# Synopsis of Contents.

---

## CHAPTER I.

### Are There More Worlds Than One?

Why are countless worlds swinging in the endless regions of space? The author believes that thousands are inhabited by intelligent beings.

## CHAPTER II.

### A Visit to the Moon.

Description of a novel city of over 60,000 Moonites. The inhabitants of the Moon are described as dwarfs having no noses because they live by eating solid air. Their odd houses, expressive paintings, strange religion, wonderful history, novel government, happy home life, etc., interestingly described.

## CHAPTER III.

### A Visit to Mars.

Marsites described as giants needing four arms. The ultimate results of capitalistic oppression graphically portrayed by a curtain system. The description of the Marsite curtain system embodies a tremendous thrust at monopolistic trusts, and should be read by Americans by the millions. The author captured by Marsmen. Illustration.

## CHAPTER IV.

### A Glimpse of Jupiter.

Jupiterites described as colossal giants averaging twenty-five feet in height. Their language a marvel

of simplicity far surpassing the English language. What Jupiterites can see with their powerful magnifying lenses. The author looked through their largest telescope and saw ships sailing in New York City harbor. Illustration.

## CHAPTER V.

### Beautiful Saturn.

Physical features. Woman the ruling genius. Excursions in airships. Illustration. Marvelous language-music. Churches on Saturn far better than those on Earth.

## CHAPTER VI.

### The Nearest Fixed Star.

The inhabitants of Alpha Centaurus live as comfortably in fire as Earthites live in air or fishes in water. One of their aerial fire carriages described. Illustration.

## CHAPTER VII.

### The Water World Visited.

On Stazza the people live in water about as fishes do on Earth. Their homes and cities under water described. Fishing for land animals. Illustration. Some of their inventions far surpass those of our own world.

## CHAPTER VIII.

### Tortu.

A far more beautiful world than ours. The moral life of Tortu the cleanest found in any world, and interesting reasons given.

## CHAPTER XI.

### A Problem in Political Economy.

On Airess the inhabitants live on liquid air, and hence have neither noses nor lungs. Monopolists control liquid air on Airess as petroleum is controlled on Earth. Illustration. Method of breaking up the power of monopolies. This chapter is worth reading by millions of American men and women.

## CHAPTER X.

### Floating Cities.

Palaces and large cities built on water. Illustration. A number of wonderful inventions described. Far surpass our world in reform movements.

## CHAPTER XI.

### A World of Ideal Cities.

Inhabitants described. Author made captive. Rich and poor. Ideal cities, how governed.

## CHAPTER XII.

### A World Enjoying Its Millennium.

How the Millennium was ushered in. The conditions under which millennial life is enjoyed.

## CHAPTER XIII.

### A World of High Medical Knowledge.

On Dorelyn four billions of inhabitants all enjoy perfect health. The government controls the whole field of medical science just as we do the post office department. No patent medicine on Dorelyn. Many new ideas picked up in medicine and surgery.

.

## CHAPTER XIV.

### A World of Low Life.

On Scum exist the lowest conditions of life found in any stellar world. "Notched Rod" language explained. Lizard like human forms. No Scumite knows who is his father or mother. A big Scumite battle witnessed. Illustration.

## CHAPTER XV.

### A World of Highest Invention.

A fertilizer invented making possible the raising of six crops in one of our years. A Tube Line for passenger and freight traffic. Wonderful storage batteries. A telephone that not only carries sound, but transmits the gestures and faces of the speakers. Thought photography.

## CHAPTER XVI.

### A Singular Planet.

On Zik decisive battles between nations are not fought by armies on land or navies on the sea, but by flying war ships called Flying Devils sailing in the air. A battle witnessed. Illustration. A practical way of settling the strife between capital and labor. The art of maintaining youthful vigor in old age.

## CHAPTER XVII.

### The Diamond World.

On the brightest planet of the universe diamonds are as plenty as soil is on our Earth, but soil is as scarce and valuable as diamonds are in our world. The heart-rending oppression of the "Soil Trust" in the Diamond World portrayed. Illustration. The

insatiable greed of "Trusts" follows the poor people into their sepulchers.

## CHAPTER XVIII.

### Triumphant Feat of Orion.

Description of a tunnel through the center of Holen, a globe 500 miles in diameter. Illustration of passenger car used. Its operation explained.

## CHAPTER XIX.

### The Mute World.

Muteites have no audible language. They converse by pure thought transmission, and no one can conceal evil thoughts. When a Muteite criminal is brought before a Court of Justice the doors of his soul are unlocked so that all past thought-images, photographed on the sensitive living plates of his mind, are thrown open to view. No hypocrisy, no conventional lying.

## CHAPTER XX.

### Brief.

The world of Brief sustains the shortest lived human beings of our universe. What we in our world crowd into seventy or eighty years of life the Briefites crowd into the narrow compass of about four years of our time. Journalism, footwear, raiment, transportation, public highways, business, religious life, etc., portrayed under such mad-rush environments.

## CHAPTER XXI.

### The Life on Wings.

The inhabitants of Swift are charmingly beautiful, and many of them can be seen gracefully moving.

on wings through the air. A charming conversation with Plume, the most beautiful woman in the universe. Illustration.

## CHAPTER XXII.

### Heaven.

Its greatness, permanency, inhabitants, degrees, seven types of intelligences, unity, employments, transportation, sexual affinities, structural aspects, etc., uniquely portrayed.

## PREFACE.

---

NY person having a reasonable education will admit that there are many planetary worlds besides the one on which we live. But whether or not they are inhabited is an open question with most people. We had been in doubt on this point for many years, but now we are settled in our conviction that human life exists in many different worlds of space. We can give no proof of this except that we have just returned from the greatest journey we ever took. We went from world to world over long distances of space as easily as one could go from place to place on the surface of our earth. *This was a journey of the soul*, for surely flesh and bone could not have traveled such amazing distances. At times we were lost to this world, being entirely absorbed in the glimpses of other worlds that were flashing upon our view in happy succession.

It can be seen without saying that this

book contains no more than a fragment of the things we saw and heard—the fragment that is most easily understood by human creatures born under the rules and regulations of this little dark world of ours.

There are, in certain other worlds, such wide extremes of bodily formation and mental capacities, that a picture of them in word or art would only be unbearable and in some instances decidedly revolting, just because we are trained here to one set of standards and chained to one surface of world conditions. It will be different in the after-death life to those who are wise enough to be pure and good in this world.

To make the book as practical as possible we have given a picture of some worlds where human life is inferior to ours, and of others where it is vastly superior,—saying nothing of the millennial life which we found in far off space.

Comparisons are made throughout the book between the life, habits, and customs of other worlds and our own. In picturing the low life of certain worlds we are led to see what a highly favored and greatly civilized

people we are, and in describing the human achievements of certain other worlds we are led to see how short a distance we have traveled in the path of human glory and civilization.

We have also endeavored to set forth in this humble volume the common relation of all rational creatures of all worlds to one Infinite Creator. We do not question the truth of this fact, and those who ask for proof must wait to find it.

We hope that this book will be inspiring to every thoughtful mind who loves to learn more and more of the great system of intelligent life of which the human creatures of this world form one link in the chain. If the reading of this volume should open to your mind numberless suggestions and compel you to ask a host of questions, perhaps you will do as we have done,—spend a long time in training your wings to be swift enough to take the journey yourself. If you will not do this, you must patiently wait until the clods of clay are shaken off, so that your free spirit may go out to live the life more vast in other worlds.

We pray that the highest kind of good may result from the truths here advanced. If this shall be accomplished, we shall have our best reward for having given this book to the printing press.

Truly yours,

*THE AUTHOR.*

*December, 1904.*

## INTRODUCTION.

---

It may seem like great exaggeration to say that this is one of the most interesting and profitable books that has been placed upon the American book market for many years. *It follows no old rut; it has found a new path,* and the reader is permitted to walk in regions which he never saw and of which he never read before. It is indeed a triumph of literary genius to give a picture of intelligent life in other worlds upon a scientific and philosophical basis. Other writers have attempted to give a description of conditions on the Moon, Mars, or some other single planet, but no one has succeeded in picturing the mysteries of life in a number of star worlds with such a fascination as is here found.

Some one may say that the book is only a work of imagination, but we challenge any one to produce a book that gives more timely thrusts at the evils of our present day life. By showing how the people of other worlds have fallen into their sad conditions the author sounds a note of

warning to the people of this world, and by giving a glimpse of the manner in which other worlds have reached their great triumphs, he gives to the people of our world a spur to loftier ideals, to greater inventions, and to a purer life.

The publisher of this volume is proud to put upon the market a book of such high value and dignity. It is quite unusual for the subscription book market to see such a princely book come into its midst. Here we have ten dollars worth of *new ideas*, packed into cream form, all for one dollar, and we positively assert that nothing like it can be found anywhere in literature. *Great books have no companions.*

The illustrations are from the masterly hands of an artist of special merit for this class of work. He happily places himself into the midst of other worlds in order to draw the beautiful pictures that illustrate and adorn this volume. The illustrations are well worth careful examination and when studied in connection with the reading matter they are seen in their greatest beauty and value. *The Publishers*

Looking Towards a Thousand Worlds.

## CHAPTER I.

### Are There More Worlds Than One?

 OUR world is large enough to excite our interest and invite our study until we close our eyes in death. Yet there are countless other orbs scattered through the solar system and throughout the vast stretches of the starry heavens. Some of these worlds are smaller than ours, but the majority of them are hundreds or thousands of times larger.

Looking away from our solar system, we find that each star is a sun, in most instances the center of a group of worlds. So, for the lack of a better phrase, we shall say that there are millions of solar systems distributed through limitless space, each one serving its part in the great universal plan.

For what purpose are all these immense worlds shining and swinging in the depths of immensity? Could it be possible that they are nothing more than vast pieces of dead machinery, barren of all vegetable growth.

and intelligent life, whereon desolation and solitude forever prevail?

Our own Earth is inhabited by a large variety of living forms ranging from the microscopic bacteria and animalcula to the glorious form of man with all his superior endowments. The air, earth and water are teeming with their billions of sensitive creatures; even a breath of air, a drop of water, or a leaf on a tree often contains a miniature world of living forms.

Amidst all this confusing animation around us, is it not absurd to suppose that other worlds, larger or smaller than our own, are barren of all life, and that from them no songs of thanksgiving ever arise to the Maker and Ruler of all things?

Such a supposition not only gives us a strange view of the character and attributes of God, but is at once repulsive to our instincts; anyone wishing to accept it may do so, but as for me and for a large company of my kind, we prefer to give a larger meaning to creation and a higher glory to the Creator.

Let no one doubt that the universe is

full of intelligent life, in myriad types of existence and infinite stages of development. Physically speaking, one cannot imagine the countless variety of ways in which flesh and bone may congregate around the human brain to make a sentient and intelligent creature.

Confined as we are to our little dark world, we know by sight of only one way in which the brain conveys its messages and serves its ends, namely, through a body of one hundred pounds or more of flesh and bone, formed erect, and capable of rendering service upon a moment's notice. Therefore some of us are conceited enough to believe that we are the most perfect and beautiful beings of the universe, the highest expression of creative art, and that all other creatures in a million orbs take a secondary place.

True enough, we occupy an honored position in the scale of creation, but while the people of many worlds are beneath us, yet there are many more planets whereon human genius has surpassed us, and we must be modest enough to take our rightful place in the drama of the worlds.

"How many planets, how many suns, how many milky ways are there?" you ask in one breath. Speaking alone of our own universe, of which the Milky Way is the jackbone, I estimate that if we multiply the number of stars by forty-nine, we shall have the approximate number of worlds that are large enough to be classed with the family of inhabited planets.

In our immediate universe there are at least one hundred million stars, a number of which have over five hundred worlds revolving around them; others have only six or ten. The average, as above stated, is estimated at forty-nine. Then, also, far out in the depths of space, there are nebulous spots visible only through the most searching lenses. These are new systems of milky ways or new universes, so immensely distant that our most powerful telescopes cannot even resolve them into star

There are inhabited worlds so far from us that, if one could travel the distance around our Earth in one second, he could proceed in one direction, at this rate of speed, for twenty million years and yet see

far ahead of him the flickering lights of numberless other inviting suns and worlds.

We cannot possibly grasp an idea of such infinite distances, neither can we form any adequate conception of the long, long stretches between star and star, which is the same as saying, between solar system and solar system. In our Milky Way the stars seem to be crushed together into a whitish jelly, but the awful truth looms up before us with all sublimity that, although these stars seem to lie one upon another, they are millions and trillions of miles apart.

In regard to our own solar system, much speculation is rife as to the existence of human creatures on the several larger planets. Theories of all kinds have been advanced, some speculative or absurd, others so plausible as to give rise to interesting questions such as communicating with Mars, and perhaps of taking a journey to the Moon. These suggestions, while fanciful, awaken our interest and excite our curiosity. Can any one predict the excitement that would prevail in our world if a human creature from some other planet were suddenly to set foot upon

our soil? We would fling a thousand questions at him to learn something of the strange realm from which he came.

And how great would be our amazement if we were to have the exalted privilege of journeying to other worlds, seeing the types of human creatures living there, and witnessing a thousand other things too strange and wonderful to mention?

I invite you to listen as I tell a condensed story of a number of worlds which I have visited, all within the boundary line of our own universe. I cannot even tell a tithe of what I saw and heard, but must content myself with giving a passing view of a thousand worlds, some of which are situated in a very distant corner of our universe.

Well you may ask: "How could you travel from world to world and see the various forms of human life, and then remain alive to tell a part of the marvelous tale?"

If it is a mystery to you, it is also a mystery to me. I cannot describe the pinions that carried me, nor tell whence came the strength that moved my wings, any more than I can explain by what process I was

preserved alive in worlds of fire, in worlds of ice, and in worlds without air. But the sight of all these things was as real to me as the dreams of the night, and it must be admitted that dreams are often as realistic as the acts of our wakeful moments.

For many years I looked outward toward the starry firmament, and at times a deep yearning possessed me to speed away to converse with the inhabitants of other spheres.

This hope I cherished so strongly that my thoughts completely overpowered me, and ere I knew it I was living at the mercy of indescribable emotions. All this continued during many revolutions of the Earth on its axis. I felt as Columbus must have felt when he was moving over strange waters. Then occurred the most notable event of my life. In the twinkling of an eye I was caught away from the Earth and, without any effort of my own, I was darting through space faster than a sunbeam.

## CHAPTER II.

### A Visit to the Moon.

**I** WAS not prepared for the quick transit to our satellite, nor for the views thrust upon me so suddenly. Before I could well collect my thoughts I found myself in the immediate vicinity of the Moon and, strange as it may seem, I was conscious of my surroundings and knew that I had power to transport myself instantly to any place I might wish to go.

To see the Moon face to face gives a charming satisfaction which can never be realized two hundred and forty thousand miles away. I was conscious of my privilege and was determined to take all possible advantage of it.

Now how differently everything appeared from the views I had snatched through the telescope while yet on the Earth. I could not see the "Man in the Moon," whose grinning face had so often looked down upon me, but

from my first point of observation everything looked as if life had never existed there and, consequently, I was about to conclude that no human beings inhabit the Moon. This theory soon vanished, for after I had traveled over a hundred miles I came to a thriving center of population, the largest city on the sphere, inhabited by more than sixty thousand rational beings.

These creatures resemble us most strongly in their mental capacities, though their bodies are out of harmony with ours, having three eyes and no nose. The third eye is situated in the center of the forehead, and the other two more toward the sides of the head.

Life is not sustained by breathing a gaseous air as we do, so that the sense of smell is performed by the protruded upper lip. At the voluntary effort to catch scent the upper lip noticeably rolls upward into a partial scroll.

I was anxious to learn how the life of these Moonites is sustained without breathing and, to my astonishment, I learned that they eat solid air at intervals of about six hours. This is not taken in connection with the

regular food, but is eaten alone and carried into a separate stomach wherein it is disintegrated by the chemical action of the stomachic acids. The gases thus formed serve the same purpose as the air we breathe into our lungs.

According to the conjectures of some earthly astronomers I was expecting to see a race of immense giants. On the contrary, I found that these Moonites grow to only about one-fourth our height, but possess fully three-fourths as much circumference of body. Notwithstanding that they are so short and rotund, they are healthy and exceedingly quick in all their bodily movements.

No doubt I shall be chided for saying that these Moon-inhabitants are a handsome people, but I was enabled to judge them by a universal standard of beauty, and I looked upon them as a product of the same infinite Creator who fashioned our mortal bodies with such marvelous adaptation of means to end.

One thing is sure, were a person from the Moon to set foot upon our planet, he would estimate us to be as far out of har-

mony with his standards of beauty as we should consider him to be out of harmony with ours.

As might be expected, these people are very peculiar in their habits. There is a small percentage of the population who are bright stars intellectually, while others are extremely indolent. When a person wins a record for laziness, it is said of him: "He is too lazy to eat his air."

The large city to which I had come was indeed a novel sight. Its buildings average in height one-third of ours, although they occupy nearly as much ground space. They are composed almost totally of non-combustible materials.

The window panes are not made of a brittle substance like glass, but resemble mica, except that they are more tough and durable. These Moonites are wiser than we in roofing their houses. They have discovered a mineral composition which in its plastic state is daubed over the roof. This, upon hardening, is proof against all conditions of weather and never needs replacing.

There are many striking features in their

architecture. In general, it may be said that they are quite far advanced in constructive ability. Some of their larger buildings look like soldiers' forts, others resemble immense bee hives, while still others appear like odd-shaped synagogues.

We are their superiors in almost every line, especially in our knowledge and use of electricity and photography, and also in our manufacturing and scientific skill. However, they have decidedly surpassed us in imitative and creative art.

Their paintings express so accurately the emotions of the heart that I found myself in tears as I saw their masterpieces. For a time I forgot that I was on the Moon, so lost was I in elevated reflections all suggested by their art creations. How I wished that I could have taken some of these specimens with me!

From the Moon our Earth looks like a large wagon-wheel hanging in the heavens. It is amusing to learn of the various opinions and superstitions that are held regarding this wagon-wheel world. Some of the Moonites declare that it is a huge lantern, hung solely

for their benefit, and scoff at the idea that it might be a world inhabited by civilized beings. More intelligent Moonites venture the theory that human life could exist on the great wagon-wheel, but declare that this is quite improbable, as the whole planet is enveloped by some thick, smoky substance in which they believe it would be impossible for human life to exist. Some look upon the Earth as the mother of the Moon, and regard the Sun as the father. This sex idea runs through most of their heathen religion, and there are more who worship the Earth and the Sun than there are who worship the God who created these heavenly bodies.

I prolonged my investigations without becoming visible, taking note of numberless facts of interest which will ever be a source of pleasure and value to me. At length, however, I concluded to take advantage of a privilege and power I possessed and, becoming visible, I entered a quiet room in the presence of a very distinguished man. He was by far the most highly educated person on the Moon.

I was more surprised than he, for I ex-

pected that he would be greatly agitated at my unaccountable appearance. Imagine my surprise when he sat motionless, gazing firmly into my face which to him was out of harmony with all ideas of correct form.

I was the first to speak, and although he had manifested outwardly such self possession, I soon learned that it was a mere show of stoicism in the presence of one whom he thought to be a spirit. In an incredibly short time we were on easy speaking terms and I was gaining the object of my visit.

Among the many things of interest that I learned from this famous character were facts concerning the history of the Moon. According to the information he gave me, I figured that human life had existed on the Moon thousands of years before its appearance on the Earth. Scientifically I could not account for this on any other ground than that the Moon, being a much smaller orb, cooled off sufficiently to sustain life on its surface long before any form of life could exist on our Earth.

The Moonities of the old era were a prosperous and progressive people, far out-

shining their successors who now occupy the sphere. After making history for several thousand years, the human race had grown to one hundred million in numbers, and civilization had reached a surprising degree of perfection.

In those long-ago ages the Moon was a much more fertile garden than now. Luxury and refinement were enjoyed by the favored sons of that period, and no one dreamed of the horrible fate that was to sweep practically the whole race into the regions of death. My intelligent informer used excessive language in trying to picture the unequaled catastrophe that put an end to the old era.

My interest was unbounded, and with awed breath I continued listening as he described the cause of this great and terrible cataclysm.

"It all occurred about five thousand years ago," he said. "The Moon was shaken by subterranean rumblings, followed by fiery ejections, covering a period of nearly one and one-half wagon-wheel revolutions. Whole cities were ruined, fertile valleys covered and human life was almost annihilated."

I knew what my informant meant by "one and one-half wagon-wheel revolutions." This would be a period of about forty days and nights of earthly time. Do you wonder that my mind flew back to the forty days and nights of rain that destroyed, at one time, on our Earth, the whole human family, except the few who were saved in the ark?

"What are the evidences of this horrible world-ending?" I asked.

"They are on every hand. Have you not yet seen the vast craters, the mountains of barren cinder, the stumps of immense pillars, partly excavated? All this, and very much more, silently unfolds a tale of horror that can be faintly pictured only by the imagination. Think of a holocaust so terrible that one hundred million human creatures are thereby swept into death in the narrow compass of forty days! The records that have been brought down to us by the few survivors indicate the continual wails of horror rending the sky while the volcanic disturbances continued. Thousands and millions ran from place to place to find shelter from the storm of fire. At one place the surface would open

and at another the lava would run. Fate, with a merciless hand, was dragging each one into one or another of the inevitable pits."

"How many were saved?" I asked with deepening interest.

"Parts of only eight families aggregating nineteen human beings."

"And how many people are on the Moon now?"

"Almost forty million."

"How do you account for this slow growth?" I asked after I had explained that on our globe a much larger number of inhabitants sprang from a smaller number than nineteen in a shorter period of time.

This allusion cost me much explanation and, after I had selfishly brushed his rising questions aside, I learned that large companies of the Moonites had been swept into death by frequent volcanic outbursts all along the line of the centuries.

No one can estimate my interest as I continued the conversation. But finally I decided to stroll through certain parts of the city and, thinking it advisable to give no

notice of my departure, I suddenly vanished from his sight. However, before leaving the room, I observed that my bewildered auditor conjectured for a long time and reached his former conclusion that he had been in touch with an apparition.

Again I resumed my visible form and walked along one of the principal streets of the city. What novel sights greeted my eyes on every side! One cannot well imagine what excitement I aroused. Citizens who first saw me lifted their flabby arms in terror and ran to the city Bizen, a place where every inhabitant, under oath, is obliged to carry special news before communicating it elsewhere.

In a very short time the city Plins, or in our language, city authorities, were coming toward me in their costly vehicles. They were preceded, however, by what we would call a body guard. Imagine their surprise to hear me shout at the top of my voice, which sounded to them as thunder would to us: "You need not fear, I will do you no harm!"

My voice had a magical effect on the

Visiting a City on the Moon.

assembling host of pigmies. They looked at me with as much curiosity as I looked at them. I stepped over their heads but was careful not to trample on the children who scampered at my approach. If one could ship a car load of these children to the Earth, they would make excellent dolls, for they range in size from only six to ten inches. Finally, I sat on the roof of one of their lower buildings to watch the gathering of the multitudes and study their curious countenances.

Some of the more educated, seeing that I was peacefully inclined, ventured close to my knees and then looked the more intently into my face, all of which was agreeable, as it enabled me to get a still closer view of their faces.

I saw that the whole city was turning out, and I wondered how the alarm could have been given so speedily. Upon inquiry, a fine artist at my side tremblingly explained that the Bizen wires had been touched for block six. This meant that every house in the city had received notice of an unusual occurrence in that section. I resolved to

learn more of this system and how it was operated without the aid of electricity.

Now I was besieged by a pressing host. At once I commenced to speak in Moon dialect. I told them whence I came, pointing to the large wagon-wheel that hung in their heavens. After a short discourse, I invited questions.

One of their leaders stepped nearer to me and acted as the spokesman of the crowd. His language and voice were of excellent quality and although visibly agitated, he bore himself with commendable dignity. Let me here translate our conversation into English.

"How came you here?" asked he.

"That I cannot explain."

"Did you walk or run?"

"I did neither."

Surrendering this line of inquiry, he went on to ask the following questions :

"Are there more creatures than you where you came from?"

"Large cities full of them."

"Are they smaller than you?"

"Their average height equals mine."

"It must be a ponderous world of immense giants beyond the comprehension of any inhabitant of our whole globe."

"But just as I appear large to you, you appear unnaturally small to me," I calmly added.

"How came that lump in the middle of your face?"

I knew the questioner referred to my nose. I took a good wholesome laugh, and the large concourse of people watched my wrinkling face with strange delight. The Moonites express all their emotions by exclamations and almost infinite variations of the lower lip in conjunction with their three eyes.

I told the spokesman that the lump on my face was called "nose," using our pronunciation, and that it grew there by nature and not by accident. I also informed him that each person in our world had such a nose, at which much merriment ensued. Lips twitched and quivered, as their eyes blinked and rolled. It seemed to me like a hideous way to laugh, but no doubt my nose seemed just as hideous to them.

Then I explained all about our dense atmosphere, the part that air played in our life, and what a fine convenience the nose is during eating and speaking. Of course all this was unintelligible to them.

I then busied myself in ascertaining the secret of their signal system. I learned, much to my surprise, that with scarcely any knowledge of electricity the Moonites had long ago discovered a means of communication which is somewhat similar to our wireless telegraphy. From central stations messages are transmitted to sensitive metal rods set up on each house-top, somewhat like the lightning rods that decorate house-tops on my own Earth. I also learned that a very thin atmosphere is prevalent on the Moon, and that this rare medium is more suited to their wireless telegraphy than our heavier atmosphere would be with its different composition.

I soon learned that great excitement was prevailing throughout the adjacent villages. Wireless telegraphy carried the news, and from all directions throngs were pressing toward the city. Furthermore I saw that the

noted personage with whom I had spent a quiet season was now making his way toward me. Not wishing to hold further conversation with him, and desiring to escape the ever-rising tide of curious questioners, I once more became invisible and proceeded to study the physical phenomena of the Moon.

I now saw that everything bore evidence to the fearful havoc of volcanic eruptions that had laid waste so large a portion of the Moon's surface. The people live in the remaining fertile belts and patches of land which are fortunately scattered in rich profusion over the greater portion of the surface, reminding one of productive oases in the deserts of our world.

Here and there, in stately museums, are stored the relics of the old glorious civilization. At a few of these places I tarried to study the achievements of a people who flourished five thousand years ago, at a time when the civilization of our world was yet young. What an interest lay wrapped up in the time-worn relics! Naturally I thought of Pompeii as I was viewing the antique treasures that had been brought to light from

their old graves of ashes, cinder and lava. In some of these specimens I saw glimpses of inventions that have never been reproduced on the Moon and never known on our Earth.

Onward I moved to take my last views of the Moon. For ragged and jagged cliffs of almost total barrenness, and yawning chasms lined with intolerable precipices, the Moon outrivals the Earth. I took a passing glimpse of the famous crater-mountains, called by our astronomers Copernicus and Theophilus, the former situated in the eastern and the latter in the western hemisphere of the Moon. The largest openings of our Earth dwindle into insignificance compared with such stupendous marvels of natural scenery.

Many similar places I visited, but I spent my last hours on the Moon in the presence of that gigantic chasm called Newton, where I was thrilled with feelings of sublimity as never before. Outstretched lay the immense opening, nearly one hundred and fifty miles long and about seventy miles broad. It was fearful to gaze into it, for my eye stretched downward mile after mile until it reached the blackness of darkness. It frequently hap-

pens that a Moonite accidentally falls into this monster Newtonian chasm. Nothing more is ever seen or heard of him.

I shuddered as I peered into this gigantic opening whose gaping mouth could swallow Pike's Peak so that its highest point would be many thousands of feet below the surface. We have nothing on our Earth that can compare with this terribly imposing sight, and as I was studying the expansive waste I could more readily understand how large numbers of human beings could be destroyed by such fabulous quantities of boiling lava as were capable of being thrown from this pit. There is no doubt that the lava and ashes hurled from this crater alone would send a withering blast of death-dealing for many hundreds of miles around.

If you have never been privileged to look upon this ponderous chasm face to face, improve your first opportunity to get a glimpse of it through as powerful a telescope as possible.

## CHAPTER III

### A Visit to Mars.

NEED not describe the manner of my flight. It is enough to say that, to my delight, I reached our neighbor planet called Mars, and at once proceeded to study its physical features and its human life.

Everything was vastly different from what I had been long accustomed to see and to imagine, and I felt quite assured that I was living in a dream. But I knew of no way to convince myself as to my bearings, so I concluded to make the best use of my time and opportunities, and leave questionings to the future.

As a physical world Mars bears a most striking resemblance to our Earth. The length of its year is six hundred and eighty-seven of our days, and the length of its day is twenty-four hours and thirty-seven minutes. Its diameter is about one-half that of the Earth and its distance from the Sun is

142,000,000 miles. Even from our own world we can discern through a good telescope the changing colors of the planet, due to the recurring seasons, each one of which is almost twice the length of ours.

There is relatively much less water on Mars than is found on our Earth, and gravity on its surface is only thirty-eight per cent. of terrestrial gravity. Imagine, then, how light everything must be. This may account somewhat for the physical proportions of its inhabitants, for they are over twice our size, and in appearance resemble us but little. They have four arms, two extra ones extending from a point just above the knees. The two lower arms act as servants to the two higher. Thus are the four used at one time in harmony.

Mars is an older world than ours, and although it receives only one-half as much heat from the sun yet it is almost of the same temperature, owing to a peculiar condition of the atmosphere which we would call "heat retentivity."

Some scientists and philosophers will at once say that such atmospheric conditions are

contrary to reason and natural law, but they must be informed that on Mars there are chemical elements and affinities not known in our world. It requires but little change in the elementary construction of the atmosphere to render it capable of strong heat-retaining properties.

Standing on the surface of this planet, my attention was easily attracted by the two frisky moons called Deimos and Phobos, at the small distance of 14,600 and 12,500 miles respectively. These two moons are constantly flying around the planet, one in about thirty hours and the other in seven and one-half hours.

The astronomers of Mars have discovered unmistakable signs of human life on the farthest of these two moons. They are hoping to be able some day to cover the intervening distance and for the first time see their old neighbors face to face.

Before I had traveled over one-half the surface of this planet I was thoroughly convinced that it was a rough, jagged world without lofty mountain ranges or peaks. The many long and narrow fertile valleys, much

resembling the canons of our own Earth, absorbed my mind with more than passing interest. Looking carefully into one of these canon depressions, I saw a class of human beings in a low state of civilization ; nevertheless, they were expert in agriculture and seemed to labor contentedly with a dull, plodding vigor beyond all reason.

According to appearances there seemed to be no social relation or connection between the inhabitants of one valley and those of another. At first I was greatly puzzled at these peculiar conditions.

Next I gave my attention to the highlands or wide barren ridges between the valleys. On these elevations I saw a highly civilized race of people living in great splendor. They enjoyed the privilege of traveling from one highland to another and of exchanging courtesies. Their interests were common, and their joys and sorrows were mutual.

At once I became interested in these extremes of life as exhibited in the valleys and on the highlands, and resolved that I would find the cause for these differences.

The authentic history of these Marsmen runs back through thousands of years. I learned with interest the wonderful past life on this world.

There was once a time when people all mingled together and cultivated the valleys. Each one by doing his part made it lighter for all. But after many years a few schemers combined and by their inventive genius succeeded in erecting vast sliding curtains over the valleys. These curtains were supported from the tops of the ridges on each side and, by their manipulation, the operators could keep the sunlight from any particular part of the valley.

Then these shrewd Marsmen exacted tribute from the valley-toilers, saying to them: "Give us a fifth part of your products, and we will give you sunlight."

So the toilers gave them tribute willingly, knowing that they could not live without sunlight. Then it came to pass that these toilers were burdened by reason of their taxes and they prayed to the rich that they might have sunlight at a lower price, but the rich replied :

"We cannot give you sunlight for less because it costs us much to keep in repair our immense curtain systems across the valley." So the poor toilers labored more and slept less, while the few rich on the elevations built unto themselves more spacious homes and lived in greater luxury all their days

In process of time some of the shrewdest highlanders devised an attachment to the curtain system by which the rainfall could also be distributed at the will of the operators. Then the rich Marsmen on the elevations said to the toilers: "Give us one-fifth more of your products, and we will give you your share of the rainfall."

The poor laborers had no alternative; so they labored still more diligently to pay their taxes for light and rain, and the burden became so heavy that they could no longer bear it. So they sent up a petition praying for sunlight and rain for a one-fifth instead of a two-fifths tribute. The rich refused to listen to this prayer, whereat the toilers refused to comply with these intolerable demands.

Then did the rich magnates of the eleva-

tions draw their curtains to keep both sunshine and rain from the valley. The laborers consumed all they had until, in desperation, they asked again for sunlight and rain, but the rich refused to give either unless the toilers would promise to give a two-fifths tribute; to do this the toilers at length agreed. Then the curtains were withdrawn, the sunlight once more kissed the valley, the rain again fell upon the fields, and some of the poor, ignorant people devoutly thanked their God for these gifts.

It occurred later that one of the many toilers, whom his Creator had endowed with unusual wisdom, became the leader of the masses in struggling for their rights. He traveled the whole length of the valley and advocated that the people should unite, march to the summit of the hill, destroy the fastenings that held these curtains and, as the coverings would fall, destroy them with fire. This leader declared that they were entitled to sunlight and rain without paying tribute to man. Gradually the workers were won to his views. The rich, seeing that their investments were threatened, hired

a few brilliant orators and sent them to the people to persuade them not to give heed to a man of one idea. These orators argued that it would be a great crime to destroy the property of others, and that their only way of securing happiness was to toil on with patience and keep looking for brighter days. The people listened to the specious sophistries and thus pushed aside their redeemer, putting off forever the day of their deliverance.

Similar troubles continued to arise in the valley, but the rich always succeeded in quieting the people before they rose to determined action.

Then the rich decided to put an end to these agitations among the toilers. Accordingly they cut off all communication from valley to valley, either by epistle or person, and refused longer to permit any poor toiler, or his children, to pursue any study whatever. By this method, in the course of a few hundred years, the valley dwellers lapsed into ignorant slaves, not knowing, except by tradition, that there were other people in other parts of Mars. Thus the rich continued

to flourish on all the highlands, for they had extended this same policy until the toilers of the whole planet were practically galley slaves, each consigned to his own narrow canon.

After witnessing the wide extent of this slavery system, I appeared in visible form to a rich dignitary on one of the most refined highlands.

He was alone and, upon raising his eyes and seeing me before him, he was greatly amazed. To see a little man with a hairy face and with the kind of clothing I wore, was all too odd for him to take in at once. He acted as if I were some unheard-of animal, but when I addressed him in his own tongue and manifested a becomingly meek disposition, he accepted me as a deformed creature afflicted with a mild form of lunacy. Then he proceeded to examine my clothing and especially my knees, trying to solve by what freak of nature I was cursed since I had no lower arms such as he had. My small face, smooth forehead, and the short straight hair on my head aroused in him no little wonder and

merriment, so that, all in all, I was the cdd-est freak he had ever seen. He soon showed by his manner how thankful he was that gracious nature had formed him so much more kindly than me.

His questions soon poured out upon me and I answered as briefly and intelligently as I could. He pressed me so hard as to the place of my birth that I finally informed him that I came from another world, whereat he was assured of my insanity and proceeded to fasten me by force until he might summon certain of his friends. Knowing that all the people of Mars could do me no ultimate harm and wishing to see what might be their intentions, I offered very feeble resistance to his course.

In a very short time there was grouped around me a curious set of people, all of whom seemed to me so horribly ugly that I felt well satisfied that I had been born on the Earth. Among the company were some eminent scholars who did no more than peer at one another and walk about me, while they were waiting for some learned professors to arrive from a distance. A long, tedi-

ous period ensued ere the company of judges or examiners were gathered from several adjoining highlands.

They took me into a large room where followed an indescribable examination during which I purposely remained silent.

The button and button holes of my clothing attracted as much attention as my unnaturally shaped head. My collar and necktie were conundrums. Not one of the learned scholars was able to advance a theory as to the probable use of such a stiff piece under my head. I could not conceal my smiles as I heard the flying theories as to the use of my cuffs. One specialist decided that inasmuch as I had only two arms, I wore these to make them appear larger. This was accepted as the most plausible explanation.

Several times they urged me to speak. The man to whom I had first appeared had told them that I was expert in their language. But I would not utter a word, being anxious to learn all I could by listening to their conjectures.

Some of my examiners were sure I belonged to a species of their animal creation,

who, in some unaccountable manner, had received the gift of intelligence. But this opinion did not gain ground, as no one could account for the manner of my clothing and especially for my pocket knife and other accompaniments. No one believed that I came from another world, and yet no one could see how or where I had originated on Mars.

Finally one of the company struck upon a popular theory. He argued that I belonged to a tribe of creatures that had developed far away in one of their almost unending forests, and that I was the first of my kind that had ever ventured so far from home.

"But how did he learn our language?" queried one.

"Any intelligent creature would by nature alone come to our language," was the conceited explanation of another.

Another gave a better theory which was at length accepted. He said that no doubt I belonged to a company that had emigrated long, long ago from one of the valleys.

After all their pains I satisfied their ruling desire by speaking. They knew not what

to say as I gave them a general description of the world from which I came.

Purposely I used their most cultured forms of expression. At once I rose to a high level in their estimation and they gradually accepted my words as true. With absorbing interest they listened to every syllable and, when I paused, their questions fell upon me in wild profusion. On my account the schools were abandoned, all the leading teachers of five elevations became my astonished auditors, and after every period of sleep I was confronted by still other classes of specialists, some from more distant elevations.

Finally, feigning ignorance, I asked where they obtained their sustenance, as I had not seen one field in cultivation. They told me the whole history of the toilers in the valley as already recounted, and how the curtain magnates received their tributes which were sufficient to feed all the people of the elevations.

"What right," I asked, "has any one to form a monopoly on sunlight or rain which are free bounties from above?"

"There can be nothing wrong about that," came the positive answer. "Any man who was wise enough to think of such a splendid system of valley-covers surely deserves all the benefit that can be secured from it."

"How did you succeed in getting the people to submit to such a system?"

"It all came by force. At first they were unwilling enough, but we withdrew their education and kept them isolated. With ignorance you can conquer any people. Now they are our perfect servants, and in a short time we need not use the curtains any more. A few masters can control the whole valley. All we need to give them will be enough to eat, and the remainder of their products we can send to the elevations."

I was struck with horror at this revolting scheme, and expressed myself in strong terms. I thought of the conditions of our world and felt thankful that it had not gone so far that the laboring classes were galley slaves to the rich; and I breathed my prayer that it might never be so.

My investigations on this planet were long extended. The educated people gave me many new ideas, although they are ignorant of many advantages which we enjoy. Their means of transportation are miserable compared with ours, and when I was explaining to the Marsmen our methods of travel they were surprised beyond measure. However their knowledge of nature and forms of animal life is far superior to ours. There I solved some of the complex questions of Biology which had long puzzled my mind during my stay on the Earth.

In their religion they worship the Source of Life, and look upon the Sun as the place to which the spirit goes at death. In brief, the Sun is their Heaven. They believe that the Sun's heat will be no barrier to the spirit's complete happiness when liberated from the body. Phonetically pronounced, they call the Sun Then-ka.

I was indeed surprised at the simplicity of their devotions to their unseen God. Even the untutored toilers of the valleys talk to the Source of Life and are constantly looking forward to the time when their hard

lot will be over that they may enter the Then-ka life. I could not help but think that their chances of Heaven were better than those of the highland caste; but I will not judge lest I might err. Who can understand the universal plans of Jehovah?

Before I left the Marsmen I informed them that certain enthusiasts of my world had been signaling to them for some time, and urged them to improve their astronomical apparatus so that they might be able to discern these signals and reply to them.

On account of my thoughtlessness I made an error, for I failed, while I was yet on Mars, to arrange a code of signals; hence I fear that there will be considerable experimenting before we can hope to establish communication with our neighbor world.

## CHAPTER IV.

### A Glimpse of Jupiter.

HE next world I visited was Jupiter, the greatest orb in the solar system, almost fourteen hundred times as large as our Earth. I found it whirling on its axis so rapidly that it makes an entire revolution in about ten hours of our time.

This voluminous sphere is in great contrast to both the Moon and Mars. Its physical constituency resembles a liquid more than a solid, and it is quite hot but not luminous. It has cooled sufficiently to admit human forms, although certain parts of the giant planet are void of all life, owing to the more intense heat in those sections.

The atmosphere is charged with thick clouds, never at rest and continually forming into immense scrolls close to the surface of the planet.

The human life of Jupiter is found in

certain belts where the crust of the planet has been hardened for several thousand years. The people have risen from rude, primitive conditions to a state of splendid civilization. In size they are colossal giants, averaging twenty-five feet in height. Their two powerful arms extend from what we would call the hips, and no one would imagine with what facility these giants use them. After extended observation, I was almost tempted to wonder why our arms were placed so high on the body. These Jupiterites are more handsome than the people on the Moon or Mars, and their faces shine with a superior intelligence. Instead of hair on the head, they have something unknown to our world, quite similar in appearance to wool.

Their two eyes blaze like balls of fire, making one of the giants appear like a fierce though not repulsive monster. The most unusual feature about the face is the peculiarity of the chin and forehead. Each is covered with convolutions of an insensible, rubber-like membrane.

The people of Jupiter excel in mechan-

ical skill. They build houses, but not by long, tedious days of painstaking labor. Such things as plaster and paint are unknown. A Jupiterite can purchase, from one of the mammoth structural factories, house sides, house ends, house floors or partitions, after any general design he wishes, and have them trimmed in any style his fancy suggests. The materials used are non-combustible and water-proof, and will wear indefinitely.

These houses can be put together in a few days and the trimmings adjusted in less than two weeks, unless the structure is very elaborate. Nearly all of their house furniture is also non-combustible, and no one has ever conceived the idea of forming a fire insurance company, simply because there is no need for one.

As the people are so much larger than we, so are all things relatively larger than we see them in our world. Wagons and carriages and cars appear as if they were made for mastodons.

I saw one of their largest bridges spanning a molten lake. Aside of it the East

River bridge would be a dwarf, either in height or length. It is certainly thrilling to step into a world where all things are so gigantic. At times a feeling of insignificance crept over me, but I took courage when I thought that a man's greatness consists in his mental powers and not in his physical bulk, for it is true that the fifty ounces of brain in the skull of a Newton have accomplished more marvels than the ten pounds of brain-matter found in the most cultured Jupiterite.

We must give the people of Jupiter credit for exercising a large amount of common sense. In many ways they are more practical than we, and this is quite as noticeable in their language as in any other respect. They have one simple language for the whole globe and in its use they are all agreed. Their vocabulary is small because they have not yet branched out into the infinite varieties of manufacture and invention.

Their words have a marvelous correspondence with the thought or the action expressed, the manner of emphasizing syllable

bles going a great distance toward expressing the shade of emotion desired.

I admired especially one thing on this bulky planet. They have but one authority for language. Hence there is no Century, Webster, Worcester or Standard, each rivaling the others for supremacy, to confuse the honest student with diverse spellings and pronunciations.

The words of the language of Jupiter are all embodied in one unique dictionary which is revised at intervals by a board of official educators; to this board all suggestions for inserting new words and changing the classification of old ones must be given for their consideration.

This dictionary is printed by the government, and a copy of it is furnished free to all public places and to each private family. When a revision is made, a copy of all the changes is furnished to each dictionary holder. The authority of this dictionary is final, and no one is permitted to publish a conflicting work.

The Jupiterites have displayed their highest genius in their astronomical advance-

ments. They know all about the Solar System, and have made discoveries inside of Neptune's orbit which our astronomers have never observed, I was thrilled with delight when I saw their telescopes with the marvelous lenses that opened the locked doors of the Milky Way. No wonder the astronomers of Jupiter have a more comprehensive view of the universe than we have. Their lenses are so powerful that they have seen the outlines of our rugged mountains, and have discovered on our world unmistakable signs of human life. During my visit thither the experts were working on a much larger lens, and it is claimed that when this is finished human forms can be discerned on the Earth and can be seen with more accuracy on Mars.

The five moons that revolve around Jupiter have been studied with marked interest. Two of these moons have displayed definite signs of human life. It is promised also that the coming lens will unlock the doors of the several moons and permit the astronomers of Jupiter to pry into the secrets of their celestial neighbors.

During the past one thousand years, the Jupiterites have made numberless attempts to establish communication between these moons and their planet, but all their efforts have failed. Either the Moonites are too stupid, or the Jupiterites are not expert enough in throwing out signals or in building air ships.

For no one thing more than another did I envy the astronomers of Jupiter than for their marvelous magnifying lenses. I knew that if we had such lenses, or the material to make them, we could watch with ease the inhabitants of the Moon or of Mars, and we could study the intelligent life on Mercury and Venus, to say nothing of the great advantages we should have in observing comets and all the numberless starry systems scattered throughout illimitable space.

The religious life of Jupiter proved to be intensely interesting to me. They have a sacred book which corresponds to our Bible, and it has always remained in its original form because there is but one language.

Since I left my own world I had not felt so kindred a touch in spirit as when I invisibly entered one of their great temples of

worship, as we might call it. No vocal music was there, but the mute beckoning of several thousand arms, as if to implore the favor of the great Inzoork or Creator, was impressively eloquent to me.

I was thrilled with joy as I learned more of their religion. I found that their love and service were akin to those of our planet, and that these same bonds unite them one to another. My conceptions were enlarging as I saw the family of God enlarging, and I felt that although I was unlike them in the physical, yet I was their brother in spirit, and that we all have one Father.

Religious liberty was enjoyed until a few centuries ago when certain restrictions were formulated. It was seen that some, in exercising their liberty, proved to be a curse to the state, and consequently a sharp battle ensued against the liberal element.

The Church won the conflict and now the profession of atheism is not allowed. If it can be shown that any sane person takes such a position, he is given a certain period to recant. If recantation is not forthcoming, he is placed in the public work-house until he

acknowledges the existence of Deity. Atheists are scarce under this severe ruling.

You may well know how I was startled to see such summary action taken in regard to unbelievers. At first I prided myself that I belonged to a world of free thought and free speech, but when I saw the magnetic effect of these Jupiter regulations I was in doubt as to the superiority of our religious and irreligious liberties.

The soil of Jupiter yields abundantly. The animals are all large and of species unknown to us. They have animals that resemble our elephant and ox; these they use for food. Common birds, as large as geese or turkeys, flourish in the extensive forests and furnish about one-third of the food for the giants.

The vegetation is after the order of our world, except that the curse of weeds and thistles is only one-fourth as great. But the people of Jupiter have learned more than we of the use of these weeds, and certain of them are cultivated to a wide extent.

I spent a long time on the planet. I saw the fiery lakes that are fed by subterranean streams of lava, and the geysers of blue

flame darting their immense tongues high in the air.

As near as fifty miles to these fiery centers can be seen gardens of vegetation and fields under cultivation. I yielded at last to a desire that prompted me to make a personal appearance. So I stopped on a thoroughfare and occupied a rustic seat at the roadside. I was dressed in my earthly costume, and sat composedly awaiting developments.

The first living creature that observed my presence was a passing quadruped. It was larger than a wild goat, and was a small specimen after its kind. For want of a better name I will call it a "dog."

As soon as I was spied by this animal he set up a hideous howl and ran at full speed. Knowing my own homeliness, I had all charity for the animal and did not censure him for being so terribly frightened at my appearance.

Soon a full grown giant came along. He chanced to be a learned professor out for an evening walk, as we would say. He seemed to be in deep meditation and did not notice

me until he was near my side. Then he stood breathless, while a feeling of fear and surprise evidently possessed him. I sat motionless, looking up into his eyes, and saw the convolutions on his forehead and chin quivering quite perceptibly. He evidently judged me to be some undeveloped species of Mon-go-din, an animal of Jupiter bearing faint resemblance to our man-ape. To my surprise, he suddenly grasped me and tightly held me fast in his gigantic arms. I made no effort to free myself.

His surprise was only intensified at my resignation. He expected a struggle, but I neither made an outcry nor resisted capture. Like an infant I lay in his arms, while he passed quick glances all over me. He was baffled beyond all measure, and hurried away toward the great college near by. Upon reaching the museum department, I was placed in a strong cage and the doors were doubly secured.

My captor ran from my presence and, in a few moments, returned with two other professors. They peered into the cage in painful astonishment, while I contented my-

self by taking my watch apart and occasionally glancing at my select audience.

Then commenced the jibbering consultation, all of which I well understood. My captor related the full circumstances in connection with his walk in the grove and the manner in which he captured me. He dwelt particularly on the indifference I manifested in all his dealings with me.

"It is a baby Mon-go-din," suggested the one professor, while the other advanced the theory that I was an abnormal child of some Jupiterite.

My watch excited their curiosity. One reached his hand cautiously through the bars and evinced by his actions what he wanted. I looked up into his eyes and spoke my first words.

"Patience, please, till I put the watch together, and you shall have it."

Not only did his arms fly away from the cage, but his whole body fell prostrate to the floor, whether from fright or surprise, I knew not. His two companions were also in a sorry plight. I pretended not to notice their

consternation, and kept myself busy in placing the parts of my watch together.

After a while I was addressed by a trembling questioner : "Where is your home, my child?" I did not lift my eyes, but completed my little self-appointed task, and at once raised the watch in fulfillment of my promise.

The timid professor ventured to accept it and, as he received it from my hand, he again asked : "Where is your home?"

"Farther away than the circumference of your world," I distinctly answered.

At this time the three agreed that I was an insane child, born out of time, and that I satisfied my propensities by gathering to myself such idiotic things as my watch and garments, including my hat and shoes.

A quiet consultation followed, after which one of the professors retired from the room and soon returned with certain morsels of food. Upon handing them to me, I at once remarked : "Keep these morsels for yourself ; I have better food to eat, of which you know nothing."

The other two professors had by this

time observed that my watch was a marvelous piece of mechanism beyond their most delicate accomplishments, and they announced the fact to their other companion who again looked at me in breathless surprise. "Where did you get this Fot-sil?" (or plaything), he queried in one breath.

"Farther away than the circumference of your world," was my evasive and, to them, unsatisfactory reply.

"Won't you tell us, child, how far away that is?" asked another with subdued impatience.

"Millions of miles." (Of course I spoke in terms of their linear measurements).

"How many millions?"

"Sometimes five hundred and sometimes six hundred millions."

Without giving them a chance for asking me another question I offered to let them see my home if they would permit me to use the most powerful telescope in their observatory.

My listeners were indeed amazed and were about to pour upon me a volley of interrogations. I assured them that I would

answer no more questions until I knew whether my request would be granted.

This necessitated a consultation with the chief astronomer who, upon learning of my peculiar request and of my unnatural formation, hastened to the museum to see the monstrosity.

I knew from what I had previously learned that this gentleman was the greatest living astronomer on Jupiter. He peered at me in the cage and was dumfounded. He exchanged a few sentences with the professor and again turned to me :

"At what time do you want the telescope?" he asked.

"Immediately."

"You shall have it, just to satisfy our curiosity," he said as he hastened from the room.

I heard the professor caution him strictly to tell no one of my presence, so as to avoid a rush from the student ranks.

In less than an hour I stood at the side of the largest telescope in our Solar System, watching the deepening shadows of night as they fell upon Jupiter.

Viewing Our Earth from Jupiter.

I spent another hour examining the ponderous machinery that was required to swing this mammoth instrument and to adjust it when scanning the heavens.

By this time my four companions were convinced that I was not an idiot, and I could see by their strange manner that they were regarding me as a spirit.

I gave my directions to the astronomer, and beheld the cylinder, two-hundred feet in length and twenty feet in diameter, swing around until it pointed toward a little flickering light that shone like a distant star.

I looked into the eye-piece, managed to get the tube pointed accurately, and then requested the astronomer to focus the lenses so as to bear upon the planetary light in range.

He knew at once the planet I had singled out. He called it Zo-ide. After the focusing was completed, I looked and, behold, I could readily discern many of the physical features of my own world.

"That is my homeland," I cried triumphantly. "I live on Zo-ide, or Earth, as we call it."

Of course my listeners were incredulous, but I proceeded to explain to them as I looked through the telescope:

"That dark ridge to the left is called 'the Rocky and Andes Mountain Systems'. The shining belt on the central portion is the 'Mississippi River'. The rough ridge to the right is 'the Allegheny System' of mountains." Then I indicated the location of our larger cities. As I pointed to New York, I saw a mere speck moving. I was convinced that it was one of our large steamships, and as I so explained the astronomer looked at me with absorbing interest.

He informed me that he had often seen the moving of the spots, and thought they were some cloud formations peculiar to our world. But I insisted on the steamship explanation and proceeded to describe an ocean liner, for these Jupiterites are not familiar with oceans of cold water on which float numerous craft.

I was then a royal guest, and passed a most felicitous night with these four celebrities. We talked of the more powerful telescope that the government of Jupiter was

manufacturing, and of the still greater views it promised to reveal.

Then I informed them of our system of science. They were astonished at the great civilization extant on Zo-ide, or our Earth.

I told them that a subtile power lay dormant in the atoms and molecules of matter, which could be released and utilized, and that we in our world called it "electricity."

During the night I learned that the convolutions on the chin and forehead of a Jupiterite served the purpose of a new sense. By the aid of these convolutions any person of Jupiter can tell in daylight or darkness the nature of any surrounding substance, whether it be hard or soft, combustible or non-combustible, good for food or not. I confess that I was unable to grasp the idea intelligently. So the people on the Moon had the same difficulty in understanding the use of my nose.

Before morning dawned I informed my appreciative quartette that I would see them no more, that I had paused at Jupiter station long enough, and that I must be off on my vast excursion trip.

They earnestly entreated me to remain so that the college students and representative persons could get a glimpse of me ; but I refused all their entreaties. When they found that I had power to leave them instantly, they besought me to remain for a few last words.

"Shall we not see you again?" affectingly asked the astronomer.

I told them that I expected to spend eternity in the kingdom of our God who made all the stars and worlds, and holds each in its respective place. "If you are pure in heart to Him," I continued, "there can be no doubt but that we shall see one another again in that happy celestial center where our eyes will be our telescopes, where our pure hearts will assent to the Fatherhood of God, and where our souls will be quickened at the universal fountain of Love."

## CHAPTER V.

### Beautiful Saturn.

**DELIGHTFULLY** busy world next met my gaze. Saturn, supreme in love, with its mysterious rings and its eight moons, now held my attention and won my admiration.

This world is almost as large as Jupiter, and its soil is more fertile. The inhabitants resemble us in physical appearance, except that they are twice our size.

Like Jupiter, it is enveloped in thick semi-liquid clouds which are never at rest. This changing atmosphere causes continual friction of particles, and this serves to produce sufficient heat to counteract the frigid blasts that would otherwise freeze out the whole planet. These atmospheric conditions attracted my attention to a great degree. I estimated as best I could, and ascertained that Saturn receives as much heat from this

peculiar atmosphere as our Earth receives from the Sun.

As I found it on Jupiter, so I found it here. The human eye is so constructed that it seems to have more than an X-ray power, for it can look through this atmosphere as readily as we can peer through ours.

The air of Saturn, being so thick, contains much natural nourishment, and the inhabitants are sustained largely by breathing. This reminded me of the manner in which our fish flourish in the waters of our globe.

Marvelous indeed are the possibilities of life. I now had before me new problems to solve, for natural laws have but a limited expression in our own world. Here science puts on new garments, but they are all cut in harmony with universal laws.

Woman is the ruling genius of this planet. Being untrammelled for a few thousand years, she has attained a higher glory than her sex has reached in any world of our Solar System.

As you scan the honor rolls of Saturn, reading the list of the eminent leaders in science, art and philosophy, you will readily

observe that woman has forged to the front. She also sits upon the principal thrones of temporal power.

Woman's beauty on Saturn is surpassing. It reaches a higher degree of perfection than any of the myriad types of beauty on this enchanting world. When I first opened my eyes on these scenes, I imagined that I had reached Heaven, but, to my chagrin, I soon found the black marks of sin that stain the whole planet.

The illustrious inventors of Saturn, living and dead, make a long list, which is headed by the name of Veorda, a woman of marvelous intellect. She looked into the mysteries of nature with a shrewd, wizard eye, but, unfortunately, lost her life early in a bold experiment with explosives. However, before she reached her much-lamented end, she had won enough honor to outshine all inventors in the whole history of Saturn.

She was the sole inventor of all explosives, and she had learned how to operate them without making any noise or smoke. This proved a valuable aid to factories and quarries, and particularly in the handling of

fire arms, of which Saturn has a very strange collection.

Before Veorda was born the flying machine had been invented and used. But aerial travel was soon abandoned owing to some terrible accidents that had occurred. During the earlier part of her career Veorda labored assiduously until she overcame a few difficulties and thereby perfected the flying machine.

It was a day of international rejoicing when her perfected machine sailed over the governments of Saturn. The invention stood every test and at once air traffic was resumed and maintained. When this woman died the governments erected to her memory the finest and costliest monument that now stands on the whole world of Saturn. Of course, I went to see it. As I stood studying the poetry of the pillars, I looked overhead and saw one of the immense aerial ships carrying a pleasure party to a distant point. I cannot describe my feelings as I lingered in the presence of the sleeping dust and saw the imperishable influence of her thoughts still working for her, in a carnal

sense, "a more exceeding and eternal weight of glory."

Yet with all this homage paid to Veorda, I cannot believe that she is more illustrious than the present living wizard of our world, the notable Edison.

Veorda lived and died a devoted worshipper of "The Great Influence," or God, and it is delightful to think that we shall associate with such great minds in our eternal abode in that Broader Life where the pure of all spheres gather. Will I do wrong if I quote that sublime beatitude, making it applicable to all worlds? "Blessed are the pure in heart, for they shall see God."

The written language of Saturn resembles the Chinese character language, only it is much more smooth and more complete.

The Shakespeare of that planet is a woman called Ziek-dod who has been dead twelve hundred years. Her writings have been quoted and esteemed as masterpieces all through these ages. Her style is singular, resembling the proverbs of Solomon, with a little more ornament in the language.

As to the subject matter, her epigram-

matic sentences are grouped and classified with an accuracy that is both pleasing and popular. At intervals the reader is treated with a sprinkling of alliterative sentences.

Ziek-dod shines as an eternal star among the great names of her world. Like Veorda, she was pure-hearted and possessed fine moral and spiritual qualities. She passed out into that Broader Life where language is sweeter and thoughts are more holy.

In music I noticed the most radical departures. The popular home instrument is larger than our organ and has nearly one hundred keys arranged somewhat like the keyboard of a typewriter.

These keys and their combinations are capable of rendering sounds to correspond with every syllable found in their words. A proper familiarity with these sounds is a part of every child's training on Saturn.

When one plays on this instrument every sound struck on the keys represents a certain vowel-consonant sound. Thus the listener hears the sounds more distinctly than we hear the words of a phonograph.

Under such conditions a musician is

capable of interpreting his exact feelings when manipulating the keys. He talks to his listeners with organ sounds. The great poet musicians can breathe out their inspirations in rapturous melodies. On special occasions famous musicians are employed to render original selections. Addresses and lectures are also given in this manner with very pleasing results.

The Saturnites know nothing of the Telephone, Telegraph, or Phonograph. But for carrying messages they have a signal system by which intelligence is flashed from one point to another with great rapidity.

Saturn has eight moons and is surrounded with the rings which have made it famous from the time the planet was first seen through the telescope. These rings and moons are inhabited by a type of human beings altogether different from those that live on the planet, and are distinctly visible to the dwellers of Saturn by means of powerful telescopes.

The human beings on the rings are not able to watch their neighbors in space, having no instruments to carry their vision

beyond the boundaries of their own peculiar abodes.

The most picturesque sight of all the Solar System is seen as you stand on Saturn, and watch the rings and the eight moons chasing one another in the heavens above you.

The inhabitants of this beautiful world believe that the soul of each God-adorer at death passes out into the spirit life on the rings where it will continue in a blissful existence until the final judgment.

The religious life of Saturn is officially controlled by men. There are many creeds, each with its own devoted followers. The leading church of this world was not organized until seven thousand years after religious life took a distinctive form. Then a man named Trique, who was a shrewd student of the times, after a careful study of the weaknesses found in existing religious bodies, and after amassing enormous wealth in business, founded a new church on a neat, practical business plan which may thus be briefly described in terms and figures of our own language.

Trique had a fortune of two hundred millions which, by investment, netted him twenty millions annually. These net earnings he used to establish his new denomination. He commenced operations simultaneously at the capitol of each of the four governments of Saturn, and at each place built two magnificent churches, costing one million dollars apiece. It took over three years of our time to build these eight churches. Before one year had expired he had started fifty other churches in the centers of Saturn's population. These churches averaged in cost three hundred thousand dollars each. Thus the plan continued, ever starting new structures until all Saturn was decorated with the churches of Trique, even village edifices costing from ten to twenty-five thousand dollars. So much for the mere outward part of the church which anybody might create if he had recourse to such enormous wealth.

Before Trique commenced any one of his buildings, he canvassed the whole community for charter members of his church. These were composed of two classes, spiritual and connected. This canvassing was

done by the finest scholars that Trique could employ. Each one was supposed to be the pastor of the community he canvassed. The conditions of the charter membership were easy to meet. All that was required for connected membership was a good moral life and a lip confession of the faith.

On account of the superior advantages offered by the Trique church it grew steadily from the beginning. I will here append a few characteristics of the organization :

1. The church takes care of all its members during sickness, furnishing a physician and all necessary medicines free of charge. The church owns drug stores and graduates its own physicians.

2. The church has its own salaried undertakers, and defrays all funeral expenses.

3. The church supplies a moral and spiritual education to all the children of its members. This school does a work similar to our Sunday-school, only it is held daily and is under a trained corps of paid teachers.

For all these advantages each member is required to give to the church one-eleventh

of his earnings and to attend the services of the church and co-operate with the pastor in the advancement of all spiritual work.

The church keeps a perpetual record of the attendance and the work done by each member.

It required a man of large business capacity to launch such a church with its radically new principles. But Trique's immense wealth was a powerful force when utilized in this manner. He made every church a strong business center commanding the respect of the whole community. Discipline was rigidly enforced. No member cared to be expelled from such a church. It meant a going out from under a warm cover at the approach of winter.

Fortunately, Trique was a clear, spiritual man and strongly urged a spiritual ministry and membership.

It can be seen why this church grew so rapidly. In fifty years it became so powerful that it could control, if it wished, the legislation in nearly all the sections of the planet.

I have given but a brief picture of this ruling church. It must suffice. I may add

that one must not imagine the church services and forms in Saturn to be like our worship. All things are so different that it would take much space and time to describe them.

For beauty of natural scenery, Saturn surpasses all the Solar System. Its air is of a different composition from ours, and its sky puts on various tints as the day passes, which is a little over ten hours of our time, but it takes nearly thirty of our years to make one on Saturn.

The immense mountain ranges present a picture of unusual beauty. The leaves of trees are rich in velvety varieties and the undergrowth appears as if trimmed by skilled hands. This is a desirable place to live. But I learned that the inhabitants of Saturn do not appreciate all this wealth of beauty, in its atmosphere or on its earth, a whit more than the people of our world appreciate the sin cursed scenery which greets their eyes.

## CHAPTER VI.

### The Nearest Fixed Star.

ALL that was required on my part was a mere act of the mind, and I went where I wished. I visited Uranus and Neptune, after which I stretched my swift wings for the great flight, away from our Solar System, over billions of miles of space. I alighted on the burning star nearest to our Earth. This star is called, by our astronomers, Alpha Centaurus, and it is said to be 20,000,000,000,000 miles away. This star is much greater than our Sun and is the center of a system of worlds larger and more numerous than those that compose our Solar System.

You cannot imagine my surprise when I reached Alpha Centaurus and found that it was inhabited by a class of human creatures who were created to live and flourish in fire. Their customs and habits are so strange that I am not capable of giving an intelligent description of them. I know that it is in-

conceivable to us how life can be developed and sustained in the midst of a burning sun, and I found that these beings in turn could not conceive how life can exist in a cold world like ours.

These creatures have no digestive organs. They live, in part, on the chemical action produced by fire breathing. The hotter the fire, the more easily is life sustained. If they were to get away from the heat, this chemical action would cease and therefore death would be as certain to them as being enveloped in fire would spell death to us.

In our eyes, their bodies are misshapen, composed of elements most of which are not found in our world. There are many cold places, or sun spots, on Alpha Centaurus, but these are shunned by the people as death traps. However, the centers of population gather on the more solid sections, most of which lie around the sun spots.

You could scarcely believe your eyes were you to look upon the durable works of architecture built by these strangely shaped mortals.

Still more wonderful are the seas of

boiling fire which are sometimes comparatively quiet, and then again, in all madness, their majestic flames shoot upward thousands of miles.

When the sea is quiet, life is oppressive in the centers of population just as it is in our world when the air is still and the summer sun is pouring down upon us. Breathing is easier and life is quickened when the molten sea boils furiously. These terrible heat blasts are most exhilarating and refreshing to the inhabitants living near enough to receive the benefit of them.

You may imagine that these people of Alpha Centaurus are idlers, being fed by the ceaseless heat waves that beat upon them. Such a conception is totally false, for I saw that industry was plainly evident, and labor had its reward in securing the necessities and luxuries of life.

These life-sustaining foods are composed of elements which can be appropriated into muscle and bone (if you will permit me to use these terms), and are obtained by re-uniting and re-combining spent forces. This explanation is somewhat mystical, but I can do

no better in describing the food production and assimilation in a pure fire-world like this one on which I had arrived.

To imagine and believe that fertility can be possible in a seething world-furnace, is too far beyond our philosophy to be conceivable. Alpha Centaurus is so large a sun that although it has a population ten times greater than our globe, yet its surface is sparsely settled.

The oceans of fire occupy the greater part of the surface of this wonderful sphere. In these great red-hot seas live the monsters of the deep, as well as a motley variety of other species, veritable salamanders, some grotesquely hideous, others surpassingly beautiful in form and hue.

On this sphere man is extraordinarily intelligent. He is almost totally ignorant of anything akin to astronomy, although some of the greater scholars have ventured the theory that there might be other worlds containing human life, providing there be fire enough to sustain them.

In some other particulars, these star-creatures have made astonishing progress.

They believe that the time is coming when the fires of their world will be blown out and all life become extinct. This they would call, in our language, the coming Judgment when every human being that ever lived will receive his just recompense of reward.

With interest I studied the manner of government, and the admirable system of education which is the secret of their progress.

I made a special effort to ascertain whence this sun receives its continued supply of fuel. The question had often perplexed my mind when I gazed toward our Sun from the shores of our world. None of the theories advanced by our scientists and astronomers fully satisfied my mind. And now I looked and studied in vain. Although the awful burnings had been in progress for thousands of years, I could see no fuel that was added to the flames. Hence I was driven to believe that Alpha Centaurus was on fire and was gradually being consumed ; this must be true of all the stars that bedeck the canopy of Heaven.

The inconstancy of this star's surface is

the greatest menace to its inhabitants. At times the solid crusts break in the contracting of the surface. All this makes terrible havoc, but the new generations take fresh courage and pluckily restore the fallen habitations.

One of the luxuries enjoyed by these fire beings at certain times is to get where the chemical action of heat is at a low ebb. That has a similar effect upon them as calming our nerves has upon us.

One of the great inventions consists in an instrument that neutralizes this chemical action of heat even where it is most intense. It is a common sight to see creatures basking under one of these instruments in a somewhat comatose state. The inventor of this instrument is worshiped almost as a god.

One of the most startling inventions of all is a machine that counteracts gravity. This, to my mind, is the greatest invention I had yet seen, and, strange to say, these fire creatures know nothing about means of propulsion except by hand power. If you were able to stand on the seething furnace of Alpha Centaurus, you would see these

machines rise far into the shooting fire and beyond, as far as occupants can go without freezing to death. Then at a reverse of the lever you would see the mysterious car descend.

These star residents have enjoyed this invention so long that they no longer appreciate its marvels. You ask me if I tried to get the secret. I saw the whole apparatus and the more I studied it, the more I was convinced that its storage battery contained heat energy. So I concluded to solve the mystery. I learned that there was a certain element found only in combination. When this element is set loose by chemical process, it will rise at once toward a large planet that revolves around this sun. This planet draws that particular element with six times more force than it is held by Alpha Centaurus. The brilliant chemists, when they first made this discovery, separated enough of this element to carry a man upward from the sun's surface. Later on they made a counter discovery of equal value.

They found a substance that would destroy this attraction if it was placed be-

tween the element and the planet. The discovery enabled a person to rise as high as he wished and then, by swinging the plate in position, the aerial carriage would either stand still or descend according to the wish of the operator.

What a boon it would be to our world if we had such an element for which Jupiter or the Sun would have so much fondness! Then with our superior knowledge of propulsion we could forever settle the perplexing problem of aerial navigation.

These exceptional people, living in such terrible fire, wear pieces of garments made of the finest texture. The hair-like threads are composed of metallic substances far more enduring than gold or platinum.

Of all the unthinkable things on this star none are so extreme as the manner in which these people hold conversation. They have no organs to produce vocal sounds.

They convey their ideas one to another by a vibration of the conversation flaps. Either the air waves, or substantial emissions, excite the sensitive face of the listener so

**Fire Life on a Fixed Star.**

that the thought intended can be accurately received.

Having a strong curiosity, I remained and studied this fire life. It opened to me new channels of thought and illustrated more emphatically than ever that all things are possible with Him who created the universe and upholds it by the word of His power.

Finally, I left this strange abode and proceeded to visit some of the eighteen worlds that revolve around Alpha Centaurus.

## CHAPTER VII.

### The Water World Visited.

**A**S I lingered in the region of the constellation of Centaurus I was more and more profoundly impressed with the magnitude and variety of created worlds.

Among the eighteen planets that revolve around Alpha Centaurus, only six are inhabited. One of these is a sinless world, or a world whereon sin never inaugurated its blighting reign; but I will say nothing of this orb as I did not have the choice opportunity of visiting it aright. I saw its beauty only through a glass darkly.

I then fixed my mind on Polaris, commonly called the North Star. In journeying thither from Centaurus I passed thousands of Solar Systems scattered in space all around me. As I was thus darting through immensity I glanced toward our own Solar System and could see nothing but a flickering star which was our Sun. Not the faintest sign could I see of our world or of Jupiter.

A strange feeling passed over me when I began to realize how far I was from home. I sped onward until I reached the North Star. It is a burning sun, but not inhabited.

Polaris is the center of a magnificent system. If a certain few of its worlds could be seen through a telescope, they would be picturesque in the extreme, somewhat resembling our beautiful Saturn. Moons play like frisky lambs around some of its worlds, and many comets dance through the length of the whole system in richer confusion than we have ever beheld in the range of our telescopic vision.

Counting the worlds of larger size only, there are nearly one hundred that fly through their orbits around Polaris, some with amazing velocity. Within the bounds of this solar system I spent considerable time.

The third world I visited I will call Stazza. It is two hundred millions of miles from Polaris and is four hundred and fifty times as large as our world.

I was amazed at the new turn of life-manifestation that I found there. To me it was unusually interesting because its tempera-

ture is quite similar to ours ; but the order of life is reversed so completely that the human beings inhabit the water, and the long narrow strips of earth are infested with numerous species of land animals. It may seem incredible that the depths of the ocean should be the seat of intelligence rivaling our own.

The human creatures of Stazza average a trifle larger in size than we, but they travel horizontally in water like a large fish. The limbs support the body in rest, and in traveling are used like the hind legs of a frog, only more gracefully. The arms closely resemble ours and have an infinite variety of uses. In addition, there are four fin-like arms that fold into the body when at rest, but are spread for service when traveling. In all it must be admitted that these Stazza people are capable of traveling more rapidly, and covering longer distances with much less fatigue than are we. They can also carry greater burdens with more ease. They wear no garments except one or two small pieces made of a tough species of sea grass.

Five-sixths of Stazza are covered with

water and its depth at a few points is very great. Throughout all the water regions there are many kinds of animal life, more than can be found in our oceans. Thousands of human lives have been lost in conflict with the fiercer kinds of these water animals, with which the people of Stazza entered upon a war of extermination over one thousand years ago, and while intelligence is slowly winning the battle, yet the warfare is likely to continue many centuries to come, owing to the fact that these hostile fish occupy the soundless depths even as deep as four or five hundred miles according to our measurement. Horned fish rising from these depths are a horrible menace to excursion parties or caravans, as well as to settlers on what we would call the frontier.

The homes of Stazza are made of metallic substances. There are a few minerals very plentiful, resembling brass, and it is a common sight to see polished buildings fantastic in their arrangement, shining through the pellucid water like gold.

The cities are built on gentle inclines

in the deeper waters and present a picturesque scene. They look more like a cluster of giant fairy abodes than like New York or London. Nothing in all the world of Stazza resembles a product of our manufacture more than the fine screening that protects every human dwelling from an invasion of small water animals. It reminded me of the mosquito netting as a safe-guard against flies and other insects in our world. But the mosquito baffles our genius, for he seems to be able to get through as small an opening as air can. Likewise, the pestiferous water animals seem to invade the homes of Stazza, notwithstanding all efforts at prevention.

The cities have no continuous streets or lanes. The principal travel is in the water over the city. The main entrance to the home is on the housetop. In the center of large buildings there is a shaft running up and down, through which the people go with greater ease than we can climb or descend our stairways. It must not be forgotten that water to them is the same as air to us, and in their domestic life the people

are annoyed by cloudy and muddy currents of water just as we are by clouds of dust in the air, on the streets, or in our homes.

The wear and tear caused by the chemical action of water on houses and furniture is not as great as the injury in our world caused by the chemical action of air, heat and moisture.

The educational systems of Stazza are quite as perfect for that world as our own systems are for ours. They have an alphabet, covering their needs in language, consisting of a series of strokes, curves and angles, somewhat resembling our shorthand systems. This language is identical in print or script, and is superior to our method of expressing thought by handwriting.

The experts of Stazza have learned the art of slicing metallic blocks into sheets of any desired thickness. These sheets serve the same purpose for them as paper does for us, and are furnished at an insignificant cost of labor. We have the very elements in our Earth to produce these metallic blocks if we knew the combination, which might be easily found if we had as much

need for them as the people of this water world.

The metallic blocks are used for a great variety of purposes. There are some high class artists who have immortalized themselves by their master-pieces, one of which I saw on a five-cornered metallic sheet measuring about eight feet in diameter.

Perhaps the most surprising feature of the educational advancement of these water spirits is their knowledge of astronomy. To them, under the water, the stars have always looked beautiful, and from an early date in their history a study of them has engaged the attention of their scholars. No one could tell the style of their telescopes if he should go to guessing for a week. Let me give you a brief description of one.

They build a metallic pipe about ten feet in diameter and from a point some two hundred feet below the surface of the water. The pipe is built until it extends a few feet above water. Inside of this pipe is a series of transparent ovals of various

sizes. These ovals are so arranged that the upper one throws its light to the lower one, down through the immense cylinder. Around each oval is built a series of fin protectors, which is the only part about the telescope I could not fully understand. They seemed to counteract the refraction of the water, and yet the water must be in the pipe to obtain proper results.

Imagine an astronomer at the base of this huge metallic structure, having at his finger's ends a dozen wire strings intricately connected with the oval system, and by the proper use of which he can increase or decrease the magnifying power of the ponderous telescope. The highest magnifying power of a telescope of this size is so great that the Milky Way is penetrated and its solar systems revealed. What an accomplishment it would be if a telescope of this magnitude could be mounted, a thing that these creatures never attempted to do. But they have built telescopes of various inclinations, all stationary. You can form an idea of the patience and endurance of these people when you learn that it re-

quired over fifty years of our time for them to perfect one of these large instruments.

Give human brains to any animal under water or over water, and it will grasp for larger views of its Creator and of the things He made. These people are thoroughly convinced that intelligent life can be found in any world where there is enough water to sustain it.

In the waters of Stazza there are many under-currents similar to our Gulf Stream. These are used by the inhabitants for transportation. They construct little hammock cars so that when they are filled with human freight they float in the water. A simple device which we might call a fin propeller is used to force the car in one direction or another as necessity may require. It is possible to enter one of these under-streams and thus travel over two thousand miles; then, by rowing only five miles, enter the return current and move homeward. A car of special design is furnished by each community in which each bridal pair spends the Wedlock Ride, or the Honey-Moon, as we would call it.

Fishing for Land Animals on a Planet of the Pole Star.

There is nothing more interesting about this race of beings than the manner in which they pluck land fruit and catch land animals, and yet when you compare this with our world, it is the same to them as fishing is to us.

In all my inter-stellar journeys perhaps there was nothing so amusing to me as to see a company of these water creatures fishing for land animals. They would creep up near shore and throw out their wire lines with various kinds of bait, according to what they wished to catch. Then followed the inevitable waiting until some innocent Jullep or Petzel would grasp the tempting morsel on the hook. A skillful jerk fastened the victim, and instead of pulling him in the water, the fisherman held his breath and rushed out of the water to get his prize. This has been found to be a safer method than trying to pull the prize into the water.

These water dwellers relish certain land animals more than we do fish.

Of course the land strips are not inhabited by human beings, but vegetation is

abundant, similar to that found in our tropical regions. Many kinds of fruit, growing on the land, are sought after by the masters of the water. In the season when certain fruits are ripe whole expeditions go out to gather them. But how can they live away from the great body of water while plucking these fruits? Let me tell you how they manage it. They have what we would call water-wagons, very wide and short, and equipped with buckets. At the rear of one of these strangely shaped carriages stand four or six men abreast immersing their heads in the water of the wagon for a fresh breath as often as necessity requires. Thus they are enabled to travel over land to any desired locality, always being careful to keep near enough the water to cover any emergency.

When they arrive at the fruit each man takes his bucket of water and proceeds to work. He plucks fruit or berries for about thirty seconds and then ducks his head into his bucket of water for a fresh breath. Then he proceeds as before. When the water is no longer fit for breathing, he carries his

fruit and water bucket to the wagon. Here he unloads his fruit and refills his bucket from the wagon, proceeding as before. At intervals the wagon must be refilled with water. During a day a few men can gather a large quantity of fruit in this manner, and it can be preserved for over four seasons.

On Stazza there has been developed a fine variety of water flowers, and no gardens are more beautiful than those that can be seen there. The higher classes of these people live a very refined life and have their homes surrounded with an endless variety of water grasses and flowers. You would scarcely believe your eyes if you could direct your gaze to a few of these homes.

In their religious life these Stazzans are eminently devoted. They have no bunch of creeds from which to take their choice, but follow the teachings of "The Great Interpreter," a man who once lived and reigned amongst them and who wrote his laws in what we would call, by interpretation, "The Book of Gold." The leaves of this book are made from an element costly and rare, more

precious to them than gold is to us. From this book all their sacred books are copied. The civil powers also accept this book as their authority, and enforce its teachings.

Sin there, as here, is the withering blast of the planet, the destroyer of the harvest fields of purity and truth. An invisible spirit of evil holds his force in disciplined command, and the man who wishes to have a pure heart on Stazza must reach it through conflicts long and sharp. The path to moral and spiritual purity is quite the same throughout the whole universe.

## CHAPTER VIII.

### Tor-tu.

**A**FTER I had finished my interesting tour of Stazza I visited in quick succession a score or more of worlds that also revolve around Polaris at varying distances. I found the majority of these planets barren of all life, owing principally to their molten condition.

Some unthinkable types of human existence are occupying the worlds that can be inhabited. I marveled aloud as I viewed a few more links of the endless chain of intelligent creation. On one of these worlds, which I have christened Tor-tu, I found human beings that resemble us more than any others in the entire solar bounds of Polaris.

Tor-tu dashes along in its unceasing course at a distance of eight hundred millions of miles from Polaris. It is much larger than our world, and is accompanied by three moons and a set of rings which faintly suggested our picturesque Saturn.

The poles of Tor-tu are inclined at an angle of thirty-three degrees to the plane of its orbit. This accounts for its temperature being quite similar to ours, although its year is eight times longer.

When I first reached this world I was impressed with its wealth of natural scenery. Flowers of charming texture and color grew abundantly over the wide expanses. The cultivated gardens contained specimens of unusual beauty, surpassing the finest products of our Earth.

When I examined the leaves of the many kinds of trees, I found none similar to the foliage of our planet, except in one or two fruit-bearing trees. The sky, instead of appearing blue, wears a greenish tinge, and the birds are robed in a variety of colors that would put to naught our arching rainbows.

In fine, it must be admitted that Tor-tu is a much more beautiful world than ours. I saw colors there that we could not produce because we have not the proper elements.

This delightful world is densely populated. Its history is much older than ours. Sin is firmly rooted in the whole planet and

its curse is just as blighting and withering as it is in our world, although it is fought more successfully and overcome more effectually in the home and in the nation.

I observed that the ecclesiastical system is similar to ours, and there is a great profusion of creeds. To my surprise I noted, in my long journey, that such a variety did not interfere with true progress, but was compatible with the purest kind of life and the highest order of civilization. The people are deeply devoted to their unseen God, and their sacrifices are astonishing. Their places of worship are the finest structures of the world. They believe it to be wrong to construct any building greater in beauty and value than the temples of God. Their music would sound quite weird to us, although it is sweet harmony to the people of Tor-tu.

The home life of Tor-tu is most beautiful. The moral life of the home and of the nations is the cleanest of any world in the whole system of Polaris. Naturally I investigated to learn the secret of this happy condition. Then I found to my joy that the relation between parents and children is very

noteworthy. The fine respect manifested by the latter for the former evoked the blush of shame as I thought of the prevailing conditions in my own world.

You may think it absurd when I describe a certain system that was a stepping stone to such splendid results. Were this peculiar system to be named, we should likely call it: "The Human Seal System."

Each person born into the world of Tortu is officially sealed or tattooed on the forehead and on the arm. It is done by the township book-keeper, whose duty it is to keep a correct record of all births, devoting a new ledger page to each infant.

This seal is a life-long mark, and must not be interfered with under any circumstances. In case the stamp is disturbed by accident, the person must report to the township book-keeper either in person or by proxy, and the stamp must be replaced on some conspicuous part of the head.

There are eighteen governments of Tortu that united on this scheme. It is so arranged that no two persons of all these millions have identical marks. Each govern-

ment has its seal of different designs from all the others.

Circles, ellipses and rectangles, with various modifications, compose the eighteen forms in use. The most powerful of the eighteen governments has for its seal the following design, which I have filled out as completely as I could, using our own figures instead of their numerals which would, of course, be unintelligible to us.

This is the actual size of the design as it appears on the forehead.

13 represents the number of the state.

21 represents the number of the county.

10 represents the number of the township.

12 represents the color of the person.

352, in the center, represents the individual's number.

This same mark is the individual's signa-

ture for life. It cannot be changed, although the person is allowed to have a metallic or rubber cut of his own design, provided he writes the individual number by hand, for any one else doing this would be a forger.

The township clerk is also the collector of the public funds. To him each person born in that township is compelled to render an annual report of his residence, occupation, and certain other facts relating to his life in general.

If any minor or adult commits a criminal act upon which the civil court has passed, this finding is recorded in the township record on the individual's page and, when the criminal has served his sentence, this fact is also recorded. This is a severe law for the criminal, but it is a great stimulus to a law-abiding career.

It is also customary for public courts to confer on worthy persons special marks of honor for extraordinary deeds or acts. A record of such rendering is also kept.

In presenting annual reports to the clerk each father reports for his minor children. This puts the father on a rightful plane of

dignity before his children, and the parent who makes a wise use of these provisions can and does reach far better results than can otherwise be done.

No child can run away from home without falling into much more trouble than he imagined he had before. At once his seal number is sent to all the countries and into every sub-division. Any one aiding or abetting such a person is severely punished. When the runaway is captured, the system of reprimand is of such a nature that the minor will be glad to remain under the directions of his parents until his maturity.

If it can be shown that a parent or guardian uses inhuman methods of punishing children, the act is criminal and is dealt with accordingly.

There are no tramps parading periodically over the countries of Tor-tu.

There is an international law that each township must care for its own paupers. Every man's forehead seal tells his birth-place and there is no escaping from it.

When a person is suspected of crime in a foreign land, the foreign officials can tell

not only where the individual was born, but they can also obtain an official record of his life by applying officially to the clerk and paying a nominal fee.

Any stranger making a serious effort to cover his forehead is looked upon with suspicion. It is a current phrase of honor among the Tor-tuites : "I am not ashamed to show my forehead."

A few hundred years after this "Human Seal Law" went into operation, no one, except the criminally inclined, would think of returning to the old reckless way, although the system was scorned and ridiculed by many Tor-tuites for about fifty years after its advent.

In considering the character of an individual, the courts and the people place tremendous stress upon the township record. Each son and daughter early learns the value of a stainless page and strives to keep his record clean.

The township, through the state, gives to each child at maturity a civil inheritance, provided his record meets the requirements of the law.

All these customs and regulations are powerful incentives to the youth to lead a good moral life and naturally tend to a respectful demeanor of children toward their parents.

This world is not only notable for its moral atmosphere, but for the remarkable progress its inhabitants have made in political economy.

They know a few things about laws, but not enough to make them so complicated that no one can understand their meaning. In law, the poor man usually has the same chance as the rich. Money has no weight in the Tor-tu scale of justice. The facts in the case are the only things that have weight, although bribery is possible and is sometimes practiced.

The laws of Tor-tu relating to deeds and titles are the most simple and yet the most effective that have yet come to my attention.

All the land in each county of Tor-tu is divided into lots, and each lot is numbered on an immense diagram at the county seat. This diagram is a miniature relief outline of the county with each lot and plot in the

county designated, and, according to our measurements, it averages almost eighteen by twenty-four feet, varying according to the size of the county.

When you buy land you buy from the county only. If you wish to purchase a lot or plot from another party who is willing to sell, the two parties concerned go to the chief real estate agent who is an official of the county and has charge of the county diagram. The former owner or title-holder, upon establishing his identity, releases to the county his claims and surrenders his title on condition that he receives the sum agreed upon between the two parties.

The county agent then issues a new title to the new purchaser. It is a simple common-sense document completely describing the new owner, his relatives and his station. Thus each purchaser has his own title from the county and it is guaranteed. Under this admirably simple system disputes as to titles are rare and can scarcely occur; but if any should arise, the county takes the defense and bears all expense of litigation.

No counter claim is even heard after a title is five years old. Thus it is impossible to resurrect an old buried claim and rob an innocent owner who purchased and paid for his ground in good faith.

In transferring real estate no lawyers are required. Several persons, however, must witness the execution of the deed.

The county publishes a journal, monthly, stating the owner of each lot or plot number in the county. This is furnished free to each land owner.

All credit to Tor-tu for these common-sense regulations! Our laws covering this field are heathenish compared with the statutes of this far distant world. There no man loses his real estate by the awakening of a sleeping title, and if this could happen he would be fully reimbursed by the county.

In our world some titles are as clear as mud. Often we pay a large sum to have the records examined and even then a purchaser has no assurance of non-interference. Here it is even possible to buy a lot, build a home, and five or fifty years afterward have it sold by some one who proves a prior

claim on the land. No such foolishness, or child-play in the guise of legal dignity, is countenanced in Tor-tu.

The whole civil system of this sphere is superior to ours. A person who violates the law is not treated to free boarding and lodging in a well heated and lighted building, as is quite prevalent in our world, but is compelled to enter profitable labor under strict surveillance. Any prisoner becoming rebellious and refusing to work is dealt with severely. If he is still insubordinate, he is placed on the revolving wheel of death until his stubborn will is broken, or he falls fatigued into the jaws of steel.

This convict labor does not compete with the regular ranks of honest toil. The main work of criminals is farming, and the products of these farms support not only the criminals, but their families as well. What is produced beyond that is sold at market price and the proceeds are applied to current expenses of the county.

In our world the honest man must pay to support the dishonest; the law-abiding must care for the law breaker. How much

longer this will continue no one has prophesied.

The manner of choosing officials in Tor-tu is both new and surprising. All the officers, from the highest to lowest, are chosen by lot instead of by popular ballot or hereditary claim. They who are thus elected remain in office during competency and good behavior.

1. Their record must be stainless during the preceding ten years.

2. They must have been graduated from the law department of the public schools.

3. They must be at least thirty-one years old.

For the highest officials the conditions are more rigid.

The teachers in all public schools are selected in the same manner from among the number who apply, and who have been graduated in rank high enough for the school in question.

At first this lot system seemed very foolish to me indeed, bordering upon absurdity, but the more I studied its simplicity and observed its results, the more I became

impressed with its good sense and efficiency. There are no political parties fomenting discord in a country under a spoils system ; no upheavals every few years and hilarious campaigns ; and no idiotic caricatures of public officials to work unbridled mischief in the hearts of the most dangerous citizens.

## CHAPTER IX.

### A Problem in Political Economy.

**A**FTER I had left the world of Tor-tu I still lingered in the heavens around the planet and examined a few of its moons. While enjoying this pleasing diversion, I learned that not far away, less than one billion miles, there was a world without an atmosphere. This peculiar condition was not new to me, for I had seen, during my never-to-be-forgotten journey, many worlds without gaseous air.

I would not have gone thither had it not been for an unaccountable desire impelling me. Obedient to my impulse, I soon found myself on this odd planet which I have named Airess.

I at once observed that the people are formed without nose or lungs. The nose is substituted by an opening into which liquid air is received and through which it passes to a bodily reservoir of two lobes in the vicinity of the heart. When I saw how these

people were obliged to fill their living vessels with this air-supplying liquid, I at once thought of the manner in which we in our world fill our lamps with oil to furnish light and heat.

Now it is true that nature supplies this liquid air in reasonable abundance, and no doubt all the people would have been happy until now had it not been for the unjust scheming of a few unprincipled men.

The strange story of the air problem on this distant world is so similar to the food problem of ours that I have time to describe it briefly.

There were certain men in Ainess, shrewd above their fellows, who secretly combined to secure a controlling interest in all the land producing liquid air.

In course of time these shrewd schemers, who are known as monopolists, gathered this liquid air into large tanks and warehouses, and put an exorbitant price upon it. The business flourished greatly because everybody was daily in need of liquid air.

The many sources of air-supply were guarded and men were employed to carry

the liquid from the raw springs to the private tanks of the monopolists. Not long after this, when the monopolists saw that they controlled all the liquid air of the country, they had rigid laws passed forbidding the importation of air from any other country. Then when all preliminaries were arranged, the magnates raised the price of their commodity.

The burden fell most heavily on the persons of limited means, for some were compelled to give half of their earnings for air.

The monopolists grew richer and richer, while the poor became still poorer, until a cry went up for cheaper living. Then the generous-hearted magnates decided to build new and larger storehouses, thus giving employment to the large army of impoverished workmen. Thus did the poor feel very grateful for the privilege of earning enough to satisfy their hungry stomachs.

With the larger storehouses now in operation the magnates were enabled to conduct this air business on a scale more economical, and so it resulted that the profits of their business were constantly increasing.

Many who were unable to work became sorely distressed insomuch that some died raving for liquid air. Others were more fortunate and were helped by charitably inclined citizens. When a few poor comrades clubbed together and contributed out of their mites, then the magnates sold air, but if the sufferers had no money, they could have no air.

A growing discontent possessed the people. They appealed to the legislative bodies, but the magnates had grown so immensely wealthy that they controlled all the law-making assemblies and gave the members air free of charge, an act of kindness indeed.

So the law turned a deaf ear to the cries of the people and many riots followed. But these were all quelled by the standing army which was also supplied with free air for the good service they were capable of rendering to the monopolists.

The multitude of laboring people could do as they chose, that is, work like slaves and live, or refuse to tolerate the monopoly and die.

Many were the pitiful scenes witnessed

Monopolizing Liquid Air on Aires.

are anxiously looking and which we designate as the Millennium.

Of all this ponderous solar system there is one world that excels all the others in its medical attainments, and of this one first I will give a flying notice.

I have named this world Dore-lyn. It is fifty times as large as our Earth and of greater specific gravity.

Its human creatures are delightfully formed and are in ruddy health and refined happiness. In shape these Dore-lynites differ somewhat from us, but long before I had reached this planet I learned something of the universal standards of symmetry and ascertained that creatures could be beautiful without resembling us whatever.

Here I found four billions of people and there is room for twenty billions more. So if you are in ill health, and have run the round of our medical fraternity without success, I would advise you to go to Dore-lyn, if you know how to reach it.

These Dore-lynites are almost three times our size and they are subject to most of our ills and many more. From an early

date the head government of this world paid particular attention to hygiene, keeping all medical work under its own care.

The government controls the whole field of medical science just as we do the post-office department.

There are no conflicting schools of medicines suc'. as Allopathic, Homeopathic, Hydropathic, Eclectic and Osteopathic. The government gives handsome rewards to any one who furnishes a new discovery or gives additional light. Everything is duly tested and proved to be a success by a corps of experts before it is given to the practicing fraternity. The government holds certain rights in experimenting that no physician or medical school would think of having in our world. The government medical schools of Dore-lyn are marvels indeed. Nothing is spared that money or talent can furnish. The full graduates of these schools are only "the survival of the fittest." Others take a secondary degree and can act as assistants or retire from the list. The government has a series of institutions that do a work similar to our hospitals and

have a corps of full graduates supplying the stations. This entire system is so arranged that every family or individual receives all necessary treatment free.

The cost of carrying on this vast system is one of the items of national expense. I will now mention some of the medical achievements of these Dore-lynites.

When a physician suspects that the blood is poisoned he at once proceeds to a chemical analysis, and if certain kinds of poison are found, the blood is filtered by the use of a fine instrument. A blood vessel is exposed and cut, and the two ends fastened to the delicate filter. Thus the blood is cleansed by passing through this instrument. Those acquainted with the manner in which the blood circulates can readily see how all the blood of the body can be reached in a short time. This method is very successful in the treatment of all bites of poisonous insects and reptiles, and all types of hydrophobia, which are ten-fold more numerous in Dore-lyn than in our world.

There are no patent medicines in Dore-

lyn. The few medicines they have are manufactured only by government authority and everybody receives the purest that can be compounded, no distinction being made between rich and poor. One thousand years ago the medical aspects of Dore-lyn were similar to those which are seen in our world to-day. People were compelled to take all manner of poisons and opiates even from skilled hands. But in Dore-lyn those days of darkness and misery are past and the people enjoy the benefit of a medical skill one thousand years ahead of us. They look back to the practice of the old physicians with ludicrous feelings just as we do when reading the prescriptions that were used in the first century of our dispensation.

We call your attention to some of the antiquated remedies of our world as related by Geike and copied from a medical journal of our own country. Following is a list:

"Ashes of wolf's skull, stag's horn, the heads of mice, the eyes of crabs, owl's brains, liver of frogs, viper's fat, grass-

hoppers, bats, etc., these supplied the alkalis which were prescribed. Physicians were accustomed to order doses of the gall of wild swine. It is presumed the tame hog was not sufficiently efficacious. There were other choice prescriptions such as horse's foam, woman's milk, laying a serpent on the afflicted part, urine of cows, bear fat, still recommended as a hair restorative, juice of boiled buck horn, etc. For colic, powdered horse's teeth, dung of swine, asses' kidneys, mice excretion made into a plaster, and other equally vile and unsavory compounds. Colds in the head were cured by kissing the nose of a mule. For sore throat, snail slime was a favorite prescription, and mouse flesh was considered excellent for disease of the lungs. Boiled snails and powdered bats were prescribed for intestinal disorders."

When we read such a list of remedies we can scarcely believe that they were ever popular, but according to the history of Dore-lyn the time will come when many of our present medicines will be out of date, and only mentioned in the old medical works.

The people of Dore-lyn have suffered in

past ages innumerable woes on account of intemperance. Alcohol is unknown to them, but they have had a two-thousand year's battle against three liquids that affect them as opium affects us. Strange to say that these terrible liquids were the bases of many of their medicines just like the anodyne medicines of our present day. Thus in Dore-lyn the old kinds of medicines created many drunkards. Since the dawn of the brighter age, a strict law prevails regarding the use of all narcotics in medicines. Then came gradually into use the many methods of treating disease without medicine, except the materials used to sustain life regularly.

Being interested in these things, I examined more closely into their past medical history, and saw more clearly the present folly of a certain part of our medicinal practice. How we are struggling with alcohol, especially as found in so many of our patent medicines, and how helpless we are in trying to abolish the sale of these medicines by reason of our unbounded liberty! In our world, a man may concoct any alcoholic medicine and sell it without liquor license, for people

become verily mad for the bottled stuff. Our nation may some day become wise enough to keep its own hand on the business that is determining the health and happiness of millions of its inhabitants.

But let me cease this digression and get back once more to Dore-lyn.

One of the most noted medical achievements on this world consists in the manner of rendering a person unconscious of pain. The anatomy of a Dore-lynite is, in general, the same as our anatomy. Their bones are arranged a little differently and the sections of the backbone have a quite different formation. When a surgeon of that world wishes to perform an operation and therefore render the patient unconscious, he presses the tough cartilagenous part of a section of the backbone with a screw device fastened to the body of the patient. This simple act renders the spinal cord insensitive, which condition may be maintained for hours without injuring the patient. Of course any point above the screw device is sensitive, and for this reason it is more difficult to render a person unconscious in the parts about the head.

Many ages ago the world of microbes was laid bare, but not before these people were masters of the microscope or an instrument serving the same purposes, although formed on a partly different principle.

These Dore-lynites have brought to light the numerous varieties of parasite broods that cause fermentations and diseases, both infectious and otherwise.

A diseased body is looked upon as being in possession of a certain brood of microbes which are destroyed either by the blood filter or the "Vaccine bath, or injection." (I know no better name by which to call it.) A few diseases are treated by doses of medicines given in a manner similar to the prescription system of our country.

The "Food Treatment" is also very popular in Dore-lyn. This is merely a hygienic selection of foods given to people of declining health, instead of having them swallow ten or twenty dollars' worth of strong medicines.

Abnormal appetites crave for a class of foods injurious to the system. In Dore-lyn they have discovered a novel method of turn-

ing the diseased appetite from its cravings toward the things needed by the system.

In performing operations, the experts of Dore-lyn have reached a marvelous degree of perfection. They have learned to make a false eye so that one can see with it. It took three and one-half thousand years of continual experimenting on this delicate creation before it was pronounced satisfactory.

The false eye is not of flesh but one of manufacture. It is placed in sensitive connection with the optic nerve, on which images are thrown by the delicate mechanism of the false eye. The sight thus obtained is almost one-half as distinct as that which is enjoyed by the normal eye.

These medical wizards also make artificial ears which are about as satisfactory as the natural ears. In certain lines of surgery we are equal to these Dore-lynites, but we cannot register with them in the whole category of surgical achievements. They have simply distanced us by five hundred years. That is, I believe that in five hundred years we can reach the fields of glory which they now occupy.

Think of laying bare a human lung and treating it with a special preparation for extreme cases of lung diseases, and also treating it with a "baking" for department cases of a disease similar to pneumonia. Perhaps the most wonderful class of operations is performed on the heart and the brain.

The heart is laid bare under a sheet of thermal rays. Fatty tissues are removed and other obstructions eradicated during the regular heart beats.

The government grants certain privileges of experimenting on her lowest class of criminals, and it is well nigh incredible what has been accomplished by cerebrum operations.

Certain murderers of vile propensities have been so changed by an operation on the cerebrum that they have no power of recalling their past life and are incapable of uttering an oath. And what is more strange, they are intent on leading an upright life and being intensely religious withal.

I am compelled to crowd a world of glorious life into a few paragraphs, but I hope that I have given such as will be for our good.

## CHAPTER XIV.

### A World of Low Life.

**W**HEN one witnesses an exhibition he must, of necessity, look upon the poorer parts of it. This was my experience in my universal journey, for on some worlds which I visited I found that human civilization was at a low ebb. One of the most notable of this class is the world next beyond Dore-lyn.

This sphere is one thousand times as large as ours, and the beastly creatures that inhabit it are four times our size.

The toilers in the deep valleys of Mars are favorably intelligent compared with these specimens of humanity. For convenience, I will call this world Scum. Its people are so constituted that their two arms can be used as legs; so it is quite common to see these Scumites travel over their planet like the more graceful of our quadrupeds. Their walking, however, is principally after our fashion, and they can change about at pleas-

ure. Either way of travel seems as natural as the other. When they walk on two limbs, the body is erect, presenting a stature of such gigantic proportions as to over-awe a representative of our world.

According to the universal standards of symmetry, these giants have an animal beauty that is anything but handsome, and they also lack those facial expressions of higher intelligence that come only through generations of cultured thinking. Their health is quite perfect and they live to a great age.

These Scumites have a language singularly their own. It is so totally different from any of our conceptions of speech that I can scarcely find words to describe it.

The medium of conversation is the Notched Rod. It is about twelve feet long with various kinds of notches cut along the two sides. Such a stick is possessed by every Scumite who expects to hold extended or descriptive conversations. It is usually held by a skin strung around the neck. While one of these persons is talking, two or three of his fingers pass from notch to notch along the rod. These indentures of

the rod represent, in their language, certain kinds of sounds and are used to assist the vocal organs in expressing the more intricate combinations of ideas. Naturally, the listener watches the fingers more than the mouth.

It is amusing to see a Scumite busily engaged in delivering a speech to a few of his fellow creatures. It would remind you of a person playing a fife or violin without producing any sound.

The children of Scum learn this rod language just the same as our children at first learn to speak our language by observation and practice.

The face of a Scumite does not resemble a human face of our planet. The mouth and jaws are at right angles to ours and this arrangement seems to be just as convenient to these Scumites as the formation of our mouth is to us. The nose lies above the mouth, but is relatively much higher, its point coming between the two eyes which are situated more toward the sides of the head.

The startling fact about this world is

that at one time in its past history fair intelligence reigned on a few parts of the planet. These intelligent sections were working their way upward on the measureless incline of progress and had won some distinctions in their sciences, as well as their religious devotions. These bright spots on the surface of this large orb were surrounded with large black patches of war-like humanity and, between these two extremes, a warfare of subjection or extermination raged without any hope or peace.

The educated Scumites had a few advantages in methods of war, but with all this they were not able to withstand the vast hordes that swept down upon them. Brute force won the battle and the accumulated light of four thousand years flickered until it was no more.

It was a fatal day for Scum when its mad inhabitants blew out the last of the candles that had promised to give them light.

When this sad and blighting victory was accomplished, these uncivilized tribes rejoiced more hilariously than at one time our Indians

rejoiced when celebrating their victories in the wild scalp dances.

Thus the dark shadows fell on this huge world. The captured educated classes made a heroic effort to continue their cultured manners and religious life, but the prejudice against them and their ways was so great that they were compelled to live in the lower strata or suffer the pain of death. In process of time, the wild woods flourished where once the temples of science and pure religion reared their imposing pillars.

What can we expect of such a race of people who have drifted from the light of civilization for so long a period? As I looked at their customs and their ways, I was reminded of a garden that has run wild. Here and there I could see traces of the once thrifty life now almost choked out by the overpowering crop of weeds.

Gradually the people became worse and worse. Sin played havoc and built carnal fires around which these children of men gathered. Sensuality became the ruling passion and, in less than five hundred years of our time, the last family observance had died

away and these creatures wallowed in the quagmire of fleshly lusts, compared with which the brute life of our world is highly respectable. "Free Love" was rampant and human offspring was cared for by mothers, or at least by such as were willing to assume the task. No one was supposed to know who was his father.

I saw this sad and sickening spectacle against which my instincts revolted with horror. It is true that if man is left totally unbridled, he sinks to a depth which it would be impossible for any species of the animal creation to reach.

As I continued looking on this low life with its horrors too numerous and too dreadful to mention, my thoughts flew back to the world whence I came, and to America where I was born, and I remembered of some who advocated "Free Love." "Let their arms be withered," I cried, rather than have such a thistle fasten itself in the soil of our social life.

Let the libertine of our world go to the world of Scum where he belongs, or rise to the dignity of man whose image he bears.

Great Battle between Low Tribes on Scum.

structures that venture far away from shore are very large, and surrounded by many acres of attachments.

It is delightful to live in one of these water mansions, go to any chosen harbor, remain as long as desired and, taking your choice of countries, dwell among the icebergs or in the tropical regions. People of delicate health can shift to any climate and change location as often as desired. This style of retired life is now the most popular of all in this peculiar world of Plasden.

The educated people are a very bright class; they have made great progress in manufacturing. This implies a long list of notable inventions in every branch of industry. It is strange that these brilliant inventors never paid attention to air travel. However, they have perfected submarine navigation to a nicety that would be teasing to the infant efforts that we have thus far made.

The people of this far away orb have greatly surpassed us in controlling and utilizing the three distinct forces which are

quite similar to electricity, and these are the wizard forces that furnish the power used to drive the motors and engines, not only of the floating cities, but also of the fixed abodes.

By a comparative study I ascertained that we have over six thousand inventions for which they have no parallel, and Plasden has nearly twenty thousand to which we have nothing similar. What an inspiring study all these facts furnished! But my space forbids enlargement. I believe, however, that if our world remains a few thousand years more, we will have learned more secrets than the experts of Plasden know to-day, although they have had a start of many thousand years over us.

There are very few worlds where the devotional spirit has reached a higher level than in Plasden. The truths of the Creator are preached and practised with a far more pleasing result than is prevalent on Earth.

Satan has found his way to this planet and has organized his forces into sworn legions against whom the armies of righteousness are waging relentless warfare.

The main secret of Plasden's high morality is found in the fact that the civil governments insist on moral laws and a careful observance of them. One blushes with shame at the looseness and laxity with which the greater municipalities of our Earth are governed, and all this under the shadow of our schools and church spires.

Centuries ago the good people of Plasden learned how to co-operate when they desired to win in a struggle against iniquity. I would give my life-blood if I could transport this secret in such a way as to make it effective on the Earth.

In our world we have before us a most humiliating spectacle. If an effort is made to extirpate some form of sin that has taken audacious root in the soil of our moral life, one reform element or denomination fights with the other until the hoe is so broken that there is nothing left wherewith to dig out the miserable roots of the obnoxious weed. Thus do we spend our energies opposing one another instead of fighting the Devil.

O, for the Plasden power of unity, be-

fore which any species of corruption can be crushed out that is opposed by the forces of righteousness !

We have succeeded, to a bitter extreme, in getting the church and state separated from each other so far that the latter scarcely ever gets a glimpse of the former, and we stand by priding ourselves in the absolute divorce. Then we have also succeeded in getting the different creeds separated by chasms so wide that it is impossible to make a combined attack against a common foe. However, these separations between sects are gradually disappearing, and over the lessening gaps the hands of a more Christian fellowship are being extended.

The Devil, wiser in his generation than the children of light, long ago united his trained forces in defense of his iniquitous schemes, and thus he is permitted for a season to sit on the throne of power and wield his black wand over the civil realm, thereby licensing iniquity, protecting vice, and spreading his dark designs over the commonwealths of the world.

We look forward to the time when the

moral and spiritual forces of our world will reach the Pladsen unity. May this be accomplished without struggling along for another century!

## CHAPTER XI.

### A World of Ideal Cities.

**A**FTER I had finished my brief stay at Plasden, I again rose high in air and looked over the oceans with their floating cities. This was one of the most charming views I ever had of any world.

I paid a passing visit to a few worlds where human life had never risen to a great height of civilization, nor can I forget the lessons I there learned of the power of sin. All this one can clearly see who visits the three worlds lying next in order to Plasden, but I will forbear the sad and sickening recital of the depth to which a world is carried by sin when once it gains a haughty ascendancy.

The next orb that attracted my attention also lay in the solar system of Dubhe, and very much resembles our own world in both size and climate. The people, who are not half our stature, are so differently formed that I could scarcely believe my own senses.

A description of them would appear only ludicrous, so I shall content myself with saying that they are refined in their manners and highly educated in all branches of human knowledge, which does not imply that their studies are identical with ours.

I was surprised at the splendid arrangement of their cities and the sensible laws governing them. One can scarcely believe that we are guilty of so much lost labor in the management of our cities, in our own way of living, and in providing for our families, until he sets his eyes on a city of another world that has notably distanced us in this respect.

These people, though small of stature, are endowed with powerful muscular systems and, through their intelligence, they have become masters of the seas and of the land, for the forests give away and savage tribes fall back before the onward march of the God-directed conqueror, man.

I then appeared in visible form and walked into one of the largest cities on this world. I had not passed one-fourth of the way toward the city's center before I was

surrounded by a curious crowd which so blocked my path that I could make no further progress. You may imagine their surprise to see a giant, as I appeared to them, with a strangely shaped head and with a soft, flabby skin, for they at first regarded my clothing as my skin.

No one could conjecture what sort of an animal I was. I remained mute and watched the rising tide of excitement. Before anyone could venture to touch me, I saw a band of officers in double-quick march hastening toward me with their curiously shaped weapons unfolded.

I stood motionless as the soldiers surrounded me. As soon as the circle was formed the leader of the squad stepped toward me with a show of bravery, but I saw that he secretly trembled. It was his oath-bound duty in such a case to lay hands on me and, if necessary, use force to take me to the central office.

I offered no resistance and went, as I was directed, till I stood in the odd looking room where all offenders of their law are taken for a hearing.

A Captive on the Planet of Dubhe.

The news of my appearance and arrest had by this time spread to all parts of the city and a motley crowd were gathering, but only a small portion of the people were able to gain entrance into the building where I had been taken.

The high officials and educators, hearing of the wonderful giant at the city hall, hastened thither with all speed. Then I saw an interesting spectacle. As these higher classes of people arrived, the lower classes were compelled to leave. The room being full, no laborer was allowed to remain if a person of nobility wished to occupy his seat. This peculiar custom or law applies to all public places and assemblies.

In a short time all the lower classes were compelled to leave the hall to make room for the unprecedented rush of nobility. Nothing so tempted me to speak as when I saw this partial rule in operation.

During all this gathering the officers stood in a circle around me and held their weapons ready for instant service. Not hearing what I was or what I might do, they were ordered to maintain this strict attitude.

Every eye was fastened on me. Some of the nobility were pale with fear; others were busy inquiring whence I came and where I had been captured.

At length the chief official made a guttural sound. This must have been a call for order and the signal for the opening of the court, for at once the wild confusion gave way to order as much as could be expected under the circumstances.

The brief formalities of opening the court were ridiculous to me. This being done, all official attention was given to me. I saw that everything was under the charge of this presiding official. He first ordered that I should be bound and, accordingly, my hands and feet were tied. Then a very heavy chain-like rope was fastened to my body and I was tied to the criminal's post.

The officers were then released and retired to their special part of the room.

The chief then stepped toward me and peered into my face with a puzzled look of great anxiety. I returned his glances calmly, but uttered not a word.

There was a breathless suspense as the

chief lifted up his hands, touched my face, and felt my mustache and whiskers. The hair was perhaps the strangest feature of my whole head, since there is nothing on their human or animal species that resembles hair.

The chief then called for a certain professor who was an expert in zoology. This intelligent man quickly came to my side and, at the request of the chief, commenced to examine me carefully.

My manner of breathing confused him most of all. He watched my chest rising and falling and my sides increasing and decreasing with every breath, until he was mystified beyond all power of explanation.

When the dignitaries saw that I could be touched with safety, numerous messages were flying to the chief, each one asking for the privilege of a closer inspection of me.

The presiding officer was cool-headed and firmly followed his own cause. He waited until the professor had finished his examination and was prepared to report, whereupon he announced to the bewildered audience that heed should now be given to the conclusion of the zoologist.

The professor mounted a throne-like elevation from which all expert opinion is submitted. A painful silence ensued as this learned man proceeded with his report.

Of course I pretended that I could not understand their language and that I was oblivious to all these occurrences, but you may be assured that I was careful not to miss a word that fell from the lips of this noted specialist who conducted himself with a dignity both pleasing and fascinating.

"I pronounce this creature an enigma," commenced the professor as he pointed his bony finger toward me, "and declare him to be the strangest problem of my life. How, and whence, and why he came to us are all alike shrouded in impenetrable mystery."

"This perplexing specimen is totally different from any species of our animal creation. He resembles a man more closely than any beast. However, he cannot belong to any family of our world for he is possessed with bodily functions unknown to us. His clothes are not the result of any natural growth, and are far beyond our finest manufacture. Each piece of his

apparel gives positive evidence that it was made with hands more skillful than ours."

"The most pleasing part of this perplexity is the face, which bears indisputable marks of intelligence. It would be eminently satisfying to us if we could communicate with him and receive some light on this living marvel."

He quickly stepped from the throne and the chief then invited four philosophers to examine me conjointly. They hurriedly responded to the invitation, for they were delighted at the honor and privilege conferred upon them.

What a peculiar experience followed! Four men touched my hands and ankles, my arms and limbs, and more particularly every piece of my apparel. Accidentally one found my purse, but could not open it. As he was faithfully pursuing his task, I felt that the time had come for me to speak.

"Twist at the two knobs," I said in their vernacular.

If lightning had struck into that room, it would not have caused more consterna-

tion. The four philosophers fell to the floor, the chief was terrified, the audience looked on in abject terror, while the officers rushed from their post with drawn weapons. All this occurred instantly, and I realized that my words never before had such an effect.

In a moment the chief was at my side and, looking into my face, exclaimed :

"Who are you and why have you remained silent?"

"I am a human being," I replied.

"From what part of our world?"

"I was not born on this world."

"On what world then?" he further asked with increasing surprise.

"On a world called Earth that revolves around a star called Sun." As I was answering these questions many wild sensations were sweeping over the hearts of the assembled nobility.

"How came you to our world?" continued the chief with abated breath.

"On wings invisible."

"For what purpose came you hither?"

"To see your manner of life."

"Will you stay with us forever?"

"I cannot."

"Have you come to harm us?"

"Not in the least."

The chief in a high state of excitement ordered that I should be unbound.

I smiled and said that I would spare them that trouble. I snapped the bands with such ease that a new fear possessed all of those around me.

I then gave them positive assurance that I would harm no one and urged that all should be silent as I wished to speak a few words to them.

Never before had I a more attentive audience. I addressed them in a natural manner, informing them that I desired to become familiar with a few of their forms and customs of life. I then proceeded to give them a description of the world whence I had come. My audience became enthusiastic and I decided to cease speaking.

The chief, although greatly agitated, still kept his hand on the throttle of the occasion. He waved the surging crowd back, demanded order and at once sent his arrowed questions at me again.

"Are you not a god?" cried he.

"I am only human."

"How could you have such power as to reach our world?"

"That I cannot explain."

"How many people live on your world?"

"One and one-half billion," I answered.

"Are they all pure-minded?"

I answered that I was pained to inform them that many of our inhabitants are wicked.

My listeners were still incredulous as to my identity. They were positive that I was a visiting spirit on a mission of evil or good, and they urged that I should disclose the purpose of my commission.

I re-affirmed my past utterances and, turning to the chief more directly, I informed him that he would see me no more. Then, without pausing another moment, I vanished. As I went, I looked backward to see the mystified countenances of all who were in the room, and then proceeded to visit the surrounding city to examine the system under which it is governed.

I found that the bulk of the trade is controlled by the city, one class of goods being kept at one place in suitable store houses. The city owns a full line of vehicles resembling our automobiles. These are very spacious. Each one is supplied with certain lines of merchandise and passes over an unalterable rail route at its own fixed period.

Thus all parts of the city are reached with the necessities of life. Those who prefer can go to the trade centers, but no special orders are delivered except by the regular cars and at the regular time.

For instance, one can go to the trade centers for meats and vegetables, and purchase what he wishes or give his order. At the time corresponding to six o'clock of our time in the morning the meat and vegetable cars start on their respective routes, while the trade centers are open for personal callers. Marketing goes on at the market center while the cars are selling throughout the city. At nine o'clock the delivery cars leave the trade centers.

Similar to the manner of our world,

each home is numbered in such a way that no two houses have the same designation. By this arrangement the delivery of goods is facilitated.

Everything in this busy metropolis goes like clock work, and everybody knows the schedule, which is simple enough to be understood almost at a glance.

All the trade centers lie along the freight and passenger railroad. This saves a tremendous amount of labor, for the goods are all transferred directly from the cars to the store-houses.

There is no Fire Department, for there is no need of one. It appears that only a few worlds in the universe use inflammable materials for structural purposes, and we are one of them.

There is a Finance Department and a Law Department, although I cannot give space for their description.

The Sanitary and Police Departments are under systems absolutely different from any that are known in our world. Their sanitary methods are no more effective than ours, perhaps less so. But the Police Department

is greatly superior. This is largely due to the fact that this city has a department gloriously ahead of any city in which I have ever lived. This department is called the Moral Department. It is managed by twenty-one men and women, one-third of whom are selected annually from a list of nominees.

Each church, meeting certain requirements, is entitled to make one nomination. The seven of these nominees receiving the largest number of votes are elected for three years.

This Moral Department is no mincing and begging institution. It has, at its disposal, the entire military battery. No mayor holds a whip handle over it. I must confess I was happy as I witnessed the blessed effect of this Moral Department. All evil is not extirpated, neither is all lawlessness overcome, but there is no brazen iniquity, no public immorality and heartless brutality such as is seen on every hand in one of our larger municipalities.

## CHAPTER XII.

### A World Enjoying Its Millennium.

**W**HAT expansive views of creation were afforded me in my universal journey! I saw all conceivable types of human life, many of which I alone could never have conceived.

With a happy soul I alighted on another world in the solar system of Dubhe where sin had been banished, and the believers, or children of God, were passing through a period of time which we would call the Millennium.

A wide contrast was now presented to my view. I had seen world after world in the tribulation of sin. Now I had come to one under the sway of righteousness, and I wish that I had power to describe what I saw and experienced.

I suddenly thought of the Queen of Sheba, who, upon seeing the greatness of Solomon's wisdom, exclaimed, "Behold, the half was not told me." I had often imagined

what the condition of our world would be when it smiles under the light of the Millennium, but I minimized the glory that is yet to come to us, judging by what I saw on this delightfully charming planet. I have no assurance, however, that the coming Millennium of our world will be altogether similar to the one I saw.

This glorious Millennium was ushered in about six hundred years ago, and I readily learned the general particulars of its commencement. The world had been very wicked prior to the dawn of this new age. The majority of the people disregarded all spiritual truths, causing the darkness of sin to hang like a heavy pall over the nations of this planet.

There were earnest devotees who lived in the light and love of God, and who preached and pleaded with the thoughtless and the indifferent. Notwithstanding all the efforts put forth on the part of the righteous, the generations of this distant world became more and more wicked until the Millennial dawn.

In the fullness of time the Millennium

was ushered in by the appearance of the chief angel who came with several hundred thousand attending spirits. At the approach of these celestial regiments the atmosphere far above the planet was darkened by ominous clouds through which the approaching legions shone with unearthly brightness. All this occurred in the twinkling of an eye, even before the busy millions could look upward. Then the chief angel and his magnificent host circled in the air, singing the resurrection song, which was augmented by ten thousand trumpeters, while the forked and sheet lightnings flashed in unison with the imposing waves of music, and heavy thunders contributed the bass intonations.

The celestial choir continued during one revolution of the planet. The vast throng sang in the air as the planet revolved on its axis. As each section of the globe came beneath the long extended line of melodious angels, the marvelous change took place for that section. The sleeping saints came forth from their graves and, with the living saints, were caught up into the air. This continued until this most eventful day was finished.

The scenes that occurred with the ungodly during this awful day beggar all description, so much so that I shall not attempt to describe the remorseful wails of horror that rent the air, only to be drowned by the ever-singing choir. It was the day of triumph for the saints, and their ears were not disturbed by the cries of terror, nor were their hearts distracted by the opening of the earth to receive the wicked.

As the saints were caught up, the wicked fell into pits and have not been seen since. The flames that issued from the rending globe set everything on fire. Who can select language sufficiently graphic to portray such a lurid dissolution of a planet, and the gathering of the faithful, quick and dead?

Thus was this large world purified by fire while the saints were gloriously enraptured. After the fury of this burning was passed, the great Creator of the universe made a new world whereon righteousness dwelled.

The saints became the possessors and rulers of this whole sphere, living in joy and peace unprecedented. It has been the happi-

est six hundred years since the beginning of this planet. How long this period will continue no one seems to know, and but few are conjecturing, for each soul is completely happy and congenially employed.

The time will come, however, when this blissful period will be at an end, only to give way to a state of existence infinitely greater and more glorious, which in our language would be called Heaven.

I will briefly describe a few characteristics of this Millennial life as I saw it and as it is now existing.

1. The saints are living in spiritual bodies. They are not cumbered with a fleshy body, and are capable of traveling through the air at a speed far beyond that attained by the swiftest winged creature of any world in the whole universe.

Their spiritual bodies are highly organized and sensitive to a fine degree. At will they are capable of rendering themselves visible or invisible, as we comprehend these terms.

As the perfectly formed flower, blushing in its wealth of color, is called beautiful, so

Beginning of the Millennium.

we would designate these symmetrical spirit-creatures, moving in the glory of their higher endowment and shaded with the living tints of Heaven.

2. These inhabitants know nothing of fatigue. Their strength of body and vitality of mind are unabating. What a contrast between the creatures of our Earth and those of the Millennial world on whom the passing of centuries has no ill effect.

3. There is nothing on this purified world to generate disease; hence these favored people never suffer any pain of body or of mind. The long line of sin-shadows has all vanished from this redeemed planet, and the atmosphere is all aglow with the mellowed light of peace and love.

4. Jealousy and all kindred feelings are unknown. These roots were all destroyed by the fire at the beginning of the Millennium. No one can imagine how enrapturing life is in the absence of stings of malice and thorns of envy.

5. The social and spiritual relationships are all harmoniously blended. No one feels himself beneath or above another, and no one

feels embarrassed in the presence of a superior human intelligence.

6. Thus it follows that the fellowship is inexpressibly sweet. You can only imagine the dignity and glory one must feel as he mingles with the righteous dead of all ages, and gathers from them a glimpse of the trials and triumphs of ten thousand years under the old reign.

7. Some of the spirits are employed in dressing and keeping the gardens in which grow the luxurious food on which redeemed creatures subsist: not cereals, fruits, or nuts, but the kind that creates the most heavenly sensations as it wastes away in perfume at the will of the user. The nearest imitation of this food ever known on earth was eaten by Christ's spirit when Mary broke the alabaster box of ointment on his head.

8. Some spirits of this Millennial life seemed to be more rapturously happy than the others. I learned that they had passed through the darkness of continual disappointments or suffered under the mis-mating of matrimonial union. Others fought through the fires of persecution and torture, and still

others passed through martyrdom for their Master's sake. All of these patiently endured all hardships leading down to the end of their mortal days.

9. The affinity between sexes is clearly marked. No love but pure love burns on the altar of any soul, and any one who wishes may stop to kindle the fires or warm himself thereat. There is no bodily contact, no decay, no weakening. This love is enrapturing, uplifting, ever drawing the lover and the loved nearer to the fountain.

In language most intelligible to us, I would say that the intercourse between sexes is one of refined telepathy, soul-connection by thought transmission, a thousand-fold more charming than the low plane of intercourse in the flesh life, with none of its attendant weakening results. This strange felicity is as indescribable as it is glorious. Each nature seeks its real complement, and enjoys the most absolute liberty, for there is not a single barrier to prevent it, as no one desires to do wrong.

This most inviting life had its charms for me, but I well knew that I could not tarry.

I lingered at a thousand fountains to catch the life-giving spray and studied, as far as I possibly could, the faces of these favored creatures.

The whole vegetable world is a long extended floral garden. Where formerly deserts lay waste and wild, now the blooming roses and expansive lawns can be seen. Is it possible to picture to your mind's eye a line of lofty mountains whose sides are dressed in living colors and trimmed with rare flowers? If you cannot paint this picture, then you must not endeavor to form the faintest conception of the natural features of this Millennial world.

Being still filled with the lingering memories of this happy sphere, and looking forward to the coming golden age of our own world, I read with pleasure a few stanzas contemplating Christ's second coming.

"A SONG OF HIS COMING."

See the virgins at midnight yearning,  
To behold the face of the Groom.  
Their lamps are all trimmed and burning,  
As they peer through the misty gloom.

"He will come," is the shout of voices,  
Which have sung in a thousand ways ;  
For the heart of the saint rejoices,  
At the thought of the coming days.

When the war of creeds will be over,  
And our King descends from above,  
Only they shall witness His crowning,  
Who have lived in the light of love.

Then the Christ shall reign in his glory  
On the throne of his sovereign might :  
And the theme of Redemption's story  
Will be sung with perfect delight.

And our minds will dazzle with brightness,  
As our thoughts forever aspire,  
For a mantle of perfect whiteness,  
Shall cover the youth and the sire ;

Then we know that none will be jealous,  
And no one will envy our lot.  
For against the one who is zealous,  
Not a soul will contrive or plot.

And our actions will chime in pleasure,  
All refined from malice and sting.  
We shall all reach the perfect measure,  
In the reign of this conquering King.

We will have everything we can use,  
In those beautiful realms of light ;  
There the people will do as they choose,  
For each one will choose to do right.

We will sail through the seas of beauty,  
And return to the shores we please ;  
Far away from the callings of duty,  
In the shade of undying trees.

All the riches of Christ will be ours,  
'Tis a wealth without guilt or pain.  
There will be no 'Contention of Powers',  
Nor the marks of official stain.

As I look from this earthly station,  
I exclaim again and again—  
O what an eternal vacation !  
Come quickly, Lord Jesus, Amen.

## CHAPTER XIII.

### A World of High Medical Knowledge.

**I** SPENT a long and profitable season in the vicinity of the Great Dipper, witnessing the almost infinite variations of human life as found from world to world, and looking upon the wild wastes of the many planets that are not inhabited.

Finally I again spread my swift wings, reached the beautiful star Arcturus and noticed among the worlds that revolve around it a few that are sinless. I was tempted to pause at one or another of these exceptional stations, but I knew that I could not tarry until I had reached the far distant constellation of Scorpio.

In this wide flight I traveled a distance so great that I will not weary the mind with mentioning the trillions of miles. Now I was in the direct path of the Milky Way and my imagination staggered as I saw the endlessness of stars and solar systems, as far out

beyond me as my assisted eyes could reach.

The star at which I arrived is one of the largest suns that blaze in the depths of immensity. It is so wonderfully great that if twelve hundred million worlds as large as ours were all crushed into one great ball, it would not make one sphere as immense as this star or sun, around which revolve about five hundred worlds or planets, many of which are greater than our Jupiter. With abounding interest I visited all the inhabited worlds of this vast system. How long it took I have no way of knowing. I did not count time by hours or heart throbs, for I was so wrapt in my observations that all else was as nothing to me.

Some of these worlds sustain a low order of human creatures, while on others there are races that have reached a high degree in the scale of advancement. Of these five hundred worlds nearly one-half are barren of all life, and of those that are inhabited some twenty are sinless worlds and thirty are now passing through an intermediate period between the probationary life and the final judgment, a period toward which we

are anxiously looking and which we designate as the Millennium.

Of all this ponderous solar system there is one world that excels all the others in its medical attainments, and of this one first I will give a flying notice.

I have named this world Dore-lyn. It is fifty times as large as our Earth and of greater specific gravity.

Its human creatures are delightfully formed and are in ruddy health and refined happiness. In shape these Dore-lynites differ somewhat from us, but long before I had reached this planet I learned something of the universal standards of symmetry and ascertained that creatures could be beautiful without resembling us whatever.

Here I found four billions of people and there is room for twenty billions more. So if you are in ill health, and have run the round of our medical fraternity without success, I would advise you to go to Dore-lyn, if you know how to reach it.

These Dore-lynites are almost three times our size and they are subject to most of our ills and many more. From an early

date the head government of this world paid particular attention to hygiene, keeping all medical work under its own care.

The government controls the whole field of medical science just as we do the post-office department.

There are no conflicting schools of medicines suc'. as Allopathic, Homeopathic, Hydropathic, Eclectic and Osteopathic. The government gives handsome rewards to any one who furnishes a new discovery or gives additional light. Everything is duly tested and proved to be a success by a corps of experts before it is given to the practicing fraternity. The government holds certain rights in experimenting that no physician or medical school would think of having in our world. The government medical schools of Dore-lyn are marvels indeed. Nothing is spared that money or talent can furnish. The full graduates of these schools are only "the survival of the fittest." Others take a secondary degree and can act as assistants or retire from the list. The government has a series of institutions that do a work similar to our hospitals and

have a corps of full graduates supplying the stations. This entire system is so arranged that every family or individual receives all necessary treatment free.

The cost of carrying on this vast system is one of the items of national expense. I will now mention some of the medical achievements of these Dore-lynites.

When a physician suspects that the blood is poisoned he at once proceeds to a chemical analysis, and if certain kinds of poison are found, the blood is filtered by the use of a fine instrument. A blood vessel is exposed and cut, and the two ends fastened to the delicate filter. Thus the blood is cleansed by passing through this instrument. Those acquainted with the manner in which the blood circulates can readily see how all the blood of the body can be reached in a short time. This method is very successful in the treatment of all bites of poisonous insects and reptiles, and all types of hydrophobia, which are ten-fold more numerous in Dore-lyn than in our world.

There are no patent medicines in Dore-

lyn. The few medicines they have are manufactured only by government authority and everybody receives the purest that can be compounded, no distinction being made between rich and poor. One thousand years ago the medical aspects of Dore-lyn were similar to those which are seen in our world to-day. People were compelled to take all manner of poisons and opiates even from skilled hands. But in Dore-lyn those days of darkness and misery are past and the people enjoy the benefit of a medical skill one thousand years ahead of us. They look back to the practice of the old physicians with ludicrous feelings just as we do when reading the prescriptions that were used in the first century of our dispensation.

We call your attention to some of the antiquated remedies of our world as related by Geike and copied from a medical journal of our own country. Following is a list:

"Ashes of wolf's skull, stag's horn, the heads of mice, the eyes of crabs, owl's brains, liver of frogs, viper's fat, grass-

hoppers, bats, etc., these supplied the alkalis which were prescribed. Physicians were accustomed to order doses of the gall of wild swine. It is presumed the tame hog was not sufficiently efficacious. There were other choice prescriptions such as horse's foam, woman's milk, laying a serpent on the afflicted part, urine of cows, bear fat, still recommended as a hair restorative, juice of boiled buck horn, etc. For colic, powdered horse's teeth, dung of swine, asses' kidneys, mice excretion made into a plaster, and other equally vile and unsavory compounds. Colds in the head were cured by kissing the nose of a mule. For sore throat, snail slime was a favorite prescription, and mouse flesh was considered excellent for disease of the lungs. Boiled snails and powdered bats were prescribed for intestinal disorders."

When we read such a list of remedies we can scarcely believe that they were ever popular, but according to the history of Dore-lyn the time will come when many of our present medicines will be out of date, and only mentioned in the old medical works.

The people of Dore-lyn have suffered in

past ages innumerable woes on account of intemperance. Alcohol is unknown to them, but they have had a two-thousand year's battle against three liquids that affect them as opium affects us. Strange to say that these terrible liquids were the bases of many of their medicines just like the anodyne medicines of our present day. Thus in Dore-lyn the old kinds of medicines created many drunkards. Since the dawn of the brighter age, a strict law prevails regarding the use of all narcotics in medicines. Then came gradually into use the many methods of treating disease without medicine, except the materials used to sustain life regularly.

Being interested in these things, I examined more closely into their past medical history, and saw more clearly the present folly of a certain part of our medicinal practice. How we are struggling with alcohol, especially as found in so many of our patent medicines, and how helpless we are in trying to abolish the sale of these medicines by reason of our unbounded liberty! In our world, a man may concoct any alcoholic medicine and sell it without liquor license, for people

become verily mad for the bottled stuff. Our nation may some day become wise enough to keep its own hand on the business that is determining the health and happiness of millions of its inhabitants.

But let me cease this digression and get back once more to Dore-lyn.

One of the most noted medical achievements on this world consists in the manner of rendering a person unconscious of pain. The anatomy of a Dore-lynite is, in general, the same as our anatomy. Their bones are arranged a little differently and the sections of the backbone have a quite different formation. When a surgeon of that world wishes to perform an operation and therefore render the patient unconscious, he presses the tough cartilagenous part of a section of the backbone with a screw device fastened to the body of the patient. This simple act renders the spinal cord insensitive, which condition may be maintained for hours without injuring the patient. Of course any point above the screw device is sensitive, and for this reason it is more difficult to render a person unconscious in the parts about the head.

Many ages ago the world of microbes was laid bare, but not before these people were masters of the microscope or an instrument serving the same purposes, although formed on a partly different principle.

These Dore-lynites have brought to light the numerous varieties of parasite broods that cause fermentations and diseases, both infectious and otherwise.

A diseased body is looked upon as being in possession of a certain brood of microbes which are destroyed either by the blood filter or the "Vaccine bath, or injection." (I know no better name by which to call it.) A few diseases are treated by doses of medicines given in a manner similar to the prescription system of our country.

The "Food Treatment" is also very popular in Dore-lyn. This is merely a hygienic selection of foods given to people of declining health, instead of having them swallow ten or twenty dollars' worth of strong medicines.

Abnormal appetites crave for a class of foods injurious to the system. In Dore-lyn they have discovered a novel method of turn-

ing the diseased appetite from its cravings toward the things needed by the system.

In performing operations, the experts of Dore-lyn have reached a marvelous degree of perfection. They have learned to make a false eye so that one can see with it. It took three and one-half thousand years of continual experimenting on this delicate creation before it was pronounced satisfactory.

The false eye is not of flesh but one of manufacture. It is placed in sensitive connection with the optic nerve, on which images are thrown by the delicate mechanism of the false eye. The sight thus obtained is almost one-half as distinct as that which is enjoyed by the normal eye.

These medical wizards also make artificial ears which are about as satisfactory as the natural ears. In certain lines of surgery we are equal to these Dore-lynites, but we cannot register with them in the whole category of surgical achievements. They have simply distanced us by five hundred years. That is, I believe that in five hundred years we can reach the fields of glory which they now occupy.

Think of laying bare a human lung and treating it with a special preparation for extreme cases of lung diseases, and also treating it with a "baking" for department cases of a disease similar to pneumonia. Perhaps the most wonderful class of operations is performed on the heart and the brain.

The heart is laid bare under a sheet of thermal rays. Fatty tissues are removed and other obstructions eradicated during the regular heart beats.

The government grants certain privileges of experimenting on her lowest class of criminals, and it is well nigh incredible what has been accomplished by cerebrum operations.

Certain murderers of vile propensities have been so changed by an operation on the cerebrum that they have no power of recalling their past life and are incapable of uttering an oath. And what is more strange, they are intent on leading an upright life and being intensely religious withal.

I am compelled to crowd a world of glorious life into a few paragraphs, but I hope that I have given such as will be for our good.

## CHAPTER XIV.

### A World of Low Life.

**W**HEN one witnesses an exhibition he must, of necessity, look upon the poorer parts of it. This was my experience in my universal journey, for on some worlds which I visited I found that human civilization was at a low ebb. One of the most notable of this class is the world next beyond Dore-lyn.

This sphere is one thousand times as large as ours, and the beastly creatures that inhabit it are four times our size.

The toilers in the deep valleys of Mars are favorably intelligent compared with these specimens of humanity. For convenience, I will call this world Scum. Its people are so constituted that their two arms can be used as legs; so it is quite common to see these Scumites travel over their planet like the more graceful of our quadrupeds. Their walking, however, is principally after our fashion, and they can change about at pleas-

ure. Either way of travel seems as natural as the other. When they walk on two limbs, the body is erect, presenting a stature of such gigantic proportions as to over-awe a representative of our world.

According to the universal standards of symmetry, these giants have an animal beauty that is anything but handsome, and they also lack those facial expressions of higher intelligence that come only through generations of cultured thinking. Their health is quite perfect and they live to a great age.

These Scumites have a language singularly their own. It is so totally different from any of our conceptions of speech that I can scarcely find words to describe it.

The medium of conversation is the Notched Rod. It is about twelve feet long with various kinds of notches cut along the two sides. Such a stick is possessed by every Scumite who expects to hold extended or descriptive conversations. It is usually held by a skin strung around the neck. While one of these persons is talking, two or three of his fingers pass from notch to notch along the rod. These indentures of

the rod represent, in their language, certain kinds of sounds and are used to assist the vocal organs in expressing the more intricate combinations of ideas. Naturally, the listener watches the fingers more than the mouth.

It is amusing to see a Scumite busily engaged in delivering a speech to a few of his fellow creatures. It would remind you of a person playing a fife or violin without producing any sound.

The children of Scum learn this rod language just the same as our children at first learn to speak our language by observation and practice.

The face of a Scumite does not resemble a human face of our planet. The mouth and jaws are at right angles to ours and this arrangement seems to be just as convenient to these Scumites as the formation of our mouth is to us. The nose lies above the mouth, but is relatively much higher, its point coming between the two eyes which are situated more toward the sides of the head.

The startling fact about this world is

that at one time in its past history fair intelligence reigned on a few parts of the planet. These intelligent sections were working their way upward on the measureless incline of progress and had won some distinctions in their sciences, as well as their religious devotions. These bright spots on the surface of this large orb were surrounded with large black patches of war-like humanity and, between these two extremes, a warfare of subjection or extermination raged without any hope or peace.

The educated Scumites had a few advantages in methods of war, but with all this they were not able to withstand the vast hordes that swept down upon them. Brute force won the battle and the accumulated light of four thousand years flickered until it was no more.

It was a fatal day for Scum when its mad inhabitants blew out the last of the candles that had promised to give them light.

When this sad and blighting victory was accomplished, these uncivilized tribes rejoiced more hilariously than at one time our Indians

rejoiced when celebrating their victories in the wild scalp dances.

Thus the dark shadows fell on this huge world. The captured educated classes made a heroic effort to continue their cultured manners and religious life, but the prejudice against them and their ways was so great that they were compelled to live in the lower strata or suffer the pain of death. In process of time, the wild woods flourished where once the temples of science and pure religion reared their imposing pillars.

What can we expect of such a race of people who have drifted from the light of civilization for so long a period? As I looked at their customs and their ways, I was reminded of a garden that has run wild. Here and there I could see traces of the once thrifty life now almost choked out by the overpowering crop of weeds.

Gradually the people became worse and worse. Sin played havoc and built carnal fires around which these children of men gathered. Sensuality became the ruling passion and, in less than five hundred years of our time, the last family observance had died

away and these creatures wallowed in the quagmire of fleshly lusts, compared with which the brute life of our world is highly respectable. "Free Love" was rampant and human offspring was cared for by mothers, or at least by such as were willing to assume the task. No one was supposed to know who was his father.

I saw this sad and sickening spectacle against which my instincts revolted with horror. It is true that if man is left totally unbridled, he sinks to a depth which it would be impossible for any species of the animal creation to reach.

As I continued looking on this low life with its horrors too numerous and too dreadful to mention, my thoughts flew back to the world whence I came, and to America where I was born, and I remembered of some who advocated "Free Love." "Let their arms be withered," I cried, rather than have such a thistle fasten itself in the soil of our social life.

Let the libertine of our world go to the world of Scum where he belongs, or rise to the dignity of man whose image he bears.

Great Battle between Low Tribes on Scum.

Compared with our world, the physical features of Scum are all fashioned on a much larger scale, and the mountains, rivers and vegetation are five times greater than ours; so are also the many varieties of wild and domestic animals.

The inhabitants of Scum are divided into many warring tribes, and it is fearful to see the conflicts that take place. During my brief stay I witnessed one of the big battles between two of the stronger tribes. One hundred and fifty thousand men went dashing into an enemy of greater numbers. It was a foot ball melee on a vast scale. Weapons were all of the hand-to-hand type, except the spear wagons which were indeed clumsy weapons of war.

Nothing is known of surrender or a flag of truce, so the conflict raged horribly to a bitter end until eighty thousand bruised victors participated in the jubilant feast that followed. Over two hundred thousand Scumites lay dead on the field and along the mountain ridges. According to past history, another such great battle is not liable to occur for another generation.

The past religion of these giants is not even on a par with idolatry. There are many saints sleeping in their graves, bright remnants of the time of the old civilization and religion.

Amidst all this present moral wreck of humanity, there are a few indications that point to better times. The nobler people of Scum are banding together with the avowed purpose of bringing back the light of culture and refinement. But it will require several thousand years of determined effort to climb to the height from whence their ancestors were cruelly and thoughtlessly dragged.

## CHAPTER XV.

### A World of Highest Invention.

**A**FTER my profitable stay in this immense solar system in the Milky Way, I crossed the vast dome of the heavens and lighted on Sirius, the brightest star in all the canopy of night. Here I found the fire life of Alpha Centaurus repeated, but I did not pause to study the odd phases presented to my view.

Onward I moved to survey the remarkable systems of worlds that revolve around Sirius. It is a veritable medley of planets, large and small, inhabited and barren, sinless, sinful and millennial. A little universe packed in a nutshell, figuratively speaking.

The orb of this group that first held my attention is very notable indeed. I have labeled it "High Invention," and it is still entitled to that distinction. It revolves around Sirius at a distance of seven million miles and is thirty-three times as large as our world, with physical features and climate quite dissimilar.

Here, in this world of ours, we are proud of the wonderful genius displayed by our inventors, and is not this conceit pardonable?

If this world should stand and inventive genius continue at its present compound rate of progress, what may we expect to see a hundred or a thousand years hence? Now imagine yourself looking down upon a world where the highest inventive skill is found. Such was my privilege at this time in the course of my universal journey.

This surprising world is inhabited by a persevering race of human beings, among whom are a large number of illustrious characters who walk in the light of ten thousand years of human achievements.

It need not be said that I was intensely interested in the study of this phenomenal world which I will call Ploid. I went from one portion of the planet to another, continually remaining invisible. After I had witnessed the unequaled sights, I paused to complete my memoranda and now, as I review my jottings, I am at a loss to know what few things I should select to try to make

intelligible to my fellow-men who live on this infinitesimal speck which is our world. First, let me call attention to :

THEIR TRIUMPHS IN THE VEGETABLE KINGDOM.

The people of Ploid have in their possession a remarkable line of fertilizers, not in the form of ground bones, but acidulous juices. These juices were improved for three thousand years until there was a particular liquid suited to each separate class of vegetables.

As used at the present time, a certain amount of the growth-acid is poured directly about the seed at the time of planting. This acid has a magical effect upon the soil and it is possible, by repeated fertilizing, to raise in two weeks a crop of zoftas, a vegetable similar to our potatoes. For raising a crop in two weeks the fertilizer costs one-half the value of the zoftas, and for maturing a crop in four weeks the fertilizer costs about three-eighths of the value of the zoftas.

Thus it is possible to raise six of these crops in one of our years. This law obtains throughout the whole vegetable crea-

tion. However, in ordinary circumstances, the stimulating acid is used in very light quantities. The people have learned by experience that vegetables have a better flavor when they have been brought to maturity by the slower processes.

These wonderful fertilizers are a blessed boon in the time of "crop failures," for then the same crop can be grown anew from the seed and hurried to maturity before the close of the season.

The curse of the vegetable worms has been reduced to a minimum on this world of Ploid. The chemists have labored patiently for one thousand years to produce a substance that will not destroy vegetable seed and at the same time kill all forms of parasites. The results have been gratifying, and with considerable pleasure I viewed a garden of the various odd-shaped vegetables that are grown, without being repulsed at the sight of such crawling specimens as tomato and cabbage worms.

The happiest result of this worm-killing substance is seen in the work it accomplishes on fruit and nut trees. There is

triple the variety of nuts on Ploid, and they are used for food more generally than in our world. There is no such an animal as a hog and no lard is used. The substitute is found in four varieties of nut oil, the result of a sweet and clean vegetable growth. Nuts are raised in great abundance, for they also supply the base for a spread just as appetizing and more economical than butter.

#### THEIR MODES OF TRAVEL.

The Ploidites have been traveling in the air for twenty-five hundred years, but they cannot control their air-ships sufficiently in all kinds of weather. The atmosphere of Ploid is relatively lighter than ours, which has made aerial travel more difficult to perfect than it would be in our world.

The main traffic, both passenger and freight, is carried on by the Tube Line, a wonderful system perfected through thousands of years of painstaking labor.

Two immense tubes, lying side by side, each ten feet in diameter, made of a substance more durable than steel, form the road bed of this lightning system of travel. The

cigar-shaped cars have hard rubber-wheels and fit over raised bars all around on the inside of the immense Tube.

The motor power is called Sky-rallic, and is communicated throughout the whole Tube Line by Brosis, a porous metal running in thin narrow bands.

This Tube Line runs without a curve from one division of the road to another, except in rare cases where a bend is absolutely necessary. In a mountainous region I noticed a stretch of Tube Line without a bend running sixty miles, according to our measurement. On prairies, the unbroken stretches are much longer.

The cars in this Tube Line travel with fearful rapidity. It requires two or three miles to reach dashing speed, after which a run of fifty miles is made in eight or ten minutes. No precaution need be taken by the motorman as nothing can get into the tube and only one train is allowed in a section at one time. Certain hours are given to passenger traffic and others to freight traffic. An immense amount of freight can thus be carried in one hour. It is possible to send a

through freight car two thousand miles in ten or twelve hours. Express cars are never connected with passengers cars. They are run on their own schedule and sometimes attached to freight cars.

This immense Tube Line was built by the government at great expense, but it is proving very satisfactory. No storms or floods interfere. No grade-crossings and no flying dust are known in this Tube Line which has brought the ends of Ploid together. Think of a person crossing a vast continent in a day, for the cars in this Tube Line run with frightful speed across the long stretches of level. They make as high as a three-hundred mile run in forty minutes, without stopping.

The signal and telegraph stations are fifty miles apart, sometimes more. In these long runs the motorman stops only when a signal is turned against him or if by accident he discerns a train in the Tube ahead of him.

The Tube Line is lighted by oval transparencies, in size and shape resembling an egg, soldered in specially prepared holes of

the Tube. The cars are not supplied with air from the tube. Fresh air is obtained from the evaporation of a semi-solid.

On the top of this Tube Line there is a double railroad used for local travel, both passenger and freight.

#### THEIR STORAGE BATTERIES.

Compared with our world, the fuel of Ploid is very scarce, but less is required to supply the industries. Nearly all power is obtained from the winds, running water and the sun's energy.

The winds are harnessed so that they blow not in vain. Almost every home of ordinary intelligence owns one of the many kinds of storage batteries used in this world. These batteries are usually located beneath the lowest floor of the house, and they constitute the reservoir whence is obtained the necessary power for lighting, heating and cooling the apartments of the home.

People who live along streams of water utilize these streams for similar purposes. It is now conceded in Ploid that the storage batteries of the home can be supplied as

economically and effectively by winds and the sun's heat as by running streams ; hence it is a common sight to see residences throwing out the old water machinery and introducing the latest design of wind-employers or sun-harnessers.

There are certain emergencies when the storage batteries fail to work or when the power is exhausted ; this happens when there is a very slight wind for several days or a heavy drain of power. In such cases fuel is used for heating and lighting.

#### PALACES OF PLOID.

The palaces of Ploid are dreams of beauty and convenience, outshining and surpassing by far the finest mansions on the face of our globe. In these abodes the sum total of glory and convenience converges, flowing from almost numberless discoveries during the last one hundred years. In round numbers, there have been five hundred thousand patents issued in the United States in the nineteenth century, but the Ploidites excel us by double that number for a similar territorial limit.

## THE REWARD OF INVENTORS.

Patents are not issued in Ploid. The government gives liberal rewards to each inventor or discoverer. The applicant appears personally before the District Committee on Inventions. If this Committee considers the invention worthy of a reward, the applicant is recommended to one of the Central Committees at the seat of the government.

This Central Committee carefully considers the invention or discovery, places on it an estimate as to its local or governmental value, and fills out papers in accordance with its findings. This paper must be signed by the Chief Inventor, and the applicant at once receives his first installment which is continued, in some instances, during natural life. In the case of some extraordinary invention, the immediate relatives of the inventor are pensioned for five or ten years in his honor.

Naturally, under this system, the government owns all inventions, and reaps a heavy return from them, enough to pay all the installments to the inventors and the officers employed to carry on this branch of the government work.

## SOME PARTICULAR INVENTIONS.

One of the most convenient inventions I saw on this planet of Ploid was the carrying of a photograph or image along a wire. The people of Ploid cannot only talk to one another many miles apart, but they can also see each other while they are talking.

This wonderful attachment to their telephones, by which the human face is also carried over the wire, was perfected over one thousand years ago. I herewith give a few uses to which this invention is applied.

1. Office men have photograph wires connected with their homes, and they can thus talk to and see any one of the family at their pleasure.

2. It can be so arranged that the wife in the home can, by touching a little knob, see into her husband's office with which the wire is connected, or the husband in the office can see into the room of the house with which the connection is made. At either end of the wire, the vision can be obstructed by drawing a curtain over the sensitive plate.

3. The foreman of an industrial work

shop can see from his home the men under his charge.

4. The superintendent of any large works can, at his will, peer into any apartment he wishes from his head office. The advantages of this arrangement can be easily seen.

5. A minister can see from his study the nature of his audience before he leaves home.

6. Farmers can watch their cattle and their fruits without leaving the house or barn, according to where the connections are made.

7. Persons can be in bed at night, and if they imagine they hear a robber in any room they can first turn on the photograph current and then the light flash. In this way one can look, without leaving his bed, into each room of the house.

Having given a few illustrations of this marvelous invention, the reader can readily see the variety of uses which it will serve.

Their latest discovery in light is a decided improvement over our electric light. I know of no sensible name to give it, but the name that comes nearest to describing it, ac-

according to our terms, would be Phosphorous Light. It gives a mild but yet positive radiance, and closely resembles diffused sunlight.

#### THE AGES OF PLOID.

One of the strangest theories of the whole universe I found on this cultured world of Ploid. They divide time into three general periods of ages :

1. Age of Fire.
2. Temperate Age.
3. Age of Ice.

The people teach that there was a race of human beings who inhabited their world when it was yet in a molten state and that, as their earth cooled off, the race became extinct.

This age, they claim, was followed by the Temperate Age, or the age in which they are now living.

It is also claimed that, when their earth cools and the frigid blasts freeze out the world, there will gradually commence the Age of Ice, or the age in which human species will exist by reason of the earth's stiff coldness.

I had no way of learning the truth or falsity of this theory.

#### THOUGHT PHOTOGRAPHY.

These Ploidites have distanced us in the study of the nervous system, including the intricate problems of the cerebrum and cerebellum. They have ascertained, by long ages of observation and experimenting, the exact effect of every kind of impulse on the brain matter. The experts are able to tell, at a post-mortem examination, what kinds of thinking were most prevalent during the subject's life, just as easily as we can judge the great or little use of the arm by an examination of its muscles.

But more wonderful, a thousand fold, is their ability to follow the course of thought in a living cerebrum after the brain has been made visible by a light more potent than the X ray. After this exposure the operator, with his wizard magnifying lens, watches the tiny tremulous brain cells in their infinitesimal quivering, as they carry messages from the soul to the world of sense and being.

The voluntary nerve action is distin-

guished from the involuntary, and there is no escape from the conclusions formed by an expert observer. The parts of the brain at work must of necessity determine the nature of the thought, and amplified experiments have been made to prove the correctness of these processes.

This scientific mind reading impressed me as the highest expression of inventive skill that had come to my attention in any world of space, and gave me new light on some of the old mysteries of mind and matter.

I tarried as long as possible on this instructive planet and have not yet forgotten many of the valuable hints of inventions that can be reproduced in my own world. Surely we are far enough away from Ploid to escape any charge of infringement, should we proceed to patent some of their inventions.

## CHAPTER XVI.

### A Singular Planet.

**I** VISITED the other seventy worlds that revolve around Sirius. Among them is one of note, called Zik, which is forty-two hundred millions of miles from its sun, and is slightly smaller than our world. It is inhabited by a race of pigmies which I will call Zikites. Wonderful indeed is the intelligence of these creatures, although their form is out of symmetry according to our standards. I will therefore avoid a description of their physical features, lest it might mar the picture of their accomplishments.

The air of Zik is heavy and the sky is opal in its effects. The chemists have thus far found in nature ninety elementary substances, and it is partly due to this large variety that the Zikites have surpassed their fellow men in thousands of worlds.

As you study the past events of this

unusual planet, you are reminded of our own history. On Zik there are heathen tribes and all grades of conflicting civilized nations.

War has reddened this distant world for several thousand years, and as yet there is no peace. Notwithstanding all this unceasing upheaval, the tide of human progress has steadily risen. It does appear that the highest light of intellect is generated like electric light through sharp friction.

The Zikites have had their Men of War, vessels of mighty strength and death-dealing in their action. But all such defense has been abandoned over five hundred years ago, and it came about in a natural manner. One of the many illustrious inventors perfected the submarine boat and the flying-machine at about the same time. Their flying-machine might appropriately be called in our language, the Flying Devil, for such it is if you consider its destroying power. One of these ominous looking machines is capable of destroying a whole navy as fast as it can move high in the air from one vessel to another.

It can also tear to pieces an enemy's

camp that lies in the open field. All this is accomplished by dropping shells composed partly of some elements not found in our world. These shells are made in such a way that they explode as soon as they touch any substance, and the concussion is much more terrible than is caused by our most powerful explosives. Because no ship could hold together under such destructive shells, the nations abandoned their navies and devoted their energy to devising a safe camp for soldiers and to building these air-vessels with additional improvements.

It was found that the only way to protect a camp was to cover it with a water proof shed, so constructed that nine or ten inches of water would remain on the roof. Then a wide shallow trench was dug around the shed and kept filled with water. These shells will not explode if they fall in that depth of water, but will explode in water of greater depth. You can see at a glance how difficult it is to manage an army under these circumstances. The only redeeming feature is that the enemy also is compelled to resort to the same protection. An international law

The Battle of the "Flying Devils."

forbids the destruction of homes in times of war.

Wars are of short duration. Usually the decisive conflict is fought in the air, and is the most terrible of them all. Imagine two of these Flying Devils approaching one another far above the surface of Zik. Each vessel is set in action long before it is in range of the other in the hope of firing the first effective shot. Each party of the conflict knows that the air vessel first struck will be at an end forever, for it will be blown to pieces and every life on board will be shattered into shapeless masses, while the wreckage falls amidst the burning of the combustibles. What a horrible ending of a short battle!

The wisest of the Zikites have proposed many plans to settle international differences but, like us, they have failed to suggest any plan that has proved to be practicable.

The largest nation of Zik has advanced far ahead of us on the labor question, but this was not reached until the contest between capital and labor had left its blood-marks through many centuries.

A brief description of the manner in which the industrial problem was solved will not be out of place. I will waste no words in showing the many points of difference between our customs and those of Zik.

After hundreds of years of painful struggling, the many laborers of this largest nation completed a solid organization and thereby gained control of the whole government. Then, in their zeal to legislate in favor of the laboring classes, the ruling element stepped to the other extreme by passing many unreasonable laws. Things passed along in this unsettled condition until a certain few of the labor leaders, having become wealthy themselves, yielded to a heavy bribe and amended the laws so as to favor the wealthy minority. The magnates of capital shrewdly took advantage of this traitorship and, in the following campaign, won the national election.

The wealthy, now having the reins of power in their own hands, took the initiative and called for a consultation between the heads of the government and the chief leaders of labor.

This proved to be a wise political move and, as a result, a new system of laws relating to all trades and occupations was enacted. The following conditions still prevail:

1. A day's work consists of one-fourth less hours.

2. A minimum scale of wages is adopted for each trade. This scale is based upon the price of certain staple articles, and within a certain limit it rises or falls with the price of these necessities.

3. All regular citizens must be supplied with work if they desire it. If they cannot get employment from some firm or corporation, the government officials represented locally must supply it or its equivalent in money. The government controls enough of the business to employ two-thirds of the male population. This enables the government to take so great a responsibility and bear it with satisfactory results.

4. Any man through negligence failing to support his family is put to the government penitentiary service, and his family is thereafter supported from the public treasury.

5. A widow or orphan is cared for by regular authorities. The by-laws of this fifth article regulate the work of women.

6. No credit is allowed except on a government credit-slip signed by the local representative of the state. If the bill is not paid by the one making the debt, the amount of which is always stipulated, the government will pay it and proceed to collect it in one of three ways. The last resort is according to article four.

There are several other sections governing private ownership of property, land and business. These new laws have had a very good effect. The number of persons getting immensely wealthy gradually decreased, and the average wealth of the laborers increased. The government has the power at any time to form a trust or combination of any line of business by paying liberally to those already engaged in it. This assists the government in carrying its heavy financial burdens, and every family is assured of support if the soil produces enough to feed the people.

And now if I knew how to describe elements that have no resemblance to anything

in our world, I would proceed to tell a story of interest to chemists. These Zikites have formed gases and solids unknown to us, and naturally they are capable of performing experiments more wonderful than anything ever known in our world. When I saw their wizard-like performances I thought that the marvelous feats of the Orient were being performed on a scale more mysterious and magnificent.

To see a man play with red hot irons and dance in a seething furnace, makes one believe that his eyes are deceiving him.

I saw a man draw the birds from heaven and dormant reptiles from the soil, but ask me not to tell how. A few of these Zikites have discovered some wonderful secrets of nature and will not disclose them except to certain ones of their own lineage. One of these secrets is the art of embalming the dead so perfectly that human features are retained forever unless destroyed by fire or human effort. The embalming fluid contains some of the elements not found in our world, but this is not the total secret. The body must lie in an air-tight receptacle into which

a secret gas is pumped. The dead body, lying in this receptacle for two hours, absorbs certain parts of the gas which enters the pores and touches those parts of the dead body not reached by the injected fluid. By this process no part of the body is subject to putrefaction and the muscles all retain their rigidity, so that one hundred years after burial the features are full, although discolored.

Not many of the common people are thus embalmed. But the bodies of prominent men and women are thus treated at government expense and unborn generations can look upon the full contour of their faces.

Another secret held by these experts is the art of maintaining youthful vigor in old age. This is a very expensive method and the government prohibits any one securing this treatment who has not won special honor in one or another particular channel. One of the highest distinctions bestowed upon any citizen of Zik is to grant him the "Angel's Honor," which entitles him to receive the Vigor Treatment during the balance of his natural life. This one thing, more than any

other, is the secret of Zik having so long a list of illustrious characters. It is the ambition of each boy or girl to make progress and some day win the "Angel's Honor."

The religious life of these Zikites is unusually intense. Their language is much more cumbersome than ours. They have a small book which contains a list of great truths whose authors claim to have been influenced by the All-Powerful, or the same as our God. This book has had a remarkable history, and has moulded the life and character of millions. Every person is left to his own notions in religion, and we see here the same picture that confronts us on our own planet, the very good and the very bad in the same house and neighborhood. They build but few churches, but here and there a home of a believer is the center of a worshipping company. On special occasions the worshipers rent or secure large public buildings and have an enthusiastic time.

At many places their Bible speaks of a place where the departed go after death, beyond the Zik life. These worshipers are linked to their God by the same kind of love-

chords that bind Christians to their Master in our world.

You cannot imagine my interest and my joy as I learned that the Zikites are looking forward to a period of time corresponding to our Millennium. Their religious literature is full of references to this coming golden age, and many poetical compositions point to it with rapturous melody of language.

## CHAPTER XVII.

### The Diamond World.

**W**HEN one reads of the size and population of our world he is thrilled with the idea of its greatness. But when he travels over land and sea, visiting the many points of interest, he is impressed four-fold with the magnitude of the Earth and the vast numbers that populate it.

It is infinitely more so in regard to the many suns and planets that compose the universe. I had read of the distances of space and of the number of celestial bodies that are scattered throughout these measureless expanses, and I was profoundly impressed with the vastness of created things and the eternal revolutions of the countless spheres. But when I took my continued flight away from the solar system of Sirius and was privileged to get a passing glimpse of many other solar systems, I was overawed a thousand-fold at the myriad motions of the myriad worlds, each serving its little part through

the passing cycles to carry out the plan of the Infinite Mind.

My next pause was at the glorious constellation of Orion on the star Rigel. This brilliant orb is not inhabited, but more than one-half of the worlds revolving around it sustain human life.

After I had taken a passing glimpse of a few worlds belonging to this system, I proceeded to visit another world that revolves around Rigel at a distance of sixteen hundred million miles. It is a trifle larger than our world and is inhabited by only about one-tenth as many people.

This is the brightest planet I had ever seen, for it dazzled and sparkled like pearls of ice in the sun, and yet it gave forth no light of its own.

I soon learned the secret of all this scintillation. I had come to a world that seemed to be covered with diamonds and precious stones. The mountains were barren of all vegetation and glistened with all the glory of a hundred rainbows.

I presumed that I had come to immense beds of quartz, but the rare brilliancy of the

whole scene set me to work to ascertain the value of these stones. To my astonishment, I found that the shining mountains and valleys were filled with genuine diamonds and precious stones, some of which are very rare according to our classification. I was dazed at the sight, first because of its brilliancy and beauty, and next because of the fabulous fortunes that were lying at my feet.

Then I transported myself to another part of the planet that I might get a view of its living fields of vegetation. Alas, I again met the shining of countless gems, set by nature in ledges of rock and massed in confused heaps all around me.

"What a rich world!" I inwardly murmured. "How can people live on diamonds?"

As I was thus musing I sped onward to one of the soil centers of this world. Here I found a small city built of diamonds and choice stones of which the people thought no more than we do of the stones brought down from our quarries.

The soil was almost worshiped. Only the wealthiest could afford to have it in their

homes for the growth of flowers. Fortunately, the soil is very productive and, by reason of its scarcity, it has received such careful attention that all worthless weeds have been actually choked out several thousand years ago.

Thus, the soil being so desirable and staple an article, it was eagerly sought after by all who lived on this shining world. Yea, some sacrificed their all that they might obtain a goodly portion of the soil. This desire was so great that it became the ruling passion of many people to accumulate soil all the days of their life, and many died of grief because they could not succeed in satisfying their ambitions.

Now when the speculators saw that the soil was so indispensable and much desired by the people, and that out of it were the issues of life, the wealthier and more crafty of them said among themselves :

"Come, let us buy all the soil, we and our brethren in all the soil centers, and let us call ourselves a Trust, signifying that we will trust one another to the secrets of our enterprise."

And behold this saying seemed good in the eyes of these wise men, and they labored diligently until, in the passing of a few years, they had secured unto themselves full possession of all the soil of the Diamond World.

And it was so in the course of time that these corporations held a great meeting and they said :

“Barns we will build to store products of the soil, and behold we will sell from these storehouses to our workmen for the labor that they may render unto us.”

This scheme was pleasing to all the capitalists and they rejoiced in the bright prospect of the future. So they built great barns and thus laid away the products of the soil. Then they appointed agents to sell whatsoever the people wished.

And it came to pass, as the seasons came and went, that these capitalists gave the laborers less for their toil, and charged them more for food at the supply stations. Thus the conditions became so severe that a man could work from the rising of the Sun to the setting thereof, and they earn scarcely enough to keep his family alive.

After this manner the land owners grew more and more wealthy, built unto themselves handsome little villages, and lived in happiness and refinement. They also erected for themselves select schools and reserved beautiful plots for their luxury and amusement.

Then did the members of this Trust, in order to protect themselves from all possible trouble, pass a civil law forbidding any laborer to own an inch of soil. Thus it was very easy to convict a man of theft if soil could be found upon his person or premises.

Now, behold, there were many little spots of vegetation scattered here and there over this whole world. But the agents of the Trust sent out numerous expeditions to gather up all the loose earth that could be found and carry it to the soil centers. This work was so completely done that every nook and corner yeilded its accumulated dust to enlarge the gardens at the soil centers and thereby increase the riches of the Trust.

Now, as time passed on, the children of the laborers were also employed to assist in earning bread, and in the course of a few

hundred years the school houses in the district of the laborers were torn down, as it was impossible for these children to receive an education, since they must needs work for their sustenance.

After many ages the members of the Trust had become so hardened that they no longer regarded the wishes of the laboring people, but pushed everything to increase their own selfish gain, insomuch that they succeeded in securing the passage of certain laws making the burdens of the laborers still more heavy.

And now, when the capitalists saw that the people did not rebel, they again counseled among themselves on this wise :

“Why should there be so much labor lost in continually quarrying new sepulchers in our diamond ridges, and why should there be so much dust lying idle in the old graves? Come, let us have a law that the dust in all graves over one hundred years old shall be sold at auction, unless the graves are redeemed by a certain amount of soil. Then these empty tombs can be again filled with the dead of our servants and their children.

Thus let it be continued throughout coming generations forever. Each year this auction shall be held to dispose of the dust remaining in one-hundred-year-old sepulchers."

These suggestions found favor in the eyes of the Trust who proceeded at once to take the necessary steps to incorporate these regulations into the laws of the commonwealth. The laborers stoutly opposed the adoption of these partial measures, but they were powerless because the Trust bribed enough of the legislators to carry their point.

All this happened many centuries ago, so that when I was there I saw the full program of one of these spectral auctions and was chilled with horror at the proceedings.

Every year this peculiar auction is held at each soil center. The wealthy are able to redeem their sepulchers, but the poor, having no soil, cannot satisfy the law; so the dust of their ancestors must be sold. Laborers are sent out to open the one-hundred-year-old sepulchers along the diamond ridges and carry the coffins to one place. Here they are publicly opened and the bones and dust

gathered into one receptacle after which the weird auction begins. No one can compete with the corporations and no one tries.

The legal form of the auction is soon over and the half ton or ton of dust is legally bought by the corporations whose officers order it to be sprinkled over the gardens. It serves the same purpose as phosphate in our fields. This awful process is repeated each year. The sepulchers, emptied thus, are open for new burials. So you can see that with all the gruesomeness of this whole business, there is an economic side to it, and the people have come to view it all in a philosophical manner.

When this wretched custom was first inaugurated a bitter wail ascended from the ranks of the laboring classes, for they well knew whose graves would be opened. Never was there such a stir among the working classes of people. They held mass meetings and grew loudly indignant until the Trust became alarmed at the uprising.

Then did some of these rich sharpsters, who were best gifted in speech, go out to meet their servants, addressing them thus :

"Let your hearts be at peace, my fellow creatures." This new law that we have just passed is a boon to every toiler, for we seek to lighten your burdens by utilizing the idle dust from the tombs. Hereafter we propose to give, free of charge, a sepulcher to every toiler in which he may take his rest for one hundred years. These graves shall be for you and your children forever. Is it not a precious thought that one hundred years after you are dead, your bodies shall again mingle with the soil and, without voluntary effort or pain, help to support your kindred yet unborn?

"If our present silly customs should prevail, the time will come when half our soil will have been carried to the sepulchers, and therefore your tasks would be more severe."

After this manner spake the glib-tongued fellows and, behold, their speeches were as oil on the troubled waters. Under their sophistries the laborers were content and peacefully went to their tasks again after three months of unrest.

Then did the members of the corpora-

tions consult again and spake among themselves in this fashion:

"For our protection let us gather, from the laborers, the youthful and the strong, have them taught in tactics of war, and make it unlawful for any to carry deadly weapons, except these trained men, whom we will call our Soil Defenders, and if any of the laborers should ask: 'Wherefore are we called to do this work?' we will say to them, 'For the defense of the soil and the defense of our families are ye called, therefore quit yourselves nobly.'

"And it shall come to pass that when the laborers commence a foolish struggle for their own selfish gain, we can use these trained soldiers to keep them in peace, and thus we need not spend so much of our breath by way of persuasion."

Behold this thing seemed reasonable and seasonable in the eyes of the Trust. They did according to these suggestions and gathered unto themselves, in the name of the civil law, the strongest of the youth and trained them in all the ways of war. Thus did these workmen lose all their liberties

by slow degrees, until they were no more troublesome, but labored like slaves to get the wherewithal to live.

As I witnessed this sad picture resulting from the inhumanity of man to man, I was at once reminded of what I had seen on Mars, and of the struggle now pending in my own world. Once more I breathed a silent prayer to the Ruler of all worlds in behalf of the crushed hands and bleeding hearts that are bruised in order that certain men may make their thousands in a day.

I studied the social life of the refined villagers and learned, with much interest, that the word they use for soil, is used in the same esteemed connection in which we use the word gold or diamond.

Preachers, teachers and orators make endless references to the soil. Finally I approached, in a visible form, a few professors who were engaged in a special discussion.

They were alarmed at my sudden appearance, not knowing whence I came nor what sort of an animal I might be. I quickly calmed their troubled minds by using language they easily understood, and explained

that I was neither a ghost nor a spirit, but a mere citizen of another world, having, for a limited period, a free excursion ticket to a thousand worlds, and that I chose their planet as one whereon to spend a fleeting period.

Not having been accustomed to such visitants, they were at first skeptical and thoroughly overawed at my presence.

I purposely became as familiar as possible and cautioned them to remain in the selfsame room and spread no notice of my presence. To this request they reluctantly consented.

After my nonplused auditors gained their senses somewhat they ventured to reply to my coaxing questions; these finally led to the following interrogations on their part:

"How large is your world?" came a question from one.

"Not quite so large as this one," I replied.

"Have you much soil there?"

"A million times more than you have here."

"What a wonderfully rich world! The

people must be gloriously happy with such fabulous wealth around them."

"The bulk of my fellow-men there are not happy," I sighed. "So many spend their lives looking for diamonds and gold, the most of whom are doomed to disappointment."

An incredulous smile crept over the faces of my newly-made friends, and by it I read the doubt that was arising in their hearts as to the truth of my utterance.

"My words are sincere," I insisted. "If you could take one bushel of your diamonds to the world where I live, you could get more soil for them than you have on your whole globe."

"That world is heaven," exclaimed a few of my hearers at once. "A world of such abundant soil cannot be any other place. Then I learned that their conception of Heaven is not a place of gold-paved streets, but a place where soil is freely distributed even on the sides of the streets.

I continued speaking, telling them how diamonds were considered in our world. These professors were astonished beyond

measure at my description, and each one seemed to crave for the knowledge to transport a large consignment of their diamonds to our Earth and return with acres of soil to the Diamond World.

I spent a felicitous period with these queer-shaped scholars of the Diamond World. They prayed and begged that I should remain and appear before the corporations. Their spirits drooped when I told them that if I had any more time to spend visibly on their world I would prefer to comfort the laborers and their suffering families who had been so long deprived of the fair treatment they deserved.

My hearers became aspen with fear, now feeling doubly assured that I was a forerunner of some terrible curse that was about to fall upon the Trusts and corporations whom those professors were serving so assiduously, without ever speaking a word of protest in favor of the human slaves around them.

Once more I related my station. But I spoke in most convincing terms of the eternal curse with which the Infinite would visit the guilty of all worlds.

As I left them I saw that my last words brought no relief to their faces and, after a long silence, they nervously discussed the whole affair, not being able to account for the exceptional experience through which they had just passed.

I visited, in a form invisible, the mansions of the rich and found that the most choice ornaments on their parlor shelves consisted of vials of soil or dirt, and in the homes of the most wealthy only I saw flowering plants.

It chanced that I visited this world at the graduating period of the greater schools. This gave me privilege to hear an oration on "The Soil and the Diamond," a synopsis of which I will translate as correctly as I can. It will be remembered that I must use terms and style suitable to our language.

"O beautiful soil ! Thou art but a type of thy maker invisible. Thou dost give birth to countless forms and nursest them all from thy own bosom. From the atom thou bringest the oak, and all its children fall back into thy arms for succor. From thy own heart spring the infinite types of vegeta-

ble beauty, all painted and frescoed by thy own exquisite touches.

"O mysterious soil! Wrapped in thy bosom lie a thousand secrets which, if I could but read, I might interpret and thus learn anew of my Creator. Thou holdest the ashes of the millions slain, and the dust of all our forefathers.

"O silent soil! How thou workest without the flying shuttle, or the hum of the busy bees. Thou doest thy greatest deeds without the sounding of a trumpet. Silently thy atoms take their places to serve in higher forms. O teach me thy mute language that I may live and sacrifice for others without my crying and my sighing.

"O humble soil! Thy elements, when formed into man, or fruit, or any kind of food, return again without complaint when touched by death. May I, like thee, take all my condescension in the spirit of humility.

"O modest soil! Thou are not gaudy like the diamond, sparkling and dazzling in a brilliant show and living for nothing higher than display. But thou dost lay aside thy feathery

tips, leaving the sun of heaven do the shining. Thou permittest water crystals to give the rainbow hues, whilst thou in thy own modest way, continuest to yield sustenance for man and bird and beast.

"O instructive soil! Wilt thou not, in thy own wise way, speak to the thoughtless man who feels content to grovel with the miserable diamond, who takes his lessons from the dead, dead rock, and feeds his soul upon such flinty food. Open his ears to hear thy words of life and light, and may he see in thee the brighter mirror reflecting the God of all."

This one oration condensed is a fair sample of the others. I listened to the whole program and then proceeded once more to view the diamond splendors before I left this world where I was well paid for my tarrying.

## CHAPTER XVIII.

### Triumphant Feat of Orion.

S I continued ranging among the planets of the constellation of Orion, I felt an indescribable desire to pause at a very small orb which revolves around Saiph, a star of the third magnitude.

Here I found, to my surprise, a gem of a world which I will call Holen. It is five hundred miles in diameter, and inhabited by a refined race of human beings, radically different from us in physical contour, but remarkably similar to us in their mental aspirations.

As a race they greatly excel us in mechanical engineering. Many evidences of their skill might be given, but we will be content to give a description of their monumental engineering feat.

Long ages ago Holen had cooled to the center, and it became the ruling passion of

her most intelligent inhabitants to communicate from one side of the globe to the other through an opening of five hundred miles almost directly through the center of their earth, or more accurately speaking, through the center of gravity.

After forty-five hundred years of experimenting the marvelous feat was accomplished.

Of all the worlds in the constellation of Orion, large or small, Holen is the only one that has succeeded in this astounding feat, although it has been and is being tried on more than a dozen worlds.

This wonderful opening through Holen's center of gravity is lined with sections of ribbed metal which cost the governments fabulous sums. This vast tube was finished thirteen hundred years ago according to our time.

Many lives were sacrificed in the hazardous work of tunneling. Were it not for the ribbed metal which afforded protection with its shelving flanges, the tube could never have been finished.

At the present time the tube is used

The Gravity-Car of Holen.

for commercial purposes and for passenger traffic. Air tight cars of special design are used, and only one car is allowed in the tube at one time.

You cannot imagine the frightful velocity of the ride, but the passenger is not as conscious of this as you might think. The first fifty miles of the descent is controlled by the exterior or surface engines. The speed is gradually increased until it reaches that of the falling body. Then the motorman releases the wizard car and the speed is steady and terrible until the car dashes past the center of gravity, after which the speed slackens at a regular rate. The car of its own momentum forces its way far toward the opposite surface of their earth.

Just as the carriage comes to a stop, the engineer or motorman, as we would call him, pulls his lever, thereby fastening the car to the ribbed side of the tube. At once a signal is given and the long, thin but strong rope descends to draw the carriage to the surface.

A perfect system of communication is

established from one end of the ponderous tube to the other. It frequently happens when an attempt is made to fasten the car that the clamps fail to work and consequently the carriage commences its second journey toward the center. Another effort is made to hold the carriage when it again comes to a stop; but if this is not successful, then comes the most peculiar experience of all. The carriage of its own momentum continues dashing backward and forward until it comes to rest at the center of gravity. Then the engineer, by communicating with the surface, gets the longest stretch of rope and is drawn two hundred and fifty miles to the surface.

This world has no atmosphere and life is not sustained by breathing, neither by the process found on the Moon.

The inhabitants get their sustenance from the soil with which they must be connected, directly or indirectly over one-half the time, or they will suffer in a manner similar to us when we are suffocating.

From this faint glimpse of their life, it can be seen that the people of Holen in

their habits are totally incongruous to all our conceptions, and if one of them were to make a visit to our world, everything he would here see would appear just as ridiculous and unthinkable to him as the things on their globe did to me.

As I surveyed this world, everything evidenced the fact that these people are born engineers. Our Eiffel Tower and Ferris Wheel would be mere playthings compared with the sky-scraping structures that adorn the various parts of this little world. It appears that the international mind runs in this one direction more than in any other, and while they surpass us in this respect, they are inferior to us in the limitless field of science and philosophy as well as in the variety of manufacturing plants.

In their religion, the Hohenites have developed to a high degree. They have no sacred book akin to our Bible. Their whole authority comes from the lips of the Divine Family, as we would term it. This family serves for religion the same purpose as the Royal Family does for the civil realm in some countries of our world. The Divine

Family are genuinely descended from their sacred ancestors who were, by a visible show of omnipotent power, appointed and consecrated to the sacred work of dispensing truth and officiating in all sacraments. The ordination of all the ministers of Holen must be held by a member of this Divine Family. By reason of this one source of authority, there is, therefore, no confliction of creeds. The great battle of the Church is with the several infidel organizations that give no heed to the genuine religion.

This Sacred Family received a code of laws which they have held from the beginning and, strange to say, no one is allowed to copy these laws in written or printed form. To do so is a type of blasphemy for which a severe penalty is imposed. Some of the infidel organizations find delight to print all or a part of these laws and scatter them secretly among the people. Such documents fall with as much pain on the premises of a believer as oaths do in our world on the ear of a delicately trained soul.

If an infidel wishes to insult a godly pilgrim, he can do it no more effectively than

by secretly fastening to the believer's residence a piece of material on which is inscribed one or more of these sacred laws.

Every believer is required to commit to memory this code of laws by hearing them from the lips of the minister. It is therefore necessary to keep in constant touch with the church service so as to be a continual hearer of these laws, a part of which is repeated every worship day.

The minister does not preach in the same sense that we understand preaching. His work comes nearer filling the office of a priest under the old Jewish church. There is much more form and ceremony than is found in our system under the Mediator, Jesus Christ.

The civil law has absolutely nothing to say on the marriage question. All this is held in the domain of the Church. In truth, the Divine Family has always regulated this question. If the legality of a marriage is called in question, all that the civil authorities try to determine is whether the marriage ceremony was performed in accordance with the laws of the Divine Family. If this point can be

established, the marriage is declared legal; if not, it is declared to be null and void. This one subject of matrimony has caused more friction between the Church and the infidels than all other issues combined. The infidels are bitterly opposed to take their marriage vows before the minister, yet this must be done to make their marriage legal. Divorce laws are unknown, although, in rare cases, papers of separation are granted by authority and under seal of the Divine Family.

The religious devotees of Holen look forward to a happier existence when their mortal life is ended. Their ideas of this future life are quite similar to our cherished ideas of Heaven.

In their moral life they have reached a higher plane than we. This is due to the fact that the Divine Family wield an influence in the civil realm that cannot be broken.

## CHAPTER XIX.

### The Mute World.

PROCEEDED on my journey until I had reached Alcyone in the famous constellation of Taurus. On one of the planets revolving around Alcyone, I found a distinctive class of human beings faintly resembling creatures that I had seen in several other constellations, but of which I have, as yet, made no special mention.

Among these people no audible language is used as a means of communication. One might think that high civilization would be impossible without such a vehicle of thought. But on this Mute world humanity has pushed far along in the great interstellar race for supremacy.

A description of the physical features of these Muteites would not only seem absurd, but would be distorting. Can you imagine a beautiful person without ears and void of vocal sound, having a head totally

out of shape compared with ours, and with a bodily framework ridiculously new to us? Such would be a brief word sketch of these far-away mortals of unusual intelligence.

These people hold all their conversation by pure thought transmission. The sense-perception is almost infinitely keen, and gestures play no part in emphasizing thought. It is amazing to see with what facility these beings express their ideas one to another.

In our life one may conceal his thoughts from the most searching human eye, but this cannot be done on Mute. As a consequence each one can read the character of his comrades, and the normal citizen well knows what necessary allowance to make for the impure thoughts that flit through the mind of his neighbor.

I studied, with absorbing interest, the many phases of this mental telepathy, or mind talking, between two or more persons even though widely separated. Imagine how glorious it must be to have real fellowship with a friend whose face you cannot see and whose hand you cannot touch.

There are limitations to this delightful way of talking. A person can hold conversation with only one absent friend at a time and then only when each one concentrates his thoughts on the other. What wireless telegraphy is to our world, this mental conversation is to the world of Mute, and it is possible that we may reach a higher degree of proficiency in this direction after we become still better acquainted with the laws of the human mind.

When I think of the many unaccountable near-thrills that send their emotions of joy and hatred into our passing life, I am somewhat persuaded that we speak this tongueless language more than we imagine. Some day we may learn the secrets that are now so heavily veiled and thereby put to naught the glory of our present modes of communication. Until then we will plod along with the telegraph, telephone, wireless telegraphy and our ever-changing knowledge of telepathic intercourse.

I will give the philosophy of this perfect means of expressing thought as clearly as I can.

As sound waves are created in our atmosphere by actual vibration, so are thought waves created on Mute by mental activity focused in any one point of the brain. Our way of expressing thought by audible words is not conceivable to these people. If one of their inhabitants were to visit our Earth, he would be at a loss to account for our movements of mouth and gestures of body when we are in the act of conversation.

The social life of Mute is marked with many peculiarities. Males and females seldom ever associate together, and social purity sends its sweet influences over the whole planet.

A science which is similar to Phrenology plays an important part in all the social customs of this sphere. It decides the marital destiny of each person, and no two are recommended to join in wedlock until they have been pronounced physical and mental mates by the official psychologists.

On this interesting world I found the most summary punishment for adulterers and fornicators. When these crimes are clearly proven, the guilty parties are put to death after a lingering sentence. This is a most

terrible punishment, but it has proven that, although a few must suffer this penalty, the general good of the whole population is thereby much increased.

I was much amazed at the construction and possibilities of the human mind when I observed the manner in which certain suspected criminals were examined in order to prove or disprove the crime of which they were charged. The doors of the soul were unlocked and the past thought-images, with their mental impressions, were thrown open to view. How can a Muteite deny the crime which is photographed on the sensitive living plates of his own mind! This reproducing can be effected only by a very special process and is never done against a person's will unless ordered by civil authority.

When I saw, on this world of Mute, the possibility of uncovering the past records of the mind, it at once suggested to me the possible nature of the final Judgment of our world when each one will stand face to face with the record of his own deeds, brought before him vividly under the light of eternity. In such an event who would think of showing a

bold front to deny the accuracy of such a direct reproduction of himself in the flesh!

Possibly the human mind may be likened to a phonograph into which we can speak while the cylinder of thought revolves; at any time afterward every syllable may be reproduced accurately.

Another striking feature of these mortals is their lack of hypocrisy. Only a small degree of it is found among all the inhabitants of this peculiar planet. No doubt hypocrisy would be greatly lessened in our own social life if we could no longer hide our real thoughts. In Mute it is very unsafe to practice deception, for as soon as the deceived one appears personally he can readily conjecture, by the mental state of the deceiver, the nature of the thought that had transpired.

Can you realize what a refreshing moral atmosphere exists in a world where conventional lying is almost unknown? In our life the daily sin of the millions is the white, or the blue lie. Think of how many we tell in our regular routine of life! We generally give false excuses instead of the real ones. We very seldom blame ourselves for errors, but

rather think diligently to study out a way to shift responsibility. Nearly the whole brood of our apologies is hatched from the serpent's egg, and then we ignorantly or hypocritically manifest surprise that our own offspring should develop an inclination to deceive or misrepresent!

Here I saw, in wide contrast to our own social order, the results springing from sincerity that has thrived through a long line of generations. Such blessings are as a breath of Heaven, rare and beautiful.

One might think, when considering this strange manner of conversation, that it would be difficult for the people to express their ideas clearly. It is just the opposite from this, for it is almost impossible for them to express themselves vaguely. They talk from the headquarters of one mind directly to the headquarters of another, instead of through a medium of cumbersome words which in our life are so often misunderstood. Thus we must admit that we have a ten-fold greater struggle than they to be perspicuous in language.

I was charmed at this most superior

mode of conversation and saw in it a higher glimpse of the Heaven language than in any other type that had yet met my observation in all the worlds of space.

The Muteites are rapid thinkers, and although they have no sense of hearing, yet they are ultra-sensitive to substantial emissions of vibrating bodies. According to all I could see, these people were not hampered by this lack of senses. They live as conveniently in their flesh life as we do, and in their mind or spirit life they are much more refined than we are.

Their earth is so different from ours in chemical combinations that the soil is almost transparent and in general has the appearance of glass. Their homes are built mostly under surface, owing to the terrific cyclonic storms that follow one another in very uncertain succession.

The average length of life is two hundred of our years. They reach their maximum energy of mind at about one hundred years, and among the brighter of the inhabitants can be found a glorious order of intellect. Some of these mental celebrities out-

shine the brightest creatures of all the solar systems of that region of the heavens.

After some hesitancy, I yielded to a desire to appear in a visible form before an assembled company of Muteite philosophers who were gathered in one of the under-surface halls of architectural beauty for consultation.

As I entered the vast hall in my natural manner I attracted unusual attention. It was amusing to see how all eyes were fastened upon me as I calmly walked toward the front of the audience. Here I had one of the hardest tasks of all my journey, to converse in a soundless language. I lacked faith at first to make the attempt, but this delay was but for a moment, for I first fixed my mind upon what I wished to communicate, and instantly a dozen or more Muteites signified that they were in sensitive touch with my thought.

I will give a small portion of the mental telepathic conversation between myself and my auditors, although I must relate it as if words were actually spoken, or it would be totally unintelligible to the people of my own likeness.

"Let no one be alarmed," I hurriedly addressed them, as a thousand giant forms were trembling at my appearance. "My mission is one of peace. I have come to help rather than harm," I continued.

"From what section of our world have you come?" came a hundred thought flashes in wild confusion.

"I am not from your world, but from another," I answered with closed mouth as best I could.

Then I learned an important feature of this mind language. A hundred or more interrogations came flying at me in thick confusion. At once the chairman or leader of the meeting gave restrictive orders which actually prohibited my audience from further communication with me, although I might address them. The chairman bid me commune with him and he thereafter acted as the spokesman of the whole assembly. It was no more difficult for these philosophers to keep their minds closed to me than it is for us to keep our mouths closed in an excitable meeting or debate.

The chairman, looking with increasing

curiosity at my strangely shaped face and head, interrogated me thus :

"Are you an angel of light, or one of darkness?"

"I am neither."

"What then can you be?"

"I am a created being from a far-off region of space. I was born on a world which revolves around a star untold millions of miles distant."

"If you are not a spirit, how could you have traveled such incredible distances?"

"That is yet a mystery to me," I admitted. "The power of my flight is much like the mode of your communication, for each is alike mysterious to me."

By this time the excitement was intense. No one attempted to grasp me or even approach toward me. I saw by the perplexing mental atmosphere of the chairman that he was being besieged by a host of questions and suggestions; so I relieved the situation by continuing my words :

"No one need consider my appearance as an evil omen. I am not empowered to curse or bless your world except by what

may flow from my immediate conversation with you."

In these sentences I thoughtlessly gestured with my arms; this set my audience wild with mingled merriment and curiosity.

"Are all as small as you whence you came?" queried the chairman.

"They are all after my pattern with some variations."

"Pray, tell me, what are those gummy flabs at the sides of your head?"

"Those are my ears," I said with grinning face. "They grew there for a purpose."

"And what can that purpose be?" further questioned the puzzled chairman.

"They are for the purpose of hearing," I quickly replied.

Then followed a curious scientific dialogue in which I endeavored to explain the sense of hearing. From this I described the manner of conversation in our world, and showed what an important part hearing played. But all this was beyond the comprehension of my auditors.

After a lengthy and most interesting discussion upon the philosophy of sound, the

next point of interest centered on my mouth and vocal organs. It was pleasing to consider these subjects because my listeners were such eager questioners and surprised hearers. No wonder that they were unable to grasp such a crude system of conversation as ours!

Then the chairman verily begged me to explain the mystery of my mission and of my unprecedented itinerary. How could I have fully satisfied his mind, even if I had endeavored to do so!

After all this came the most pleasing communion thus far of all my journey. I learned much by the interchange of ideas. Nature's vast book opened to me some new and charming pages.

Toward the close of my stay the affinity between us grew to a marked degree. Although we were widely apart in physical aspect, yet we were supping from the same bowl of affection and, with this happy turn, we talked of our permanent companionship.

"But I cannot abide with you," I reluctantly answered.

"Ah, torment us not with such a thought," affectingly pressed the chairman.

"I have other worlds to visit, and must hasten away. Touch me not," I cried as the chairman unconsciously moved toward me in an urgent appeal.

"How soon shall we see you again?"

"No more forever, unless you see me in that widest expanse of life which in our world we call Heaven. There the pure of all worlds will gather and commingle in delightful fellowship forever."

I was then urged beyond all etiquette to tarry a short period and visit certain parts of their world. But I informed them that I had seen more of their world than they imagined, and that the object of my visit had been reached.

## CHAPTER XX.

### Brief.

 ONE of the medium sized worlds that revolve around Alcyone sustains the shortest lived human beings of our universe. It is seldom that any of the creatures reach more than four years of age according to our standards of time. They are nearly as large as we and relatively much lighter in weight. All the periods of physical growth are correspondingly decreased. Children walk four or five weeks after birth, and are capable of receiving regular instruction at the age of five months.

Strange as it may seem, this sphere, which for convenience we will call Brief, revolves very slowly on its axis, so that our world makes fifteen times as many revolutions as this planet.

It requires but little arithmetic to figure out that the people of Brief do not see the sun rise very often. When it does appear in the morning sky, all the public signals blow

and the people appear in one or another of their places of worship. This beautiful custom has been in practice for over three thousand years. The worship is not sun worship, but a genuine service of thanksgiving to Him who ruleth over the sun and supplies it with fuel to burn. It appears that on all worlds everything is regulated in accordance with the length of human life. On this world of Brief all vegetables mature in periods so short that one marvels when he hears it. Think of cereals reaching maturity in seven or eight of our days, or during one day of Brief. Early in the morning certain crops are planted and are harvested at night. Two or more days are required for maturing other crops. Actually the people of Brief raise their crops with less labor than is required amongst us.

If you were permitted to look upon the public and private life of this incredible world, your first sensation would be dizziness, not to mention the weirdness of all sights that would confront you at every turn. People would seem to be in a mad rush, and it would appear that all business is done with insane rapidity.

Furrows of care and trouble begin to deepen on the faces of these Briefites as they approach an age of what we would call three years, and if by lease of strength they pass on toward an age of four years, it is but an evidence of their exceptional vitality. It seems to be true that the experiences of a long life of sixty or eighty years is crowded into a narrow compass of four years by a miracle of spheres not comprehended by finite minds.

No doubt a detailed description of this whirling and dashing life would be of interest to us slow, deliberate creatures. But I can give only a passing glimpse.

#### JOURNALISM.

Things happen in such quick succession that the news is hustled out at all hours of the day and night; not on sheets of paper, but through automatic news-receivers, machines somewhat akin to our telegraph instruments.

The state supplies each home with an automatic news-receiver. Thus a record is kept in each home of all messages received so

that they can be read at leisure. To speak in a manner more easily understood, I will say that the news is telegraphed to each home as soon as possible after the events transpire. But compared to our customs, the news is very scarce. There being no competition, no time or space is required for sensational trash. Thus, if nothing of importance occurs, nothing need be transmitted. The official news-censors decide as to the relative importance of occurrences. There need not be a certain amount of news telegraphed each hour. The government verifies, as much as possible, all reports before they are transmitted. There are indeed some advantages in the government being in constant touch with each home under its care. The advertising department pays nearly all expenses of this whole system of journalism. Announcements for private gain are paid at a regular rate. It costs more to advertise at certain periods than at other times, all regulated by the customs of the people.

Under these regulations everybody receives the news, and only the essential news, except advertisements which must come in

**Sunrise Signal in Brief.**

batches at certain intervals. Of course, people take their choice as to reading advertisements.

#### THEIR FOOTWEAR.

The soles of the feet of these Briefites are composed of a substance most nearly resembling hoof material. They never think of covering the feet under any change of climate. If one of the Briefites were to step upon the shores of our rugged Earth and see the cotton or wool and leather that lies around our feet, it would appear to him as the most ridiculous thing imaginable, and no doubt his shapely feet of ivory cast would be of more than passing interest to us.

#### THEIR RAIMENT.

Their raiment is altogether after new models. Neither the men, women, nor children seem to seek this means for self-beautifying. They seem to think that beauty of character has a radiance more to be desired than the flash of opals or the luster of silks. Their garments partake of the loose flowing order. For instance, a strong fabric of chosen shade

is fastened at the neck, hip, knee and ankle, and lies carelessly over the parts between. The females never graduated to the corset degree, and while they do not cut a scientific figure, yet they surely develop a more ruddy waist after the model intended by the Designer of the body.

#### TRANSPORTATION.

The methods of traveling are so contrary to our conceptions and practices that I almost forbear to attempt any description. Yet I was entertained and instructed as I witnessed the moving of humanity along a street of a busy city. Have you ever noticed how quarters of beef are carried from a car to an elevator or refrigerator on steel rods connected with wheels running in a groove or on a specially prepared track? In a city of Brief, overhead tracks after such an order run along all business streets and certain residence streets. Spare me a detailed description of this peculiar traveling system. Suffice it to say that a person, in lightning rapidity of motion, rushes from a store, springs upon a passing seat and is hurled

away by the power of an overhead cable system. When an exchange of seats is necessary, it is all done so easily and so quickly that you would wonder why we tolerate trolley cars.

In traveling from city to city, a system is in use that I will call the Toboggan Slide System, although the cars run on wheels. The car is raised in a shaft about one hundred feet and then by gravity it dashes two or more miles according to the lay of the land traversed. Then another rise more or less than one hundred feet is experienced, and then another wild dash. I have no words of praise for this system, although the Briefites can cover considerable territory in an hour. They look upon this gravity system as a wonderful achievement, for it has not been in operation for more than three hundred years.

The power of steam has never been utilized. No genius of all this active world of Brief ever conceived the idea that almost unlimited power lies wrapped up in thin vapory water. But they have discovered what we would call gaseous oil, and have learned

to put it to work, so that it is the main force employed in hoisting and all other purposes where power is required.

Nothing like a traveling locomotive has ever been made, although I learned that a bright wizard was experimenting and that he prophesied great changes when his gas-propelled vehicle was perfected.

Think of how much value an ordinary citizen of our world would be to these Brief-ites, if he could step upon their world and communicate with them concerning the magic wonders of steam and the manner of constructing stationary and movable engines, to say nothing of the hidden wonders of electricity. Quadrupeds that take the place of our horses are used for drayage, although nothing except the two-wheeled class of vehicles was ever used until some eighty-seven years ago

#### PUBLIC HIGHWAYS.

These interesting people excel us in their style and manner of home-building, fencing and making public highways. We are heathenish in our progress along the line of road making especially. In all my vast journey

among the worlds I found only a few, comparatively, whereon the roads were inferior to ours.

In the world of Brief the state prescribes the manner of public highways and each citizen must contribute his share to their creation and maintenance.

These Briefites excel us in more than a score of ways. They are much purer in morals, more refined in manner, more harmonious in government, and unusually bright in mathematics. Very intricate and elaborate problems are solved by these people of a few years. They are inferior to us in a hundred ways. In the broad fields of 'manufacture and invention they lag a long distance in the rear. This is principally due to their lack of time.

#### RELIGIOUS LIFE.

The religious life of the people of Brief is, on an average, of a higher type than is found in our world. Their belief in immortality has run parallel with their existence as a people, and their devotion to their Creator is marked with unusual fervor.

Their Redeemer is worshiped quite separately from God, and with distinctive adorations. The name of their Redeemer, phonetically rendered, is Kerm-Cher. The most faithful translation of this word into our language would be God-affluence.

Kerm-Cher, or God-breath, appeared upon Brief full grown, and pronounced his benediction on the race, declaring his origin, and the purpose of his coming. Similar to Christ, he confirmed his identity by unanswerable miracles.

Many, however, disbelieved in Kerm-Cher, and held to the old axiomatic truths. Thus creeds were prevalent and they remain until now, only there is much less variety than is found amongst us.

Kerm-Cher set up a new reign, and accepted a temporal throne for a season. He finally announced that his ambassadorship would soon cease and that his followers would lose the throne of civil power, that they would be tested for a season in the valley of humiliation and by the fires of terrible persecution, and that they who would endure unto the end would be glorified.

These religious features are remarkably similar to the system under which the Christian religion of our globe is fostered.

## CHAPTER XXI.

### The Life on Wings.

**A**S I darted from world to world, I was not then fully conscious of the vast stretches of space that I had covered. No mortal nor angel tongue can even commence to describe the vastness of created things and the trackless oceans of space in which the ponderous suns and planets revolve.

According to the classification of our astronomers I next found myself in the constellation of Perseus, and was again convinced of the weakness of our most powerful telescopes, for I now saw thousands of immense stars, hitherto invisible to me. Not one of these stars is within a trillion miles of any other.

In this distant system of our universe I saw that the same plan of creation obtained. Around a majority of the stars a group of various sized worlds revolves. On many of these worlds human life abounds in endless

degrees of development and in a countless variety of manifestations. I marveled anew as I saw the endlessness of the Infinite Mind, supporting not only the conscious life of this whole constellation, but also of all the constellations of our universe, and of all the universes scattered at large throughout the unending depths of space.

I paused at a star of variable magnitude in the Milky Way, but took only a passing glance at the physical wonders of this great sun, compared with which our own Sun is a mere pigmy. Onward I hastened to one of the larger worlds of this solar system which, for my convenience, I will call Swift.

Here new wonders opened wide to my view. Human beings, charmingly beautiful, moved over the face of the planet or on wings through the air at pleasure and with great ease. These creatures are about three-fourths of our size, and are most gracefully formed. Their whole physical appearance is more similar to a bird than to a human being of our Earth. They are relatively much lighter than we, and are covered with nothing akin to feathers.

If you were to see them standing in their erect posture and walking with man-like dignity, you would at once feel that they are the lords of the creation on their world, and so indeed they are.

These ethereal creatures have the loveliest eyes of any human beings I ever beheld in any world. They sparkle with the brilliancy of a diamond and move with the quickness of electricity. The head is small but symmetrical and all physical proportions are most harmoniously adapted even to a nicety that would be pleasing to the most refined tastes of our world.

At first I could not understand how these people of Swift could travel so conveniently in the air, for their wings are very small and the exertion when flying is very limited. But the lightness of the body, the heaviness of the air, and the unusual strength of the Swiftites, each conduces its share to the fortunate result.

In my thoughtlessness I envied these gifted people and wished that when I would return to my world, I could enjoy such privileges of flight. I soon checked this rising

covetousness, and again contentment flung over me its white mantle.

The bodies of these Swiftites are covered by nature with a clean growth of soft, silken hair. They change their garments with the seasons, but at all times dress very sparingly and neatly. They are so easily clothed that all their apparel occasions them no more trouble than the more seasonable covering of the head gives to our women.

The average length of life is nearly four hundred years of our time. There are very few worlds in space where the general health of its inhabitants is as perfect as is found on this beautiful planet. There are but few doctors because there is but little demand for them. Those who are engaged are under government service, and all persons who are unfortunate enough to become ill receive at least all medicine and professional attention free.

We are quite an exceptional world in our medical system. In all my journey I saw comparatively only a few worlds that have the private system of medical treatment. Have we not noted the laboring husband

bending at his toil for eight or ten hours to pay the physician who calls for a few minutes? In some cases this program is continued for weeks, until the honest toiler finds himself confronted with a doctor's bill and medicine bill to haunt him until the debt is either forgiven or paid at great sacrifice.

On the world of Swift and in the vast majority of civilized worlds in space, the community or government furnishes a salaried physician within reasonable reach of every home. The doctors of Swift are not expected to work night and day. They have shifts to divide the toil equally.

In architecture this distant planet excels us by far. I improved the opportunity and went to witness a magnificent temple of worship which has been in process of erection for over two hundred years. Any conceit that I previously had on account of the large structures of my own world quickly vanished at the sight of this imposing edifice. During my visit the winged workers were laboring on the upper stories and I watched them with great wonderment as they descended from the clouds to carry materials to the

higher stories. Can you imagine the picture of workmen flying in all directions with tools, each one busily employed? It is promised that the present generation of employees will live to see the completion of this notable structure.

This vast building is the national religious center of the Swiftites. Each government has such a central station, and from it all temples of worship are controlled. Here the church and the state are yet married, and the state maintains its religious departments with careful scrutiny. The chief ambition of each government has always been to outshine the others in the glory and magnificence of its central temple which, of course, is fire proof and almost time proof.

One may wonder as he gazes upon this extensive structure why there are seventy thousand sleeping rooms and dining halls built after such extensive plans as to entertain, at one time, twenty-five thousand guests. All this is to accommodate the vast throngs that take their sacred pilgrimage once in a year under an arrangement by which one tenth of the able-bodied go each thirty-nine days, which corresponds to our month.

The most notable feature of this central temple is the main service room, built at fabulous cost and capable of accommodating one hundred thousand pilgrims at one time. The most costly sections of this one room are guarded night and day by armed government soldiers.

The religion of these Swiftites is of a very pure kind. The ministers of this national church are fully equipped before entering upon their office. The training schools for ministers attracted my closest attention. Fortunately, these people have no language complications as we have, so that a prospective minister can spend some of his time studying the Book of God's Revelation instead of spending a great portion of his training period in learning the languages in which the book had once been written.

A minister's training consists as much in voice culture and the many branches of elocution as it does in acquiring a correct knowledge of God. But in illustrative teaching Swift leads us by far. I was profitably entertained in the main temple as I listened to one of the famous orators discoursing to

an audience of eighty thousand. Not only did his canary-like voice penetrate to all parts of the large room, but his objective illustrations clinched the truth remarkably well.

A series of special services is held at the close of each month. The most wonderful of all these exercises, or renditions, is called "The Mediator Service." This is one of the most spectacular and impressive exercises outside of Heaven. Even the famous Passion Play of Oberammergau ( our world ) with the less glorious exhibitions at Horitz and Selzach, all dwindle into insignificance compared with "The Mediator Service" on the world of Swift.

During my visit I witnessed the full program of this sublime rendition. The music was inexpressibly grand as rendered by the vested Mediator Choir. Naturally the Swiftites have sweet, bird-like voices. Can you conceive the effect of a triple choir of these human warblers all trained in perfect harmony and unison?

When you consider that nearly the whole population witnesses these special exhibitions

at least once a year, you can the better understand why the spiritual condition of the people has reached a high very level.

I investigated the many interesting features of this inviting world and found that in some respects we are inferior to these human bird creatures, although in many other respects we are superior. Electricity is known in their world, but they have not yet harnessed it; hence they are ignorant of telegraphy and a long list of similar inventions which we enjoy.

In agriculture the Swiftites are ahead of us. They raise their crops with less labor relatively than we. All things considered it is easier to live on Swift than here.

Knowing that my time was limited, I decided to secure some nuggets of truth by a personal interview; so I concluded to appear to the wisest person on the planet, who was a woman of wonderful mental acquirements. In addition to her superior intellect she was also bewitchingly beautiful.

I waited for the best opportunity and came near to her as she was about to spread her wings for a morning flight from

the beautiful summit near her summer home. Not wishing to cause her undue alarm, I at first spoke softly, remaining invisible and watching her rare eyes send their glances toward the palmy trees around me, as her wings were relaxing quietly at her side. She was positive of having heard a voice, and as she still further scanned the immediate surroundings I saw that perplexity was furrowing marks upon her face.

"Hast thou time to spend with a friend from another world?" I calmly inquired as I was still unseen by her.

She was nervously agitated, but being of strong fibre she quickly rallied with her answer, "Where art thou and who art thou?"

"I am on a peace mission from a far distant world," I quietly said as I slowly became visible to my audience of one.

Naturally she was alarmed at my appearance, and consequently I drew gradually farther and farther away until she gained more self-possession and turned interestingly toward me.

"Ah! how can you be a spirit without wings?" were her first unexpected words.

"But I am no spirit," I said assuringly.

"You cannot be otherwise," she insisted.

"Believe what you wish, we have no time for parley. I am delighted to visit your world and I desire, if possible, to have some mysteries solved. Can you help me?"

Plume, for that is the name I called her, was much unsettled. She scanned my form with wild curiosity and I feared that she would at once use her wings at their swiftest.

"Pray do not fly hence," I quickly urged. "I will never harm you, even though we could converse together forever. Believe me true, and rest your wings and heart in peace."

My words had some effect toward calming her mind and with more placid features she still looked at me half shrinkingly.

"Are you not happy that you have wings with which fly?" I continued, hoping to create a more natural familiarity.

"Happy? No more than for my feet, my ears, or my life," she answered in a more composed manner. "You say that

you are from another world. Where' can that be?" was her welcome query.

Then I pointed my finger in the direction of our world and remarked :

"If you could travel in that direction on swift wings day and night for a few millions of years, you would still be far, far away from the world where I live."

"And is that world inhabited by sensible creatures?"

"It is."

"But how could you have traversed so great a distance?"

"Never can I explain that mystery to you. Be content that I am here."

"Are you in the image of the other human creatures in that far away world?"

"In general they are all fashioned as I am."

"No one having wings?" she added with surprise.

"Not one."

"How can that be true?"

"Because we were made without them."

"And have you no way of moving through the air at pleasure?"

"Not without artificial machinery."

"Artificial machinery?" she repeated.

"What can you mean by that?"

Of course they have no word for balloon or flying machine, and I found it difficult to describe the shape and explain the philosophy of these things. I did the best I could in her language, and after I had finished my description she for the first time smiled and said:

"That sort of a construction would be a fine thing for the indolents of our world who, through misuse or lack of use of their wings, have no more ability to fly."

This was interesting to me and I closely inquired as to the cause of this loss of the wing power. Plume grew more and more familiar in her address and in a long conversation told me of the many conditions that make people unfit to fly. I deduce from our conversation a few of these causes.

1. Simple neglect.
2. Gluttonous life.
3. Sensuality of a low and heavy life.
4. Pride. Some yield to a supersti-

tious notion that it is honorable to make but little display of themselves, and allow their wings to be bound or partly clipped.

5. Certain kinds of sickness render the wing-chords inoperative.

I learned that altogether nearly one-half of the population are unable to fly. How my mind flew back to our own life as I was learning of these sad conditions. There is a sort of a life on wings in our world, although the wings are invisible. But on account of the low, mean lives so many are living, they never rise above the miasmic contagion of the sin and self level. These unseen wings are either paralyzed or clipped.

Plume now actually stepped toward me. What a graceful tread. She was indeed the most charming creature I had met outside of my own world. She seated herself near me on the rustic bend of a tree unlike any in our world and hurried her questions at me as if she realized that I would not tarry long. At length she gratefully said :

"I am beginning to believe that you

are really a son of another world, or else I am reveling in a day dream."

"Happy am I that I can learn from you some of the truths after which I am seeking," was my evasive reply. "Tell me, Plume, something about your faith religiously."

"I worship the God who made all things and am hoping to live in the wider life after my mortal days are ended."

"Do you expect to meet, in that wider life, representatives from other worlds?"

"Ah! I have often thought that it might be so," she answered, as her face brightened in poetic fervor, and her eyes sparkled with seraphic luster.

"It shall all be so, and much more," I declared. "In that life you can fly without wings and mingle with the pure from the unnumbered worlds of space."

"What an incentive to a pure life," she quickly added.

"Talking of wings, do you object if I see more closely the cut and style of your wings? I never saw before a human creature possessing a pair."

After a moment's hesitancy she raised

her right arm and with it the one wing unfolded. I ventured near enough to see the intricate network of muscle and bone woven around the arm and filling the space between the raised arm and the side of Plume's body. She was surprised at the interest I manifested in the human wing. After this she offered to furnish an able escort to conduct me to several points of interest.

All this I declined and informed my talented friend that I must hasten away to another world.

"Let me go with you," she strongly insisted.

"Your wings are not of the right kind," I replied hurriedly.

"They are strong enough to bear us both," were her inviting words.

"But not beyond the atmosphere of this world," I explained.

I quietly arose, scanned once more the beautiful valley before me, and indicated that I was about to wane into the invisible. Then did her womanly nature assert its supremacy and she, for the first time, touched my hand imploringly :

"Have I been dreaming, or do my eyes deceive me? How can all this be true? Your hand is sensible to my touch. I implore you to remain until I speak to you more about the sciences of your world."

In all my journey I never yielded to persuasion before. But somehow I consented to spend a season longer of most charming fellowship, talking of the elements in nature, their chemical affinities, and the laws of matter and mind. Plume was unusually bright in the philosophies, and I gathered from her many truths which had always before been hidden to me.

Finally I became rigid in my determination to leave, for I knew that I could not stay.

"Grant me one request," she begged.

"Let me hear it."

"Promise me that you will return."

"Impossible, impossible!"

The parting that followed was indeed memorable. Without any further notice I suddenly vanished, but still tarried invisibly in close proximity.

Plume was now left in deep bewilder-

ment, and I could not even conjecture the details of her warring thoughts. Finally I saw that for which I had tarried. Plume lifted her wings and flew skyward as beautifully and gracefully as any bird of our earthly air.

## CHAPTER XXII.

### Heaven.

**A**FTER my ambition to visit one thousand worlds had been realized, and I was darting toward the confines of our own little Solar System, instinctively I looked out once more over the vast stretches of space. All around me, at amazing distances, loomed up the millions of spheres which I had not visited by reason of my limited time. I felt like some one who, after gaining his first thousand dollars, has a wild craving to accumulate ten or one hundred thousand more.

Still I scanned the heavens while deeper longings pervaded my soul. While in this mood the most unusual vision flashed upon my eyes. Suddenly I forgot whither I was going and in wild astonishment I drank in the first view of Heaven. Inwardly I marveled that I had not seen at least a part of it before.

Heaven is fashioned on a transcendently large scale. It is not a single sphere, but a universal chain of vast and luminous star-groups, scattered harmoniously throughout the infinite regions of space, so that a part of it lies suspended preciously near to our own Solar System. Heaven is more real and substantial than the suns and planets of the universe, although not one of its numberless parts can be detected by the human eye, or discerned through a telescope. These luminous orbs that constitute Heaven control the movements of the planets, suns and systems which we call material. They are whiter than snow and shine with a luster not dazzling, but restful to the eye capable of seeing them.

How this glimpse put to naught all my former crude conceptions of Heaven, and if I found myself unable to describe the wonders of many a dark world which I have visited, how much less could I portray the vastly superior beauties of Heaven which are so far beyond the glory of dark, rugged worlds that I felt an inex-

pressible desire to take up my abode there at once and to remain forever.

Inwardly I shouted for joy as this new light illumined my face, and I loathed to think of proceeding on my journey to any sin-cursed world of the universe, for the ties of kinship, friendship, and earthship all vanished at the sight of such resplendent spheres.

#### THE GREATNESS OF HEAVEN.

There is no language to be employed that can fitly describe the parts of Heaven I saw, and I know that the greater glory was curtained from my view. But the size of the lustrous orbs is not equaled by the large material suns that blaze in the depth of immensity. Heaven's diamond splendor extended as far as my unassisted eyes could reach, and according to the way it appeared it must extend without limit.

It would require one hundred millions of years for a child of God to take one excursion trip to the physical worlds of our universe. Then there are millions of such universes, ( I know of no better name to use )

each one occupying its own immense stretches of space. These universes average about sixteen hundred millions of worlds each.

Heaven is infinitely greater than this whole material fabric, so that if a spirit is inclined to travel, he will need all eternity to study the works of God as displayed in the glorious abodes of Heaven and in the changing aspects of created worlds.

Let us give a deeper meaning to the stanza of the poet by substituting "million" for "thousand."

When I've been there ten million years,  
Bright, shining as the sun,  
I've no less days to sing God's praise,  
Than when I first begun.

Compared with this life more vast, does it not appear that our own insignificant existence on our tiny Earth is as the creeping of a mere insect on the leaf of a giant oak?

#### PERMANENCY OF HEAVEN.

The only permanent or imperishable feature of our universe is the Heaven part of it. The created or visible worlds are mere dark appendages of the real spheres, and are

serving their parts in bringing fruit to their Maker.

Sin-cursed and sinless worlds are coming to an end continually, and as rapidly are new ones flung out or old ones re-peopled to serve as garden plots to bear fruit in the form of created intelligences who serve and admire God through choice.

Heaven is indestructible. It has already been in existence since the morning of time. In all my journey, no angel or mortal could tell me how many cycles ago that was. But it must be said that Heaven does not always present the same aspect. Mansions are built for the reception of new arrivals, or for the vast delegations from millennial worlds.

#### THE INHABITANTS OF HEAVEN.

They come from all parts of the universe, from millions of spheres. The righteous of any world, at death, are suddenly transported to that part of Heaven lying nearest to their world. This is the Abraham's bosom where the spirit is happy until it takes up its abode with its own spiritualized body in a millennial reign, after which,

by a decree of the Final Judgment, it is given its credentials to the illimitable life of all Heaven.

This is Paul's third heaven. Oh! what unlimited expansion! What incomprehensible principles, to move at large in quest of universal truths as seen in the seven types of Heaven's spiritual intelligences, and in the unending manifestations of God's work and love as displayed in all heaven and in all the peopled planets of space!

Not one of these blessed inhabitants ever grows old or suffers fatigue. They are capable of moving with tireless energy from one part of Heaven's vast domains to any other portion.

#### DEGREES OF HEAVEN.

In space there are many sinless worlds where human species are propagated, not as the result of any sexual affinities, but in a manner totally unintelligible to a finite mind. They who reach Heaven from such a world cannot drink in the same kind of enjoyment as those who come up out of great tribulations from the spheres of a

sin-cursed world, and who have struggled for mastery and forged their way to the sky through armies of aliens.

But these creatures are perfectly contented, for they have no way of realizing the glory resulting from the victory over the world, the flesh and the Devil.

Then there are degrees of glory among those who come from a sin-cursed world. Some have many treasures laid up in Heaven, while others centered their affections too much upon the transitory things of time and sense.

There are also various orders or degrees of glory among the seven types of intelligences of which Heaven's multitudes are composed. Some of these may be suggested to your mind when you read more of this seven-fold life.

#### SEVEN TYPES OF INTELLIGENCES.

1. The first class of beings is composed of those whom we comprehend as the Trinity, whose highest glory is expressed in the Mediatorial personage who can be seen at will by any of Heaven's hosts from any world.

A Glimpse of Blissful Life in Heaven.

2. The cherubim and seraphim, or the highest order of spirits, who have always been pure and holy. They constitute the next rank of the celestial host.

3. The third class is composed of the general host of angels who also have been holy from eternity, and who serve as ambassadors to various points of the limitless creation.

4. The spirits of those who have risen from sinful worlds by virtue of a God-approved and God-appointed Mediator. To join the ranks of this class we, who serve God, are hastening. This is no low order or caste in Heaven, but they who belong to it vie with higher angels, and taste sweetness beyond the capacity of those who, in other respects, are our peers. The angels desire to look into the deep mystery of salvation's plan.

5. The matured and maturing spirits of those who left sinful worlds before God held them accountable for their deeds. To this class belong our children who precede us into the final abode.

6. The spirits of those who have risen

from sinless worlds to take their infinitely higher degrees in this Heaven life.

7. The matured and maturing spirits of those who left the sinless worlds before sense perception was duly developed. They form a distinct class of spirits and have their distinctive marks.

#### UNITY OF HEAVEN.

Redemption's plan for each sinful world is somewhat similar to ours, so that there is a oneness in the whole family of the redeemed. This is one main factor that makes the bond of unity perfect and renders the fellowship of the celestial hosts absolutely without a flaw.

True enough, each of the seven classes of intelligences is a mystery and a glory to the others. But there is no friction, no jar. Each one is perfect in himself and happy in spirit.

Although each one of the vast companies carries the distinctive impress and the spiritual peculiarities of his own planet, yet they are all now fashioned after the symmetry of the Heaven life, and no one bears a single

repellant feature, but rather each spiritual body is beautiful to the eyes of all the others, and each one breathes the same atmosphere of purity and converses in the self-same language of love.

#### A HOME-LIKE PLACE.

No feature of Heaven is more beautiful than its home-like atmosphere. The soul is not chilled by the two-thousand-mile-cube cities, or by the long, long stretches of Divine masonry. God is as a real father, and all his subjects are as our blood-relations. We feel it, and the inspiration of these truths takes a deep hold of Heaven's vast populace.

#### EMPLOYMENT.

Now and then large excursion parties visit various points of our own universe and frequently span the incredible distances in order to study the works and life of other universes.

Each soul is occupied in gratifying its own master passion, and lives in the delightful fellowship of the saints.

## TRANSPORTATION.

There are no vehicles or cars of any kind. Actual wings are unknown except as used by certain birds of Heaven. Spirits travel as rapidly as desired by a mere submissive connection with the universal system of power filaments, all of which center in God. More refined power than electricity is transmitted over these substantial filaments to any point of any world. The fleshly body is not sensitive to this spiritual power, but the pure soul, when free from the body, is at once sensitive to these chords of power and is carried swifter than a current of electricity to Abraham's bosom, where it is entitled forever to a free use of this perfect power without being subject to any kind of taxation.

## SEXUAL AFFINITIES OF HEAVEN.

Contrary to some of my former ideas I saw that the inhabitants of Heaven are not all of one sex. The male and female are clearly distinguishable, and they bear relations one to another still more refined than was manifest in the *Millennial World*.

The most holy affinity exists between the several types of intelligences. Here the glorious fires of love burn never to reach a climax. Lovers have been drinking from perennial fountains for a million years, and their ecstasies are rising still. Pure love is as endless and infinite as time and space, and its mystery is deep to these shining throngs of Heaven who look into one another's faces with untrammelled emotions. Think of falling in love with the inhabitants of other worlds and of having the capacity and right to foster a thousand or more types of affinity, each one differing from the others !

These relations are so highly refined and so gloriously developed that one must not think of reducing them by comparison to the level of the flesh life.

#### STRUCTURAL ASPECTS OF HEAVEN.

I would not attempt to describe the structural glory of Heaven, for I know not where nor how to begin. Seemingly all things are transparent even to the center of vast orbs. Magnificent cities apparently lie suspended far under the indefinite surface of

the orbs composing Heaven, and free passage ways of phantastical design ramify throughout all the glorious under-surface regions.

Architectural greatness here finds its unmatched examples. Seven-mile diamond arches are common-places, and towers of two thousand miles in height and one thousand miles in diameter, as the corner stone of a city, are nothing unusual, although many cities are built on a smaller plan. Nothing needs repairing, and nothing is mortgaged. The wealth of unnumbered trillions is easily represented in one orb of Heaven's empire.

I now saw a thousand-fold more clearly than ever before the absolute folly of fixing our affections on the perishing things of the mortal life in our dark and dusty world.

While my eyes were still feasting on the sublime picture before me I began to realize that my privilege would be of short duration, as the vision was fast waning. I looked intently until the last curtain fell, and reluctantly I continued my journey toward my own little world. I now felt that, if the whole Earth were my own property, I would gladly push it all aside if I could be a mere

door keeper in one of the heavenly cities of my God.

And very often since that time I have cast my longing eyes skyward, hoping to catch another glimpse of that fair scene.

How I long for that restful picture,  
A vision of Heaven, once more ;  
With its trillion orbs of beauty,  
And its wealth of endless store.

There are saints from unnumbered planets,  
Where they lived in a million ways.  
Now they mingle in perfect glory,  
Through the length of eternal days.

There the poor are wealthy forever,  
For the beggar sits down with the King.  
The man who never knew music  
Will vie with angels to sing.

Here the hopeful student, progressing,  
After failing does often grieve ;  
But in Heaven each lesson is perfect,  
No theory to blind or deceive.

Here the runner, in breathless struggle,  
Sees the other in touch of the goal ;  
But Heaven gives each one the laurel,  
To be crowned while the ages roll.

## LIFE IN A THOUSAND WORLDS.

There they have no light of a candle,  
For there are no shadows of night.  
There the flash of unnumbered opals  
Sparkles on in their wealth of light.

In that home-like palace of Heaven,  
Where these myriad trillions are,  
There the Lord is the self-same Master,  
And Love is the self-same star.

THE END.
