ANIMAL MAGNETISM.

"The subtlety of Nature far transcends the subtlety of either sense or intellect." Bacon.

The subject of "Spirit Rapping" has lately excited a great deal of attention, both in this country and America, and has been much animadverted upon by the press of both countries. By the aid of "Spirit Raps," persons are declared to be enabled to hold converse with their deceased relatives; the raps being so directed as to indicate certain letters upon the Alphabet, upon which the enquirer is looking, and thus spelling out the message sought to be conveyed from the land of Spirits. These Spirits of deceased relatives will also, it is affirmed, move tables, &c. &c. at the request of the Medium, or through her, at the request of The Movement of the Tables, where it is not the effect of a trick, (and in all cases which the writer has witnessed, it has been,) is now proved not to rest with Spirits, not to require the presence of a Medium at a Guinea per sitting, but can easily be obtained, in a short period of time, by a few persons seating themselves round an ordinary table, and submitting to a few simple conditions, when the mundane character of the experiment will be sufficiently obvious.

Upon this new development of the powers of Animal Magnetism has been grafted this most Gigantic Imposture of Spirit Rapping. An Imposture, which, in America, has made a few wise men foolish, and many weak ones mad.* So far as the Imposture has been represented by an American "Medium" in this country, the Exposure in the Leader newspaper, by Mr. Lewis, and in the Zoist for the present quarter, is complete. It is needless, therefore, to repeat the exposure here; all who are interested in this subject, we refer to the above mentioned publications. Our purpose is, at present, to collect such mate-

^{*} The New York Asylum has 30 or 40 inmates from this cause alone. (See Dr. Kendrick's Report.)

rials together on the subject immediately before us, as will convince every unprejudiced and impartial mind of the existence of the extraordinary phenomena of Motion, imparted by touch and volition.

The theory of "Animal Magnetism," and its application to disease, has, notwithstanding the opposition it has met with from the Medical Profession, forced its way despite of adverse interests, and obtained for itself a high position. A "local habitation," in the shape of the "Mesmeric Infirmary," has now for some years existed, and this institution numbers amongst its Vice Presidents, The Earl of Carlisle, Baron Goldsmid, Monckton Milnes, Professor De Morgan, and Dr. Whately, Archbishop of Dublin. Thus embracing amongst its supporters the first Logician and first Mathematician of the age.

Notwithstanding the accumulated proofs of the potency of Animal Magnetism in the cure of the most inveterate diseases, the Medical Profession, as a body, tried to scout it down, branding its operators Impostors, and its recipients Dupes. They have reiterated, that any fluid, force, or influence, however subtle, passing from the human body through the hand, existed only in the brain of the visionaries who affirmed it. "Time," however, "works wonders," and, lo and behold, a demonstration is now presented to the world more palpable than the so-called visionaries could have imagined. The triumph of Dr. Elliotson* and his noble colleagues, who have so bravely "stood the pelting scorn of half an age," will be now complete. Who have been the most faithful in their observations on Nature, will soon be glaringly apparent, and then all honor to those who seeing the Light walked in it, and shame and confusion will be the lot of

^{*} Dr. Elliotson has, perhaps, sacrificed with this generation his well won fame. All honor to him for this! Yet his noble stand for the yet dawning truth shows him to be a man of great courage, intellect, and self-denial. He may descend to the grave without his fame, but let him not repine. Posterity will yet repay him for all. (Dublin University Magazine, October, 1851.) This prophecy is nearer fulfilment than the writer supposed.

those who wilfully closed their eyes to it; or seeing the Light, preferred the Darkness.

We will now turn to the subject of "FURNITURE LOCO-MOTION," and give a few directions for the application of the newly developed force.

Let a few persons take their seats round a wooden table, (the material of which is unimportant,) and having denuded their fingers of rings, place their hands flat upon the table, until the table exhibits a tremulous motion, then let them rise up, keeping the hands a few inches from the table, and, if it be well charged, it will rotate rapidly. In all probability, the force produced issues from only two or three* persons in the group, and it is therefore better that the experiment be made with seven or eight persons, in order to secure a number of persons having the required influence. Should no motion be apparent after the experiment has been tried for half an hour, another group had better be performed. If this be inconvenient, let the same group try again, occupying different positions. A table without any metallic substance connected with it is preferable, and it has been found, that where the table has been insulated, the effect has been stronger. This can easily be done. If the table be a four legged one, each leg can be placed in a salt-cellar or tumbler, which will insulate it completely. It is affirmed, that persons have more of this force after taking food than before.

If a Hat be taken, let all the persons that can, take hold of the brim with both hands, under the conditions mentioned above, and wait till the motion begins.

The following extracts will show what has already been accomplished.

(From a Correspondent of Galignani's Messenger.)

On the evening of Saturday, April 30th, I witnessed at the house of an American gentleman in Paris, a series of experiments, of which I will give a brief account. It may be proper to say that some fifty persons were present, among whom were several l'arisian savans of great eminence, and who participated in the performances; there were also other persons of high distinction. The party was strictly private, therefore I do not give the names. No professed adept in the art was in the room. In the first place, a light mahogany tea-table, with six legs, was placed on the waxed floor of the saloon, and the palms of the hands of four persons (two ladies and two gentlemen) were placed upon it. The formation of a chain or circle connected by the touching of the little fingers, being a mere pedantry of those who

^{*} The writer is acquainted with a lady who can move an object entirely by herself.

know little of the subject, was not observed. In three minutes, the table cracked, undulated, and then moved on being directed by the will of one of the party; it moved along the floor slowly or rapidly to the right or left, forward or backward, when thus directed it also rose on two legs, and resisted strong pressure before it would come down. While standing on two legs, it also turned round to the right and the left, as directed by the will. A child of seven years, weighing 35 lbs., was put upon the table, and it then moved as before, though somewhat less rapidly. Similar experiments were made with other tables, one larger and one smaller, the former moved freely under the hands of two of the French scientific gentlemen, going round and backward and forward, and rising upon two legs or one, in exact obedience to their volition. They fully admitted the astonishing reality. large table, weighing 75 lbs., was tried, and the experiments were perfectly successful. It moved rapidly and freely, and rose upon two legs, by the volition of one of the party, an effect equal to raising a weight of 15 lbs. The experiments were repeated over and over again. There was no doubt, I believe, in the mind of any person present as to the facts here stated. I need but add, that these are but confirmations of what is familiarly known in the United States, and what any sensible person may determine for himself. Let the experiment be made in any circle of a dozen persons, men and women, among these some will probably be found to have the requisite magnetic power, four such persons being found the test is obvious and certain. Two persons of strong magnetic power will succeed perfectly. also seen one person go through with all the performance. to be understood, that a person who has not the power to charge the tables, can direct them if he has a steady intellect, and a strong persistent power of volition. He must put his hands on the table with the others, as far as my observation goes. be understood that I here state facts, and attempt no philosophical explanations.

(The writer of this pamphlet has had this statement of facts

confirmed by a Gentleman who was present.)

The Times of the 20th April, contains an account of similar

experiments at Vienna.

The following complete and detailed account of a series of experiments, by Mr. Bates of the Nautical Academy, appeared in the *Morning Advertiser* of a few days since. It is much to the credit of this well-conducted paper to have been the first journal that made public the first successful experiments in London.

Experiment 1.—A small round mahogany table, about 30 indiameter, was employed; five gentlemen sat around it with their hands (fingers) so placed that a ring of fingers surrounded the

table, the little fingers of each neighbour being joined, also the thumbs of each operator. During the period of about half an liour, sensations of throbbing in the fingers and thumbs, pains in and about the regions of the elbows were experienced, and a perceptible vibration of the table observed. The table was placed on the floor *uninsulated*.

Experiment 2.—The same table, under the same circumstances, was employed, but instead of five, seven gentlemen operated: on this occasion an electrometer, composed of two flaxen threads suspended from a brass wire, was employed to indicate if the table had received an electric charge; the threads were held together by a small strip of lead, and the brass wire was brought into contact with the table by a piece of iron wire. While the table remained uninsulated no effects were perceptible during half an hour beyond the throbbings and pains mentioned above.

Experiment 3.—The table was now insulated, by being placed firmly on an ordinary electrical stool about a foot square, a party of gentlemen sitting round as before; the same phenomena of throbbing at the fingers' ends, pains in the elbows, &c. were observed; at length two gentlemen, sitting opposite each other, experienced similar phenomena, especially a particular sensation on the balls of the thumbs—in one instance the ball of the thumb was in contact with the table, in the other in contact with the operator's other thumb: about this time a remarkable vibration of the table was observed, its peculiar character was perhaps noticed more distinctly by the threads of the electrometer exhibiting a trepidatory motion which had not occurred before. A railway train passed during these vibrations, but as several had passed during the experiment the distinctive character of this vibration was apparent. The next phenomenon observed, about twenty minutes after the commencement of the experiment was remarkable—the operators, without being sensible of any motion, observed the position of their hands to be different, i.e., their hands had moved towards the right, so that while they remained in a sitting position a kind of hoisting was produced, the motion of the table now became apparent; to retain the position of the hands on the table it was necessary for the operators to rise—a rotatory motion was induced, which, from commencing very slowly and gradually accelerating, occasioned the operators to follow the rotating-table first at a slow and afterwards at a brisk walk; while thus proceeding, a gentleman attempted to reverse the motion, by pulling the table in the contrary direction, and by exerting muscular force upon it, in this he succeeded; the other operators declaring that some one was pulling the table. The direction of motion, when influenced by the electricity or magnetism of the party, was contrary to that in which the hands of a watch move; in one or two instances there was a slight

tendancy to move in the opposite direction, but it was soon overcome.

Experiment 4.—A large sheet of gutta percha was laid on the floor, on this was placed two smooth boards, and the table uninsulated (so far as the boards were concerned) placed on them. A party of six operated in this instance, some of the gentlemen not having operated in the former parties. The fingers in contact were simply laid on the table, and a strict eye kept on certain marks on the boards, to ascertain the exact time of the commencement of motion. Nothing beyond the sensation above mentioned was noticed during twenty minutes.

Experiment 5.—The table was now insulated as before, so that it was insulated as regarded the operators, by the glass stool, and they and it insulated, as regarded the earth, by the guttapercha. In three minutes the rotation was induced; it was in the same direction as before, viz., contrary to that in which the hands of a watch move, and was maintained during six minutes,

in which the table made upwards of six revolutions.

Experiment 6.—Everything remaining as before, a party of ladies and gentlemen placed their hands on the table; in two minutes the rotation commenced, the period of revolution being about one minute.

Experiment 7.—A party of gentlemen now placed the palms of their hands on the table, their fingers being unconnected; in this case rotation in the same direction was induced in a short time.

Experiment 8.—Two gentlemen standing opposite each other, placed the palms of their hands on the table with similar results.

Experiment 9.—The rotation was induced, when one gentleman placed the palms of his hands firmly on the centre of the table, pressing in the direction of the axis of the supporting pillar.

Experiment 10.—The gutta percha and boards were removed from the floor, and the table insulated by the glass stool being placed thereon, the party sat round as before; in two or three minutes the rotation commenced at first slowly, but accelerated so rapidly that the operators were obliged fairly to run, till at length, being exhausted, their hands were removed from the table, and the motion stopped.

It may be mentioned in conclusion, that in addition to other numerous instances that could be given, the above class of experiments have been successfully performed by the Bishop of Oxford, the Earl of Carlisle, the Ladies of Lord Grosvenor's family, Mr. C. H. Wild, the Engineer of the Great Exhibition, and many other names distinguished in science and literature.

P.S.—After the above was in the press, a large amount of evidence reached the writer, which, more than confirms the foregoing statements.
