPTNAL ATIO

I Fiow of the base of the brnin, front portion of the spinal marrow, and sevoral attached nerves: $a$, cerebrum (large brain); $b$, cerebellum (litlle ors:- which is lower and posterior than the other); $c$, apinal marrow; $y$ medulla oblongats, the so-called bulging spinal marrow which swells out us it enters the brain, 1, the nerves of smell; 2, nerves of sight; 3, 4,5 8, nerves going to different parts of the head, of no particular interest in this place; 7 is related to the nerves of bearing; 8,9 , nerves going to the longre and gullet, sto.]

Those of the lower extremities, $k k$, unite in distinch bundles before entering the spire; proceeding upward, we find nerve after nerve running into the back-bone, through holes bored for their reception, as $n, c, h, g, z$, show the nerves as they come from the superior extremities, or arms; $m$, those of the neck, etc. The spinal canal is already filled when the nerves enter it by two kinds of nervous matter, the white and the grey; the latter is supposed to be the origin of sensation and motion, as we invariably find, by tracing the nerves to their terminations, that they end in it ; and we know the , lerves are nothing more than communicating media.

Lady. By your course of reason, I would conclude that cutting the nerve of a part, before it entered the grey matter, would destroy all sensibility in that part.

Docros. And motion as well. All distinct masses of the grey matter in the body are termed ganglia : the spinal cord, from its lowest part till some distance upward in the neck, is composed of two ganglia, sensation and motion. With regard to cutting the nerves. that has been done so often, and so invariably with the same result, that it has become an established point in science, of no sensation of any kind existing, except as connected with a superior essence. Sensation in the lower animal seems even on a par with their intelligence. The gadfly, Dr. Good remarks, when it fastens on the hand, can be cut to pieces without its experiencing any apparent pain; and the idea of Shakespeare has been long ago exploded-that

[^0]The nerve of sensation, and that of motion, are bound in the same sbeath, till within a short distance of the upinal cord; they then separate, and each enters it own ganglina. This cut shows a front section of the - firm' and and nerves:-

SPINAL OORD AMD YREREA

A represents the spinal cord; B, the united nerves; C, the branch for motion, travelling alone; $\mathbf{D}$, that of sensation, which always thickens into a knot in its progress before entering its ganglion.

At the upper part of the spinal marrow, we find a series of ganglia in pairs, one set behind the other, in regular order, and always found in the same relations to their parts; these are the ganglia of the special senses. So much has observation been directed to these points, and so true and unvarying is nature, that, by examining the size of the ganglia of the animal, we can tell the degree of perfection the several senses have attained. In the eagle, ive find the optic ganglion large; in the hound, the olfactory; in the rabbit, the auditory; and is all instances, the same resin $t$ olds.

The nerves supplying the teeth come from the thirs oranch of the five pair marked in the side view $5^{\prime}$.

TThe numerals correspond to those in the cut of the cerebro-spina axi. The tree-like and branchy appearance of the cerebellum, or leeser brain, is well shown.]

Many of the lower animals have only two ganglia, sensation and motion; as we ascend the scale, and find animals possessed of special senses, so do we find the corresponding ganglia present ; still ascending, we find a new pair of ganglia, which I will denominate those of ingtinctive intelligence; for, in proportion as the animal exhibits marks of intelligence, do these ganglia increase in size, and the enlargement gives shape to the skull. So small is this in some animals, that they have a perfectly flat skull on a line with the spine. As we still ascend the scale, it continually enlarges, and the
skull protrudes above the spinal colunn, as may be seer in the dog and horse.

In man, the ganglia of instinctive intelligence-or uccording to Coleridge, of understanding-is out of all proportion, as regards size, to the others; it covers them all, its bulging in front forming the forehead.

Lady. One might find some excuse, in what you are saying, for the eastern ideas of transmigration; a constant and perfect ascent from the very lowest germ of life to man would give rise to some ideas of its being one identical spirit-an immortal being undergoing its education for eternity, and, in the highest and last stage of material maturity, preparing for its future spiritual existence.

Doctor. You will be much surprised to find that the brain of the child before birth is not the miniature brain of the man; but, on the contrary, rises, as you have just guessed, from the lowest to the highest, passing through the grades of animated existence till it arrives at ita present state in man, and even then continues growing if cultivated, as many well-attested cases have fully demonstrated. The head of Napoleon, after he became emperor, was much larger than it was some years previous; a fact shown by two busts of him, now at Paris, taken at different periods.

A Scotch gentleman once informed me that the eldest son among the aristocracy of Great Britain is titled from birth, and, at the death of his father, receives the honors of the deceased without any delay; but that with the heir to the throne it was entirely different-he must be made a knight, a baron, an earl, etc.; gradual and successive steps giving him rank-the laws, unless these preïminaries are observed, leclaring him without
any. I have never made inquary to know whether the matter was so or not, but, at any rate, it illustrates the stages of the lords of creation, as they style tnemselves.

Lady. You have destroyed transmigration, as there could be no occasion of 1 etracing the steps if on seon -ver.

## CONVERSATION IV.

## DOJBLE LIFE OF MCAN.

Deasac. You will remember the care of the life power, when first excited, to complete all the arrangements required in nutrition. These arrangements are called by anatomists the organs of vegetable or organic life: such are the stomach, liver, heart, arteries, veins, kidneys, etc. Another set is required for the soul : the organs composing it are called the organs of animal life: such are the brain and voluntary muscles.

Lady. To recall your former comparison, every thing that relates to keeping the house in good order, and feeding its inmates, would belong to the vegetable organs, while the animal are devoted to obeying the commands of the soul.

Doctoz. You comprehend my meaning. The apparatus in animals that pertains to nutrition, though indirectly influenced by the brain, is a system within itself, having its own set of nerves and ganglia. Its ganglia differ from those of animal life, in being of a reddish grey color, and lying among the soft parts; they are distributed from the orbit of the eye to the lower part of the back bone, and have a grand centre or brain, called the semi-lunar ganglion, which lies behind the stomach.

So sparsely are the nerves of sensation given to the organs of vegetable life, that, in surgical operations there is little or no pain felt after the skin is cut. Har
vey, tne demonstrator of the circulation of the blood was acquainted with a young nobleman who, from dis* ease, had the heart so exposed that it could even be handled while beating: he found, to his astonishment, that unless his fingers came in contact with the outer skin, the young man was altogether unconscious of the heart being touched.

The cut on page 65 shows the ganglionic system of organic life. A A A A is the semi-lunar ganglion, or brain of the system; the letters and numerals name the different ganglia from the organs they superintend. need not mention all these, my object being only to give a general idea of the two lives, vegetable (organic) and animal, that belong to our system.

Lady. Has a distinct separation ever taken place between the two sets of organs, so that one acted while the other was quiescent?

Doctor. Yes; and quite enough to prove that the body and the mind can exist independently of each other. In concussion of the brain, sensation, thuught, and locomotion, the functions of animal life, are entirely passive, while the organic continue with the usual activity and regularity. Sleep, which I will refer to again in a short time, affords a less striking instance.

Dr. Good remarks that in cases of suspended animation, by hanging, drowning, or catalepsy the vital prinsiple continues attached to the body after all the vital functions cease to act, often for half an hour, and sometimes for hours. In the year 1769, Mr. John Hunter being then forty-one years of age, of a sound constitution, and subject to no disease except a casual fit of the gout, was suddenly attacked with a pain in the stomach which was shortly succeeded bv a total suspension of

-ATETKOHO BYBTEM OP VROETABE KTH.
the action of the heart and lungs. By the fower of the will, or rather by violent striving, he occasionally in flated the lungs, but over the heart he had no contro whatever; nor, though he was attended by four of the - chief physicians of London from the first, could the ar tion of either be restored by medicine. In about threequarters of an hour, however, the vital actions began to return of their own accord, and in two hours he was perfectly recovered. Sir Everard Home observed that in the attack there was a suspension of the most material involuntary actions; even invohintary breathing was stopped, while sensation, with its consequences, as thinking and acting, with the will, were perfect, and all the voluntary actions were as strong as ever.

Dendy mentions aases in which this power of disconnection was voluntary. Colonel Townsend's case was one of undoubted authority. That officer was able to suspend the action of both his heart and lungs, after which he became motionless, icy cold, and rigid, a glassy film overspreading his eyes. As there was ne breathing, the glass held over his mouth showed no apparent moisture. Though all consciousness would pass away, yet the colonel could re-animate himself when he chose. Dr. Cleghorn relates the case of a man who could stop the pulse at his wrist, and reduce himself to the condition of fainting by his will.

Though it is only in rare cases that the will has ang power over the nutritive organism, yet the emotions always exercise a very considerable influence. Every one has experienced the manner in which ill news spoils the appetite. Some cases of the effects of imagination, in producing fear, and thus exciting disease, we have slready reviewed, but a few more will not be out of
place here. Platerus tells us of scme girls p.sying near a gibbet, when one of them threw stones at a crimina, suspended on it. Being violently struck, the body swung, and the girl, believing it was alive, and was descending from the giblet, fell into violent convulsions and died.

Wescloff was detained as a hostage by the Kalmucs, and was carried along with them in the memorable flight to China. His widowed mother had mourned him as dead, and on his sudden return, the excess of joy was fatal instantaneously. In the year 1544, the Jewish pirate, Sinamus Taffurus, was lying in a port of the Red Sea called Orsenoe, and was preparing for war, being then at variance with the Portuguese. While he was there, he received the unexpected intelligence that his son (who, in the seige of Tunis, had been made prisonet by Barbarossa, and by him doomed to slavery,) was suddenly ransomed and coming to his aid with seven ships well armed. He was immediately struck as if with apoplexy, and expired on the spot. The same effect was produced upon the door-keeper of Congress during the revolution, who, on hearing the news of a victory won by his countrymen, fell back and expired in ecstacy.

Lady. I suppose it is in the ganglion of the understanding that phrenologists map the seats of the various properties of the mind.

Doctor. It is: they say that if there are separate ganglia for the special senses, which are, after all, but mere modifications of general sensibility, why should not the same plan hold good in locating the different properties of the mind, which may be called the special senses of the understanding; and the anatomical analo
gres favor this view. It had been said, be bore phrenology was known, that the faculty by which the astronomer calculated eclipses was as distinct in his mind, and oreserved its individuality as much, as the eye in his body.

Lady. It would also account for the influence of habit, our constant pursuit of one object fostering the germ of an organ to maturity. What is the bran made of?

Docror. Its chemical constitution is principally albumen. It is formed of an immense number of arteries, veins, and nerves. Dr. Gall was the first to completely anravel its complex web, which he was enabled to do nfter hardening its substance by long-continued boiling in oil.

Lady. The ancients must have been aware, as well as ourselves, that the height and prominence of the forehead were the distinguishing traits of a high degree of intelligence, when they made the foreheads of the gods bulge out beyond an angle of ninety degrees.

Docros. They were as close observers as ourselves, and I am inclined to think knew almost as much. Nearly in the centre of the brain is a substance, commonly about the size of a pea, called the pineal body which Galen considered to be the seat of the soul: an idea that has been much ridiculed. But an attentive study of the brain has convinced me of the truth of Galen's supposition; for it has communicsation, by means of nerves, with the most important ganglia. And 1 think it reasonable to suppose the soul occupying a superior and independent position, overlooking and governing the inferior powers; and precisely such a position would be obtained y a residence in the pinea
body; this opinion is confirmed by the fact, that in idiot its means of communication are mostly cut off and injured.

Lady. Can disease of the body injure the soul?
Doctos. On!y by acting on its means of communica tion with the external world. We have considered the soul to resemble a man shut up in a dark and central chamber of his house; be has servants stationed at the windows who tell him what they see; an apparatus, also superintended by servants, is fixed on each side of his house, to collect sounds, which are then reported; and the other senses communicate in the same manner. Cut off from all personal observation, he can only judge of the outward world from his messengers; when these are true to their office, and the full growth of the brain is attained, man is in complete possession of all his faculties; if he does not become eminent then, he never will. For many years his messengers have been imparting news, and the time has come when they should work up and mentally digest all this material. Knowledge digested becomes wisdom. For this purpose, the uvenues gradually close; the servants become old and inactive; and at last-" sans hearing, sight, and taste"his communications with the external world are at an end; he then moves around-a walking vegetable. Where nature's laws are allowed free operation, we never find abrupt transitions; all rises by a gradually ascending scale; and as man bids adieu to this world ${ }_{i}$ annther begins opening to his view, and the soul becomes gradually accustomed to its future mode of existence.

Lady. While on this subject, I would like to know id wo have wo brains?

Jocios. Yes. Dr. Wigans has lately written a very interesting book on the subject: be argues that as we nave duplicates of all the organs of animal life-such as the eyes, ears, etc.-and as each of these produces a distinct and separate impression on the orain, and were so made the better to render us able to judge of, and correct, erroneous impressions, by comparing the effect of each, so the duality of the brain was intended for the same parpose.

Lady. I can easily conceive why the senses shoulc be double, as I have seen persons who were deaf in one ear, and from that cause could not tell the direction from whence the sounds they heard proceeded. The expariment, cited by Abercrombie, of placing a cent on the edge of a table, and standing at the extreme distance rom the table to be enabled to knork it off with ease. with both eyes open, by means of the finger when the arm is stretched out-and the certain failure attending the effort when one eye is closed-would prove the nevessity of two optical organs.

Doctor. Dr. Wigans argues, in relation to the brain, in a similar manner, and thus accounts very ingeniously for all stages of insanity. He says, that as there are two brains, and each receives from its nerves a distinct impression, both, provided they are healthy, will convey a correct and single report to the soul; but if diseased, a very different and conflicting account reaches it, and neting first on one, and then on the other, produces insanity, more or less complete in accordance with the amount of disease. He makes a madman, in this sense, most truly, a " man beside himself"-who holds series of conversations with himself, which, if the separate trains we:e followed out, we should find consistent

In themselves. Let us ailow the seat of the soul to be the pineal body, and the theory of Dr. Wigans will be verified.

Lady. Insanity, then, might be considered, in this light, as a squinting of the brains !

Docror. I am glad to perceive you understand the llustrations. We are now very near to our sick devoees in the Egyptian temples. But I must first make a few remarks on the functions of the brain. The office of this organ is to secrete the nervous fluid, by means of which the mind holds communication with, and directs, all the parts to which it is connected by nerves. Though the organs of vegetable life have a ganglionic and nervous system of their own, still many fibres from the orain and spinal marrow are sent to them, and, as in he case of the emotions, a powerful though indirect nfluence is exerted upon them. So long as we have n supply of the nervous fluid, sensation, thought, and locomotion (the functions of animal life), are in vigorous exercise; but the moment the supply becomes deficient or ceases, a partial or total failure of these powers depending on the quantity, is the direct result, and slumber succeeds, to allow more of the necessary article to be secreted. Whatever acts on the irritability of the brain, so as to change or alter the nervous secretion, acts in a corresponding manner on all the parts to which the changed fluid is carried by the nerves.

The optic and auditory nerves are the principal servants that wait on the mind in conveying news. The eye and ear resemble each other in being instrument for the purpose of condensing vibrations, to make them ufficiently intense to produce impressions on their sep.
arate nerves, so that messages can be carrieo to the inner chamber.

Lady. Is light produced by vibratiors, as well as sound? I have always considered it to be composed of particles of matter.

Doctor. It is now proved to be merely the vibrations of an ether existing throughout all space, and empable of being excited by luminous bodies.

Lady. If the optic nerve were uncovered, then we might do without the eye, as the vibrations of light would alone suffice to produce distinct images.

Doctor. We need not have recourse to so violent a. mode of reaching the special senses, which even then would require something more to insure success. The material in ordinary life has the preponderance; but we are so formed that the spiritual in certain cases may obtain the balance of power; in proportion as the latter gains the ascendency do the servants become more active and easily impressible, till at length a point is reached where the apparatus for condensation can be enturely dispensed with. In this state, the vibrations of light that strike on the bony covering of the head will find the nervous matter behind it sensitive enough to convey impressions to the sensorium. This state is commoniy termed that of clairvoyance.

Lady. Can we, in any case, ever hear sounds without the ear?

Dorsor. Easily; and it does not require any preparaticn to produce that effect. Hold your watch in such a manner inside the mouth that nothing is touched, and no sound will be heard; but by closing the teeth on it a lond ticking can be instantly perceived. The sound Iravels through the bony structure to the au litory nervea

Lady. You certainly present proof sufficient; it is as gou say. This reminds me of a story I iead some yeara ago about a merchant in Holland, who had not heard a sound for years, till once, while smoking, the end of his pipe accidentally touched a harpsichord, on which him daughter was playing; to his astonishment, he was conscious of the music even to the lowest tones, and he afterwards found that he could converse with any of his family through the medium of a stick supported by the teeth of each.
Doctor. As nature does nothing abruptly, the ascension of the spiritual over the material is gradual. The influence that produces it in fascination is the nervous rluid or vapor thrown off from the person operating. This vapor acts upon the irritability of the patient; by sympathy it is transmitted to the brain; the secretion of that organ is changed; and the ultered nervous fluid it in making when sent to the various parts over which it has influence by the nerves, produces a series of resulta called fascinating phenomena.
Lady. Does not the loss of this fluid injure the fascinator?
Docror. In some cases it does, but there are many so gifted as to impart it without danger. A sensation of weakness ensues, which soon vanishes by a new supply of fluid from the continued secretion of the brain. It is the patient that runs the greatest risk, for many persons take the office upon themselves without any ability to discharge its duties properly, and much trouble often ensues in consequence. So well is this understood, that in Prussia it is a criminal offence for any but physicians to operate. Cases have occurred, urider my notice, in which the chest has been paralyzed ; in others, incessaut
vumiting produced, and convulsions have been very common. Its true mode of action should be thoroughly understood before it is practised, and then orily by the order and in the presence of the physician himself.

Lady. It is divided into stages, is it not?
Doctor. Yes, into six, each of which are again subdivided into six others, making thirty-six in all.

The first stage seems a mere quickening of the senses; it is characterized by a sensation of coolness, and a feeling of more wakefulness than before. In your own case, at this point, you felt, I remember, rather more uneasy than before I commenced; but, in another instance, I was told by the patient that it was impossible to operate on him, so much was his mind filled with the idea of a necessity of going to sleep in being fascinated. I had doubted his susceptibility up to the moment he spoke, but I was then convinced I was affecting hirt ; and, in fact, he was soon insensible. The quickening of the senses is often shown without the agency of fascination, as in fever, when the slightest noise will disturb a man, whom, in health, the explosion of a cannon would not move.

Lady. I have often felt so. Last week I had a severe headache, and coul 1 not endure any motion whatever around me, and, if I was touched by accident, was in absolute pain.
1)octor. An extraordinary class of phsnomena owesits oxistence to a peculiar development of this susceptibility I mean what is commonly called idiosyncracies, or pecuharities. I have heard Professor Revere speak of a ludv who lived in a state of agony during the flowering season of plants; the pollen floating in the atmosphere Icted upon her irritability in such a manner as to pro-
duce serious disease, realizing in her own experience Pope's idea of

- Quick effluvia darting through the bram, Die of a rose in aromatic paia;"
and, strange to say, his lines on more refined sensibility and its consequences, have all been verified in this stage. Some men cannot endure the presence, or even proxi mity, of a cat; others abhor cheese. Stepping into a friend's store one evening, while his clerk was absent, to procure some ipecac, I was requested to weigh it out myself, and replace the bottle on the shelf; should he do it, he said, it would cause him a week's illness. And this seems, too, an instinctive precaution, warning the system against unseen evil, and to disregard which would be dangerous. The friends of a young lady having tried in vain to induce her to eat cheese, enclosed a very small quantity in some cake, which she swallowed without suspicion; an alarming and long continued illness was the result.

The sense of chilness, felt in the first, stage increases, and the pulse begins to rise rapidly; the second stage continues but a short time, and finally ushers in the third, which is denoted by a dreamy and triumphant state of feeling. If any pain exists it now ceases, and the eyes close beyond the power of the will to open. The chosure of the eyelids 's, beyond doubt, caused by fixing the eyes so steadily on an object as to exhnust their nervous power. Mr. Braid, of Manchester, Fingland, has proved this fact ; he considers that it will account for all the phenomena of fascination. His writings, however, demonstrate exhaustion in a most incontestible manner, but they most assuredly do nothing else; it was labor lost. the facts being well knowa long
before, and never doubted. Your personal experience only reaches this stage.

Lady. Is it possible to produce curative effects with out reaching the third stage?

Doctor. The second and even first, when thus artificially induced, will often have a beneficial influence But it is a difficult matter to mark out and separate these stages, closure of the eye not being sufficient evidence, for it may not occur at all. I heard this morning of a man who had three teeth drawn while in one of these stages, and was shown the teeth. The fascinator, after trying several times to close his eyes without success, undertook to draw the teeth. Though at other times exceedingly sensitive, the man from whom they were drawn did not experience the slightest pain.

As the fourth stage is approached, rigidity of the muscles can be induced; the body and limbs may be fixed in the most strange and painful attitudes without causing any pain, and thus continue any length of time. Arrived at the fourth, sensation totally ceases ; and a cataleptic state intervenes. Surgical operations can now be performed without pain, or the knowledge of the patient. The nervous system undergoes a remarkable change ; pither the white matter is not capable of carrying, or the grey of receiving, ordinary impressions.

The fourth is the highest state that man can induce by artificial means; but some persons are so peculiarly constituted as to continue ascending. As they near the fifth, clairvoyance becomes fully manifest. Passing the fifth, the spiritual obtains the entire predominance, and the things of the invisible world are displayed with more or less clemeress. in proportion as they verge an the sixth which is dath.

Lapy. Fasc_nation seems to me to be a separation between our animal and vegetable lives. As the ties that bind the animal to earth are loosening, it gaina vigor and power; and qualities, the germ of which we have only been enabled faintly to discern below, expand to their full proportion, giving rich promise of future capability.
Docros. True; and at the sixth, the separation of soul and body is completed, and the corruptible puts on incorruption, and the mortal immortality.
Lady. Then perhaps the final separation of soul and body is accomplished by an angel fascinating us, and death's cold dart be, after all, a pass from a superior being. As I review the wonders I have just heard, it appears to me exceeding strange that so minute a cause as a pass in fascination should produce such astonishing results.
Docros. It is a very difficult matter to tell what small causes are. A little yeast, mixed with a thousand gallons of malt infusion, will make the whole ferment. A grain of calomel will sometimes alter the irritability of the whole system. Why, then, should not the most highly organized product in our bodies, acting, too, with every advantage on the most sensitive powers of another, produce a strange effect ?

But to return to our patients in the goat skins; you will have no trouble now, I presume, in understanding how it was that they had peculiar visions; for, if my supposition of Satan first moving men to the discovery of fascination be true, nothing can de more rational than to suppose he also appeared, or some of his demons, assuming the form of Esculapius, and prescribing the proper remedies for diseases. Though it must havg
caused him considerable chagrin to relievo $f$ un, and in any way promote human happiness, still it had the advantage of increasing the faith of his devotees, and the number of his followers. That Satan exercised a direct influence on the mind of the emperor Julian is evident, by his deadly hatred of all that pertained to our Saviour, and his mad attempt to refute his prediction in relation to the Jewish temple. Indeed, Julian himself tells us that, when sick, he had often been cured by Esculapius pointing out the proper remedies as he slept in that god's temple.

It would be an easy matter to fill volumes with proofs taken from the early history of the ancient nations; proofs, too, which show, in the most convincing mannes that fascination was universally known and practised by the priests of the temples; and that it was principally in this way they were enabled to retain their power and influence over the people. Even Origen tells us that in his day vast multitudes flocked to the temples of Esculapius for relief from infirmities; and distinctly intimates that many remarkable cures were really performed. A few instances from these early times are all we can consider at present.

Charles Radclyffe Hall gives to Apollonius Tyanneus the palm as a mesmerizer. He seems to have been a man of prodigious fascinating power, and was not only famous for curing diseases, and his powers of clairvoyance, but also in foretelling events. While delivering a public lecture at Ephesus, in the midst of a large assembly, he saw the emperor Domitian heing murdered at Rome; and it was proved, to the saisfaction of all, that while the murder was performing, he described every circumstance attending it to the crowd, and announced
the vely instant in which the tyrant was slain. It $i$ recorded, that so great was his nervous influence, thal his mere presence, without uttering a single word, was sufficient to quell popular tumults.
Pythagoras, also, ranks high, and not undeservedly. Afler receiving his education in Egypt, he ever after assumed the dress of a priest of Isis. It is related of him that he could give relief from any pain or diseaso; his method consisted in passing the hands slowly over the body, beginning with the head, retaining them for some time at a little distance from the piace of disease. In common with the philosophers of his day, he veiled the real means of relief under the form of an incanta tion; for, while fascinating, he kept continually uttering magical words. His power over the lower animals must also have been considerable; he is said to have tamed a furious bear, prevented an ox from eating beans, and stopped an eagle in its flight.

Hippocrates, the father of medicine, was not himself entirely free from the wish to keep this means of cure secret. He informs us that there are two distinct parts in the practice of medicine-the common, such as young herls, and the secret; which latter must only be divulged to particular persons, who are in favor with superior powers. He mentions, that when the eyes are closed, there are times in which the soul can discern diseases in the body; and also that the light we derive from dreams is a great help in our progress to wisdom.

## conversation v.

## SPIRITUAL ETATER.

Ladr. 1 am glad to see you this morring, Doctor I wanted to ask you if cases ever occurred, in our day of persons seeing the spiritual world I remember your remark of the celestial gates, in Mansoul, being losed, but they were not taken away; why, then, should they not be occasionally opened in the nineteenth sentury, as well as the first?
Docros. A little research will convince you that such cases are anything but uncommon : that of William Tennant, a Presbyterian clergyman, of Brunswick, New Jersey, is well known, and of undoubted truth.

He tells us, that while conversing with his brother on the state of his soul, and the fears he entertained for his future welfare, he found himself, in an instant, in another state of existence, under the direction of a superior Being, who ordered him to follow. He was immediately wafted along, he knew not how, till he beheld, at a distance, an ineffable glory, the impression of which he found it impossible to communicate to mortal man. "I immediately reflected on my happy change, and thought, Well, blessed be God! I am rafe at last, notwithstanding all my fears. I saw an innumerable host of happy beings, surrounding the inexpressible glory, in acts of adoration and joyous worship; but I did not see any bodily shape or representation in the glorious appearance. I heard things unutterable.
heard their songs and hallelujahs of thanksgiving and praise, with unspeakable rapture. I felt joy unutterable and full of glory. I then applied to my conductor, and requested leave to join the happy throng; on which he tapped me on the shoulder, and said, 'You must return to earth.' This seemed like a sword through my heart. In an instant, I recollect to have seen my brother disputing with the doctor. The three days during which 1 had appeared lifeless, seemed to be of not more than ten or twenty minutes. The idea of returning to this world of sorrow and trouble gave me such a shock that I fainted repeatedly. Such was the effect on my mind of what I had seen and heard, that if it be possible for ? human being to live entirely above the world and the things of it, for some time afterward I was that person. The ravishing sound of the songs and hallelujahs that I heard, and the very words that were uttered, were not out of my ears for at least three years. All the kingdoms of the earth were, in my sight, as nothing and vanity; and so great were my ideas of heavenly glory, that nothing which did not, in some measure, relate to ti , could command my serious attention."

So numerous are the cases of this kind of experience, that time would not be profitably occupied in considering them; but it will be well to dwell a moment on another class, of opposite character, which is not lesa frequent.

I have often seen men who, after a prolonged indulgence in every species of wickedness and blasphemy, have suddenly experienced a change, which gave the spiritual, in their system, the predominating influence. At such times they become awnre of the presence of .he devils, who rv acting upon the corruptions of then
nearts, have been successfully engaged in tempting them to sin.

More heart-rending pictures than these, of agony and distress, are seldom or never witnessed. They have many times described to me the shapes and gestures of their tormentors, and the unholy thoughts they were endeavoring to instil into their minds. While speaking to me, they would often be seized with a frenzy of fear, and would close the eyelids, and cover them with their hands, in a vain attempt to shut out the horrible spectacle. An urgent desire to commit suicide in some violent manner is gencrally felt, and many find it im possible to resist the temptation. Multitudes, in this way, are lost every year. I should remark, here, tha delirium tremens can be produced in many ways without the use of alcohol, as by tobacco and opium.

We are thus enabled to trace, in a measure, the deal ings of heaven with our fallen race. The good man worn down by disease and grief, as was Tennant, is not allowed to despair; his heart is cheered, and he is encouraged to persevere by a view of the mansions prepared for him when his toils and troubles are ended below. The bad man is suddenly arrested in his career of wickedness, by withdrawing the veil that covers invisible things, and is thus shown his prompters in vice, and the future companions he must assoc ate with in eternity whose torments he must share if he continuen in the way of destruction. Happily, in some a change is produced. I know one to whom the warning sufficed, and who, at the present time, is serving under the banners of the Prince of Peace.

Lady. And this accounts exactly for the manner in which Elisha's servaut, tat you mentioned some time
since, had his eyes opened. When Elisha prayed "Lord, I pray thee, open his eyes," he must have meant the spiritual ones; for the others could discert the surrounding danger. I suppose the Saviour and is apostles and prophets performed the miracles recorded in Scripture by means of great el.dowments of iascinating power.

Doctor. On the contrary, there is so booad a line of distinction drawn between the power of performing miracles, and that of fascinating, that it seens impious to confound the two.

The difference between the heathen fascinators and the priests of Jehovah was well shown when they finally failed to compete with Moses in showing wonders, and were forced at the last to exclaim, "This is the finger of God."

Passing Balaam and the prophets of Banl, who competed with Elijah, let us examine the witch of Endor. Artificially inducing clairvoyance, and thus holding intercourse with familiar spirits, was puniahanie by death in Israel.
Lady. I would ask if you think the women fascinateo Saul?

Docror. By no means; the whole scene in the 19th chapter of Samuel has its counterpart in mary a similar transaction of the present day. A friend of mine once wishing to obtain intelligence of a son who had been dead about three years, went to the house of a clairvoynat. At his request $I$ was present. The husband of the clair royant put her to sleep, and, in a lit le time sne announced the fact of her spiritual state, and soon afterwards found the gentleman's son. Messages were given and received by both parent and chilc. through the me
dium of the clairvoyant, and my friend departed natis fied : although I still felt incredulous.

When Saul entered the woman of Endor's house, the latter was evidently unaware ef his character ; and it was only upon a strong pledge she consented to employ her art. The moment she entered the clairvoyant state, however, she was at once aware of the rank of her guest, and exceedingly frightened at the consequences. Our translation reads as if she was scared at Samuel, but this was evidently not the case-witness the cry, "Why hast thou deceived me? for thou art Saul." When after he had succeeded in tranquilizing her personal fears, she gave the description of her spiritual visitant ${ }_{s}$ Saul perceived that it was Samuel, and bowed himself to the ground. The conversation occurred through the woman, who, on being awakened when it was finished had so little recollection of all the occurrences as to be totally unaware of his rank, and persuade him to eat in her house and recover his exhausted strength.

The manner in which the magicians were enabled 0 foretell events is graphically shown in the 22nd chapter of the first book of Kings: "I saw the Lord sitting on his throne, and all the host of heaven standing by him on his right hand and on his left. And the Lord said, Who shall persuade Ahab, that he may go up and fall at Ramoth-Gilead? And one said in this manner and another said in that manner. And there came forth a spirit and stood before the Lord, and said, I will persuade him. And the Lord said unto him, Wherewith ? And he said, I will go forth, and I will be a lying spirit in the mouth of all his prophets. And he said, Thou shalt perzuade him, and prevail also: go forth and do so."

Of course, then, when the king, rejecting the adv ce of Jehovah's minister, sought counsel of his own seers, they gave him the revelations of the false familiar. And it was not the only time evil befell man, when, "an the sons of God came to present themselves before the Lord, Satan came also amongst them."

When Naaman came to Elisha to be healed from his leprosy, it was evidently with the expectation of visiting a more powerful fascinator than any in his own country. Elisha, to render him aware of his error, would not let him enter the house, but as soon as the horses and chariot stopped at his door, sent out a messenger, saying "Go and wash in Jordan seven times, and thy flesh shall come again to thee, and thou shalt be clean." But Naaman was wroth, and went away and said: "Behold. I thought, he will surely come out to me, and stand and call on the name of the Lord his God, and strike his hind over the place, (in the context it reads, move his hand up and down over the place), and recover the Ieper."

Lady. I have always been struck with the narrative inyself, but your view explains the whole matter to my entire satisfaction, and I do not wonder at the effect it produced on Naaman's mind, to cause him to renounce his idolatry, when he returned cured out of the river, after his servants persuaded him to obey the prophet's injunction.

Doctor. These instances will show how totally out of the power of all physiological explanations were the miracles I have before mentioned the accusation brought against our Saviour of having gained his wonderful powers by stealing magic secrets from the Egyptian temples Had those who preferred the charge been as
open to conviction as the idolator Naaraan, but little observation would have convinced them of its groundlessness.

Lady. Did the magicians ever pretend to cast out devils?

Djctor. Our Saviour presumes that power in common use amongst them when he says, (Matt. xii., 27,) in answer to their remark of his casting out devi's by the power of Beelzebub: "And if I by Beelzebub cast oui devils, by whom do your children cast them out?" Josephus accounts for this power in speaking of Solomon, whose sagacity and wisdom he pronounces to exseed those of the ancients; "insomuch that he was in 30 way inferior to the Egyptians, who are said to have seen beyond all men in understanding; nay, indeed it was very evident that their sagacity was very much . ferior to that of the king's." "God also enabled him 1) learn that skill which expels demons, which is a use1 ll science to men. He composed such incantations, ilso, by which distempers are alleviated; and left belind him the manner of using exorcisms, by which they drive away demons, so that they never return; and this method of cure is of great force until this day. For I have seen a certain man of my own country, whose name was Eleazar, releasing the people that were demoniacal in the presence of Vespasian, and his sons, and his captains, and the multitude of his soldiers ; and the manner of the cure was this : he put a ring, that had a root of one of those sorts mentioned by Solomon, to the nostrils of the demoniac, after which he drew out the demon through his nostrils; and when the man fell down, he adjured him to return unto him no more, mak mg still mention of Sulomon, and reciting the ir canta
tions which he composed And when Eleazar would demonstrate to the spectators that he had such a power, he set a little way off a cup or basin full of water, and commanded the demon as he went out of the man to overturn it; and thereby let the spectators know that he had left the man. And, when this was done, the skill and wisdom of Solomon were shown very clearly."

Lady. After all, the practice of divination was forbidden by the Jewish law, and the penalty was death. It it deserved so severe a punishment in those days, how can it be harmless in our own?

Doctor. In former times, the higher powers of fascination were universally abused, and made to subserve idolatry. Those who practised it, sedulously kept the people in perfect ignorance as to its real nature. Even when fascinating, the priests continually chanted magic verses, to which all the curative powers were ascribed. Still it appears to have been lawful to use it for benevolent purposes, as the physicians did not scruple to employ its influence for king David.

Lady. Casting out devils, from an account given in Acts xix, 13, was not always attended with safety: 'Then certain of the vagabond Jews, exorcists, took upon themselves to call over them which had evil spirits the name of the Lord Jesus, saying, We adjure you by Jesus, whom Paul preacheth. And there were seven sons of one Sceva, a Jew, and chief of the priests, which did so; and the evil spirit answered and said, Jesus I know, and Paul I know, but who are ye? And the man in whom the evil spirit was, leaped on them and overeame them, and prevailed against them, so that they fled out of that house naked and wounded."

Docros. It was not only among the ancients that
false religions, based on assumptions and supported by the pretended miracles of fascination, existed; there in quite as much of this kind of imposture prevalent in modern times.

Some years ago, in the town of Saco, in Maine, lived Robert Cochran, a man who, by pretending to a more than ordinary share of inspiration-working wondere, curing diseases by the laying on of hands, and other apparent miracles-created a schism in the church to which he belonged, drawing after him a crowd of zealous fullowers. Upon his death, as his mantle did not descend to another, the society declined in numbers, until. finally, nothing more was heard of the schismatica for a long period. Some time afterward, when the sect had nearly been forgotten, a man-who, it was known, had many years before embraced Cochran's tenets, and had, since then, lived a life of perfect seclusion-entered the town on business. Passing by a lawyer's office, his attention was attracted by a gentleman in it fascinating the lawyer's son. He stood, transfixed with astonishment, before the door, until the process was completed and the boy asleep; when he exclaimed aloud, "My God! that is the way in which Robert Cochran used to give the Holy Ghost."

The Mormons rest their claims of being the true church on the same basis: "Is any sick among you, let him send for the elders of the church, and let them pray over him, anointing hin with oil in the name of the Lord, and the prayer of faith shall save the sick man." It is a notorious fact that the exhibition of this proof, an they wish it to be supposed, of apostolic power, has been the means of converting the majority of that deluded sect. Some three years since, I attended a Mormon
lady, who hal disease of the heart, with markea success. One day, while operating, an elder of the faith who stood by, remarked that I possessed the gift of laying on of hands. I paid very little attention to his remark at the time; but some weeks afterward, while visiting a friend one evening, I heard a lady explaining the tenets of Mormonism, and triumphantly quoting her own case as an illustration of the fact of their possessing apostolic power, more especially the gift of healing by laying on of hands; she had frequent attacks of tic doloreux, and nothing except that rite of the Mormon church had ever sufficed, for one moment, to alleviate the pain.

She was speaking with considerable animation, and had prodused a powerful impression on the minds of those present, but was suddenly arrested, in the midst of her interesting and enthusiastic discourse, by an attack of that horrid disease. Finding that she was suffering the most exquisite agony, I rose rather hes:-tatingly-for I dislike scenes-and offered to relievo her, giving her the assurance that one of the Mormon elders had pronounced me in possession of the gift. The drowning will catch at a straw; and my proposition was assented to, but evidently without any hope of success on the part of the sufferer. In less than a minute-for her system had been prepared by repeated fascinations-she was powerfully under my influence, and the relief was immeasurably greater than it had ever been before. After awaking the lady, I explained the whole matter to those present ; and it is very probable that but few of my hearers ever undertook a pilgrimage to the holy city of Nauvoo.

In classifying the fanatical sects, the Swedenborgians
follow the Mormons Their name is derived from Emmanuel Swedenborg, a Swedish philosopher who became clairvoyant in the fifty-third year of his age, in 1743. The ascendancy of the spiritual over the material occurred naturally in him, probably owing to some defect in the constitution; for intense study and a sedentary life paved the way for this change. Swedenborg rejected faith-that is, would not believe anything which could not be demonstrated to the under standing-the faculty that judges according to the , enses-and of course would not receive any religion, the doctrines of which he could not perfectly comprehend.

He ardently desired a knowledge of the soul, and the method he took to procure this knowledge gives a good illustration of his character. He tried to obtain his wish by confining his experiments to the dead body To give his own words: "The body being her (the :oul's) resemblance, image, and type, for this purpose I um resolved to study her whole anatomy, from top to ooe." Had he but studied the laws of life in their living operation, he would have escaped the errors he afterward blundered into.
Lady. Such a mode of operation seems to me about as rational as going into a printer's office when be is out, and trying to form an idea of his countenance from an examination of the type lying around; or inspecting a worn-out and cast-off steam-engine, with an idea to unvestigate the properties of stcam: life ir. the one case, and vapor in the other, (the only things that ean give the required infornation.) being equally absent.

Doctor. Swedenborg, not finding his own observa. ions very satisfartory, calls ty his aid the observations
of others, and professes, on this subject, to have obtained the greater part of his knowledge from books, and those written by men who, like himself, from the shape of fibre and spiracle, endeavored to diagnose the functions and mode of operation of each organ. His philosophical works are filled with such nonsense ay this, and, as he proceeds, there is a gradual and legitimate degeneration into downright materialism of a modified character ; he proclaimed all life to consist in an influx from Deity, and that a plant, a dog, and a man, difier, in reality, orly in the shape of their receptacles. You will easily understand how he gained this idea, by considering the brains of different animals, and considering that of man as only a little more powerful and complicated than his inferiors in the animated scale. The study of living nature would have taught him the lifference between the faculty, judging by sense, and .hat in which reason, free-will, and self-consciousness existed. Knowledge, on such a subject, gained from the dead body, is only such
> - " ${ }^{\text {" }}$ a putrefaction breeds In fly-blown flerh, whereon the maggot feeds, Shines in the dark; but, ushered into day, The atench remaine-the lustre diss away."

Swedenborg was a moralist. His pride dispensed with a crucified Saviour, and consequently a Trinity. "The tuath is, that the division of God, or of the Divine essence, into three persons, each of which by himself, or singly, is God, leads to the denial of God." "It is as if there should be Unity and Trinity painted as a man with three heads upon one body, or with three bodien under one head, which is the form of a monster. If any one should enter heaven with such an idea, he would
certannly be cast out headlong, although he should say that the head or heads signified essence, and the body on bodies distinct properties."

Lady. Do you not think that a person who is really nonest in an erroneous opinion will be saved?

Doctor. I do not believe that erroneous opinions of the doctrines of salvation can be honestly entertained. Our Saviour tells us: "He that doeth the will of my Father shall know him that sent me." He has promised his Spirit to guide us into all truth. Consequently, if we really want instruction, by the perusal of the Scriptures, and prayer, with an active, watchful life, we can obtain all we wish from Him who giveth wisdom to all men liberally, and upbraideth not.

Following the example of many others who preceded him, Swedenborg allegorized the Scriptures, with the exception of the Epistles, which, sturdily resisting all such attempts, he pronounced wanting in an internal sense. He fortifics the dogmas of his system by direct consultation with, and advice from, the celestial powers. Finally, buoyed up beyond measure, he declared that the second coming of Christ was manifested in his person, and that his illumination (clairvoyance) ushered in the last judgment, which took place, not on earth, but in the spiritual world. Among other interesting matters, we are informed, by him, that in the interior of Africa exists a race of spiritual believers (the term he applied to his disciples) : that marriages take place in heaven as well as upon earth, our Saviour's words on that subject being figurative; that God resembles a man in shape, his body forming the universe, each atem being a solar system; that a man consists of five spirita one contained within the other, like a nest of arothe
cary's pill-boxes; man is not naturally aware of his only he (Swedenborg) being permitted to see and reveal the mystery; that there is a purgatory of thirty years; that in heaven there are separate places for different nations; that, in heaven, God is seen by the angels, with the right eye as a sun, with the left eye as a moon; that there are lower animals in the spiritual world ; sickness exists there, etc., etc.

Several well-attested cases of Swedenborg's clairvoyant powers are recorded. Once, while dining with a friend, at a place many miles distant from his own town, he suddenly rose and walked out in the open air, seemingly in great agitation. At length he entered the house, apparently composed, and informed the company present that there was a great conflagration near his own residence, and that he had been fearful for its safety; but it had just been quenched within one door of his house. The next post brought a full and perfect confirmation of all he had said.

At another time, when the queen of Sweden was jesting with Swedenborg on account of his pretensions to intercourse with the spiritual world, he offered to convince her of the fact by any proof she could propose She told him that the late king, her husband, at the moment of death, when she was alone with him, had whispered something important to her, and if he (Swedenborg) could tell her what it was, she would be satisfied that he had spiritual communication. The next afternoon, Swedenborg called on her, mentioned that he had seen her husband, and had been informed by him what were his last words, which he then told the queen. Her majesty immediately swooned away, and, on recovering, expressed her astonishmert: declaring that she
had no songer any doubt relative to the philosopher's power.

Swedenborg taught that the spirit gives shape to the pody, and if any member (as a leg) is lost, still the per fect spiritual shape is preserved. Some persons confirm this view by instancing cases where pain remains in the toes after the limb to which those toes belonged has been cut off.

Lady. Do such cases ever occur?
Doctor. Very frequently. The next day, and sometimes for months after amputation, considerable pain is felt in the excised member. After the nerves have habituated themselves to their new relations, it cease.s. Physiologists account for this singular matter in variols ways; but many consider the spiritual solution the bes . He also taught that after death, as the body remained is exactly the same shape, it was very difficult, from the preconceived notions of that state, for the deceased to really believe they were in another world. He seems to entertain much dishike to Calvin, whose entrance to the spiritual world he thus describes: "I have heard (from the angels) that when he first came into the spiritual world, he believed no otherwise than that he was still in the world where he was born; and, although he heard from the angels who were associated with him at his first entrance, that he was now in their world, and not in his former world, he said, ' I have the same body, the same hands, and the like senses. ${ }^{\text {' }}$ But the angels instructed him that he was now in a substantial body. and that before he was not only in the same, but in a material body, which invested the substantial ; and that the material body had been cast off and the substantial lemained, which is man. This, a: first, he understood
out the next day, etc." As we have spent sufficient time on Swedenborg, I must conclude by mentioning that his religion was evidently formed before his illumination, and that, clairvoyant only in a low degree, his philosophy every where chimes in with his revelations.

Lady. Have others ever given to the world any similar experience?

Doctor. Many have done so; of whom the seeress of Prevorst is an instance. In 183-, in the upper part of our city, a boy resided in whom this anomaly existed. A Methodist minister lived in the same house and being much interested in the boy, would often take him as a companion while visiting his charge. The boy would often cross the street to avoid the proximity of some one passing ; and, upon being asked the reasons for his conduct, would reply, "that the person was wicked, and had given evil spirits power over him, and he could see them flocking round, filling his mind with evil suggestions." Some time after this, two young ladies passed a night in attendance upon a poor woman who was dying; her children, a boy and two girls, wore in the room. Just before her death, she called the boy to her, and, after a little conversation, they heard her remark, "Is that all ?" While his mother was dying, the boy fell upon the floor in a convulsive fit, in which he continued, despite of all assistance, some ten minutes ; but at last rose, exclaiming, " Mother is happy, and I am satusfied !" and was perfectly calm afterwards. The ladies seized a chance, afforded by the temporary absence of the boy, to ask the girls what all this meant; they replied, that their brother could see spirits, and their mother, wishing to find out what some dark forma
around her bed were saying, he told her they merely came to carry her off, when she ręplied, "Is that a!l?" On inquiry, they found it was the same boy with wkor the Methodist minister was acquainted.

It is probable thst the prophets in Israel, in ancient times, had the powers of the inner man developea. This change in the system seems to have been the test Elijah gave Elisha, whether his request would be granteo. "And it came to pass, when the Lord would take up Elijah into heaven by a whirlwind, that Elijah went with Elisha from Gilgal," etc. "And it came to pass, when they were gone over, that Elijah said unto Elisha, Ask what I shall do for thee before I am taken from thee. And Elisha said, I pray thee, let a double portion of thy spirit be upon me. And he said, Thou hast asked a hard thing; nevertheless, if thou see me when I am taken from thee, it shall be so unto thee," etc. "And it cane to pass, as they still went on and talked, that behold there came a chariot of fire, and horses of fire, and paited them both asunder; and Elijah went up by a whirlwind into heaven, and Elisha saw it." etc.

## CON PERSATION VI.

gTAGES IN DYING.
Docrom As wo have considered the vanous stagea of fascination, from a mese quickening of the senses to death, it will be well to consider this last a little more in detail; as, in doing so, we shall in a measure review the thers.

Lary. Does the dying person pass through the six stages in regular succession?

Docros. I believe that is generally the case.
Lady. But how then do you account for the extreme pain that is often felt in dying ? The stages of fascinaton soothe pain-they do not cause it.

Doctor. That is very true; and when these stages really commence there is no longer any pain; but up o the first stage the fatal disease exerts unlimited sway After the fourth commences, bodily insensibility is an nevitable consequence; the violent convulsions of the muscles do not cause suffering in the mind. Dr. Adam Clarke, when relating his recovering from drowning, stated to Dr. Lettsom that, during the period of his apparent unconsciousness, he felt a new kind of life. He says, "Now I aver, 1st. That, in being drowned, I felt no pain. 2d. That 1 did not, for a single moment, lose my consciousness. 3d. I felt indescribably happy ; and though dead, as to the total suspension of all the functions of life, yet I felt no pain in dying; and I take it for granted, from this circumptance; those whe die by
drowning feel nu pain, and that probably it is the easiest of all deaths. 4th. That I felt no pain till once more exposed to the action of the atmospheric air; and then I felt great anguish and pain in returning to life, which anguish, had I continued under water, I never should have experienced," etc.

Dr. Moore cites Mr. Green, who, in his diary, menthons a person who had been hung and cut down on a reprieve, who, being asked what were his sensations stated that the preparations were dreadful beyond expression, but that, on being dropped, he instantly found himself amidst fields and rivers of blood, which gradually acquired a greenish tinge. Imagining that if he could reach a certain spot he should be easy, he seemed to himself to struggle forcibly to attain it, and then he telt no more. Schiller, when dying, was asked how he felt. "Calmer and calmer," he replied. Dr. Moore nays that when the vital flame flickered, almost extinguished, the heart faltering with every pulse, and every breath a convulsion, he said to a dying believer, who had not long before been talking of undying love, "Are you in pain ?" and the reply, with apparently the last breath, was, "It is delightful !" In another person, in whom a gradual disease had so nearly exhausted the physical powers that the darkness of death had already produced blindness, the sense of God's love was so overpowering, that every expression, for many houis, referred to it in rapturous words, such as, "This is lifethis is heaven-God is life-I need not faith-I have the promese !"

Lady, I would ask if there is any certain sign by which we may recognize death so as to prevent burying alive ?

Dooros Only one, and that is putrefactio. 2 . Dendy ettes several cases of prematuie interment, some of which I will mention :
On the exhumation of the Cimetiere des Innocents at Paris, during the Napoleon dynasty, the skeletons were many of them discovered in attitudes struggling to get free; indeed some, we are assurcd, were partly out of their coffins. So noted was this matter in Germany, as to give rise to a custom of placing a bell-rope in the hand of a corpse for twenty-four hours before burial.

Miss C. and her brother were the subjects of typhoid fever. She seemed to die, and her bier was placed in the family vault. In a week her brother died also, and when he was taken to the tomb, the lady was found sitting in her grave-clothes on the steps of the vault. having, after her waking from the trance, died of terror or exhaustion.

A girl, after repeated faintings, was apparently dead and taken as a subject into a dissecting room in Paris. During the night, faint groans were heard in the room; but no search was made. In the morning it was appa rent that the girl had attempted to disengage herself from the winding-sheet, one leg being thrust off from the trev sels, and an arm resting on an adjoining table.

The emperor Zeno was prematurely buried; and when the body was soon after casually discovered, it was found that he had, to satisfy acute hunger, caten some flesh from off his arm.

Ladr. Have there not been cases in which recovery has taken place?

Doctok. None that bear any proportion to the premature interments. A romantic story is told of a young French lady at Paris, who was condemned by her father
to a hated marriage, while her heart was devoted to another. She fell into a trance and was buried. Under some strange influence her lover opened her grave, and she was revived and married. Dendy tells a story of another strange lady, who was actually the subject of an anatomist. On the existence of some faint signs of vitality, he not only restored the lady to life, but united himself to her in marriage.

Bourgeois tells that a medical man, in 1838, from the sudden influence of grief upon the organic system, sunk into a cataleptic state, but his consciousness never left him. The lamentations of his wife, the condolence of friends, and the arrangements regarding his funeral, were all distinctly heard. Perfectly aware of all that was going on around him, he was placed in the coffin, and carried in solemn procession to the grave. As the solemn words, "Earth to earth," were uttered, and the first clod fell upon his coffin lid, so sudden an influence was produced upon his organic system by terror, as to neutralize the effect of grief-he shrieked aloud, and was saved.

A story is related of a lady who fell into a cataleptic state after a violent nervous disorder. It seemed to her, as if in a dream, that she was really dead; yet she was perfectly conscious of all that happened around her in his dreadful state. She distinctly heard her friends speaking and lamenting her death at the side of her coffin: she felt them pull on her dead clothes, and lay her in it. This feeling produced a mental anxiety which was indescribable. She tried to cry, but her soul was without power, and could not act on her body. She had the contradictory feeling as if she were in her own body, and yet not in it at the same time. It was as
equally impossible for her to streten cut her arm or to open her eyes as to cry, although she continually endeavored to do so. The internal anguish of her mind was, however, at its utmost height when the funeral hymns were sang, and when the lid of the coffin was about to be nailed on. The thought that she was to be buried alive was the first one which gave activity to her soul, and caused it to operate on ner corporeal frame.

Abbe Menon tells of a cataleptic girl, who was doomed to dissection; when laid on the table, the first cut of the knife awoke her and she lived. Less fortunate, says Dendy, was Cardinal Somaglia, who, falling into syncope from intense grief, it was decided that he should be opened and embalmed. As the surgeon's knife punctured the lungs, the heart throbbed, and the cardinal attempted to avert the knife with his hand ; but the pie was cast, and he died.
A. gentleman was apparently seized with apoplexy while at cards. A vein was opened in both arms, but no blood flowed. He was placed in a room with two watchers, who slept, alas I too long; for, in the morn ing, the room was deluged with blood from the punc tures, and his life was gone.

Lady. Did the persons who recovered relate any spiritual views?

Doctor. In some cases; but the most of them experienced nothing more than a separation between organic and nuimal life, so complete, indeed, as to deprive them of the use of the voluntary muscles for a time. A review of these facts will justify the conclusion that inter ment is wrong until putrefaction commences.

Wonderful stories have been related in all ages about the wonders of trance, or the fifth degree. Moore giver
the substance of one from Plutarch: Thespesios of Sol fell violently on his neck, and was supposed to be dead. Three days after, however, when about to be interred ${ }_{t}$ he recovered. From this time, a wonderful change was apparent in his conduct ; for he had been licentious and prodigal, but ever after was devout, noble, and conscientious. On his friends rezuiring the reason of this strange conversion, he stated that during his apparent death, his rational soul had experienced marvellous vicissitudes; his whole being seemed at first on a sudden to breathe, and to look about it on every side, as if the soul had been all eye, while, at the same time, he felt as if gliding gently along, borne upon a stream of light. Then he seemed to meet a spiritual person of unutterable loveliness, who conducted him to various parts of the unseen world, and explained to him the mysteries of divine government, and showed him the manner in vhich wickedness meets its reward. This vision exsrted all the influence of truth upon his mind, and entirely altered his character and conduct.

The Methodist denomination afford many strange instances of singular experience, so well known that it would be useless to repeat them. We will conclude the degrees by a chapter from Dr. Nelson, who, in his Caitse and Cure of Infidelity, (a work published by the American Tract Society, and which ought to lay on the shelf of every family in the land, with the Bibie and Bunyan's Pilgrim's Progress; a work, too, which no child of mine, able to tell the letters, should ever fail o peruse and commit to memory, mentions several cases of the spening of the spiritual eye. The unbes liever, at the point of death, sees the reality of those things at which he formerly scoffed; he commences the
passage of the river (a transition of the stages) with stoical indifference, but before reaching the other side evinces the most terrible despair, and the parting spirit tids adieu in a wail of agony. The follower of the Man of Calvary approaches the brink with fear, but ere long, the choral music of the seraphim proves a cordial to his fainting spirit, he pants to enter the blessed abodes he sees opening before him, and the rapturous exclamation, " Lord, receive my spirit !" announces that he sleeps in Jesus. You are suffic iently prepared to appreciate the physiological state he describes without further explanation.

## OBSERVATIONS ON MAN'S DEPARTURE.

"While attending medical lectures at Philadelphia, I heard, from the lady with whom I boarded, an account of certain individasle who wera dead to all sppearance, during the prevalence of the yellow fever in that city, aud yet recovered. The fact that they asw, or fancied they aaw thinge in the world of apirits, awakened my curiosity.
"She told me of one, with whom she was acquainted, who wes sa confident of his discoveries that he had seemingly thought of little elso afterward, and it had then been twenty-four years. These thinge appeared philosophically strange to me, for the following reasons:-
"First: Those who, from bleeding or from any other cause, resoh a state of syncope, or the ordinary fainting condition, think not at all, or are unable to remember any mental action. When they recover, it appeari either that the mind was suspended, or they were unable to recollect its operations. There are those who believe on either side of this question. Some contend for suspension; others deny it, but say we never can recall thoughte formed while the mind in in that atate, for reasons not yet understood.
"Secondly: Those who, in approaching death, reach the first state of insensibility, and recover from it, are unconscious of any mental sctivity. and have no thonghts which they can recall.
"Thirdly; If this is so, why, then, should those who had travelled fus ther into the land of death, and had sunk deeper into the condition of bodily inaction, when recovered, be conscions of mental action and romember thoughts more vivid than ever had Heshed across their soula $I_{s}$ the health of boyhood, under a vernal sun, and on a plain of flowern?
"After this, I felt somewhat inclined to watch, when it became my besineae year after year, to stand by the bed ci ieath. That which I say
whe not calculated to protract and doepen the slambers of infideli:- bus rather to dispose toward a degree of rentleseness; or, at least, to further obeorvation. I knew that the circle of stupor, or inseusibility, drawn sround life, and throagh which all either pass, or eeem to pass, who go nat of life, wes urged by some to prove that the mind could not exist unlees it be in connection with organized matter. For the same reason, others have contended that our souls must sleop until the morning of tho resurrection, when we shall regain our bodies. That which I wirnessed for myself, puahed me (willing or unwilling) in a different direction. Bofore I relate these facts, I must offer something which masy illustrate, to in certain extent, the thoughts toward which they pointed.
" If we were to atand on the edge of a very deep ditch or gulf, on the distant verge of which a curtain hange which obstructa the view, wo might feel a wrish to know what is beyond it, or whether there is any light in that unseen land. Suppose we were to let down a ledder, protracted greatly in its length, and ask a bold adventurer to descend and make discoveries. He goes to the bottom, and then returns, telling us that there he could see nothing-that all was total darkneas. We might very naturally infer the absence of light there; but if we concluded that his powers of vision had been annihilated, or that there could surely ba no light in the land beyond the curtain, because, to reach that land, a very dark ravine must be crossed, it would have been weak reasoning; wo mach so, that, if it contented ns, we must be easily satisfied. It gave mo pain to notice many-nay, many physicians-who on these very premises, or on something equally weak, were quieting themselves in the deduction that the soul sees no more after death. Suppose this adventurer descends again, and then ascends the other side, so near the top that he can reach the curtain and slightly lift it. When he returns, he tella na that his vision bad been suspended totally as before, but that he went nearer the distant land, and it was revived again; that, as the curtain was lifted, he aaw brighter light than he had ever seen before. We would say to him; 'A certain distance does suspend; but inaction is not loss of sight : only travel on further, and you will see again.' We can anderstand that any one might go to the bottom of that ravine a thousand uimes; be might remsin there for days, and, if he went no further, be could tell, on his return, nothing of the unseen regions.
"Something like this was illustrated by the lacts noted during many vears' employment in the medical profession. A $f \in \mathrm{~W}$ casea muat be masee in examples from the lint.
"I was called to see a female, who departed under an influence which causes the patient to faint agnin a ad again, more and still more prufoundly, until life is extinct For the infi rmation of physicians, I mention, it was aterine hemorrbage from mapparably-natinched placents. When recow ered from the first condition of syncope, she appeared as unconscions, orea deatitute of activity of apirit, as whers namally do. She mank again ano pevived: it was atill the wure. She fainted asore prolonsidly atill: and
when awake again, she appeared as others usaally io who have ac boughts which they can recall. At length she sppeared entirely gone. It did aeem as though the atruggle was forever past. Her weeping relatives clasped their hands and exclaimed: 'She is dead! but, unexpeot edly, the wiked once more, and, glancing her eyes on one who sat near exclaimed: 'Oh, Sarah, I was at an entirely new place!' and then munk to remain insensible to the things of the place we live in.
"Why she, like others in fainting, should have no thonghta which she could recall, when not so near death as she afterward was when ahe had thought, I conld not clearly explain. Why her greatest activity of mind appeared to happen during her neareat approach to the fatore world, and while so near that, from that stage, scarcely any over retarn who once reach it, seemed somewhat perplexing to me. I remembered that in the case recorded by Dr. Rush, where the man recuvered who whe, to all appearance, entirely dead, his activity of mind was unueual. He thought he heard and saw thinge nnutterable. He did not know whether be was altogether dead or not. St. Panl says he was in a condition so near to death, that he could not tell whether he wes out of the body or not, but that he heard thinga unutterable. I remembered that Tenuant, of New Jersey, and his friends, could not decide whether or not he had been out of the body; but he appeared to be so some daya, and thought his discoveries unutterable. The man who cuto his finger and faints, recovering speedily, has no thoughts, or remembers nose: he does not approach the distant edge of the ravine. These facta appeared to me poorly calcriated to advance the philosophical importance of one who has discovered from sleep, or from syncope, that there is no other existeace, because this is all which we have seen. They appeared to me rather poorly calculated to promote the tranquility of one aeoking the comforts of atheism. For my own part, I never did desire the consolstions of everlating nothingness; I never could covet a plunge beneath the black wave of eternal forgetfulness, and cannot say that these obeervations, in and of themselvee, gave me pain; but it was evident that thousands of the acientific were influenced by the weight of a amall pooble to adopt a creed-provided that creed contradisted Holy Writ. I had read and heard too much of man's dopravity, and of his love for darkneas, not to see that it militated againat my system of deism, if it should appear that the otherwise learned should neglect to observe, or if obeervant, should be eatiafied with the most auperficial view, and, neizing mome shallow and questionable facte, build hastily upon them a fabrio for eternity.
" In the cases of those who, recovering from yellow fever, thought they had enjoyed intercourse with the world of spirite, they were iodividuale who had appeared to be dead.
-The following fact took place in recent days. Similar occurrencea lupressed me daring years of observation. In the city of St. Louis, a fornale departed, who had a rich portion of the comforte of Chriatianity

It was aftet some kind of spasm, that wes strong enougn to havy beet the death-struggle, that she said-in a whisper, being unable to speek eloud-to her young pastor: 'I had a eight of home, and I saw my Seviour?
"There were others, who, after wading as far as that which seemed to be the midille of the river, and, returning, thought they had seen a dif ferent world, and that they had an antepust of hell. But these cases wo pase over, and look at facts which point slong the same road we have been travelling.
" I was surpriked to find that the condition of mind in the case of those who were dying, nud of those who only thought themselves dying, differed very widely. I had supposed that the joy or the grief of death originated from the fancy of the patient, (oue supposing himself very near to great happiness, aul the other expecting apeedy suffering.) and resulted in pleasure or apprehension, My discoveries secmed to overturn this theory. Why should not the professor of religion who believes himself dying, when he really is not, rejoice as readily us when be is departing if his joy is the nffipring of expectation ? Why should not the alarm of the sooffor, who believes himself dying and is not, be as nniform and as decisive as when he is in the river, if it comes of fancied evil or cowarilly terrors 1 The same questions 1 asked myself again and agaln. I have no doubt that there is some strange reason connected with our natural disrelish for truth, which canses so many physicians, after neeing such facts sn often, never to observe them. During twenty years of observation, I found the state of the soul belonging to the dying was, uniformly and materially, unlike that of those who only supposed themselves departing. This is best made plain by noting cases which occurred.
"1. There was a man who believed bimself converted, and his frienda, judging from his walk, hoped with him. He was seized with disease, and believed himself withion few paces of the gate of futarity. He folt no joy; his mind was dark, atid his soul clouded. His exercises were painful, and the opmaste of every eljuyment. He was not dying. He recovered. He had mist been in the death-stream. After this he was taken agnin. He believed himsolf dying, and he was not miataken. All was peace, serenity, hope, triumph.
"2. There was a man who mncked at holy thinga. He becams serionaly disrased, and nupposed fimself sinking into the death-alumber. He was not frightrned. His fortitule and composure were his pride, and the thast of his friends. The numanted firmmess with which be sould enter fisurity was rowken of exultingly, It was a mistake. Ho was not in the contition of diseolution. His soml never ford been on the hne batween two worlits. After thit he was taken ill again. He sup pozend, as before, that he was entering the next state, and he really Pas; but his soul seemed to fiel a ditident atmosplices. The borrors of wose scenes have been often duacribed, and are when saen. I noed mot
uedeavor to picture such a departare here. The only difficul:y in which I was thrown by such cases was, 'Why was he not thas agonized when he thought himself departing 1 Can it be possible that we can stand se precisely on the dividing line, that the gale from both this and the coming world may blow apon our cheek ? Can we have a taste of the exercised of the next territory before, we enter it $q^{\prime}$. When I attempted to acconnt for this on the simple ground of bravery and cowardice, I was met by the two following facts :-
"First, I have known those (the ceses are not unfrequent) who were brave, who had stood unflinching in battle's whirlpool. They had resolved never to disgrace their system of unbe.ief by a trembling death. They had called to Christians in the tone of resolve, saying: 'I can die es coolly as you can.' I had seen those die from whom entire firmneen might fairly be expected. I had heard groans, even if the teeth were eleached for fear of complaint, such as I never wish to hear again; and I and looked into conntenances, such as I hope never to see again.
"Again, I had seen cowards die. I had seen those depart who were naturally timid, who expected themselves to meet death with fright and alarm. I had heard such, as it were, sing before Jordan was half forded. I had seen faces where, pallid as they were, I beheld more celeatial triumph than I had ever witneased anywhere else. In that voioe there was a sweetness, and in that eye there was a glory, which I never could have fancied in the death-spasms, if $t$ had not been near.
"The condition of the soul, when the death-stream is entered, is nos the same with that which it becomes (oftentimes) when it is almost passol. The brave man who atepa upon the ladder acrose the dark ravine, with eye undaunted and hanghty spirit, changes fearfully. in many cases, when he comes near enough to the curtain to lift it, The Cbristian who goes down the ladder, pale and disconsolate, oftentimes atarts with exultation, and tries to burst into a song when almost across.
"Case of illustration.-A revolutionary officer, wounded at the battle of Germantown, was praised for his patriotism. The war ended; but he continned still to fight, in a different way, under the banner of one whom he called the Captain of his salvation. The applause of men never made him too proud to talk of the Man of Calvary. The hurry of life's driving pursuits coald not consume all his time, or make him forget to kueel by the side of his consort, in tae circle of his children, and anticipate a happy meeting in a more quiet clime.
"To abbreviate this history, his life was such that those who knew him believed, if any one ever did die happily, this man would be one of that class. I anw him when the time srrived. He said to thoes around hin: ' I am not as happy as I could wish, or as I had expected. I cannst say that I distrust my Saviour, for I know in whom I have be lieved; but I have not that pleasing readiness to depert which I had looked for ' This distressed his relatives boyond expresion. Hid
friente were greatly puined, for they had looked for triumph. His de pertare was very slow, and still his language was: 'I have no oxhilara tion and delightful readineas in my travel.' The weeping circle pressed arouxd him. Another hour passed. Hia hands and his feet became onirely cold. The feeling of heart remained the same. Anothne bour passes, and his vision has grown dim, but the state of his soul ia anchanged. His daughter seemed as though her body could not sastain her soguish of spirit, if her father should cross the valley before the cloud passed from his sun. She (before his hearing vanished) made an agreement with him, that, at any stage as be travelled on, if he had a discovery of advancing glory, or a foretaste of heavenly delight, he ahould give her a certain token with his hand. His hands he could atill move, cold as they were. She sat holding his band, hour after hour. In addition to his sight, his hearing at length failed. After a time he ap peared almost unconscious of anything, and the obstructed breathing peculiar to death was advanced near its termination, when he gave the sken to his pale but now joyous dnughter, and the expressive flash of exaltation was seeu to spread itself through the stiffening muscles of his face. When his child asked bim to give a signal if he had any happs view of heavenly light, with the feelings and opinions I once owned, 1 conld have asked: ' Do yon suppose that the increase of the death-chill will add to bis happiness? Are you to expect, that as his eyesight leaves, and as his hearing becomes confused, and his breathing convulsed, and as he sinks into that cold, fainting, sickening condition of pallid death, that his exultation is to commence '
"It did then commence. Then is the time when many, who enter tine dark valley cheerless, begin to see anmething that trausports; but nome ane too low to tell of it, and their frienda think they departed under a cloud, when they really did not. It is at this stage of the journey that the enerny of Giod, who started with look of defiance and worda of pride, evems to meet with that which alters his viewo and expectations; bat he cannot tell $i t$, for his tongue can ao longer move.
" Those who inguire after and read the death of the wife of the cel ebratod John Newton, will find a very plain and very intereating instance, where the Savionr secmed to meet with a amiling countenance bis dying serrant, when she had advanced too far to call back to ber sorrowfal friends, and tell them of the pleasing newa.
" My attention was awakened very much by observing the dying faweies of the servants of this world, differing with such characteristic ingularity from the fancies of the departing Christian. It is no uncommon thing for thise who die, to believe they see, or hear, or feel, that which appears only fancy to by-standers. Their friende believe that it in the overturning of their ittollect. I am not alront to enter into the dissumsion of the question, wheiter it is, ir is nol, always fancy. Soms atu Lute it to wene than fanes : fat if ratuch az, in many inatuncer. the
atod is deranged while its habitation is falling into raine around it, and inasmucb as it is the common belief that it is only imagination of which I am writing, we will look at it under the name of fancy.
"The fanciful views of the dying servants of sin, and the devoted friends of Christ, were atrawgely different, as far as my observation extended. One who had been an entire sensualist and a mocker at religion, while dying, appeared in his eenses in sll but one thing. 'Take that black man from the room,' said be. He was answered that there was none in the roum. He replied: 'There he is, standing near the wrindow. His presence is very irksome to me-take him out.' After a time, again and again, his call was: 'Will no oue remove him? There bo is-suroly mome one will take him away!'
"I was mentioning to another physician my aurprise that he should have been so much distressed if there had been many blacks in the room, for he had been waited on by them, day and night, for many yeara; aloo that the mind had not been disessed in some other respect; when he told me the names of two others (his patients)-men of similar liveewho were tormented with the same fancy, and in the same way, while dying.
" A young female, who called the Man of Calvary her greatest friend, was, when dying, in her senses, in all but one particular. 'Mother,' she would say, pointing in a certain direction, 'do you see those beautiful orestures?' Hor mother would answer: 'No, there is no one there, my dear.' She would reply: 'Well, that is strange. 1 never saw such countenances and anch attire. My eye never rested on anything so lovely. Oh, says one, this is all imagination, and the notions of a mind collapring; wherefore tell of it? My answer is, that I am not about to dispute or to deny that it is fancy; but the fancies differ in features and in texture. Some in their derangement call out: 'Catch me, I am aink ing-hold me, I am falling,' Others say: 'Do you hear that music? $O$, were ever netes so celeatial !' This kind of notes, and these classea of fascies, belonged to different classes of individusls; and who they were, was the item which attracted my wonder. Such things are noticed by few, and remembered by slmost none; but I am inclined to believe that, if notes were kept of such cases, volumes of interest might be formed.
"My last remark here, reader, is, that we necessarily speak somewhet In the dark of such matters ; but you and I will know more shortly Brth of us will see and feel for ourselves, where we cennot be mistaken, in the course of s very fow montha or yeara."

[^1]
## conversation vit.

## OPERATION OF MEDICLNE.

Lav. Here is a box of pills, sent me, this morning by a neighbor, who was in last evening when my sor entered, and having noticed a number of little black spots on his face, said his blood was in a bad state, and that these pills would purify it.

Doctor. Frequently washing the face will remove the black spots, or worms, as they are commonly called. You have, no doubt, often noticed an oily matter on the face; the oil is made by minute glands lying under the external skin; these glands send out a tube to carry the oil to the surface; sometimes dust will collect on the orifice of the tube, and form the black spots your neighbor observed on George; the oil thus prevented egress, becomes hardened, and, when squeezed out, resembles a worm from the shape of the tube.

Lady. What is the use of this oil?
Dосток. To grease or lubricate the external skin, so as to prevent irritation either from atmospheric causes, or the motion of the muscles underit. To return to the pills, can you tell me of any mode by which they could gain access to the hlood, to effect such an important object as purifying it ?

Lady. I have always considered that medicines operated by changing the nature of the blood; but I now see that they cannot approach it; to do so requires a
passage through the lacteals, mesenteric glands, and thoracic duct; and you have informed me that even the pyloric orifice of the stomach will not allow anything to pass it, except properly-prepared chyme.

Doctor. Allowing, for a moment, the pills entered the blood, what would ensue?

Lady. They would be instantly taken out of the circulation either by the lungs or kidneys, which are excreting glands, acting, I suppose, as constables to remove everything offending and unnecessary.

Docror. There is a complete system of guards stationed in our bodies, to prevent the entrance of improper substances, beginning with the warnings of taste; but unhealthy agents, by presenting themselves too frequently, will at last accustom the sentinels to their appearance, and can then enter with impunity, and without danger of being ejected by the excretory organs.

This fact may sometimes be witnessed in the vegetable kingdom. The late Dr. Mitchell, of this city, had once sent to him a basket of saline-tasting peaches Around the base of the tree upon which they grew, a quantity of brine had been thrown. The spongioles or leech-suckers at the roots, at first, refused the salty matter admittance, but, their excitability (irritability) being altered by continued contact, at last sucked them up, and thus a strange phenomenon was the result.

Alcohol has produced the same effect on the human system. A surgeon mentions a case of setting fire to the blood of a confirmed drunkard, which he had just drawn, its strong odor tempting the experiment.

Lary. That drunkard was not much removed. 1 ahould think, from a state of spontaneous combustion.

Doctoz. Probably not; saturating the system with
alcohol is perhaps one of the first steps in that process Bone is composed of a mixture of phosphoric acid and lime (phosphate of lime); as an acid is the union of a base with a certain amount of oxygen, phosphoric acid is made of phosphorus and oxygen. When the chemist wishes to exhibit intense combustion to his audience, he throws a piece of phosphorus into a jar of oxygen gas, and produces a blaze rivalling that of the sun. In a healthy state of the system, the life power controls all the elements, and, as shown in the vegetable kingdom, only allows them to unite in a manner that subserves its own purposes; but when lowered and debilitated by excessive stimulus, the power becomes weakened, and finally lost in death; the elements then obey their natural affinities, and a virulent internal combustion ensues.

Lady. The drunkard, in a double sense, then, is a self-moving porter-house. Is it not very strange, that, with all the clear and accurate information known relative to the organs and their functions, such profound ignorance on the subject of the operation of medicine should exist?

Docros. You have quoted, almost verbatim, the common jargon of the day; it is used by those noted for vague and confused notions on physiology. I do not think any man, who cannot give the rationale of the medicine he prescribes, should be trusted to practice. So far from being dark and in any way incomprehen sible, it is easily explained, and the effects of medicino capable oi being predicted with almost mathematical certainty.

The study of the different organs in the system, after the life power has departed, is called Anatomy. When living and proper agents stimulate irritability, so as to
produce a healthy action of these organs, the study is called Physiology When improper agents or stimul act on irritability, an alteration of the vital powers ensues, with a corresponding alteration of function, disease results, and its study is called Pathology. In the latter case, how do you imagine the system can become right again?

Lady. Only, I should think, by the direct interposition nf the Almighty?

Doctor. After the Croton aqueduct was finished, the pipes laid down, and the whole in successful operation, do you suppose anything more was required?

Lady. Yes, a company of superintendents and laborors, to constantly inspect every part with the greatest care, and instantly repair whatever breaks in the line, or other damages might occur. The water-works would not even be safe without such a precaution.

Doctor. The life power has an exactly similar re-serve-a distinct and powerful conservative principle, ralled by the older physicians, who were well acquainted with it, the Vis Medicatrix Natura. Whenever a part is injured, it is the office of this principle to come forward and repair it ; so very intelligent appears its operation, that some have attributed the effects to a special interference of the Creator, and others supposed $t$ was the rational soul.
Lady. The two seeds cited in your article on the Vegetable Kingdom, to show the difference between the forces of life and those of chemistry, brought instant conviction to my mind, and the clear conceptions I then acquired have proved serviceable since in pursuing this subject. Can you not illustrate the conservatize rin ejple in a similar manner?

Droros. Have ycu ever read the natural history of the dormouse?
Ladpy. It is one of the hybernating or winter-sleeping animals; in summer it is very lively and frolicsome; as autumn approaches, it becomes very fat; and when cold weather sets in, retires to a concealed nook to sleep out the winter, but comes forth in the spring almost fleshless. While in the hybernating state, its breathing is very slow, and its temperature the same as that of the surrounding atmosphere.

Docror. If a dormouse is taken from its sheltered hole, in the midst of winter, and placed in a receiver surrounded with a freezing mixture, some very curious phenomena will be evolved. As the cold increases and the little portion it had is becoming absorbed, its breathing will be proportionally slower, and the heart pulsate more feebly; this state of things continues-thu animal constantly failing-until a point is reached where remaining another moment would destroy life. At this very point an unseen power presents its workings, a hidden spring is touched, and an evident change takes place with extreme rapidity; the pulse becomes fuller and faster; a warmth diffuses itself over the surface; the eyes brighten and limbs contract; finally, in less than three minutes, the little animal is as hot, and his pulse as rapid, as in the midst of summer. Take the dormouse now out of the receiver, and expuse him to the open air, and his torpidity gradually returns; it is then best to restore him to his former nook. The conservative power that preserved the dormouse from leath, we name the Vis Medicatrix Nature.
Lady How is this power developed in the humap porly?

Doctor. Let us suppose a combination of peculiax oircumstances, as the poisonous air of a marsh (marsh masmata), to act on our excitability, an injurious influence is immediately exerted upon the system; it sinks juickly, a chill is felt, and this chill increases, lowering and depressing us, till a point is gained (as in the dormouse experiment), from which we cannot descend with life; at this point the conservative power awakes; it acts on the other powers, more especially on the brain; the nervous secretion becomes altered and radiated to every part; a change is induced, fever ensues, and with it a long drain of other symptoms which finally terminate in puofuse perspiration, and a restoration to health.

Lady. Then fever, and the symptoms which are commonly considered the disease itself, are nothing more than signals of battle going on within for the purpose of liberating us from injurious influences. If such be the case, why does the physician interfere in the matter at all, and of what use are doctors ?

Doctor. The true physician remains a spectator, or rather general, watching the battle's progress with a careful eye; knowing each separate stage and crisis, and how far nature can be trusted, he often does nothing more than to clear the battle-field, (remove injurious influences,) and allow her to combat alone.

Lady. Suppose it becomes necessary for him to interfere?

Doctor. If nature cannot cope successfully with the eexipting form of disease, it is his business to substitute another form which she can conquer. It is a pathologi sal law that there can be but one disease at a time in he system; and, acting on that law, he brings some nfluence stronger than the original sue to bear on ex
eitability; in other words, he must produce a different alteration of the vital powers, which he is certain the sonservative principle can rectify.

Lady. If it is stronger than the original one, why should it not be still worse for the vis medicatrix to combat ?

Doctor. Each thing produces an influence peculiar to itself; and our ideas of strength are only comparstive. What will powerfully depress excitability may give the vis medicatrix little effort to overcome, and vice versa.

There is a class of bodies, which, properly prescribed, produce a decided and powerful effect on excitability; an effect which experience has taught us it in always in the power of the vis medicatrix to subaue, and restore the system when laboring under their influence to health. Such are the medicines, as opium, camphor, arsenic, and quinine.

Lady. Is arsenic a medicine?
Docror. A very useful one. You must not suppose that its only use was to make stearine candles and German silver spoens. Nothing in nature was ever created for murderous purposes; it is man who perverts them.

Lady. After the effect is produced on excitability by the medicine, the original malady disappears; the physician is then treating sickness he has himself induced, and curing diseases of his own infliction.

Doctor. Exactly so; and this shows you what care and judgment should be exercised in selecting the right medicine. Cases occur in which, out of a list of twenty purgatives, one alone is suited to the existing nature of he complaint.

Lady. But, doctor, how can you discover all these
separate modifications of disease; how can you possi bly tell what is going on within the system?

Doctos. In the same manner as we discover the existence of a life principle and its properties-that is, by observing the phenomena they exhibit.

You will remember that every part of the body has a separate office to fulfil, that there are two lives, an animal and vegetable, in action, developing distinct series of phenomena, and that the study of all the functions in health is physiology.

When pernicious influences act, and the whole train becomes disordered, the physician, previously well ac quainted with the results produced by healthy actions observes the changed appearances disease presents to his view, and from these deduces his opinion relative to the amount of injury, and acts accordingly.

Lady. Will you be kind enough to apply this to s particular case?

Docror. I was sent for, yesterday, to see a man, who I was told had been ill for two or three days. On entering the room, and observing his countenance (often a sufficient index by itself to the experienced), its wild and haggard aspect led me to look for abdominal disease.

Sitting down by his bed, I inquired the history of the case, and then proceeded (without his suspecting it) to a regular examination.

The functions of animal life are sensation, thought, and locomotion. Everything had acquired a bitter taste to him, and noise of any kind was agonizing; his mina was wandering; and, to conclude with anima bfe, he was feeble as a child.

Turning to the vegetable system, I found respiration
more frequent than in health, but perfectly full, and no pain about the chest; the pulse fast and rather weak. but steady; this absolved the heart and lungs. Upon examining the tongue, I found it covered with a thick yellowish-brown fur, characterizing trouble in the liver: and as the lining membrane for nostrils, mouth, stomach, liver-tube, etc., is one continuous sheet, disease of ono part would soon extend along the whole surface by sympathy, and, reaching the tongue, paint on .ts surface the cause of trouble for the information of the physician; the skin had a vellowish tinge, was at times cold and moist, and at others hot and dry ; the howels and liver, more especially the stomach, were very sensitive 10 pressure, and vomiting came on every ten or fifteen minutes, at which times he ejected a greenish watery Puid, etc., etc.

The day of his attack, he had been eating a very 1 earty dinner, with some unripe fruit as dessert, and . aen quickly returned to work (he was a stone-cutter) lreneath a hot sun; soon getting sick, he went home where an old woman, a great doctress of the neigh. norhood, had been summoned to attend him; she called his disease janders, and every hour or two, during the day, poured down his stomach strong tansy tea.

I concluded that his unwholesome dinner had been imperfectly digested, and when the chyme wished to pass the pyloric orifice, the sentinel tightly contracted his muscular ring, and refused admittance by blocking up the passage. The hot sun, acting on the brain, altered the nervous secretion, a share of which, being radiated to the stomach, made matters worse; and the ctomach, findintr ifself utterly incapable, in such circumstances, of re-digesting the food, cast it off entirely by
the tsophag is; the bile that was preparer. c act on the chyme being poured out about the time it ought to be there, and finding nothing to act on, altered the excita bility of the sentinel at the pyloric orifice, and gained admission into the stomach, from whence it was immediately thrown out, sharing the fate of the food. To crown all, the tansy tea, by producing irritation, kept if the morbid action, involving all the parts connected with the lining membrane, as the liver, etc.

I caused him to be removed into a cool and quiet room; had his feet bathed with mustard and warm water, to assist the action of a mustard plaster on his stomach; and then caused a strong injection to be adninistered, leaving a powder to be taken at a certain ime afterward. The vomiting ceased, the bowels noved, a terrible headache (which I forgot to mention m my notice of sensation) disappeared, etc., etc., and the next morning found him free from all pain, but very weak. This is called the active plan of treat.zent.

Very frequently, a mere removal of injurious influences, by allowing the vis medicatrix free scope, will be sufficisht to cure. This is called the expectant plan of treatment.

Ladi. Nature, after all, hes to fight her own battles, the physician generally deng nothing, except, by removing injurious influences, to show fair play; the utnost he can perform is to substitute one morbific cause for another. If it were not for the vis medicatrix, there would be no science of medicine-we should all die off ss soon as injured.

Doctor. I am glad that you understand so wolk what I have been endeavoring to teach; you have now
learned enough of the principles of medicine to pursue the study as much as you choose.

Lady. Does fascination act by inducing a new discase?

Doctor. Most assuredly; it forms no exception to the mode of operation of the others, from all of which it differs, however, by giving the vis medicatrix less effort to displace its effects. I suppose this fact will make no advice needed with regard to fascinating healthy persons, as direct disease is thereby induced.

Lady. Why did I not get well directly after the first fascination?

Doctor. From the influence of habit, and the same eauses still acting that produced your disease in the first instance. Directly after the effect of each operation was over, and before the disease again seized upon you, the system had time to gain strength; as the intervals increased, more strength was acquired, until, at length, your frame was strong enough to resist the injurious influence, and then your recovery was complete.

Lady. In what manner does the water cure operate? A friend of mine was very anxious that I should try it; he thought every case of chronic disease in the continent of Europe would soon be cured at Graefenberg.

Doctor. I have very little doubt but that it would have killed you. You can no more expect one particular medicine, or plan of treatment, to cure all diseases, than to find one book which would suit all readers; or one coat capable of fitting all men. Wherever life is present, variety is certain to be found, as well in disease as in health. In certain cases, fascination, as a curative agent, is invaluable; but, recommend it as a succedaneum, and it is certain to do much mischief.

Hydropathy, as a curative agent, acts exactly on the dormouse principle; it depresses until the vis medicatrix rises to the rescue. The process you will observe, has already been gone through with at the first time of the attack; it says to nature, " You have failed in your attempt, try again." In many chronic cases of long standing it is certainly a valuable remedy; that it is a new discovery, or that it will supercede all other remedies, are both ridiculous ideas.

Lady. I am aware, doctor, that you have attentively examined homœopathy; and since such a golden opportunity prosents itself for inquiry, I should be much obliged if you would tell me what it really is worth; many of my friends think its cures are almost miraculous?

Doctor. Cases of medical treatment under such circumstances, stand in the same relation to truth as the tricks of a juggler to the deductions of science ; suct, reports, in fact, have elicited the remark that "medica' facts are medical lies." Whaiever militates againss common sense and experitnce cannot be received ar evidence.

Lady. Their infinitessimal Jocer leaa me to conclude that their object is to let nstu"e, i. a a cases, take care of herself. Much harm cannot se done except by induring delay.

Doctor. That alone should cond,mn the wrole matter, as no where are "delays so dangerou." es in med. cins, a life often turning on an hour of time. My stud of Hannehman has led me to consider him possesse, of remarkable talent, and that the whole system of ho mœopathy is nothing more than a disguised recommendation of fascination. Do you remember how he tests the strength of his medicines ?

Lady. By the number of dilutions; the greater tha number, the more powerful the medicine.

Docros. That simple fact should have led to the discovery of his meaning, the solution of his enigma. He diructs his medicines to be prepared by hand, and considers them increased in strength proportionally as the hand is laid upon them: this is nothing more than a practice, long known, of mesmerizing medicine for patients.

Lady. Still I should have thought that where so much was at stake, he would have given some intimation of his secret more plainly than that ; that he would even in some cases direct them to fascinate.

Doctor. He has done so: where nature alone will sure, or the expectant plan will suffice, he directs the minimum doses; in more serious cases, you must, to use his own words, "stroke the patient down with the palm of the hand till relief be obtained."

His object, in concealing his real sentiments, was doubtless to escape the ridicule of the age in which he lived. If he possessed an acute sense of mirthfulness, great must have been his merriment to have known that glass factories, in many countries, were solely employed blowing his little vials; thousands of apothecaries engaged in manufacturing medi ines to fill those vials; machines inventing to prepare nis triturations and dilutions; and, finally, hosts of the sons of Esculapius, equipped with whole pharmaceutical establishments in thsir coat pockets, visiting their patients, and who, ever and anon, were drawing forth the organen of him upon whom they looked as more than mortal, to seek fresh nstructions regarding the best nathod of dispensing sugar plums.

It is rarely that persons will take pains to exancone into any system of medicine ; the small amount of medical knowledge out of the pale of the profession, owing most likely to the small amount within, has given an idea that the whole subject is nothing more than a system of guessing; and those entertaining this view are rather pleased with homœopathy, as being a practice in which wrong guessing cannot produce much detriment.

Another source of injury to the science of medicine has been various hypotheses started by men who were not properly versed in the laws of life. During the prevalence of a certain deadly pestilence in the West Indies, the blood was, in all cases in those affected, dark, slmost black. A physician, who had been bleeding a pratient, found the dark blood, as soon as it gained the I $\omega \mathrm{wl}$, become of a bright healthy-looking red; and, upon e camining the matter, found the florid appearance was o wing to some table salt which had been accidentally left it the bowl; his sapient brain instantly conceived the ilea that it was the loss of muriate of soda (common alt) in the blood that caused the fever. This fancied piscovery changed his whole plan of treatment, and his ufter practice consisted in injecting solutions of salt into the veins, and giving it by the stomach. His fellow physicians followed his example as soon as the matter was published. The uniformly fatal termination of all cases treated in this absurd manner at length obliged the doctors to relinquish the practice ; but the hypothesis, like the bodies of ancient heroes, was accompanied to the grave by thousands of victims slaughtered to its honor.

Lady. What is the meaning of transfusion of blood ?
Docros. It was discovered that where death would
ensue from the loss of olood, taking a supply from the veins of another and directly introducing it into that of the patient, would preserve life in many instances. The French received it wth open arms, and were eager to embrace the advantages it offered. Supposing the secret of perpetual youth was made known, old age hastened to fill its veins with the blood of juvenescence. Though the majority who tried the plan fell victims to its fatal influence, it still continued to be the enthusiasm of the day till a prince of the blood royal was added to the list of victims. The laws immediately made it a penal offence, and it fell into disuse.

A knowledge of the laws of life would have prevented all this victimizing, as it would also correct many popular prejudices. You wished me, some time since, to vaccinate your son George, because more than seven years had elapsed since he had taken the cow-pox, and I could not then explain the reason why I did not think it was necessary.

Our bodies are perpetually changing; they are not the same to-morrow as to-day. This fact, which they could perceive but not explain, puzzled the ancients: "To be another, yet the same!" was the astonished exclamation of an old philosopher. By the constant absorption and deposition of matter, it has been computed that we undergo a total change every seven years; and persons informed of this, think the effect of vaccination worn off, when every particle of matter that was present in the body at the time of the operation is departed. The life principle is entirely forgotten in this estimate ; impressions made on it are indelible ; every particle of matter it directs to be removed, is replaced by an exactly simi:ar particle; thus a depression in the
skin, or mark of any kind, often remains for life. When perfectly vaccinated, the system is forever surely guarded against the attacks of small-pox; but when any doubt exists relative to the former effect, it is well to repeat the operation.
You must not be surprised to find doctors often disagreeing with this explanation; for there are as many secte in medicine as in theology. Many of them, perhaps a majority, consider the human body a vast chemical laboratory, and scoff at the notion of a life power. Some of these affirm, and others deny, the existence of an immortal soul, by which last, when allowed to remain, those who believe in it solve all the living problems shemistry cannot explain.

Since the days of Hippocrates, or rather his ancestos Esculapius, there has always been a church of faithful pricsts of nature, who closely observed her laws and obeyed her dictates. One after another of these has added his quota to the general amount of information, till, being fully prepared for generalizing, the great-principles of health and disease have been established, which no doubt will continue in force till this mortal puts on immortality. These true physicians are known under the name of vitalists, or observers of life.

Our opponents, when they talk of uncertainty and confusion, but proclaim the chaos existing in their own minds, on which the spirit of truth had never moved ta correct disorder, and impart life and light.

## CONVERSATION VII\&

## PREVISION.

Docros. The patient, while under the influence of fascination, will, in some cases, often materially assist the treatment by prescribing remedies for himself, his instinctive faculties undergoing remarkable develop ments.

This power has been named prevision ; but I think it is susceptible of a two-fold distinction-that which re lates to the organism, and by perceiving " a series of organic movements, consequent one upon the other," and thence foretelling results; and that which is probably the communication of a superior being, in attendance upon us, and whose revelations are made only for special purposes.

We will name the first organic, and the second revealed, prevision.

Lady. This organic prevision seems to me nothing more than a development of the vis medicatrix nature.

Doctor. It certainly resembles it in many particulars, and the fact of its being possessed by the lowet animals to a considerable extent favors your view.

Bruce tells us that the African Arabs secure themse.ves from the mortal consequences attending the bite of serpents, by chewing a particular root, and washing themselves with an infusion of certain plants in water; he gives a particular account of several of these plants, some of which seem only capable of acting against the
power of the serpent ; others, only against that of the scorpion; and a third sort, against both; and all wil operate both as an antidote and preventive. Vargus throws considerable light on the manner in which the Arabs acquired the knowledge of these plants; he was a gentleman residing at Santa Fe , (S. A.,) who was accustomed to venture into the open fields and seize the largest and most venomous serpents, from whose bite he was perfectly protected by drinking a small portion of the juice of the quaco-wilhy, and inserting some in punctures made in his hands, breast, and feet. The name of the plant is derived from the Indian term for the serpent hawk, who was observed, before attacking poisonous serpents, to suck its juice, which, when tried for the same purpose by mankind, proved equally effi cacious.

An old writer long since remarked that no fact appeared better attested, in the history of human knowledge, than that of a proficiency in the art of practical physic, far beyond the scope of their other attainments ; forming a curious but unfailing trait in the character of savages. Now, whether that proficiency was attained by observations made on the instincts of the lower anımals, or the result of their own organic prevision in a fascinated state, it is hard to discover; perhaps it was compounded of both.

The apes of Abyssinia are reported to have, by trials on themselves, first exhibited to men the laxative properties of the cassza fistula. A dog having had some sheep's blood injected into his veins, was observed to immediately vegin eating grass; and this was considerea by the transfusers sufficient evidence that the nature of each animal resided in the blood, and that the
dog wou.d in future partake of the qualities of the sheep. A gross error; the organic prevision of the dog warned him that to produce vomiting was to obtain relief from the pain caused by his cruel tormentors, hence his conduct; for he is commonly observed, when vick, to eat a quantity of prickly grass, an expedient that seldom fails to answer the purposes of an emetic.

Lady. I was once called, while in the country, to witness something of this kind. It was a toad fighting with a large spider; every time the toad was bitten, it ran off, and, having eaten some plantain leaves, would return to the fight. A person present, while the frog was trying to reach the plantain, covered it up; he swelled up immediately, and died in consequence.

I am aware that hogs, after being kept for some time without salt, refuse food, and greedily devour ashes or cinders in great quantities. Some time ago, I met with un anecdote of a gentleman who, when sick, never used medicine ; giving, as reason, the example of a monkey in his possession, that, if ill, would abstain from food a few days, when he was always sure to recover health and spirits.

Doctor. But that the fascinated patients of the Egyptian temples remembered their visions, I should have elassed such cases in organic prevision: as an instance of the latter faculty, I will quote a case from the report of the commission of the Royal Acaderny of Medicine, and vouched for by them.

[^2]Wo at the tonth, which took place on the 19th of August. It was on that day, at nine o'clock in the moraing, that he ennounced, that on the teme day, at four o'clock in the afternoon, he should have an attack of epilepsy; but that it might be prevented, if he was magnetized a little before that period. The verification of his prediction was preferredand, therefore, no precaution was taken to prevent the paroxysm; we contested ourselves with observing him, without his having any auspicion that we were doing so. At one o'clock he was seized with a violent headache;-st three be was obliged to go to bed,-and at four o'clock precisely the paroxyom attacked him, and lasted about five minutea. Two days afterwards, Cazot being in somnsmbulism, M. Fouquier sod denly thrust a pin, of an inch long, between the thumb and the forefinger of the right band; with the same pin, he also pierced the lobe of the ear;-and the eyelids being separated, the white of the eye itself wan repestedly struck with the head of the pin without occssioning the amalleet indication of sensibility.
"The commission met at the Hopital de la Charite on the 24th of Auguat, at nine in the morning, in order to observe the experiments wbich $M$. Fouquier, one of ite members, proposed continuing apon this invalid.
"At this seance, M. Fouquier took his station about six feet in front of Cazot : he looked at him firmly-made nee of no passes with the hands,observed the most perfect silence, and Cazot was asleep in eight minutes. At three different times, a bottle of ammonis was held under his nosebe countenance becarne flushed-the breathing quickened, but he did oot awaken. M. Fouquier thrust a pin an inch long into the fore-armi flerwards, another pin was thrust to the depth of two lines, obliquely ender the chest $;-$ third was similarly inserted into the pit of the stoesch; and a fourth was thrust perpendicularly into the sole of the foot. M. Guersent pinched him in the fore-arm so severely as to leave a bruiso aark;-and M. Itand leaned the whole weigbt of his body upon hir bigh.
"We endeavored to tickle him by lightly pasaing a little piece of paper under the nose, upon the lips, apon the eyebrows, the eyelashee, the neck, and the soles of the feet-but nothing conld awaken him. We then urged him with questions. 'How many more sttacks will you have I' 'Daring a year.' 'Do yon know whether theee attacks will be near to each other $\uparrow$ ' 'No.' 'Will you have one this month ?' 'I shall have a fit on Monday the 27 th, at twenty minutes before three o'clock. 'Wi.l it be a strong one ?' 'It will not be half so strong ss the last.' 'On what other day will you have an attack "' After an expreasion of impeLience, be answered,- A fortnight hence, that is to say, on the 7th of Beptember.' 'At what hour ${ }^{\prime}$ ' 'At ten minutes before six in the morning.'
"The illnons of one of his children obliged Cazot to leave ls Charite oa that very day, the 24th of Auguat. But it wan agreed that he abould retare on Monday the 27 th , early in the morning, in order that the ft
which he had declared to be impending in the afternoon of that dey, of twonty minutes before three, might be sccurately observed
"The ateward, having refused to take him in when he presented him self for admittance, Cazot repaired to the house of M. Foissac in order te complain of this refusal. M. Foissac, as he afterwards told us, preferred dissipating this attack by magnotism, to being a solitary witness to the occurrence,-and consequently we were unable to establish the exactitude of this prevision. But it still remained for us to observe the parox ysm which he had announced for the 7th of September. M. Fouquier having caused Cazot to re-enter the hospital on the 6th, under the pretext of paying him some attentions, which he could not pay out of that eatablishment, had him magnetized in the course of the day of the 6 th by M. Foissac, who put him to sleep by the simple act of his will, and by steadfastly looking at him. In this sleep, Cazot repeated, that the next day he should have an attack at ten minutes before six in the morning, and that it might be prevented if he was magnetized a little before. At a signal agreed upon, and given by M. Fouquier, M. Fuissac, of whose presence Cazot was ignorant, awakened him in the same way as he bad put him to sleep, by the sule act of his will, notwithatanding the questions which were eddressed to the eomnambulist, and which had no other object than to conceal from him the moment in which he ought to waken.
"In order to be witnesses of this second sttack, the commission met on the 7th of September, at a quarter before six in the morning, in the ward 8t. Michel, at la Charite. There they were informed, that the svening before, at eight o'clock, Cazot had been seized with headache, which had tormented him all night,-thet this pain had occasioned the enseation of beating in his head, and that he had had some darting sense. tions in his ears. T'en minutes before six o'clock we witnossed the epileptio attack, characterized by contraction and atiffness of the limbs, -by the repeated and forcible tossing of the head backwards,-by the convnleive olosing of the eyelids,-by the retraction of the globe of the eye towarde the mof of the orbit,-by aighs,-by screams,-by insensibility to severe pinching,-and by the biting of the tongue between the teeth. This set of symptome lasted for about five minutea, during which, be bad two remissions of some seconds each, and then a painfol relazation of the limbs, and wense of general exbaustion.
"On the 10th of September, at ten o'clock at night, the commission met again at the house of M. Itard, in order to continue its inquiriea apon Cazot: the latter was in the library, where conversation had been carried on with him till balf-past seven, at which time M. Foissac, who had arrived since Cazot, and bad waited in an ante chamber separated from the library by two closed doora, and a distance of twelve feet, began to magnetizo bim. Three minutes afterwarde Cazot said, I thiek that Folsoac is thert, for Ifeel $\begin{aligned} & \text { ny yoelf oppressed and enfeebled. At the }\end{aligned}$
expiration of sight minutes he was completely saleep. Ho was again questioned, and assured ue, that in three weeks from that day, that is, on the first of October he ahould have an epi.eptic paroxysm at too minutes before noon.
"It was desirable to voserve with equal care, as on the 7th of September, the epileptic atteck which he had predicted for the 1st of October. With this view, the commission met wether on that day at half-pant eleven, at the house of M. Georges, manufacturer of hats, No. 17, Run des Menetriers, where Cazot lived and worked. We learned from M Georgos, that he was a very regular workinan, whose conduct was ox-cellent,-and that he was, both by the simplicity of his mind, and by his moral principles, absolutely incapuble of lending himself to any decep tion; that he had had no attack of epilepsy since the one which the comunisaion had witnessed at la Charite;-that not feeling himself well that morning, he had remained in his own chamber, and was not at work;that at this moment, there whe with him an intelligent man, whose vera city and discretion might be relied upon; that this man had not told him he had predicted an attack for that day ;-that it appeared that aince the 7th of Scptember, M. Foissac had had some communication with Cazot, but without permitting the inference that he had in any way recalled to him his prediction, since, on the contrary, M. Foissac attached the highest importance to the circunstance, that no one should apeak to the patient on the subject of what he had nunounced. At five minutes before twelve M. Georges went np into a room situated immediately under that ocen pied by Cazot, and in one minute afterwards he came to inform us that the sttack had supervened. We hastily ran to the sixth story, that is MM. Gnersent, Thillaye, Mare, Gnoneau de Musny, Itard, and the Reporter, where, on our arrival, the watch pointed at one minute to twelve by the true time. Assembled around the bed of Cazot, we distinguished the epileptic paroxysm characterized by the following symptoms : tetanic atiffuess of the body and of the limbs-rossing of the hend, sad occssionally of the truuk of the body backwarda,- a convilsive retraction, and up-turning of the eye, so that the white of the eye only is visible,- very remarkable fulluess of the face and neck,-contraction of the jaws,partial convulsive movements of the fibres of the museles of the right arm and fore-arm; -soon afterwards so decided a tetanic attack, that the trunk of the body was so raised as to form the segment of a circle, of which the ouly bases were formed by the head and the feet; which movements terminated by a sudden collapse. A few moments after this attack, that is, after one minnte of relaxation, a new paroxysm, similar to the preceding one, took place; thete were uttered inarticulate sonods-his respira tion very frequent and interrupted,-the larynx being rapidly and vio lently raised and depressed; and the palse beating from 132 to 160 in r minnte:-there wan no frothing at the mouth, nor contraction of the thambe to tha inside (ftye palm of the hand. At the end of six minater
the paroxysm terminated by deep sighs, by relaxation of the limbs, and opening of the eyelide.
"The invalid fixed an astonished look upon the persons present, and somplained of being painfully stiff, eapecially in the right arm.
"Although the cormmission could not doubt the veritable action prodaced by magnetism upon Cazot, even without his knowledge, and at a certain diatance from him, yet they desired to acquire a new proof of this state ;-and as it had been proved at the last seance, that M. Foissac had had some communication with him, and therefore might have wold him that he had annonnced an attack for the lat of October, the commission were also desirous, while submiting Cazot to some new trials, to lead M. Foisacac himself into error as to the day ou which his epileptic should have ennounced as the next for the return of the paroxysm. By this plan we should shelter ourselvea from every apecies of connivance, oven supposing that a man, whom we had alwaya seen honest and upright, could possibly have any secret or collusive anderstanding with a man without education, without intelligence,-and that in order to deceive us. We will coufers that we did not ourselves do this injustice, even in thought, to either the one or the other; and we feel bound to render the rame teatimony to MM. Dupotet and Chapelain, of whom we have more than once had occasion to spesk to you.
'The commiseion met again on the 6th of October at noon, in the iibrary of M. Bourdois, at which hour Cazot arrived there with his child, M. Finsarc having been invited to comest half-past twelve: be was exact
his appointment, and remained in the ante-room, without the cogni-
nce of Cazot, and without any communication with us. We sent to inform him, however, by a side door, that Cazot was seated on a aofs, placed ten feet from the door, which was closed, and that the commisaion requested he would magnetize, and awaken him also at that distance, he, M. Fuissac, remaining in the ante-room, and Cazot in the library.
" At twenty-three minutes before one, while Cazot was occupied widh the converantion which we carried on among ourselves, or examining the pictures which adorn the library, M. Foissac, placed in the next room, began to magnetize him: we remarked that in four minutes Cazot began slightly to droop the eyelids-that he had a restless unquiet air-and that in aine minutes he was asleep. M. Gacrsent, who had attended him for hin cpileptic attacks at the Hopital des Fufants, asked him if he remembered him:-he answered affirmatively. M. Itard inquired, when he shoold have a paroxysm. He replied that it would be this day four weeks, (the 3rd of November,) at five minutes after four in the afternoon. He was then asked when he should have another, to which be anawered, after apparent reflection and hesitation, that it woald be five weeks after the one which be had just indicated-the 9 th of December, at half past aine in the morning.
"The proces verbil of this ofence haviug been read in the presence nt

M. Foisano in order that he might sign it with us, we wiahed, as it has been above remarked, to lead him into error: and in reading it to him before presenting it for signature to the members of the commisaion, the roporter read, that the firat attack of Cazot would take place on Sunday the 4th of November, whereas the somnambulist had fixed Baturday the 3rd. He practised the same deceit with regard to the second; and M Foisac twok a memorandum of these erroneous indications as if they had been exact; but having some days afterwards put Cazot intu somnambulism, as he was accustomed to do, in order to dispel his headaches, ha learned from him, that it was the 3rd and not the 4 th of November, that he onght to have a return of the fit, and be informed M. Itard of this on the lst of November, believing that there had been an error in the proces verbal, of which, neverthelees, M. Itard maintained the ansumed correctress.
"The commission again took all the necessary precautions to enable them to observe the attack of the 3rd of November;-they met at four o'clock in the afternoon at the house of M. Georges; they learned from him,-from his wife,-and from one of the work-people, that Cazot had gone through his customary labor all the morning, till two o'clook in the wfternoon, and that during bis dinner, he had complained of headache: that nevertheless he had returned to his work, but that the headache increasing, and having felt giddy, he had retired to his own room-had gone to bed, and to sleep, MM. Bourdois, Fouquier, and the reportes preceded by M. Georges, then went ap atairs to Cazot's noom: M. Gecr ges alone went in, and found him in a profound sleep, which he begyed of us to observe through the door, which was partially open to the stain ease. M. Gaorgen spoke loudly to him-shook him rather rudely, pulled him by the arm without awakening him. Cazot was then seized with the painfal symptoms which constitute an attack of epilepay, and preciselv similar to that which we had fornerly observed upon him.
"The second attack announced at the seance of the 6th of October, for the 9 th of December, that is, two months beforehand, took place at half past nine, or a quarter of an bour later than had been predicted, and was characterized by the same precursory phenomena, and by the same symptoms as those of the 7 th of September, 1st of October, and the 3rd of November,
"Lastly, on the 11th of February, 1828, Cazot fixed the perivd of a sew attack for the 22nd of the following April, at Give minutes beforo goon: and this announcement, like the preceding ones, was verified within five minutes, that is, at ten minutes before twelve. This attack was remarkable for its violence, for the species of madness with which Cazot bit his band and fore-arm,-for the violent and repeated shooka with which the body was diatorted and for its having lasted thirty-five minates, when M. Foissac, who was present, magnetized him. Very moon, this convuleiv, state gielded to the state of magnetic nomnambaliner
laring which Cazot got nut of bed, sat down upon a chair, and asid that be was very much fatigued; - that he sh, uld have two more attacke one of which should be nine weeks from to-morrow (Jane 23 rd, ) st ures minutes after six. He would not fix the second attick. becanse he must think of what wonld take place beforehatud. (at this moment he sent awsy his wife, who was present.) and adhexl, that in about three weeke aftee the attack of the 23ril of Jume, he should gomad; that his madness would last three days, during which he should be so mischin-vons, that he should attack every boxly ;-that he should even ill-treat his wife and his child ; that he ought not to be left alone with them;-and that he did not know that he sbonde not kill an individual withat intending it. It would be necessary to bleed him from both feet; 'then.' said he, 'I shall be well for the month of August ; and once cured, the disorder will not retwrn, whatever circumstanecx may happen to me afterwarda.'
"It was on the S2nd of April, that all these previsions were announced to un, and two days afterwards, the 24th. Caznt wishing to atop a runaway horse which had got the bit between his teeth, was violently thrown down against the wheel of a cabriolet, which uccasioned a fracture of the left supranorlitiry ridge, and bruised him horribly. He was conveyed to the Hopital Beaujon, where he died on the 13th of May. On inspecting the body, and opening the head, there were fonnd tracee of recent mernliranons inflammation.-purulent collections nuder the integuments of the okull. and at the extremity of the chorvid plexus, a substance externally thite, but yellowixh internolly, and which contained some amall hydurids.
"We see in this history a young man, sabject for years to attacks of - pilepay, for which he had been troated successively at the Hopital dee Diffants, and at Saint Louis, and in consequence of which he had been exempted from military service. Magnetiom acted upon him, although Le was perfectly ignorant of what wan going on,-and he became somnambulint. The ayinptoms of his disorder were ameliorated; the paroxysms dimitiohed in frequency;-his headaches, his oppression disspperared under the influence of magnetism;-he prescribed for himself a treatment appropriate to the nature of his malaly, and from which he promised his restoration. Mngnetized teithont hin knotelodge, and from a diatance, he fell intn momnambulism, and was aronsed from it with the same pramptitude, as if he had heen magnetized close at hand. Finally, he indicated with extraordinary precision, one or two months beforehand, the day and the hour of the return of the epileptic attack. Yet notwith standing he sas thits eniluced with prevision for attacks at so great a dia tance of time, and eren for atlacks which would never take place, he did mot forexer. that in tirn tays he shouli mert with a fatal acrident.
"Wifhout attempting to reconcile all which at first minht is npparently contradictory in auch a history, the commission would draw your atten tion to the fact that the previsions of Cazot related only to his attacks; thet they are reducible to the knovrledge nf organic modifications 4 him
sslf, which were prepsring, and which would arrive ss the ueceeary rowalt of the interior fusctions; that these previsions, although of greates oxtent, are really precisely similar to thooe of certain other epileptics, whe recoguize by divers premnnitory symptoms, such as headache, giddiness, irritability, the aura epileptica, that they shall soon have an attack. Is it then surprising, that these somuambulists, whose sensations, as you have ween, are extremely acute, ahould be able to foresee their attacks a long time previozaly, according to some symptoms, or interior impressiona, which escape the notice of waking men $\boldsymbol{f}$ It is in this wey, gentlemen, that we may understand the prevision attested by Aretaus in two parte of his immortal works,-by Sanvages, who also records an example,-and by Cabanis. Let us also add, that the prevision of Cazot, was not absolute, and unalterable, but conditional ; since in predicting an attack, ho announced that it would not take place, if he was magnetized, and that in point of fact, it did not take place:-the previeion is wholly organic, wholly interior. Thus we easily anderstand, why he did not foresee an event wholly exterior,-that is to asy, that accident led him to meet a ranaway horse,-that he was imprudent enough to try to stop him, and that he received a mortal injury. Thns he might foresee an attack which wan not to happen. It is the banu of a natch, which in a given time, ought to paes over a certain portion of its facial circle, and which does not describe that portion, becanse the watch is broken."

Cases of revealed prevision are quite as common as those of organic, and have been known a much longer period. Socrates presented a remarkable instance of this kind. He informed his disciples that he possessed a genius, who told him future events and directed his conduct, and whom he never failed to obey. He often warned his friends (by the advice he told them of his genius,) against certain courses of action, and, in every case where they refused to profit by his counsel, disastrous results followed.

He predicted all the events of any importance in his own life, and lastly, his death and its mode. After sentence was passed on him, his enemies waited but the return of a ship to put it into execution. The night before the vessel was expected in, his disciples were grieving bittel/y to think that before another evening
the philosopher would be taken from them; he informea the sorrowful group around him that the ship had been injured at sea, and would not return for three days; and the event happened as he predicted.
Cazotte's famous prediction was verified, even to the ninutest point, in the history of the French revolution. Newnham takes it from La Harpe ; you cannot fail to de intensely interested in its perusal-its truth is undoubted.
"It appears but as yesterday, and yet, nevertheless, it was at the boginning of the year 1788. We were dining with one of our brethren at the Academy-a man of considerable wealth and genius. The company was numerons and diversified-courtiers, lawyers, scademicians, etc., and, eccording to custom, there had been a mugnificent dinner. At deseert, the winee of Malvoisin and Constantia added to the gayety of the gaeata that sort of liberty which is sometimes forgetful of bon ton:-we hed arrived in the world, just at that time when anything was permitted that would raine a laugh. Chamfort had read to us some of his impious and libertine tales, and even the great ladies had listened without baving recourse to their fans. From this arose a deluge of jeats against religiou. One quoted a tirade from the Pscelle; another recalled the philosophia lines of Diderot-

> 'FIt des boysax du dernier prbeco, Serraz le con du dernier rol'-
for the sake of applauding them. A third rose, and, bolding his glass in his hand, oxclaimed: ' Yes, gentlemen, I am as sere that there is no God, is I am suse that Homer is a fool;' and, in truth, he was as sure of the une an of the other. The conversation became more serions; much admiration wes expressed on the revolution which Voltaire had effected, and it was agreed that it wan his firet claim to the reputation he enjoyed. Ho had given the prevailing tone to his age, and had been read in the ante-chamber as well as in the drawing-room. One of the gueata told us, whila bursting with laughter, that his hairdresser, while powdering hid hair, had said to him: 'Do you obseroc, sir, that although I am but poor miserable barber, I have so more religion than any other $7^{\prime}$. W ooncladed that the revolution must aon be consummated; that it wes indispensable that anperstiton and fanaticism should give place to philos ophy, and we began to calculate the probability of the period when thia should be, and which of the present company should live to see the reige of reasm. The oldest complained that they could scarcely flatter them eolves with the hope; the younger rejriced that they might entertain hia very prabable expectation: and they congratulated the Acederay
mpecially for baving prepared this great work, and for hsping been the great rallying point, the oentre, and the prime mover of the libertyo thought.
"One only of the guests had not taken pert in ell the joyoumeses of thin conversation, and had even gently and cheerfully checked our aplendid enthusiasm. This was Cazotte, an amiable and original man, but unhap pily infatuated with the reverios of the illuminati. He apoke, and with the most serions tone. 'Gentlemen,' said he, 'be setiafied ; you will all see this great and sublime revolution, which you so much desire. You know that I am a little inclined to prophesy; I repeat, you will soo it.' He wes answered by the commen rejoinder: 'One need not be a conjeror to see that.' 'Be it so; but perhaps one muat be a little more than conjoror for what remains for me to tell you. Do you know what will be the consequence of this revolution-what will be the consequence to all of you, and what will be the immediate result-the well-establiehed effect-, the thoroughly-recognized consequence to all of you who are hore present ' ' ' 'Ah!' said Condorcet, with his insolent and half-sup- $^{\text {sen }}$ pressed smile, 'let us hear-a philosopher is not sorry to encounter a prophet.' 'You, Monaieur de Condorcet-you will yield np your last oreath on the floor of a dungeon; you will die from poison, which you will have taken, in order to eacape from execution-from poison which the happiness of that time will oblige you to carry sbout your person.'
"At firat, astoniahment was most marked; but it was soon recollectnd that the good Cazotte is lisble to dreaming, though apparently wid awake, end a hearty laugh is the consequence. 'Monsieur Casotto, the relation which you give us is not no agreeable as your Disble Amoureax, :a novel of Cazotte's.)
" ' But what disble bas put into your head this prison, and this poison and these executioners? What can all these have in common with philosophy and the reign of reason? 'This is exaotly what I say to you; it Is in the name of philosophy-of humanity-of liberty ; it is ander the reige of reseon that it will happen to you thus to end your career; and it will indeed be the reign of reason, for then she will have her temples, and indeed, at that time, there will be no other temples in France than the temples of reason.' 'By my truth,' said Chamfort, with a sarcestic smile, 'you will not be sne of the prieats of those temples.' 'I do not bope it; but you, Monsieur de Chamfort, who will be one, and mons worthy to be so, you will open your veins with twenty-two cuts of a rasor, and yet you will not die till some months afterward.' They looked at each other, and laughed again. 'You, Monsieur Vieq d'Axir you will not open your own veins, but you will canse yourself to be bled six times in one day, during a paroxysm of the goat, in ordor to make more sure of your end, and you will die in the night. Yoa Monviour de Nicolai, you will die upon the scaffold ; you, Monsieur Bailly -n the scaffold; you, Monsieur de Mslesherbes on the acaffold.' 'Ab

God be thanked,' exclaimed Roucher, 'it seems that Monajeur hes as eye but for the Acaderny; of it he has just made a terrible execution, and , thank heaven . . . . . ' You ! you also will die upon the scaffold.' Oh, what an admirable guesser,' was uttered on all sides ; 'he has awora wo exterminate us all.' 'No, it is not I who have aworn it.' 'But shall we, then, be conquered by the Turks or the Tartaral Yet agaia . . .' ' Not at all; I have already told you, you will then be goverued only by philosophy-only by reason. Tkay who will thus treat you will be all philosophers-will always have upon their lips the self-same phrasee which you have been putting forth for the last hour-will repeat all your maxims-aud will quote, as you have done, the verses of Diderot, and from La Pucelle.' They then whispered among themselves: 'You see that he is gone mad;' for he preserved, all this time, the most serious and solemn manner. 'Do you not see that he is joking, and you know that, in the character of his jokes, there is alwaya much of the marvellous.' 'Yen,' replied Chamfort, 'bat his marvellousness is not cheerful; it asvors too much of the gibbet; and when will all this happen 9 ' 'Six jears will not pass over, before all that I have said to you shall be pecomplished.'
${ }^{* 4}$ Here are some astonishing miracles (and, this time, it was I mynelf who spoke), but you have not included me in your list.' 'But you will be there, as an equally extraordinary miracle; you will then be a Christian.'
" Vehement exclamations on all sides. 'Ab,' replied Chamfort, 'I am comforted; if we shall perish unly wheu La Harpe shall be a Christian, we ere immortal.'
" 'As for that,' then observed Madame la Duchesse de Giammont, 'we women, we are happy to be connted for nothing in theae revolutions: when I say for nothing, it is not that we do not always mix oursselves up with them a little; but it is a received maxim that they take no notice of us, and of our sex.' 'Your sex, ladies, will not protect you this time; and you had far better meddle with nothing, for you will be treated eutirely as men, without any difference whatever.' 'But what, then, are you really telling us of, Monsieur Cazotte? You are preaching to ue the end of the world.' 'I know nothing on this anbject ; but what I do know is, that you, Madame la Duchesse, will be conducted to the scaffold. you and many other ladies with you, in the cart of the oxecotioner, and with your hands tied behind your backe.' 'Ah! I hope that, in that case, I shall at least have a csrriage hung in black.' 'No, madame; higher ladies than youraclf will go, like yon, in the common sar, with their hand tied behind them.' 'Higher ladies! what: the princenees of the blood" "Still more exalted personages.' Here a sensible emotion pervaded the whote company, and the countenance of the hoat was dark and hwering; they began to feel that the joke wat berume too serious

#### Abstract

" Madame de Grammont, in order to diasipate the cloud, twok no notioe of the reply, and contented herself with saying in a carelese tone: ' $Y$ ow see that he will not leave me even a confeseor.' 'No, madnme, you wib not have one-neither yon, nor any one besides. The last victim to whom this favor will be afforded will be . . . : He stopped for a moment. 'Well! who then will be the happy mortal to whom this prerogutive will be given?" "Tia the only one which he will bave then retained-and that will be the king of France.' "The master of the bouse rose hastily, and every one with him. He walked up to M. Cazotte, and addressed him with a tone of deep emotion: ' My dear Monsieur Cazotte, this mournful juke has lasted long onough. You carry it too far-even so far ns to derogate from the society in which you are, and from your own characuer.' Cazotte suawered nut a word, and was preparing to leave, when Madame de Grammont, who always songht to dissipate $u$-rious thought, and to restore the loat gayety of the party, approached him, aaying; 'Monsieur the prophet, nho bes foretold us of our good fortune, you linve told us nothing of your own.' IIe remained silent for come time, with duwncast eyes. 'Madtrae, have you ever read the siege of Jerusalem in Josephas 1' 'Yes! who has nut read that! But answer as if I had aver read it.' 'Well hen, madame, during the aiege, a man, for neven days in succession, went round the ramparts of the city, in sight of the besiegers and besieged, crying unceasingly, with an ominous and thundering voice: Wo to Jerusalem!-and the seventh time he cried: Wo to Jerusalem-mo to myself! And at that moment an enormous stoue projected from one of the machines of the besieging army, and struck him and destroyed him.' '

Joan of Are's case will appropriately follow that of Cazotte ; it is also a matter of history, and may be relied on without the slightest hesitation. Like Socrates, she openly professed herself under the guidance of a familiar genius, whom she called St. Michael. She at length fell into the power of the English, by whom she was (as might be expected from the ignorance of the age), regarded as a witch; they tried her as a herctic and sorceress by an ecclesiastical tribunal, and after condemration, burnt her at Rouen. I will take the aocount from Newnham:

[^3]Governor of Vancouleurs, that the king had suffered great lomes belero Oricens, and would experience forther losses unleas ahe were sent to him. The exactitude of this announcement determined Bandricourt to cend her.
"The next day, on her departure, many persona asked Joan how abe sould possibly undertake this journey, since the whole country wes overrun with aoldiers; she answered that she should find the way clear. No aceident happened to ber, nor to those who accompanied her, and evea very few difficulties during the whole journey, which lasted eleven daye, through an enemy's country, at the close of winter, over a distance of one hundred and fifty leagues, and intersected by several doep rivers.
"On the 27 th of February, when she was about to be presented to the king, a man on horseback, who saw her passing, employed some blagphemona expressions. Joan heard him, and, turning her head, said, ' He, dost thou blaspheme the name of God, and yet so near to death ?' In sbout an hour afterwards, thin man fell into the water and wandrowned.
"The following month, Joan informed the doctors, who were commiesioned to examine her at Poictiers,-
"1. That the English would be beaten; that they would raive the seige of Orleans; and that this city would be delivered from the said English :
"2. That the king would be consecrated at Rheims;
"3. That the city of Paris would be restored to its loyalty;
"4. That the Duke of Orleans would return from England.
"The king, in conacil, having determined to send Joan to Orleans, they commissioned her to conduct a convoy of provisions, of which the place atood in the great est need." "It was observed to her, that it would Ive a difficult enterpriee, considering its fortifications, and the English beDicgers, who were atrong and powerful. 'By the help of my God;' anawered she, 'we will pat them into Orleans easily, and without any attempt to prevent us on the part of the English.'"
"The generals of Charles VII., not daring to take the ronte which Joan of Arc pointed out to them, the convoy was obliged to halt at some leagues from Orlenus, from the want of water, and from sdverse winds. Everybody was confounded and in grief; but Joan announced that the wind would soon change, and that the provisions would be easily thrown Into the town, in sprite of the English; all which was completely verified.
"The English retained one of the heralds whom Joan had seat to summon them to surrender;-they even wished to burn him alive:-and they wrote to the university of Paris to ccusult upon the subject: Joan aseared them, that they would do him no harm.
"When Joan appeared on the redoubt called the boulevard de la Belle-Crix, to summon them to rnise the aiege, these londed her with sbues, especially oue of thr - offirver, th whou Joan replied, that 'be spoke Galsely and in apite on ibrom all, they would soce depart; but that be
monld newt nes it, and that many of his people would be killed. In fact when the fort of Toornelles wres taken this officer wished to make hit escape by the bridge which eeparated the fort from the suburba; but an arch gave way beneath his feet, and he, with all his men, were drowned.
"Having introduced the convoy of provisions and ammanition inte Orleans, Joan foretold to the inhabitants, that in five daye not an English man would remain before their walls.
"On the 6 Lh of May, Joan informed her confessor, that on the nez day she should be wonnded above the bosom, while before the fort at the end of the bridge. And in fact she received a lance between the neek and the shoulder, which passed out nearly half a foot behind the neck.
"On the moraing of the 7 th, her hoat having invitod her to partake of aome fish which had been brought bim, she desired him to keep it till night, because she would then bring him a stranger whe would do his part in eating it. She added, that after having taking the Tournelles, ahe would repass the bridge-a promise which neemed impossible to any body; but which neverthelees wes fulailled, like all the other imposesibilities.
"The irresolution of the king was the greatest puniahment to Joan:'I sball only continue for a year, and a very little more,' said sbe; \&I must try to omploy fhat year well,'
"The Duchesse d'Alençon wes greatly alarmed, on eeeing ber husband at the head of the army, which was about to enforce the coronation of the king, at Rheims. Joan told her to fear nothing-thnt she would bring him back safe and sound, and in a better condition than he was at that moment.
"At the attack of Jergean, the Duc d'Alençon was attentively reconneitering the outworke of the town, when Joan told him to remove from the apot on which he was standing, or that be would be killed by some warlike missile. The duke removed, and almoat immediately afterwards, - gentleman of Apjou, by the name of M. de Lade, was struck in the very place which the dake had just left.
"The English generals, Talbot, Searles, and Falotaff, having arrived, with foar thoosand men, to the relief of the Castle of Beangenie, in order to raise the siege of that place, Joan predicted that the Engïsh woold not defend themselves-wonld be conquered, snd that this triampb would be almost bloodless on the part of the royal army; and that there would be very fem-not quite to say no one-killed of the French combatants. In truth, they loot but one man, and slmoet all the Engliah were killed or taken.
"Joen had told the king not to fear any went of troops for the expeds. than to Rheims, for that there would be plenty of parsons, and many would follow him; in truth, the army increased visibly from day to day and numbered twelve thousend men by the ond of June, 1429.

- When the ermy had arrived before Troyes, that city shat ite gatos
and refused to yield. After five days waiting, and useless efforta of capits Iation, the majority of the council advised to retarn to Gien; but Joat declared that in less than three days ahe would introduce the king inte the city, by favor or by force. The chancellor said that they would eves wait six days, if they could be aure of the truth of her promises. 'Dout: nothing,' suid ahe- you will be master of the city lo-morrow.' Immedintely preparations were made for the projected assault, which sc alarmed the inhabitants and their garrison, that they capitalated next day
"Charles feared that the city of Bheims would oppose a long reaist. ance to hin arms, and that it would be difficult to make himself master of it, because he was deficient in artillery. 'Have no doubt,' ssid Joan, 'for the citizens of the town of Rheims will anticipate you. Before you are close to the city, the inhalitints will surrender.' On the 16 th of July, the principal inhalitants of the city laid its keys at the feet of the king.
" During her captivity, Joun mada the following predictions, on the first of March. 1430, in the presence of fifty-tine witnesses, whose names are given faithfully by M. le Brun de Charmettes:- Before seven years are past, the Euplish will abaudu a larger prize than they have done before Orleann. and will lose everything in France. They will experience the severest luss they have ever felt in France; and this will be by a great victory which God will bestow apou the French.'
"Paris was actually retaken by the French, under the command of the Marahal de Bichemont, and the Count de Dunois, on the 14th of April, 1436.
"As to the great victory which should prove so fatal to the Engliah, M. le Brun thinks may be understood either the battle of Tormigny, gained by the French in 1450, nnd which resulted in the conquest of Normandy or the battle of Castillon, fought in 1452 , in which the remowned Gen Talbot perished, and which completed the submission of la Guienne to France.
" In order to explsin the expression, will lose everything in France, the aame suthor recalls the fact, that the people in general restricted the term France to what had originally composed the immediate dominion of Hugo Capet and his anceessors, as l'Isle de France. l'Orlcamnia, le Berri, la Touraine, etc. Thus Joun of Arc, born at Domremy, at the extremity of la Champagne, said that St. Michael had ordered her to go into France.'

## Lady. I have been reading a somewhat similar ac-

 count, belonging, I presume, to the same class, in the "Use of the Body in Relation to the Mind," by Moore; be says:[^4]andeveloped faculty, which, in another state, may be propur to man Ine nature and character of this strange endowment will be beat expreseed in the language of one who believed himself to be possessed of it. Heinrich Zschokke, s man remarkable for the extent of his honor able labors as a statesman and an author, solemnly writes the following passage in his antobiography: 'It has happened to me sometimes, on my first meeting with strangers, as I ailently listened to their discourse, that their former life, with many trifling circumstances therewith connocted, or frequently some particular scene in that life, has passed guite involuntarily, and, as it were, dream-like, yet perfectly distinct, before une. During this time I usually feel so entirely absorbed in the contemplation of the stranger's life, that at last I no longer see clearly the face of the unknown wherein I undeaignedly read, nor distinctly hear the voices of the speakere, which before served in some measure as a com mentary on the text of their features. For a long time I held anch visions as delusions of the fancy, and the more so as they showed mn even the dress and emotious of the actors, rooms, furniture, and other accea wries.' He was at length astonished to find his dream-pictures invs riably confirmed as realities, and he relates this instance as an example of his visionary gift: 'One day, in the city of Weldshut, I entered an inn (the Vine) in company with two young studeuts. We supped with a numerous company at the table d'bote, where the gueste were making cery merry with the peculiarities of the Swise, with Meamer's magnetism, Lavater's physiognomy, etc. One of my companions, whose nutional pride was wounded by their mockery, begged me to make some reply, particularly to a handeome young man who sat opposite to ns, and who had allowed himself extraordiuary license. This man's life was at that moment presented to my mind. I turued to him, and asked whether he would answer me candidly if I related to him some of the most secret passages of his life, I kuowing an little of him persoually as he did of me. He promised, if I were correct, to admit it frankly. I then related what my vision had shown me, and the whole company were made acquainted with the private history of the young merchant-his school years, his youthfol errors, and, lastly, with a fault committed in reference to the strong-box of his principal. I described the uninhabited ronm with whitened walls, where, to the right of the brown door, on a table, atood a black money-box, etc. A dead silence prevailed during the whole nerrative, which I alone occasionally interrupted by inquiring whether I spoke the truth. The startled young man confirmed every particular, and even, what I hod scarcely expected, the last mentioned. Touched by his candor, I shrok bands with him, and asid no macre. He is, prob ably, will liring *

## CONVERSATION IR.

## SONNAMBULIBM.

Lady I have been reading Dendy's Philosophy of Mystery, and have marked a number of cases which seem to bear much resemblance to some of the stages of fascination.
He says that somnambulism is the most perfect paradox among the phenomena of sleep, as it exhibits actions without a consciousness of them; indeed so complete is suspension of sensibility that contact, nay, intense inflictions, do not produce that mental consciousness which is calculated to excite alarm or even attention.
He says that in London, 1833, a man was brought before Alderman Thorp, who had a parcel cut from has arm, although he had strapped it tightly on to prevent this, as he was often falling asleep during his walk. Yet, even then, he usually took the parcels to the proper directions.
The crew of a revenue boat, on the coast of Ireland, about two o'clock in the morning, picked up a man swimming in the water. He had, it appeared, left his house about twelve, and walked two miles over a most dangerous path, and had swam about one mile. After he was taken into the boat he could not be persuaded that he was not still in his warm bed at home.
In 1834, Marie Pan was admitted into the hospital at Bordeaux, France; her left arm and hand covered with
deep and bleeding gashes, its tendons projecting, and the bones broken. She had, in her sleep, gone into a loft to cut wood with a hedging bill; thinking she was cutting the wood, she had hacked her forearm and hand until she fainted away and fell, bathed in her own blood. She had felt no pain, but merely a sensation, as if the parts were pricked with pins.

In 1832 some fishermen near Brest, in France, were surprised at finding, at two o'clock in the morning, a boy about twelve years oid, up to his waist in the sea, fishing for flounders, of which he drew up five or six. Their surprise, however, was increased to wonder when, on approaching him, they found he was fast asleep. He was taken home and put to bed, but was mmediately afterward attacked with a raging fever.
In 18-, says the Augsburg Gazette, Dresden was the scene of a melancholy spectacle. As early as seven ir the morning a female was seen walking on the roof of one of the loftiest houses in this city, apparently occupied in preparing some ornaments as a Christmas present. The house stood as it were alone, being much higher than those adjoining it, and to draw her from her perilous situation was impossible. Thousands of spectators had assembled in the streets. It was discovered to be a handsome girl, nineteen years of age, the daughter of a master baker, possessing a small independence, bequeathed to her by her mother. She continued her terrific promenade for hours, at times sitting on the parapet and dressing her hair. The police came to the pot, and various means of preservation were resorted to. In a few minutes the street was thickly strewn with straw, and beds were called for from the house ${ }_{1}$ but the heartless father, influenced by the girl's step
mother, refused them. Nets were suspended from the balcony of the first floor, and the neighbors fastened nheets to their windows. All this time the poor girl was walking in perfect unconsciousness, sometines gazing at the sky, and at others singing or talking to herself. Some persons succeeded in getting on the roof, but dared not approach her for fear of the consequences if they awoke her. Towards eleven o'clock she approached the very verge of the parapet, leaned forward and gazed upon the multitude beneath; every one felt that the moment of the catastrophe had arrived. She rose up, however, and returned calmly to the window by which she had got out. When she saw here were lights in the room, she uttered a piercing shriek, which was re-echoed by thousands below, and fell dead into the street.

Doctor. You have extracted all that is worth noticing in the Philosophy of Mystery; for a man is certainly unfit to treat on physiology who believes, liko Dendy, that electricity is the source of life, and who, driven to confess the fact of the existence of several cases of apathetic trance produced by fascination, which he quotes, says, "It is, I believe, quite true, that they were unconscious of the operation; but even this is not safe. Pain is given us as warning against extreme $2 n j u r y$, that by our complaint or suffering, the surgeon's mend may be on its guard."

Newnham says that the phenomena of somnambulism are established and recognized by the antagonists of fascination. And that in fact the knowledge of somnambulism rescues many of these matura. phenomena from the alledged dominion of sorcery and of the blackfrt, under which they have been classed by the ignorant
and the short-sighted, and restores them to theit proper position as the natural effects of natural causes.

Dendy, continually rushing into dilemmas from which he cannot extricate himself without overthrowing his former positions, remarks. "That whatever may be the influence imparted by tractions, the phenomena of excited somnambulism are similar or precisely to those spontaneously occurring." "In a word, mesmerism is true in part: it may induce catalepsy, somnambulism, exalted sensation, apathetic sensibility, suspended circulation, even death. Clairvoyance and prophecy alone are the impositions as regards its effects," etc.

In both cases the parties remember nothing whatever of the recurrences experienced in sleep-waking. The actions of many natural sleep-wakers explain the origin of many stories of pixey and fairy, who would enter, ir some cases, the houses of their friends at night, and do up all their work for them, and in others cause much trouble, to whom they bore ill-will, by breaking their crockery, overturning chairs, etc. A tailor in this city who worked for a shop which furnished suits made to order at twenty-four hours notice, had taken a coat to finish by the next morning, under the expectation of his wife assisting him. Arrived at home, his wife was ill, and unable to do anything to help him beyond sewing the sleeves. He worked steadily at his task during the day, but so much did his unusual efforts exhaust him, that despite himself he went to bed with a heavy heart, for he dreaded, with good reason, the loss of his situation from the disappointment of his employers. When roused at an early-hour the next moming, he hastily prepared to resume his work, when, to his utter astonishment, he found the coat perfectly finished, and done too,
he confessed, in a much better manner than at was possi ble for him to do it. Immediately perceiving that ${ }^{-}$ was the deed of his guardian angel, he fell on his knees and gave thanks. He told me that it was the only way in which the coat could have been made; for, on account of his exertions the preceding day, he was utterly incapable of working, and the next morning could do little more than stand. He had evidently risen in the night and finished the coat himself, and must have done this in complete darkness, for a light would have, in all probability, (owing to a peculiar state,) awakened his wife, and they had but one room.

Marcus, the freedman of Pliny, dreamed that a barber. sitting on his bed, had shaved him, and awoke well trimmed; Marcus had unconsciously shaved himself. Dendy mentions that early one morning, at a farm-house in Sussex, England, an immense number of foot-prints were observed by the men about a gate, which were not there over night. On their return the servant girl was relating her dream; that she was told the cows had got into a wrong field, and that she had gone out, opened the gate, and driven them back. She had been observed by one of the family performing her dream. A young gentleman at Brenstein was seen to rise, get out of his window on the roof, and take a brood of young magpies from their nest, and wrap them in his cloak. He then returned quietly to his bed, and in the morning related his dream to his two brothers. They had slept with him and witnessed this feat, of which he would not be persuaded until they showed him the birds in his cloak.

Dr. Gall relates a case of a Mr. Roggenback, whe informed him, in the presence of many persons, that be
nad beer a somnambulist from infancy. In this stata his tutor had made him read, look for places on the map, (and which he found more readily than awake,) and perform many other actions, all of which he per formed more readily than in his waking moments. All this time bis eyes would be open and fixed; he did not move them in the least, but would turn his head to vary their direction.

A story is credited to Professor Upham of Bowdoin College, relating to a farmer who rose in his sleen, went to his barn, and thrashed out five bushels of rye in the dark, separating the grain from the straw with great exactness. Captain Brown, of Portland, Me., while at sea, became very ill and confined to his berth. Those on board noticed a peculiar stiffness and rigidity of his limbs. Though encompassed by timber, and unable to go on deck, he saw distinctly all that passed around him; describing many vessels that passed his own, logether with several at a great distance, at anchor; and told all that took place on board of them. His descriptions were confirmed in every instance where it was possible to make inquiry.

The letter of Mr. John Wise, of Lancaster, Pa., will aptly conclude our cases of natural somnambulism :-

[^5]tras awakened by a alight shower of rain, and it was with diffiralty , made a ssfe deecent by way of the next neighbor's house, which obliged me to rouse the family in order to get back to my bed again.
"The most singular feat, however, the. I performed in the somnambu ic atate, was a situation that I got into, out of which I could not extricata ayself again in a waking ptate, neither could I, upon trial, without the sistance of something to atep on first, get into it again. The room in shich I slept at this time, had in it an old-fashioned cradle of double gagth, made for twin babes. This was placed upon a long narrow keg, which atood on its ends, so that when standing alongside of it, the sidea of the cradle came within two inches of my chin, and it was so poised, that a slight p ponderance either way would capsize it. During one of my noctornal arsmbulations in the middle of the night, by some means I got into this adle, without the assistance of anything that would eunble me to atep 1 , save some atrange inexplicable cause. It was a cold winter nigbt, and I became awakened while in the act of pulling books from around me, which were in the cradle at the time. After being perfectly awakened, it required a great deal of caution to support my centre of gravity, until I had called the assistance of some of the family to enable me to get down.
"In the somnambulic state, I am told my eyea are wide open, and have a glassy appearance. Although I would answer questions, and talk freely on aubjects that were indicated by my conduct, yet it was next to mpossible to awaken me by any other process than the application of cold water. After a more advanced age, these aymptoma have taken a different form. my nightly perambalations being confined to my chamber, and they are more particularly connected with the organa of hearing and vision. It does appear, that, like the inner vision withont the sid of the external eye, there is aleo a distinct faculty of hearing, independent of the external ear. This has been experienced by persons of my acquaintance. I have frequently hastened to the place from whence sounds sppeared to come. Generally it sppears to be the calling of my name, by persons whose voice 1 can recognize; but the most frequent delusions are through the eye. These symptoms, from their frequency, although not fearfal in themselves, have been of late a source of annoyance, and they elways occur in a half-waking condition. The clearer and amoother the chamber in which I sleep, the lens am I annnyed with these delusions. Of these aymptoms and their operations, I have a tolerable distinct recollection afterwards. I generally find myself sitting up in bed, in the act of getting ap and moving towards the objects, which mostly appear to be human beinga, and often persons of my acquaintance. Although this happens te me in a half-waking condition, still, I possess the faculty of reasoning within myself apon the necessity of not minding these delusions, but seldom become perfectly satiffied uutil 1 get up and try th touch tha object bat invariably get a wake on being touched by another person

Atror being awakened, it has often appeared to me that a conflict had been going on between the material and spiritual functions."

Lady. Is somnambulism ever induced by disease?
Doctor. There have been a great number of casen recorded by the medical profession, in which illness developed the faculty, and when restored to health it would be lost. Many of these cases present all the phenomena of induced prevision, clairvoyance, etc.; and, what will seem a strange fact regarding the matter none ever think of doubting them, not even the most bitter opponents of fascination; yet speak of them in connection with fascination, and you will but excite their anger.

We find a case published by two French gentlemen of this character. The patient predicted a detail of the principal events that should happen to her in the course of the following years, of the maladies to which she would be subjected,-of the remedies which would be necessary,-of the effect of these remedies,-of the crisis which she would experience,-and of the precise period of her cure; all of which were substantially cor eect and accomplished.

Lady. Do medicines ever produce symptoms similar sthese?
Doctor. Quite a large number of cases produced by redicinal substance, are also recorded ; the cases vary rom those of intense mental exaltation and development $f$ the intellectual powers, to catalepsy and trance.
Dr. O'Shaughnessy, describing the effects of Indian semp, tells us that in a lad of excellent habits, ten dropa of the tincture induced the most amusing effects. A shout of laug'.ter ushered in the symptoms, and a transition state of ataleptic rigidity, occurred for two on
three minutes. IIe enacted the part of a rajuh giving orders to his courtiers; he could recognize none of his fellow-students or acquaintances; all to his mind seemed as altered as his own condition; he spoke of many years having passed since his student days; described his teachers and friends with a piquancy a dramatist would envy; detailed the adventures of an imaginary series of years, his travels and his attainments of wealth and power ; he entered on discussions of religious, scientific, and political topics with astonishing eloquence, and disclosed an extent of knowledge, reading, and a ready apposite wit, which those who knew him best were altogether unprepared for. For three hours and upwards he maintained the character he at first assumed and with a degree of ease and dignity perfectly becoming his high assumption.

Similar facts were known in ancient times. The Thracians used to intoxicate themselves by casting the seeds of certain poisonous plants into a fire made for the purpose, around which they sat and inspired the uarcotic fumes. Moore says that there can be no doubt that the incantations of witcheraft and magic were generally attended with the practice of burning herbs of a similar kind. The ancients deemed certain temperaments essential to the reception of the divine efflatus, and the melancholic was considered the most suitable, especially when aggravated by rigid abstinence and the use of narcotics, (this exactly suits Swedenborg, etc.) Pliny informs us that the soothsayers were accustomed to chew roots supposed to be of a certain species of henbane. The Hindoos employ the Indian hemp for the same purpose; and in St. Domingo the supposed prophets chew a plant called cohaba, that
hey nay be the better able to look ints the unseen world and perceive the shadows of coming events. Sophocles called the priestesses of Delphos laurel eaters, because they were in the habit of chewing the leaves of that shrub before they mounted the tripod, etc., etc.

Townshend tells us of a sleep-waker who played beautifully on the flute, and was accustomed o improvise upon that instrument with all the musical genius he possessed; but the charming strain, once uttered, was lost forever. One day, in sleep-waking, being asked to write down a composition, he instantly seized music paper and a pen, and wrote down the air you observe on this paper. I need not mention that he was utterly incapable of such a display of talents in the waking stats.

## 

POUS LA FLTTE.

# The following case of diseased somnambulism is wen from Mr. Sandby, It is related with singular ruthfulness and accuracy. 

" It is perfectly true, that our poer friend who han now been some monthe with us, presenta one of those siugular and almost incrediblof hysterical or nervous affection, which are at distant interval witnessed under the diapensation of the Almighty.
"The overthrow of the regular functions of the nervous system, was secsaioned by the almost sudden death of her father, to whom she wes mosest fondty attached, who was seized with illness, during her absenca from him, and died in a few hourn after she returned to her home. I cannot enter into any longer details of the case, which bas been attended with all those varieties, which have long characterized the complaint, among medical men as the Protean disorder. The extraordinary powers communicated to the other senses by the lemporary suapension of one or two of them, are veyond credibility to all those who do not soitness it; and I really seldom enter into any of the details, becanse it would be but reasonable, that those who have not seen, should doubt the reality of them. All colora she can distinguish with the greatest correctness by might or by day, wheither presented to her on cloth, silk, muslin, wax, of even glass-and this I may anfely say, as easily on any part of the body To with the hands, althoagh, of course, the ordinary routine of such an exhibition of power, takes place with the hands,-the other being that of mere curiosity. Her delicacy of mind, and high tone of religions feeling, are such, that ahc has the greateat objection to make that which she regards in the light of a heavy aftliction from God a matter of show or curiosity to others, althoagh to ourselves, of course, sll these unusual axtravagances of nervous sonsibility, are manifest, for at least twelve ont of every twenty-four hours. She can not only read with the greateal rapidity any writing that is legible to us, music, etc., with the mere passing of her fingers over il, whether in a dark or light room, (for her signt is for the most part suspended, when under the influence of the attack, or paroxysm, slthough she is perfectly sensible,-nay, more acut a sad clever than in her natural state,) but within this month past, she has been able to collect the coutents of any pristing or MS., by merely laying ber band un the page, without tracing the lines or letters;-and I naw her tast night ouly, declare the contents of a note just brought into the room $\boldsymbol{m}_{t}$ in this way, (when 1 could not decipher it myself without a candle,) and with a rapility with which 1 cunild not have read it by daylight. I havo seen her dovelop hand-writing by the application of a note to the back of her hand, neek, or foot; and she can do it at any time. There is nothing onatybal in thie, for of course the nervous susceptibility extends all over the surfice of the halv, but nse and habit sanes us to

Fimit itn power more to the fingers. Many, oven medical men, tske apor themselvea to declare, that we are all (her medical attendants as well) under a mere delusion. We ask none to believe anyting, il they prefor not to do so, end only reply-The case is equally marvellous eithen way:-either that this our poor patient should be thus afflicted, or that eightoen or nineteen persons of my family and friends, in the daily habit of sesing her, should fancy she is for every twelve hours out of the tweny-four, doing at intervals, that which she is not doing. There are many exhibitions of extravagant powere which she possesees, that we tall of to no one; for finding it difficult to acquire credit for leseer things, wo do not venture on the greater. Her poner ceases the moment the allack pasees off. A considerable awelling has at times been visible at the back of the heed, which has yielded to the treatment.
"It is certainly a case which would be an instractive one, in the consideration of the physiology of the human frame; but she, poor thing! be mat averse to experiments being purposely made on her;-but in her ewery day life among us, we have no lack of proof for atl we believe and tnow.
"Between the attacks, she is as perfectly in a natural atate, as ever she was in her life. There is bat one paradox in her state; and that is, that abo can at such times, hear some sounds and not olhert, thongh very mach londer,-and sec aome things, and not others, though placed before her. Ehe could hear a tuac whistled, when she could not hear a gun fired close to her. It is certainly the absorption or absence of mind that ocosmone Hing abocest to some thinge, though present to others, lizer any eboent anal and threa Dr. Y-acoorntes for it ${ }^{n}$

## HISTORY OF FABCTATION.

Docros. We have now reviewed, with \& rapd glance, the six stages, curative effects, and natural conditions, simulating the phenomena of fascination. To complete our plan, I have compiled a brief history of the matter, which, with your permission. I will read.
Lady. I am anxious to hear it. It certainly appeers strange to me that the matter should have been forgot. ten through the middle ages, and, until very lately, remain unknown.

Doctos. That it was known and practised is an undoubted fact, but it was, after the Christian era, confined to convents; and many a miracle at the tombs and other depositories of the relics of saints, may safely be referred to this agency of fascination. In some instances, the Esculapean visions, prescriptions, etc., were repeated. St. Gregory, bishop of Tours, tells of the efficacy of pilgrimages to the tombs of saints. Says he: "Any person filled with faith, coming near the tombe and praying, will be speedily cured of whatever illness may befall them. Some affirm that the saints appear to them in the night (of course while sleeping on or near the tomb), during their dreams, and reveal the proper remedies." For any number of sinilar instances, see accounts of St. Martin, Protegene, Moses of Lysbia. Jolianus of Edessa, St. Litard, St. Fortunatus, etc., etc.
Leger quotes George Fabricius, who, in his Commen
tary on Poets, 1720, p. 73, says that he saw, in Padua country people who were going to the church of St. Anthony for the purpose of obtaining salutary visions during their sleep. "This," says Fabricius, "exactly resembles the ancient pagan worship. And in truth, even at the present day, the churches of saints are resorted to, to receive the same kind of revelations for curing disease."

The king of France, from the time of Clovis, was the royal fascinator of his day. Laurent tells us that one of the officers of Clovis was afflicted with scrofula; the king felt much concern for him, as the resources of medicine had been tried in vain. He dreamed, one night, that if he touched the officer's neck, it would become well; he arose in the morning and did so; from that time the power remained in his family.

Marino Cavalli, ambassador from Venice to France in 1546, thus describes the operation of touching for the scrofula. After giving a description of the reigning monarch, Francis, he says: "Like all the monarchs of France, he has received from heaven the singular gift of curing the evil. Even Spaniards flock hither to profit by this miraculous property. The ceremony takes place some solemn day, like Easter, or Christmas or the festivals of the Virgin; the king first confesses and receives the sacrament, then makes the sign of the cross on the sick, saying: 'The king touches, may Gor cure thee! If the sick were not restored, they woula not, doubtless, flock hither so far; and since the number augments always, we must believe that God takes this methed to deliver the infirm, and to increase, at the same time, the dignity of the crown of France." The power, however, it seems only remained with them

While virtuous; for the abbot of Nogent tells us that Philip the First, who at first possessed the gift when he ascended the throne in $\mathbf{1 0 6 0}$, lost it by indulgence in vice.

Many other monarchs, determined not to be outdone, assumed the same power, not curing scrofula alone, but all other diseases; in one instance it was of singular benefit to one of the "Lord's anointed." James, the exiled king of England, engaged himself as a toucher for scrofula in the public hospitals of France. Fascination was also useful, in some cases, to the royal operators themselves: Tytler, speaking of Charles VI., tells us that "he once narrowly escaped being burned to death, and in consequence was seized with a dreadful fit of frenzy. To relieve him, they sent for a magician from Montpellier, and he became somewhat better."

We are told by Beniveni, a Florentine physician, that he hed a young man under his care, who was wounded in the chest by an arrow, which surgical skill could not ext'act. After a time of great pain, this faculty of prevision became developed, and he told the day and hour when the arrow-head should issue from the wound, and the time of his perfect cure; said he would go to Rome, die there, etc., with many other strange particulars, all of which, to the astonishment of the narrator, happened exactly as he had predicted them.

In the eighty-fourth page of the Life of the Queen of Navarre, it tells, while lying at Metz, at the point of death, in consequence of a severe fever, she described the battle of Jarnac in every minute particular; told the victory of her son; his falling to the ground, death of the prince of Condé, and flight of the enemy; and the information was confirme. ${ }^{l}$ the next night, $s$ the
estonishment of her attendants, who had thought bes delirious while giving it.

Van Helmont tells us, that "there exists in man a certain energy which can act beyond his person, according to his will or imagination, and impart virtues, and exercise a durable influence, even on distant objects"

Cardanus at Naples, in 1501, performed extraordinary cures by fascination. He declared that nature had endowed him with strange faculties. He could go into sleep, waking at will, and in that state cure himself of an occasional attack of the gout, prescribe remedies, see at a distance, and correctly predict future events. For all these faculties he was imprisoned, as a sorcerer. st Bologna.

A volume might easily be filled with facts similar to the above. But it is unnecessary to recite them all; when once attention is awakened to the subject, enough can be found in our every-day reading and observation. Suffice it to say, that there is an uninterrupted chain of evidence from the earliest times to the present. I shall briefly, then, recount a few of the most remarkable, which I will mainly extract from Dr. C. R. Hall, a bitter opponent of fascination, but who, despite himself, gives such evidence in its favor-even his own experience proving it-that the perusal of his book, "The Rise, Progress, Mysteries," etc., etc., will convince any person of the reality of the subject he tries to injure, and also of his own silliness in endeavoring to make ridicule a test of truth.

In the seventeenth century there appeared in England a gardener, Levret, an Irish gentleman, Valentine Great raks, and a Dr. Streper; and in Italy, Francisco Bagnone, etc., all of whom possessed the power of curing
diseases by touching or striking with the hand. The most celebrated of these, Greatraky is represented by the Lord Bishop of Derry, as being a simple, unpretending man, and sincerely pious. The same authority informs us, that not only had he seen, among other cures, "dimness cleared and deafness cured by his .ouch, etc., etc.; running sores of the king's evil dried ap; and kernels brought to a suppuration by bis hand grievous sores, of many months' date, in a few days healed; obstructions and stoppages removed;" but "even cancerous knots in the breast dissolved."

Gassner, in 1770, excited much attention in Germany and performed several miraculous cures. In 1794, a Count Thun appeared at Leipsic, professing to cure gout, palsy, and other complaints, by the imposition of his hands; he was of a weak constitution, and his success would vary.

Mesmer was born in 1734. He was a severe student, and soon became a proficient and able physician. It has been truly observed that from time immemorial the mineral magnet was employed as a remedy in the cure of burns, and other injuries, but it was not until the sixteenth century, when alchemy was tn its zenith, that its use as a remedy for internal diseases became general. At this time there was the earliest speculations on the extensive diffusion of the magnetic principle which, as in our own day, was made to explain the motions of the planets and the laws of life.

Mesmer fell into the universal error, and commenced treating the sick by means of magnetized rods, which he obtained from Father Hell or Holl, a Jesuit, profeasor of Astronomy at Vienna. His great success astonrehed himself, and ver? much chagrined the professor
the consequence of which was an irreconcilable quarre between the two. The acuteness of Mesmer soon led him to perceive that he might dispense with the rods and that he could produce the same effects by merely drawing his own hands from above downwards in front of his patient.

His success in fascination was wonderful; for a great number of years nothing like it had been seen in Europe, and the fame of Mesmer spread rapidly. He left Vienua, and travelled through varions towns and cities in Europe, met with considerable encouragement finally returncd, and then left for Paris, where we find him established in 1778. D'Eslon, one of the court physicians, was his first convert ; others soon followed, and the majority of the Parisians declared in his favor He finally surmounted the enmity of all his opponents and retired with a large fortune, the result of his benevolent exertions, after founding a school of pupils, nearly all of whom became celebrated. The facts in his experiments were allowed by the French Academy of Medicine, but the idea of a fluid denied.

The Marquis de Puseygar, one of Mesmer's pupils, having, in March, 1784, fascinated his gardener, found that his patient was capable of holding a conversation while wrapped in induced somnambulism. He found, moreover, that the patient not ouly understood the words, but even the unexpressed thoughts of his master, and would answer with equal clearness the intended question while it was yet a mere suggestion of the mind, as after it had been conveyed to him in language This was the origin (wrongly so called) of induced somnamberlism.

In 1778 Perkins, an American surgeon practising in

London, invented and obtained a patent for his "metal. lic tractors." The tractors were merely small pieces of steel, strongly magnetized, (nothing more than a different form of the magnetized rod.) They were applied over the affected part, and gently moved about, touching the skin. Gout, rheumatism, toothache, and palay, were a few of the diseases cured by the tractors, etc Among those who publicly vouched for the truth of the wonderful cures performed by means of the tractors, were eight university professors, four being professors of medicine; twenty elergymen, ten being D.D.s; thirty-six medical men, nineteen being M. D.s.

To prove the error of these doctors of divinity and medicine, two men in Bath had precisely similar instruments made of wood, painted and shaped so as exactly to resemble the real ones. These were publicly tried with all due solemnity, at first upon five hospita patients. Of these four were affected with chronic rheumatism in the ancle, knee, wrist, and hips. The fifth had chronic gout. All were much relieved. One was sure that his knec was warmer, and thought tha' he could walk across the room. He did so, though he had previously bern unable to stir. The following day the real metallic tractors were applied, with results pre cisely similar. Mr. Smith applied the wooden tractort to a patient with rheumatism of the shoulder, so severe as to prevent his raising his hand; in four minutes th man wous able to lift his hand. In another patient ths. fictitious tractors caused so much increase of suffering, that he would on no account submit to a repetition of the operation. Had these sapient individuals but half the talent of Mesmer, they would soon have discovered the real scurce of action.

Fascination has beer known and practised to a greater or less extent in the United States since tea early part of the nineteenth century; at the preseni time we have scores of lecturers traversing the country The people receive it rather doubtingly; they want some show of reasoning to sustain what they consider experiments against the laws of nature. To show the feeling I cannot do better than add an editorial from one of my exchanges. After describing the scene, performers, and examining committee, to the latter of which he belonged, he says :-
"The first evening the lady's eyes were bandaged so that the commitlee were natisfied she could not see. On Thursdoy night more then usual pains were taken. Adbesive plasters were pat over her eyes, and they did positively adhere so closely to her skin that they were with difficulty removed. Over these, soft kid gloven were spread, over theso again, a handkerchief was tied, secured above and below by tape stringe.
"It was an unusual and very severe test. Her eyes were, withons loubt, in total darkness-in regard to that, there is no possible mis take; but notwithatanding all our precantions in bandaging, shz did ame. She read the names of a score of newspapers, and some of the smaller print on them-she read writing with a lead pencil-told the time by sumerous watches, though set far from the true hour, and described the watches. She also read several bank notes.
"She held the papers, etc., over her forehead, at the lower edgo of her nair. While engaged in her readinga she was very aprightly, and evinced considerable smartness-but we have not room for farthor detail.
"In regard to this matter, we can only say that wo do not comprehand it. If it be trickery, it is splendid trickery. The jugglers of the Eest matound yon, but they prepare all the machinery-here you are allowed so prepare the subject to your own astisfaction. In regard to the preaumption that arises in the mind, so soon as we are convinced that she cannot see with her eyes, that there is some series of cunningly devised und secret signs by which communications are made to the young ludy, wo have to say, that watchea and papera were given to her that no eye saw but our own, and yet she told es usual
"Our atubborn skepticism prompts as to say, that though witnemelng sucb bewildering testa a thousand times we would believe we were a
 krin, upllroagh bes skull."

Lady. I think there is evidence enough on the subect of fascination to convince the most incredulous, and were the matter of our conversation published, no one would rise from its perusal without keing a thorough believer.

Docror. In advancing the various arguments, I have merely reviewed the substance of the conclusions that have convinced myself. Some curious phenomens accidentally observed, led me to examine the matter closely, and the result has been not only an entire conviction of its truth, but an equal conviction that that truth may be made so plain as to appeal to the common sense of all.

My knowledge of the subject has given me a : Iue to unravel much of the history of superstition in this world. I have found fascination to be a most terrible agent of imposture in all ages, as we have before seen Jehovah punished its practice among the Jews with death; that is, its practice as regarded the production of spiritual clairvoyance for purposes of divination : in other respects it was extensively known and practised as a curative agent. Witness the case of David, etc.

In our own day, Robert Cochrans, Joseph Smiths, Swedenborgs, etc., etc., are in turn gaining hosts of followers, and all through ignorance on this subject. Fascination, however, will most assuredly crush them. and so well is this fact known, that, perceiving ite onward progress, many of them are even now endeav. oring to wrest its phenomena to support their own views. Professor Bush says that the "Clairvoyance of Swedenborg was not induced by human agency." Granted. "That, unlike the magnetic seers, who are n a state of internal, but not at the same time of exten
nal consciousness, Swedenborg was in both at once Hus prerogative was the opening of a spisitual sight whith left him still in the enjoyment of his naturat sight. Hence he could know and distinctly describe ir his state of external consciousness, what he saw with his spiritual eyes, and could know with perfect accuracy, free from all illusion, what was going on around him in the natural world, at the same time tnat he perceived what was transpiring in the spiritual world; and so perfectly was he in the possession of external consciousness while in the exercise of his spiritual perceptions, that on one occasion, when moving in a funeral procession, he was actually engaged in conversation with the spirit of the person whose body he was following to the grave."

If such be the case, and Swedenborg's supernatural claims rest on the fact of his seeing and holding communication with both worlds at once, then must a single well-authenticated fact, like that of the boy who possessed a similar power mentioned some pages back, overthrow all such claims, or indefinitely extend them; and this, too, without considering that Swedenborg's revelations were a natural sequence to his former philosophical speculations, and but confirmed them. However, as my object in these conversations was more to suggest thought than enter into detail, we will now end them.

Lady. Will you be kind enough to give me some directions with regard to the best manner of faseinating? As you think ladies as well as gentlemen can practisn it, I would like to be able if ever called upon.

Doctor. With pleasure; and I do it the more readily pecause I know your motives in such cases woud be
proper ones. It is certainly one of the must remarkable facts in the whole matter, that the moral feelinga exercise an extraordinary influence. Philippe the First of France has not been the only one who lost the power by ill conduct; for the evil disposed often become curbed and shorn of their strength in a surprising manner.

Both patient and operator should be comfortably seated, so that neither will experience uneasiness in consequence of pusition. The seat of the operator should be higher than that of the patient-the apartment neither too hot nor too cold, and as few witnesses as possible, but one person always present. Never begin the process if agitated, but wait until perfectly calm and self-collected. When all is ready, seat yourself oppo site the patient, inclining sideways, and taking his hand. so that the inside of the thumbs of each press against the other, the hands resting on a knec of each; keep them in that position a few minutes, until an equal warmth is felt, gazing, after the first minute, steadily, out not with an effort, into his eyes. Still gazing. release his hands, and unite your own with the palma touching each other; then separate them to the right and left transversely, (remembering that while communicating the influence, the hands, when passing from the patient, must always have the back turned to him, and the reverse when taking him out of the state,) raise them to the head, let them rest on it a few moments, slowly carry them down the side and lower part of the head to the shoulders; allow them to rest a few moments there also, and then gradually pass down the arms to the end of the fingers which should be resting on the knees; al his time only the extremity of your own fingers should
souch, and tha very gently; at the end of each pasa slightly shake your fingers, as if to throw something from them. You had better continue the passes, as a general rule, until the eyes of the patient close. Then allow your hands to rest two or three minutes on the head, and keeping your fingers in a crooked position, so as to directly point to but not touch the parts you traverse, pass slowly over the eyes and chest to the stomach, where the thumbs had better remain about twice as long as they did on the head, the fingers resting on the sides; thence carry them down to the hips, knees, and feet. Do this a few times, and then confine your passes to the arms and body, without the head.
The sitting may continue from half an hour to two hours ; but forty minutes I have found a good average time. Of course, it depends, in a great measure, on the impressibility of the patient, and the degree of relief given. When it is desirous to terminate it, make two or three passes from the knees to the feet; then several transverse passes before the face and chest in a brisk manner.

Make up your mind, beforehand, not to be alarmed at any strange and unexpected symptoms that present themselves during the operation; and whatever does occur, keep perfectly cool, and betray no agitation of manner; if you let any signs of alarm escape you, your patient is almost certain to go off into convulsions. Mrs. W. came into my house, one day, in extreme pain, arising from a wrist that had bee": twice sprained; at times her agony was dreadful. ad opiates, etc., entirely fauled to relieve her. A few passes down the arm and wrist gave ease, and finalif, by continuing the prccess the pain ceased: at the end of twenty-four hours it re
turned, and the same results followed the operation The third tine, I proposed putting her to sleep; after a while her eyes closed; she made a violent effort to open them, and, failing, became much frightened, and a cold perspiration broke out over her. I instantly reversed the passes; but it was some time, after awaking, before she became calm. She was afterward courageous enough, went to sleep without trouble, and became finally cured.

One of the first cases upon whom I ever operated was a Miss L. After a lapse of some ten minutes, she declared herself incapable of breathing, and I could not discern the pulse at the wrist. Her agitation became extreme; she said death would surely ensue, and wished her cousin, who was present, to call her mother. The cousin, equally with herself, was frightened; so much so, indeed, that she was incapable of obeying her request, though making great efforts to do so, seeming like a person with the nightmare. Though dreadfully agitated, I continued the passes, directing them altogether from the knees to the feet, and making some in in a transverse direction over the chest. She soon breathed and the heart beat; but, ere both actions were regulariy established, she was insensible. I have rarely seen a person more benefited by the effects of fascination.

When you can be guided to the seat of pain, keep your fingers over the spot, and make the passes in that direction. Toothache, headache, sore-throat, rheumatism, etc., will vanish under such manipulation, often with a rapidity that equally astonishes the operator and the patient.

In operating, husband your strength as much as possible use no nore exertion than just enaugh to give
the requisite motion to the hands and arms. You will lose enough by imparting the nervous fluid, without unnecessarily increasing the debility. This is a common fault with young fascinators.

If the operator succeeds in giving relief from pain, he has produced the only pheuomena he ought to expect. Do not allow the skepticism of those about you to rashly involve you in the mazes of experimenting on your patients. Point the unbcliever to the results; if he attributes them to imagination or anything else, don't dispute the matter-let him have his own way, without your interference. Have patience-bide your time-and your turn will come, and, when it does, will richly recompense the delay, and satisfy your curiosity So great are the marvels, that our minds must be grad nally prepared to receive them, or we could not bea the communication with safety.
Newnham remarks, that the most important and fun damental characteristic of a good operator is, on his part, the possession of sound thought and firm will ; hn inust not employ his processes in a thoughtless or care less manner, or they will be unsuccessful; but he must really throw his mind into the duty-must be attentive to what he is about-must wish to do good-not allowing himself to wander into distant or discrepant scenes, but concentrating his will upon the object before him. He should be free from impertinent curiosity-a capital moral blemish in ordinary life, but still more so in magnetic pursuits-because the good of the patient is forgotten, the attention of the operator distracted, and fixed upon any object rather than his patient's health in such cases, no satisfactory results can be expected
Deleuze spoaks of a prosian that may be employed

W th great advantage in local pains; this is, to place a piece of hinen several times folded, or a fragment ot woollen or cotton cloth upon the suffering part; apply the mouth above it and brearhe through it ; it excites a lively sensation of heat, and the breath, which in charged with the nervous fluid, introduces it into the system. Then expel the pain by passes.

Somnambulism (says Deleuze) demonstrates the twofold existence of the external and internal man in a single individual. It offers a direct proof of the spirituality of the soul, and an answer to all objections made against its immortality. It makes evident the truth, known to the ancient sages, that man is an intelligence, served by organs. Never seek to produce it ; but when it comes naturally, profit by it as much as possible. It is dangerous to try to produce this state by directing passes to the head; make them equally over the body. If nature is disposed to this crisis, the fluid will. of itself, be carried to the brain, and the tendency be manfested by the extreme tranquility of the patient. Then, after passing your fingers, five or six times, at a short distance before his eyes, ask him whether he sleeps, and if be answers in the affirmative, you may ask him regarding the treatment. Don't press questions, if he shows no disposition to speak: let him alonc-it is of no consequence; it is not your object to render him a sleej-waker, but to cure him. If such a state were necessary, it would spontancously develop itself.

In concljsion. I would remark, that the onlt object of the operator should be to cure his paTIENI ; THIS CANNOT BE TOO STRONGLY INGIBTED UPON. TRY NO EXPERIMENTS; WAIT PATIENTLY, AND FOLLON TAE TEACHINGS OF NATURR.

## APPENDIX.

## 

"In October, 1842, on my way to the synod of Genews I moest the ight at the honse of Mr. Hall, at Byron. In the evening I galled or dev. Mr. Childs. On entering the room, I found his eon, an intelligena boy aged ton years, then in a cataloptic fit, sitting in his father's arms and his feet in warm water.
"In a few momente he recovered. He frequently had from three to six fits a day-bad received the best medical attendance in the region: was no better-daily worse. He had lost entirely the powor of apeech, for several days. Great fears were felt that he would never recover There was a sore place on the back corner of hia head, and on the spine, occasioned by a fall, some months previous. When the fits passed of he became hungry, and not at all droway; and during the interval sppeared preternaturally bright, and engaged in sports with companions, as usual.
"After I had conversed a few minutes, I asid, 'I would have him magnetized;' to which his father replied, 'I don't believe in it at all,' and the mother added, ' If you'll put me to sleep, I'll believe, and not without' I replied, 'I would try it: it may do good, and can do no barm.' During this conversation, I made a few pasees in front of the child, chiefly with one hand, and without any particular concentration of the mind or will, and mostly with my face toward the mother. In lean than a minute the father said, 'He is in another fit! No, be isn't, I declaro: I believe he is asleep.' Mach sarprised, (for I had never mag netized one, ) I said, 'It surely cannot be what I have dono; but if so I cen awaken him.' Then, with a few reversed passes, he swoke. 'Well, this is strango,' said $I_{i}$ 'but I can put him asleep again, if it is real,' I then seriously repeated the passes, with both hands, for one or two minutes, and placed him in the perfect mesmeric sleep. I then fixed my eyea on a lady on the opposite side of the room, the boy not yet having spoken for three days, and said, 'Henry, what do you seer' in a fall, decided voice. He replied, 'Azubah.' I then looked his mother in the bace, naying, 'What do you see t' He gave a name unknown to me$I$ looked to bin father, who replied. 'It is her maiden name.' I then took

Tt the fece The mother now whispered to one of the childron, whe Left her seat, and I said, 'Henry, what is she going for 't' 'Bugar, and I love it,' be answered. She went to the closet, and broaght the sugar. I put mume into my month, which neerned to give him the asme pleasure an II had pot it in his own. I then ssid, 'What kind of sugar is it 'Maccovado.' 'What is its colort' 'Well, wir, a kind of light brown.' A amall glean jar, with a large cork, was now placed in my hand, whea bmmediately I observed the olfactory nerves affected, and the muscles sbout the nose contraoted at the same moment. I said to the girl, ' Whes la it"' to which the boy answered, 'Hartahorn.' 'How do you know Y' 'I smell it.' I myeelf neithor knew nor amelt. I then took out the cork and applied it to my own nose, when be instantly placed hie fingors ou that part of the nowe next the forehead, and anid, 'I feel it here,'-Jant where I myeelf experienced the burning sensation.
"During all these experiments be sat on his father's knee, with his bead down on his breast, and reclining againat his father.
"I now anked him, ' What is the matter with you f' 'My brain in eore,' 'Where 1 ' 'At the bottom of it.' 'Where it joins the apinel marrow,' (medella oblongata I) 'Yes.' 'What occasioned it t' 'I fols from the grest beam in the barn.' His mother here asked him, ' Why did you not tell as before I' 'I feared you would not let me play there.' 'Can Doct. A - cure you 1' 'No.' Why not?' He don't know anything about it,' (rery decidedly.) 'Can Doct $\mathrm{C}-\mathrm{r}$ ' ' Na .' 'Why $v$ 'He don't anderstand it', 'Will the medicine you now ano do you good 1 ' 'No' 'Of what is it composed' 'There is taryentine In iL' 'Does the Ductor give it you for tape-wornt ${ }^{\prime}$ ' Yes.' Hav' you any ${ }^{\prime}$ ' 'No.' 'Would you like to walk $\gamma$ ' 'Yes.' 'Well, walk.' He arose promptly, atepped between the chairs, and anid, 'Well, wif, where oball I gop' •From the wall to the door, and back.' This la did, avoiding every obstruction; and, at my direction, returned and met ngain with his father. 1 now, without notice to any one, placed my fafier on the organ of Benevolence, thinking at the moment it performed th, office of Veneration, and said, ' Would you like to pray ?' With somes Ightnem, he said ' No .' Some questions were asked, by his mother and mynelf, about the Bible, etc.; bat no Veneration appeared. I then recollected the true office of the organ, and asid, ' Have you enything in your pocket 1' He took out a knife. 'Give it to me for my little boy, which be did promptly. I removed my band. 'Have you anything stise r' 'I have a pencil.' 'Will you give me that for my other boy 1' It has no head $t$ ' 'Never mind; give it-won't you "' 'I shouldn't like to. 'Well, but you will!' 'I couldn't come it!' (with preculien smphacis., Azubah said, ' Ask him where the heed of the pencil is. Where is it, Henry ${ }^{1}$ ' 'Well, sir, in the parlor.' 'Where1' 'On the window'. Azabah mid, ' Why, I picked it ap and pat it there to-day ! (Wle certeinly did mel know this.) I then mid 'Henry, aan you get int

He arose, and went into the parlor in the dark, and took the head of the pencil-case from the window, to the very great surprise of us all. In deed, we were all so astonishod, that it seemed a dream. Vurng these and subsequent proceediugs, he spoke with a promptness, boldness and propriety, in advance of his years, and beyond himself in his natura stato; and so perfectly evident was it that he was in a somnambulic state that no akeptic, I verily believe, could have doubted.
"At my request he returned to his seat. I touched Benevolence, and matantly he handed me the pencil-case. 'For my boy 1' 'Yes, sir.' I then silently, and without any willing, and with a feeling of curiosity te see and test the matter, touched Reverence. His countenance at once masumed a softened and solemn aspect. 'Henry, would you like to pray "' 'Yea, air.' 'You may.' He then commenced praying inandibly. 'You tnay pray alond.' He then prayed in a low, audible voice. On touching Tune, he sang a tune, though not in the habit of singing. On tonching Combativeness and Destructiveness, he raised his clenched fiat to strike me. He was ignorant of Phrenology, and also of my intention to to ach any particular organ ; nor did I, in any case, will the activity of the organ. I now took nut my watch, and holding the dinl towarde myaelf, and above the line of his vision, his eyes being closed, and his head bowed forward, and my hand also being between him and the watch, I aaked him, 'Henry, what time is it ?' 'Eight o'clock, sir,'-which was exactly the time by the watch, thongh by the clock in the room it was fifteen minutes faster. 'Heury, how long ought you to sleep ?' 'Well, sir, I must sleep two hours and five minutes.' 'Will you then awake i' 'Yes, sir.' 'Very well.' This I did for the propose of testing his knowledge of time, as atated by Townshend, an English clergyman, whose work on this subject I had read.
"I then said, 'Will you go with me to Mr. Hall's Y' 'Yes.' 'Well, now we are there-now we are in the parlor: who is here ?' 'Mr. and Mrs. Hall; Mr. and Mrs. Bardwell.' 'Who else?' He did not give their names, but intimated that they were atrangers. He deacribed the room and position of things, all of which I found correct, on going to the nouse shortly after. These persons were not in the hnbit of being there in the evening, but company having come in, they were all together at that moment. As this was in his own town, I did not deem it proof, and mossid, 'Will you go to Batavia?' 'Yes.' 'Well, now we are theronow we are at my house-now we will go into my ronm: what do yoa soe 1' ' 1 see a large table covered with black cloth, and with books and papers senttered over it.' 'How large is it $\psi$ ' 'It is about five feet long.' 'How many book-cares $T$ ' 'Three, sir.' 'What sort of a stove 9 ' H, pould bet es did rias dearibe jos, for it was an quoce a thing as ant to bo

by taree and a half, ) or has left it in exoh confusion as mine weat at the momerat
"1 may hore any that, doring the whole period of his sleep, he coald bear the queations of others put to him, and would anawer them, if 1 were willing; but if I willed otherwise, or forbade him to speak, as I often did, be then woald enswer no one but myself, not oven father or mother; nor could he hear their conversation with me, nor with each other.
"I now left him for sn hour, and went back to Mr. Hall's, giving him beave to converse only with tris father. On my retarn, I foumd him in the same state. He utterly refused to speak to eny one bat his fathor, abd told him that ho should not have another fit till the following Sabl,ath, (thie was Monday evening,) which proved true; but when that day came, he had several.
"At nine o'clock and three minatee, holding my wafch ae before, and standing eight or nine feet from him, I asked the time. He gave 'nise o'clock and five mimutea.' 'Look sharp,' said 1. 'Oh! three minutos,' maid he. We were now curioue to nee if he would awake bimself at the two hours and five minutes, and as be did not awake when the clock in the room reached that time, I eaid, 'Henry, did you mean by my watch, or by the clock 7 ' 'By your watch, air,' 'Very well.' At the exset moment he opened his eyen and looked around, nnd this without any aot or wrilling of mise; and what was very affecting and convincing, he coald no longer speak at all, and was unconscioua of all that ho had asid or done.
"I have said that he had no return of fits till the following Sabbath One day after that 8sbbath, he came in to his mother, mich agitated, and apparently going into a fit; and making the pesses, be molicitod his nother to do it,-who, merely to pacify him, peseed her fingers over him; and soou he fell into the mesmeric sleep, and escaped the fit. Aftor thas, he was so highly charged by his sister, that when she wha in the next room, in the cloeet, he would instantly taste anything ohe tasted, eat what she ate, ote.
"In ten days I retarned, and magnetized him again, and wont throogh several of the above experiments. He alwaye, while in the mermoris atate, declared that it benofited him, rolieved all pein, and would oare him.
"After I left, at my saggention, ne was daily magoetized: his fita left bim, his voice returned, the sore spotes on his head and back were removed, and he recovered rapidly, till the family coold no longer mee merize him. A man in the village was fomed, who could and daily did, till'he appeared entirely well. On omitting it he had a fit or two, and it wras resumed; and when I last asw the father, he informed me that they sonsidered the child cured.
"I may add, I have since cured toothache greatly rolieved tio doloreax
and removid other peins and awellings, as well as hosdecho. I anset however, s full beliover in all which is affirmed of olairroyante-whet soe and know, I believe. In respeot to many well-asthenticated facte, I neither affirm nor dony. That thore are many cases of groes dooeption and imposition, I fully believe. On each a sabjeot, it can hardly be otherwise. This, howsyer, is a reason why men of charector and intolli genoe should issertagate it, rather than otherwise. ${ }^{4}$ But it ia deception. Well, then, let us expose it by a finir trial. 'But it is the work of tha levil.' How do you know 1 What is the ovidence 1 What harm has it done 1 ' Oh, bed mon have ueed it for bad onds!' And what is there In the world that has not been so used 1 If it in the work of the devil, then we are not to be ignorant of his devices, and ehould make the examiuation for one's eelf; for ignorant and bad men will not expoes his do vioea. From experiment end observation, I bave no doobt that, an a remodial agont, mesmeriam is yot to sccomplish much good; and so thene can reenlt from it, except, like all other blessinge, it be abused.
