THE MASTER KEY OF LOVE

FOREWORD

There never was a time, as far as history tells us, when the need of true sex knowledge was more necessary.

The time has arrived according to statistics on this subject, when divorces have increased almost over marriages.

Young people are getting married and divorced before they reach Manhood and Womanhood. Why? is the universal question. The answer is very simple and will be found in this book. Never mind what you think you know on this subject. Read this book carefully and then you will know *All that is known* on this subject. Then you will be surprised to find how little the average man and woman know about this beautiful and sacred subject.

The Author does not want any credit. What he desires is to see humanity a super race of beings. Not only physically but mentally superior to any thing human yet known. Do not read this book to believe or to disbelieve. Read it *to know*. There is only one way to get anything and that is create it and if these United States wants to become a great nation, we will have to create great and strong children.

So mote it be.

H. O. SAXON.

THE MASTER KEY OF LOVE

FIRST DIVISION

Love

Its Nature and Realization

We have many definitions for the word or term Love and in all philosophies love is given such a wide and abstract meaning that, after all our analysis of it, we do not thoroughly understand it. Buddhism considers love as one of the Viharas or Sublime Condition, the others being sorrow, joy and equanimity. In the Christian doctrine we find love interpreted as one of the central motions upon which good conduct depends, the other notion being faith. On Love depends the "fulfilling of the law," and the sole moral value of Christian duty—that is, on love to God, in the first place, and secondly love to all mankind.

Out of this love of God and mankind comes The Ideality.

So our definition of Love is a conscious realization of ideality.

Now let us analyze this statement. We find, first of all, that Love is a conscious realization. Love has been crudely yet correctly termed an emotion. It is an emotion because it is sensed, realized; it is an emotion because it stimulates certain nerve centers and produces certain physiological conditions.

In the process of mental realization to physiological actuality we have involved the difference essentially between reality and actuality. Thus in some cases Love may be a conscious realization without resulting in an actual stimulus. We know we Love. Love itself naturally presupposes a realization of something; without its realization it is not possible. To love requires apperception of its realization—but realization of what? Physiologically the only condition that is actually made conscious is in a degree proportionate to the degree of realization of the element making for love.

Thus love is capable of intensity, depth and expression.

When the conscious realization of love is extreme, full, satisfying, it produces the maximum of stimulation on the nerve centers just as do joy, sorrow, fright, anger and other elements of emotion, and whereas in all other emotions an effect of exhilaration, excitement and rising spirit is felt and experienced, Love produces a calmness, peace, quieting of the nerves, an attunement with harmony which is not resultant from any other emotion.

So we say that Love is a conscious realization of

Ideality

Take the normal young man or woman in search of a mate or his or her ideal of a mate. They go out to search for their Ideal. Do they find it? No, they do not. Why? Because they allow themselves to be carried away with passion, which may be a grade of Love but can hardly be called Love.

Just fancy, the average young man tells the average girl she is his ideal woman; just fancy picks her from among all the daughters of men to be his wife; and strange to relate, he really believes it, too. She also more often than not thinks he is the greatest young man in the world, etc., and carried away by a degree of love they get married and do not live happy ever after. How sad, but how true. Well, it can all be avoided and we will show you how before you finish reading this book.

Now, we cannot go into detail here about the causes of disappointments before and after marriage. But it is a well known fact that the greater part of them could be avoided if young people understood Psychology and Psycho-analysis. Owing to this complex civilization under which we live 98 per cent of us have "complexes," if we are to believe the very greatest minds that this century has produced; so in the next chapter we will give you some very interesting facts about Sex complexes and how they can and are being overcome.

THE MASTER KEY OF LOVE

SECOND DIVISION

Complexity of Sex and Sublimation

Sigmund Freud, M. D., D. D., the father of psycho-analysis and probably the world's greatest authority on the subject of sexual suppression and perversion which influence man materially in so far as health, strength, normality and success are concerned, voiced his professional opinion thus:

"The sexual instinct, or accurately speaking, the sexual instincts (for analysis reveals that the sexual instinct consists of *many* elements, of many partial instincts) is undoubtedly more developed in man than in the majority of the higher animals; at any rate it is more constant in man for it has almost entirely outgrown the periodicity which characterizes it in animals. Owing to its peculiar capacity to change its object without losing any of its intensity it places great amounts of energy at the disposal of civilization. *That faculty to exchange the original sexual object for another object, no longer sexual but psychic in nature, is known as the faculty of sublimation.* (1)

"In contrast with the versatility of the sexual instinct wherein resides its cultural value, we observe in the sexual instinct also

a stubborn fixity which makes it impossible to transvaluate it entirely and leads to what we call abnormalities. (2)

"The original intensity of the sexual instinct must vary greatly in each individual; at any rate *the proportion of it which lends itself to the process of sublimation is extremely variable.* (3)

"We may well imagine that the person's organization determines in every individual case *what part of the sexual instinct can be sublimated and transvaluated,* and the influences of life and the intellectual influence of the psychic apparatus extends somewhat further the process of sublimation. (4)

"But the process cannot be carried on ad infinitum any more than the mechanical transformation of heat into energy. (5) The majority of human organisms seem to require a certain amount of direct sexual gratification, and the lack of that gratification, whose amount varies with every individual (6) bring forth manifestations which, on account of their functional harmfulness, and of their subjective character of unpleasantness, we must consider as pathological." (7)

1. The Art of Sublimation, which is termed the Science of Transmutation, was taught continually and successfully by the Randolphian or Redrosian school for more than fifty years previous to the

publication by Freud of his theories and experiences.

In the school mentioned, sex was considered as the dynamic energy, the potential force, underlying all successful achievements. It was, and still is maintained that the primary object of the creative power is the reproduction of the species, but aside from this, and of *greater importance to the individual*, is the employment of the potency for the Rejuvenation and Regeneration of the self-being, and inclusive of this process is the resultant health, strength, efficiency, success and final spiritualization of the *inner man*, the Soul.

Freud terms this the "faculty of sublimation," and correctly so. He is dealing with the refinement of the gross sex power, or passionate nature, into the potent energy which prevents man from falling into degrading habits—by misuse of the constructive power.

The method for the accomplishment of the power of transmutation, or Sublimation, has been the quest of the ages.

2. Instinctively all *normal* men seek to express their creative impulses in the propagation of the species. But herein is the enigma, there is a constant urge for further and other exercise. Due to the universal ignorance of any other avenues for the expression of the creative nature, except that of procreation, men either suppress or abuse the godly function. As so thoroughly pointed out by Freud—the result is *neurotic or neurasthenic* con-

ditions if the desires are suppressed; or the degradation and degeneration of body, mind and soul if unholy exercise is permitted the creative energy.

Freud was not by any means original in his theories or experiences. Centuries before the Christian era a master of men had thoroughly learned these lessons by daily, hourly and minutely watching a nation of formerly healthy men and women being decimated because of their unholy expression of the creative passion. *Moses was the greatest psycho-analyst and instructor in the Art of Sublimation known to the human race.*

3. Individuals differ greatly. Each human being is a law unto himself and must be personally, characteristically and individually considered. The Redrosian school has always done this. It has sought for the weakest link in each individual chain; the while laboring to strengthen that weakness, at the same time transmuting the greater strength into refined elements, thus establishing a state of health, strength, potency, normality, success and spiritualization—in the individual.

4. Not only is it essential to analyze the personal characteristics of the individual, it is just as necessary to determine to what degree the mind—these thoughts and desires—are governed by sex longings. If these aspirations, having their foundation in the creative nature, are below par they must be strengthened, otherwise the person is negative, inert, and a failure; *vice versa*, if there is an ungovernable inclination toward continued and unseasonable expression, the thoughts and de-

sires, through a process of sublimation, or transmutation, must be turned into other channels, such as success in the Arts, the Sciences and other esthetic labors, or into avenues leading to achievement in business or constructive enterprise.

5. Illogical and unreasonable as it may at first appear, there is actual danger in carrying the process of transmutation or spiritualization too far. Total non-physical expression is capable of inducing a mental-physical state analogous to that of degenerative practices. The only sane and normal state is that of equilibrium. Physical expression must not be entirely suppressed. Nature has an equal demand with the Divine on man.

Continual, exclusive and unceasing — therefore unreasonable—laboring to turn the creative (sex) energy into Spiritual channels frequently, nay almost always, ends in mental and physical inertia—a dangerous neurosis—more difficult to overcome than conditions resulting from libertinism.

6. The human organism must be considered as a complete unit. Its requirements, both physical and spiritual, must have the most careful, sane and logical attention. The body must be strengthened, the creative energy elevated and controlled. Only then can man be at his highest spiritual state, mental efficiency and physical strength.

7. When man (or woman) has so misused himself as to have induced functional disorders, mental inertia, creative weakness or abnormal tendencies, he becomes "a case" and is in immediate need of analytical attention. Destructive habits must be

body in ignorance, perhaps deeper than his own.

"All criminals and parasites have a feeling of inferiority and compensate in the wrong way. Instead of going to work, the burglar will take your money and perhaps kill you if you resist him. The professional beggar will disarm you with his tears.

"Other neurotics feel inferior to the task of living in this world of struggle and competition. They create an absurd world of their own in which they live. Then we call them insane. Instead of trying to be wealthy and powerful by socially acceptable means, study, work, co-operation with their fellow beings, they 'imagine' they are all those things and become violent when we contradict them.

"Every nervous disease, be it a headache, or epilepsy, or loss of memory or stammering, or absolute insanity is an asset to the diseased person. It makes him a privileged character, enables him to shirk his duties, to become a parasite on his family or the community.

"The cure (generally and in part) consists in revealing to the neurotic what he is trying unconsciously to do through his nervous ailment and then develop in him a sense of his obligations to the community. After which the neurotic will seek happiness* in less direct but more social and ethical ways."

eliminated; elevating thoughts and desires instilled; constructive practices daily pursued and normality established.

Dr. Alfred Adler of Vienna

Dr. Adler, internationally known as a physician and acknowledged as one of the world's greatest psychologists, has this to say. To quote him:

"All mental disturbances can be traced back to some 'feeling of inferiority' which compels the person suffering from it to seek easier, safer ways. There may be something the matter with our heart, our stomach, some gland, our appearance, etc.

"Like Nature herself, we constantly seek compensation. When a kidney is removed, for instance, the other kidney grows larger and does as much work as two did.

"When we feel inferior in some way, we try to gain superiority in other ways. The normal man seeks a kind of superiority, which will be good for him and others; if weak he will go to a gymnasium and develop a set of good muscles. The abnormal man, on the contrary, will compensate in the wrong, unsocial, selfish way. He is weak. Instead of becoming strong, he will try to make everybody weak or imagine that everybody is weak. He is ignorant. Instead of learning something he will try to keep every-

accepting the statement that the Soul of man—that one part of the human which is directly from the Divine, can be commercialized without destroying it.

Irrespective of the completeness of Man's knowledge of Psychological Law, if the creative function has been weakened, debased or destroyed, there can be neither mental energy nor physical strength. Without these failure is assured. In addition to these acquirements a thorough knowledge of the subject in which one desires to achieve must be attained.

As an illustration, let us state that in an investigation of more than *twenty-five hundred men and women* who had taken courses in so-called Psychology and momentarily been deluded into the belief that "mind is all potent" irrespective of physical conditions, only three actually succeeded. The rest returned to their previous state of mental inertia.

Health—Strength—Success—Immortality

Desirable as these are, they have their beginning (as the mighty river in the mountain springlet) in intellectual understanding and the strengthened, purified, exalted sex life.

Seeking all lawful attainable knowledge on the subject is therefore man's duty, and quickly returns him the greatest compensation for time, money and energy expended in the research.

The *true* physician, philosopher, scientist and psychologist, the thoroughly awakened man and

The Psychologist

The *true* Psychologist—the man and woman giving serious study to Psychological science with the sincere intention of benefiting the race, has been, like the Physician, forced to the conclusion that even with a complete fundamental knowledge of all the laws (were that possible) governing mind and soul, the application of these laws to the end of health, strength, efficiency and success is *utterly impossible* if the sex—the creative function—is weak, debased, degraded, suppressed or destroyed.

The Pseudo-Psychologist

We are well aware that America, more than any other country in the world today, is the "happy hunting ground" for a numerous brood of those who have given a superficial study to the potency of *mental vibratory forces*; that these are drawing audiences numbering thousands; inculcating superficial, though flowery, dogmatic statements, which they term "*laws of success*," and, because of their personality, are inducing their listeners to believe that if they—the hearers—will but enroll for their course, they will quickly meet with success, gather the shekels and be able to spend nine-tenths of their time on expensive vacations. As one of these empirics voices it: "Commercializing Your Subconscious Mind." Imagine it! A gullible people

* Dr. Adler unconsciously sums up the "whole law and prophets" in the one word "Happiness." Evidently, subconsciously, he admits that "happiness" is the aim and end of life.

hidden thoughts and impulses which, for lack of a better name, we call "subconsciousness," and bring to the surface facts and conditions amazing to the patient himself.

The indiscriminate and inaccurate use of the word "sex" in connection with modern psycho-analysis has, unfortunately, led to much misunderstanding and confusion on the subject. "Sex complex," in the sense in which it is employed in present day psycho-analysis, is a broad term including many different things not ordinarily identified with the word "sex." Love of home, love of family, and love of wife or husband, to quote familiar examples, might properly be described, from the standpoint of psycho-analysis, as "sex complexes."

A man goes to a physician, for example, and complains of headaches or even some more serious localized symptom. A thorough examination of the patient fails to reveal any underlying cause of the symptom complained of. Here, then, is a physical ailment without any real physical reason for its existence. It develops that the man is away from home and has had word that his wife has taken sick. He is unable to go home and has been overwrought with anxiety over his wife's illness and the welfare of the children. The worry and the anxiety have precipitated, as it were, in the form of a localized physical ailment. A clear case of physical trouble due to mental anxiety originating in a readily discernible "sex complex"—love of wife and family.

woman in whom has been born the longing to attain the highest is no longer satisfied with the husk of the knowable facts concerning procreative and recreative Laws. These demand *The Truth*, the highest, most divine knowledge obtainable.

Sex Complexes

Probably the most prominent modern investigator into mental states and their influence upon general health and well-being was Freud. Of recent years there has come prominently before the public a so-called "new" science of health and happiness called psycho-analysis and based largely upon Freud's teachings.

Freud's experiments led him to conclude that all human troubles are traceable, in the last analysis, to a sex complex in some form. In many cases—perhaps most cases—the last fundamental root-cause of the thing complained of is so obscured that it is extremely difficult to make the "last analysis." Frequently, patients themselves are not conscious of an underlying sex complex. Many times, the suggestion that such a fundamental cause may exist is indignantly dismissed as absurd—particularly by cultured women with all the instincts of delicate refinement. To such a woman, the suggestion seems to verge upon the indecent, and she will have none of it. Yet, Freud found that, even in cases where it seemed almost impossible to trace back to a sex complex, he could, with adroit searching of the patient's mind, delve deep into that vast pool of

Few cases, of course, are so obvious and so readily analyzed as this. Yet, psycho-analysis has established to the satisfaction of the foremost physicians and psychologists that in back of every case that comes to a doctor in his practice there lies a sex complex of some sort—if it can be but reached! The patient himself may be entirely unconscious of the fact that sex repression of some sort is at the root of his ailment. Nevertheless, psycho-analysts are satisfied that it is there, whether discovered or not. In the case described above, of course, the sex repression lay in the fact that the patient, by reason of his inability to go home at the time, was obliged to repress the natural urgings of his love of wife and family.

Happiness: Love

An Approach to the Personal Problem

In the working out of any personal problem—in fact, of any human problem—unquestionably the most important and at the same time the most elusive element to be reckoned with, is that intangible something peculiar to the individual which (for lack of a better name) we call the “personal equation.”

To deal with the various factors entering into the make-up of a man or woman is to deal with shifting sands. Each individual—so far as personality is concerned—is as a law unto himself or herself. In not two persons is it ever possible to

find exactly duplicated the same balance of impulses, habits, virtues, vices and lines of thought. True, we have certain common denominators of human conduct such as the law, the accepted moral code, convention and, perhaps, that somewhat vague and much abused standard of action called "common sense." Outward conformity to these norms, however, simply means that society's dictates of behavior have been followed; by no means does it imply that identical thought and stimuli have actuated those who obey.

Individuality holds sway in each and every member of the human race. Our present day highly organized civilization, operating under established customs and rules of action, forces most of us into an apparent sameness of mind and behavior—as far as all outward signs are concerned at least—while within each heart and brain there often seethe thoughts and impulses entirely at variance with the outward actions. Occasionally, these inward urges prove so strong that the fetters of law and convention are thrown off and outward expression is given to the heretofore hidden thought—ofttimes, unfortunately, to the ultimate harm and distress of the individual.

Unique as are the circumstances in each individual case, nevertheless there exists a general starting point from which consideration and solution of the personal problem may be approached. That starting point lies in the common aim or goal of all mankind: *happiness*. Every individual wants to be happy and is striving for that, one way and

another. Just as the moral, mental and physical make-up varies with each individual, so does his idea of happiness. To the guilty conscience happiness means peace of mind. To the ambitious man happiness is represented by wealth and power. To the ascetic, happiness is moral exaltation. To the scholar, happiness means knowledge. To the sick, happiness lies in recovering health.

So we see everyone has his different idea of what constitutes happiness for him. But fundamentally we all agree happiness means everything to us all.

But how few attain happiness. Men make millions in business, and lose their health mostly in doing so; is that happiness? Emphatically no. The only fun the average millionaire gets out of his millions is the getting of it. Money has been called the root of all evil. Well, it may be, but it is certainly very useful here, and no matter how angelic you may become, you will not be able to do much good without it. Money is a means to an end. A servant, not a master, and anyone who loses love or health over money is to be pitied.

Love is the Real Happiness. It does not matter much who you love or what. But we really live by Love, although we do not actually realize it. People do not commit suicide (unless mentally unbalanced) if they have someone or something to love. Many a dog has saved people from destroying themselves. So love much. Love is the Law. Love under Will.

Love and Its Power

Love can take the stars out of the sky and juggle with them. The old Jew in "The Golum" did that for the love of his people. Love is the most strong and terrible thing on earth. But it is also the most beautiful created thing, because it creates all. Without love there would be no life, because it is Life. Life incarnate. Life is life in its fullness of Love. Love is the feeling in Spirit, and Spirit is all; because if we take away the spirit, there is not life. Spirit is the essence of life everlasting. We see life or spirit in all created things. Love produces Life and Power. The miser who lives for gold will spend all for a loving woman. The genius will be full of inspiration and write, play, and sing beautiful songs for Love.

The Power of Love has driven people to commit suicide. The wise man, and the great man, are full of wisdom, but Love sometimes drives them foolish. The brave man is made weak. The coward is made strong by Love. Because Love rules the Universe. Love made darkness into Light and is God incarnate.

Love is the Law. Love under Will.

THE MASTER KEY OF LOVE

THIRD DIVISION

THE PRINCIPLES OF HARMONY

Applied to the Selection of Sexual Consorts

This division contains a clear exposition of the laws of Nature governing the selection of companions for life. It shows what temperaments are adapted to each other, and what are discordant, and the reason why. It explains the great laws of electro-magnetic affinity, the relation of the anatomical temperaments, and the laws of chemical affinity as expressed in human organization. It also gives direction for the detection of organic sexual weakness in either sex and the signs of complete manhood and womanhood. It is the design of the author to instruct every young man and woman in the principles that underlie the conditions of happiness in the marriage relation, so that no mistake will be made in the selection of a companion for life. It shows

1. *How to judge what temperament is suitable to your own.*
2. *How to test the possibility of love and enjoyment of companionship.*

3. *How to avoid those who are unfit for matrimony by disease or organic incompleteness.*

4. *How to conduct a magnetic courtship.*

5. *How to preserve the harmonies when they have been secured.*

6. *Causes and cure of jealousy.*

7. *The true philosophy of divorce, showing for what reasons and how a marriage should be terminated, and the behavior of the parties after divorce.*

Modern society has established the conventional marriage after many years of evolution. It is supposed to be an ideal state, in which the parties find great felicity; but this supposition is seldom realized in practical experience. As a matter of fact, observation justifies the belief that the great majority of marriages are positively unhappy, and it is well known that some are completely destructive of life and health. These unhappy conditions cannot be ascribed to evil actions or bad character of the parties, or of either of them, in many cases. Some of the most deplorable conditions I have ever observed have existed in marriages in which both parties possessed exalted character and were actuated by the loftiest impulses of devotion and love.

The true law of happiness may be declared in these words: THE PARTIES MUST BE ADAPTED TO EACH OTHER IN THEIR PHYSICAL ORGANIZATIONS, AND THEY MUST UNDERSTAND THE LAWS OF HARMONY AND PRACTICE HUMAN ASSOCIATION WITH THE SAME SKILL WITH WHICH MUSICIANS PRACTICE

MUSIC. *To do this successfully requires a knowledge of the elements of human character as the musician must understand his instrument. The instrument (i.e., the human characters associated), must be such as can be adjusted to harmony, and the laws of harmony must be observed in producing the music of human happiness.*

Proper Selection of Sexual Consorts and the Harmony Which Results Therefrom

First

How to Tell What Temperament Is Suitable to Your Own

The temperament of any individual is made up of a great many conditions. The seven primary conditions of temperament are called, the Electric, the Magnetic, the Motive, the Vital, the Mental, the Acid, and the Alkali. As the names indicate, the first two of these relate to the relative proportion of electric or magnetic conditions, the next three to anatomical development, and the last two to relative proportion of chemical elements. The temperament of the individual is the final proportion in which all these elements combine in his constitution, and to make a perfect affinity his consort should have a temperament in which the elements

are so blended that those which are strong in him shall have a corresponding strength of the harmonious elements in her. That is to say, electricity should be harmoniously opposed to magnetism, acid to alkali, the anatomical temperaments should be so blended as to secure harmonious relations otherwise.

It is not unusual that we find the temperamental elements uniformly distributed over the whole individual so as to make his whole body belong to the same temperament. This occurs sometimes, and in such cases the individual is adapted to a person of the opposite sex who has a corresponding temperament. But as a general rule, a careful analysis has to be made of various parts of the body to determine the temperament of each. Thus it often happens that a man will be electric in his brain and magnetic in his digestive organs, acid in the upper part of his face and alkali in the lower, motive in his legs and vital in his trunk, etc.; and in all of these cases it is true that he should have a different, but harmonious condition in his consort.

To understand my analysis of this subject, the reader must remember that electricity is always manifested by the states of gravity, respectivity, coldness, and darkness; that magnetism is always manifested by the states of vibration, radiation, heat, and light. So whenever we find any part of the body dominated by electricity, that part will always be found to be dark and cold, and if it is dominated by magnetism it will be found to be light colored and warm. In studying the tempera-

ment of the individual, I consider it first as a whole, in general appearance of the body, and then observe particularly the temperament of the skin, the digestive organs, the heart, the lungs. The relative states of electricity and magnetism of these parts of the constitution being determined, there is not much else that is likely to exert any controlling influence.

The electro-magnetic conditions of the sexual organs is indicated by the color of the organs themselves and by the color of the beard. Where electricity dominates, the organs will be dark in complexion and the beard will be dark or black, according to the intensity of the condition. Where magnetism dominates, the organs will be ruddy in color, the beard will be light brown, red or flaxen, according to the degree of magnetism. Females as a rule, develop no pronounced beards, but an inspection of the down on the upper lip and the cheeks will show what the color would be if the beard were developed. It is hardly necessary to add that the most delightful effects of sexual intercourse can only be experienced by those whose sexual organs are harmonious in temperamental adaption.

Those who are electric in the skin have a dark skin, while the magnetic skin is ruddy, in all sexual association the electro-magnetic conditions developed in the skin are important factors in the pleasures to be derived from personal contact, and persons who possess the same conditions are naturally repulsive to each other, while those who pos-

sess harmonious conditions find that personal contact is always delightful and productive of health on both sides.

The electro-magnetic conditions of the digestive organs is indicated by the color and temperature of the lips, tongue and mucus membrane lining in the mouth. Here, as in all other cases, the electric condition is indicated by dark color and cool temperature. A magnetic condition will be indicated by a bright red in the lips and tongue, while the gums and mucus lining of the mouth will be much paler than in the electric temperament. It is a great truth, not generally known, that persons possessing the magnetic condition of the digestive organs are repelled by persons having a similar condition, while those of an electric type are repelled from persons having the electric state. The most delightful effects are produced by the union of harmonious conditions here as elsewhere.

The electro-magnetic condition of the heart is indicated by the temperature of the chin and extremities. Persons who are ruddy or florid in complexion of the chin, and who have warm hands and feet, are magnetic in the heart, and possess a powerful circulation. This is one of the most important conditions of temperament, and in the selection of a consort it is imperatively necessary to select a person whose circulation is opposite to your own.

The electro-magnetic condition of the brain is indicated by the color of the hair. The darker the

color of the hair, the more electric. The lighter the color of the hair, the more magnetic the condition of the brain. It follows therefore that two persons having the same color of the hair never can be harmonious in their intellectual processes, because they possess brains which are approximately in the same electro-magnetic condition, and therefore antagonistic.

Black hair harmonizes well with all the colors above brown, including red. Brown hair, if dark, will harmonize with light brown, red, and golden. Dark red hair will harmonize with light brown, golden and flaxen. Light red hair will harmonize with dark brown and black. Light brown harmonizes with black, dark brown, and dark red.

The electro-magnetic condition of the lungs is indicated by the nostrils. Persons who have electric lungs have dark nostrils and the breath is cool. Persons who have magnetic lungs have wide and red nostrils and the breath is usually warm. The pleasure of sexual companionship is greatly enhanced by a correct condition of harmonious association in this particular.

The electro-magnetic condition of the cerebellum is indicated by the color of the eyes. The cerebellum is the seat of amateness, or sexual love, and the eyes indicate the harmonies of this passion as the hair indicates the harmonies of purely intellectual intercourse. The association of two persons having the same color of eyes is sexually antagonistic, because the cerebellum of each is in the same condition. To secure the highest expression

of sexual passion the cerebellum of one person must be electric and the other magnetic. For this reason blue eyes are harmonious with dark brown, violet with hazel, gray eyes with brown; while those persons whose eyes are mottled with a mixture of blue and brown may consort with either light blue or dark brown, being careful to select the color which is least represented in their own.

It is impossible to emphasize too greatly the importance of harmonious adaption in these particulars. Love is simply the mutual attraction existing between positive and negative forces, and the action of these forces is entirely dependent upon electro-magnetic conditions. The reason why any man loves any woman or any woman loves any man, is simply because he has magnetic conditions which correspond to her electric ones, and vice versa. The reason a hungry man loves food or an overheated one seeks shade is found in the understanding of the same great principle. Hence it follows that when one or more of these conditions are harmonious and the rest are inharmonious, there will be some gratification between the parties, but it will fall short of a complete happiness just as much as the adaption is lacking in complete obedience to the great law of electro-magnetic affinity. Thus we will suppose the case of a man and woman who are adapted to each other in everything except the color of the eyes. They may have the most delightful experiences in mere intellectual conversation; they may enjoy personal contact, kisses and caresses, and even sexual intercourse to

a great degree (if these organs are all harmonious); but they will fall short of the realization of complete harmony in sexual passion, because the cerebellum of each is in the same electro-magnetic state, and they will fail to reach the same electro-magnetic state, and they will fail to reach the highest forms of ecstatic experience. In the case of a man and a woman who are harmonious in every point except the color of the hair, there may be ecstatic sexual experience, great pleasure in personal contact and caresses, but they will be antagonistic in their habits of thought, and will not be able to afford each other mutual assistance and co-operation in purely mental occupations. While it is true that a companionship involving the loss of only one condition of adaptation might be infinitely better than none, or the results attained in the average marriage, every well organized person will concede that where complete happiness is possible of attainment, it is folly to accept anything less.

The electro-magnetic conditions are the great fundamental facts to be considered in estimating any adaptation for companionship. But the anatomical and chemical relations are important incidentals which aid us in understanding the minute details of the electro-magnetic conditions, and must never be treated with neglect. These anatomical and chemical relations of the various parts of the body enable us to determine the relative intensity of the action of the electro-magnetic forces.

Thus it may be stated, as a general rule, that the anatomical conditions indicating the vital tem-

perament in any part of the body are an evidence that that part of the body is more magnetic than electric, that the conditions indicating the Motive Temperament are an evidence that the part is more electric than magnetic, and that the conditions indicating the Mental Temperament are an evidence that magnetism is more rapidly radiated, and that the body will pass rapidly from positive to negative conditions, and vice versa.

For the foregoing reasons, therefore, we should select for a person having the Vital Temperament a companion who possesses a strong endowment of the Motive, while those persons who are deficient in Vital development are naturally associated with those who are stronger in this element. This principle should be extended to different parts of the body. It is not unusual to find a person who is vital in the form of the trunk who is nevertheless very muscular in the arms and legs. Such a person should be associated with a companion in which these conditions are reversed. And it is equally true that where there is a strong endowment of the Mental Temperament, causing a rapid expenditure of magnetism, association should be made with a person who has less of the Mental and more of the Vital and Motive, while those persons who are deficient in mental vivacity and rapidity should be associated with persons who possess a stronger endowment.

I do not wish to be misunderstood here as advocating the union of great extremes of development. I do not think that the best results are obtainable

in companionship of extremes. I do not advocate that a very fat man should consort with a living skeleton; that a man six feet tall should select a woman under five feet in height; nor that a dull stupid man should be joined to a bright vivacious woman. I do not hesitate to assert, however, that the union of such extremes, as a general rule, would be more happy than the union of persons of similar character. But in the exercise of good sense and judgment, the reader will understand that an excess in any direction is to be counteracted by a difference in the consort, which will in a harmonious degree correct the eccentricity.

The inferences to be drawn from the chemical conditions of temperament are as follows: Where the Acid Temperament exists, it indicates an excess of one of the elements of chemical equilibrium and it should be neutralized by the opposition of the other element, viz., the Alkali. Acid persons will show in their conduct, in their vivacity and quick actions, rapid thoughts, and sometimes in sharpness of temper, the corrosive action of the excessive element. Alkali persons on the other hand show by their slow and deliberate action, the absence of the acid stimulant. When these temperaments are united harmoniously, a great beneficial mutual influence results. The alkali person is excited to quicker and more effective action; the acid person is soothed and restrained. The most important effect is shown in the result of sexual intercourse and in kisses and caresses. Sexual intercourse between two persons of the Alkali Temperament is

stale, flat, and unprofitable; between two persons of the Acid Temperament it is irritating and exhausting; between persons harmoniously adapted in these particulars it is, when properly performed, exquisitely enjoyable and mutually beneficial. The same results are experienced in a minor degree in the effects of kisses and caresses. The reader who will study the doctrines set forth by me in my divisions, Nos. 3 and 4, will understand at once that it is impossible for parents possessing the same chemical conditions of temperament to produce perfect offspring or to experience the highest joys of the act of sexual intercourse.

The Acid Temperament is distinguished by convexity of feature and sharpness of angles; the Alkali Temperament by concavity of features and the absence of angles. This is true both as to the general contour of the body and the outline of each feature.

In the Acid Temperament the body is usually slender (never fat), angular in contour, and of medium weight. The face is pyriform, or oval, in general outline, convex in profile; the chin round—sometimes slightly retreating; the teeth sharp, and arranged in a convex form of jaw—sometimes projecting. The tongue is sharp and round, and the lips prominent, whether full or thin; the nose is not so sharp (generally Roman); but when the acidity is not so pronounced it may be straight. The eyebrows are prominent; cheekbones usually so; the forehead slightly retreating, and most prominent at the base.

The Alkali Temperament is distinguished by the reverse of the foregoing conditions. The body is plump, often fat, rounded in contour; weight usually heavy. The face is round in general outline and concave in profile. The chin projects forward at the base. The teeth are flat, or receding in arrangement in the jaw, causing the mouth to fall in slightly, adding to the general concavity. The tongue is broad and flat; the lips usually finely formed, but concave; the nose concave, sometimes degenerating into a pug; the cheekbones and lower part of the forehead not prominent; the forehead flat above the eyebrows, bulging at the top, usually high and wide at the top.

When the Acid and Alkali Temperaments are blended in the individual, causing some of the features to take to acid and others the alkali forms, great care should be taken to select a consort having the opposite condition of each feature. It must be constantly borne in mind that the sweetness of sexual intercourse is always in direct proportion to the intensity of the magnetic current, and that this intensity depends upon features being opposite to features in harmonious conditions throughout the entire organization. For instance, the acidity expressed in the forehead of one person could not be harmoniously set against the alkali expressed in the chin of the consort, because the forehead and chin have no sexual correspondence. Each feature expresses the condition of a department of the organization which must be harmoniously opposed by a

different condition in the same department of the character of the consort.

I am sometimes criticised by those who have only a smattering of physiological knowledge for emphasizing too much the temperamental conditions of adaption. In the light of these explanations of effect, I think, the candid reader will agree with me that it is impossible to dwell too strongly upon their importance. It is also true, that when the temperaments are harmoniously adapted the sexual organs will also be adapted, unless there is some congenital deformity which makes the character so eccentric as to place it outside of all general rules for calculation.

The temperament governs the form of the head and the relative activity of the brain organs to a great degree. It will be found by examination that persons possessing the same temperament in all particulars will agree substantially in the development of the organs of the brain and in the manifestations of character. It is a general rule that the largest and most active organs of any given brain are more magnetic in their conditions than those which are smaller and less active. To secure perfect electro-magnetic opposition, it is therefore important that persons having very active and powerful development of the brain should select companions who are less powerful and active in these departments and more active and powerful in those which are comparatively dormant in the first instance. I advise those persons who are large in love to select those who are "medium" in develop-

ment; but never advise them to select a person who is "small" in any department. There is a great difference in having an organ or group of organs medium in size and dormant in action, and therefore capable of being aroused to a great degree of enjoyment by the superior magnetism of a companion, and that condition which represents weakness and deformity. It is necessary for a man of large amative affection to select a woman of good, full, medium, or even large development; but if he is magnetic and positive in the action of this organ, she should be electric and negative, and then both will experience the highest degree of pleasure, because she will be capable of receiving his love, and he will be capable of furnishing enough to satisfy her. The same principle applies to all organs and groups of organs. A person who is strong in language, and who loves to talk, will be antagonized by one who possesses the same characteristics. On the other hand, he does not want a dumb person for a companion, but one who possesses the organ of language sufficiently large to ask questions and suggest further conversation but possessing a receptive condition which may profitably absorb the information which the first person is so ready to impart.

The careful observation of the rules of temperamental affinity which I have discussed in the preceding paragraphs, constitutes the only method by which this congenial and agreeable relationship can be established. It may be remarked that the adaptation of conditions of organic quality are gov-

erned by the same general rules, persons possessing very great strength being benefited by association with those who have relatively greater delicacy and responsiveness, etc.

How to Test the Possibility of Love and the Enjoyment of Companionship

Courtship is an institution of modern society, designed to afford the prospective candidates for matrimony an opportunity to test their affections and to become acquainted with each other's characteristics. But as the parties are usually ignorant of the first principles of character study, the process is very much like bringing an ignorant boy or girl into the presence of an exquisite musical instrument and expecting such a novice to produce harmony. The ridiculous and destructive false modesty with which nearly all persons treat the subjects of marriage and the sexual relations precludes the possibility of giving intelligent instruction in most cases.

I will also assume that the reader has selected a candidate who in physical aspect seems to realize the harmonious adaption of the temperamental conditions; also, that the family history, the education, accomplishments, and personal appearance are satisfactory, and that both parties are actuated by a sincere desire to ascertain whether a congenial condition exists. As courtship is generally conducted, no intimacy is allowed until the young man has declared his love and proposed matrimony. If the

young lady for any reason thinks he is a desirable match, she accepts him, and thereafter it is considered dishonorable to break off the match. The result is that the parties marry without any reasonable knowledge of conditions of happiness, and when the intimate association of marriage discloses their incompatibility is too late to separate without scandal and loss of social position.

I have shown how this unnatural condition of things can be avoided by the substitution of a rational system of selection. But as the plan outlined requires the co-operation of a number of persons who are well informed in relation to these topics, and as modern society does not contain the conditions of such co-operation, I shall endeavor to here set forth a modification of the plan, so that any individual may conduct his selection upon rational principles.

I may as well remark that I consider that a woman has as much right to select a man for companionship as a man has to select a woman, and that a proposition leading to the experimental stage of courtship comes with propriety from either sex. The notion that a woman must passively await the advances of a man is a relic of barbarism, and owes its origin to the passive condition of the female slaves who awaited their purchasers in the mart.

Begin your advances to a favorable acquaintance with a declaration of your admiration and respectful friendship, and a statement that you feel honored by a compact of fraternal affection. Declare

your intention of soon selecting a permanent companion, and request the privilege of intimate association and affectionate regard. Be careful, however, to state in explicit terms that you do not mean at this time to make a proposition of marriage but that you wish the opportunity to show your own excellencies and to test your feelings. If this declaration is made in diplomatic language and in a sincere manner, it is likely to be accepted, unless the person is antagonistic to you in some way, or is dominated by ideas of propriety founded upon false philosophy, or is perhaps precluded by circumstances from granting the request. When the proposal is accepted, and both parties cultivate intimacy with sincere desire to test the possibility of love, the following tests are invaluable:

1. Clasp hands, and note the harmony or inharmony of the clasp itself, and the effect of its prolongation. If the hands do not seem to fit harmoniously, and if the contact becomes unpleasant when prolonged, it is a sure sign that the dispositions will not harmonize. If the clasp is harmonious and the effect of prolonged contact continues to be agreeable it indicates that the general effect is harmonious; but there may be inharmonious conditions which this test will not reveal.

2. In every intimate association kisses and caresses will reveal the most important information, if the parties are sufficiently instructed to make the tests intelligently. As a general rule, in courtship between refined persons, the advances are

so delicate and the contact of the parties so restricted that little is learned. To be of any value as tests, caresses and kisses must be sufficiently passionate and complete to enable the parties to obtain the complete effect of the flavor of the fluid and the magnetic or electric effect of the caresses, and the parties must exercise sufficient jurisdiction over the passions to form a judgment as to the effects of both. If this instruction is fully carried out, they will find that where the adaptation is reasonably perfect, the caresses exert a highly beneficial effect, and that the kisses increase in sweetness and enjoyment is greater at each interview. If this result is not reached; if the kisses become repulsive and the caresses become wearisome, or the parties find that after complete and intimate association that love does not continually augment in intensity, the conditions of harmony are absent, and all thought of continued companionship should be dismissed; but the parties may continue to be affectionate friends as long as it is mutually agreeable. This judgment should not be formed hastily and I consider it unsafe to form a conclusion from any impression which may only be momentary. I recommend that this experiment should last at least six months unless the parties discover in a shorter time that it is positively disagreeable. In some of the best adaptations I have ever known it took some time for the best results to be established, especially in those cases where the parties were young and inexperienced, and had not learned the art of expressing the emotions

freely. Love, like everything else, is a creature of growth, and takes time to develop.

3. In walking together, keep step, and notice if it is an easy thing to do and if the gait of one is harmonious with the other. The walk is an un-failing indication of character, and it is impossible for persons to harmonize in character who experience great difficulty in keeping step or who tire each other by the walk.

4. Notice the effect of conversation. If after a long interview you experience the feeling of fatigue and you find this the usual result, the character is inharmonious with your own. Language is the principal avenue of expression, and its effects cannot be too closely watched. If the conversation inspires you, and you feel rested and instructed after each interview, or this is the general result, the indications are in favor of harmony.

5. Some nationalities are sufficiently well informed to know the desirability of previous tests of intimate association before marriage, and the custom of "bundling" among the Dutch, and similar customs among other nationalities, have their origin from a crude effort to establish a test of this kind. In the custom of "bundling" the male and female are each sewed up in sacks in such a manner that it is impossible to have sexual intercourse without rupturing the sacks, and thus being detected. In this condition they are allowed to sleep together and note the effects upon their feelings. Whatever may be the general result of such a custom, there is no question as to its value as a test. It is impossible

for two persons to sleep together a number of nights without the conscious of increased affection and desire for companionship or the entire loss of such desire. The effect of sleeping together may be summed up as follows: If the parties are not harmonious, they will in a short time exhaust their magnetism to such a degree that all mutual attraction ceases. If they are harmonious the effect will be delightful, and the desire for its continuance will increase for a number of months. Then there will be a culmination in which no great degree of increase of desire will be felt, but it will continue to be a pleasant experience. If the parties are perfectly harmonious this may continue for many years, but as a general rule the pleasure of contact will be greatly intensified if they do not continually sleep together. If they are not perfectly harmonious, the magnetism will gradually be lost, hence as very few couples are perfectly harmonious, it is a good rule to occupy separate beds, and sleep together occasionally as desire and expediency may dictate. The loss of magnetism, and the subsequent neutralizing of affection, will be slow or rapid in its progress as the parties are more or less harmonious.

The period of experimental courtship may be as long or short as the prudence and the circumstances of the parties may dictate but I suggest that six months is not unreasonably long, and I also believe that any reasonable man or woman ought to be thoroughly satisfied of the results of such a test in one year of continued intimate association. In

the meantime the matters considered in the next section are of the greatest importance.

How to Avoid Those Who Are Unfitted for Matrimony by Disease or Organic Incompleteness

It is of the utmost importance that all persons who become parents of offspring should be able to transmit to such offspring bodies unimpaired by disease. Hereditary taints of insanity, consumption, syphilis, scrofula, and similar diseases exist, and it is impossible to prevent them from being handed down to the third and fourth generation unless every person who contemplates parentage searches his own family history as well as that of the proposed consort for the evidence of these conditions. When a well defined tendency of this nature is found, there is no choice but to avoid the selection of such a person. I do not believe that persons tainted with hereditary disease should be deprived of a legitimate sexual association and the joys of congenial companionship, but I do insist that all such persons should avoid offspring. Reproduction should only be of the best.

Hereditary diseases of the types mentioned above do not always appear upon the surface, and are not easily detected. Sometimes the effect skips one generation entirely, to reappear in the next. It is a good rule to remember that a woman is more likely to inherit the conditions of her father and that a man is more likely to inherit the conditions

of his mother, and then search the family history of both accordingly. When this has been done, the conditions exhibited by the individual selected are to be closely observed.

"The following points of female beauty are nature's own advertisement of a healthy condition of the sexual system:

"1. Large limbs, indicative of strength to sustain the body during the period of pregnancy.

"2. Broad hips, indicative of a large pelvis, giving abdominal support during pregnancy, and easy delivery.

"3. A relative narrow waist, indicating freedom from suppressed menstruation, and a proper expansion of the hips.

"4. Breasts, standing out prominently, firm in texture, with large nipples, and a bright pink aureolla surrounding nipples, free from discoloration, all of which indicates a correct condition of the womb.

"5. A graceful carriage of the body, a springing, vigorous, rythmical step, a sweet breath, good teeth, clear complexion, pleasant musical voice, a well-shaped neck and back-head, red and full lips, and a well developed chin, projecting forward slightly, clear, bright, animated eyes, all are indispensable indications of good sexuality, and any departure from these peculiarities is a warning that the female is in whole or in part unsexed and

(NOTE—In a correct female figure the waist should measure, in circumference, two-fifths of the height, the hips at broadest part, nine inches more.)

should be avoided in selecting a companion for matrimony."

The points enumerated in the last paragraph apply equally well to estimating the sexual strength of the male, with the addition of broad shoulders, deep chest and a contour of body broadest at the shoulders and tapering toward the feet.

What is here stated as indicative of a healthy condition of the sexual system applies with equal force to the general health of the whole body. I will here add certain indications of inherited weaknesses which the reader may find very valuable.

Inherited weakness of the heart is indicated by a narrow and receding chin, and a general unsteadiness of the walk and movements of the body and a lack of a graceful correlation of these movements.

Constitutional weakness of the stomach and digestive organs is indicated by sunken cheeks and a general narrowness of the face across the lower part in a line with the mouth.

Weakness of the lungs is indicated by narrowness of the face at the cheekbones, and if this is complicated with the weakness of the digestive organs just noted it is a pretty sure sign of consumptive diathesis. This will be emphasized if the chest is narrow and contracted and the nostrils are narrow, and small in size.

Organic incompleteness is, in my opinion, the most fruitful cause of sexual misery, next to wholesale ignorance, of which it is the legitimate offspring. By organic incompleteness, I mean a

rudimentary condition of the sexual organs of the body, of the sexual organs of the brain, or both. The sexual organs of the body are the penis and the testes, and those organs intimately associated with them in the function of reproduction. It is also evidenced by a general completeness of the face, especially of the lower part of it, and by a full, round chin. When these organs are small and incomplete it is evidenced by a deficient chin, and deficiency of the backhead and neck, which is very noticeable to anyone who has paid any attention to observing human characteristics.

Some persons have only rudimentary sexual organs of the body. It is quite common for females who have never menstruated, and who have only rudimentary sexual organs, to marry, through the universal ignorance which exists on this subject. Of course, such persons are incapable of sexual desire or intercourse in any form, and yet they are frequently selected as wives by ignorant men. The consequences are deplorable in the extreme, often resulting in the most frightful personal injury by attempting intercourse where it is manifestly impossible. This rudimentary condition results from arrested development, caused by paralysis of the organs in infancy. The same condition exists in the case of many men, whose sexual organs have never developed, owing to paralysis, neglect or disease. Such men are incapable of correct intercourse, or of satisfying the desires of any normally organized woman, and it is a truth that persons of either sex afflicted in this way can never

expect anything in marriage but disappointment, unhappiness and personal injury.

Where there is organic incompleteness of the sexual organs of the body it is always evidenced by a deficient development of the organs of love in the brain and by a deficient chin, and also by a deranged condition of the circulation evidenced by clammy cold hands and feet. The eyes are dull or glassy in expression, and the mouth is always repulsive in appearance.

A keen observer of human nature once remarked to me, "It is a safe rule never to fall in love with a woman, unless you can love her mouth." I replied, "The rule applies to both sexes."

It is a curious fact that the organs of love in the brain may be so deficient that the individual may be utterly incapable of affection, and yet he may be sufficiently intellectual to learn to repeat the most ardent expressions of love in written or spoken language. It does not therefore follow that because a person is able to breathe the language of passion that he is able to experience it. And it does not even follow that he is insincere, for under the impulse of the weakest scintillation of love, he may make the most ardent expressions and sincerely believe that he means all he says, when he is simply repeating what he has learned in a literary way as the proper thing to say on such an occasion.

The trained observer of human nature would never be deceived, however, as he would be able to estimate, before a word was spoken, what the possibilities of the person would be in the ex-

perience of a natural passion. And those who have trained the sense of taste to discriminate in the flavor of kisses would not be deceived, because persons who are afflicted with organic incompleteness are incapable of giving a kiss which is sweetened by love.

Right here I wish to say, that the reason a kiss from a loved and loving human is sweeter than a similar caress received from an animal is because the human being is organically more complete. A kiss from a reptile would be so destitute of flavor that it would not be desirable to any well organized person, even if he were friendly to the reptile, as all persons should be. A kiss from a dog would be several degrees better, and I have seen some ladies kiss and fondle their dogs with evident relish, although I could not but criticise their taste as long as reasonably decent manhood was obtainable.

The more complete the manhood or womanhood of a person, the sweeter and richer will be the flavor of a kiss. It is this fact which gives to the kiss its great value as a test, and those persons who are afflicted with organic incompleteness will give kisses which are as destitute of flavor as those of the lower animals. A superbly sexed woman remarked to me once, in speaking of an incomplete man, "I would as soon kiss a toad!" There was more philosophy than contempt in the remark.

How to Conduct a Magnetic Courtship

Assuming that the reader has made a successful selection, according to the principles announced in

the foregoing sections, and that he is himself a complete specimen of manhood, the following suggestions will be useful. I direct my remarks to the man for conventional reasons, but there is no difference in the application of the principles in the case of the woman:

First of all, remember that in order to make the proper impression both parties must be well informed on these topics, else you are likely to waste all of your magnetism where it is not appreciated. When a lady and gentleman know the facts, and they test each other intelligently, great profit results from the mutual respect called out by the display of each other's powers. The following rules will enable the reader to make all necessary tests:

1. Study carefully the strong and weak points of the proposed consort, and remember that all strong organs manifest themselves by positive action, and that this action gives the greatest enjoyment to their possessor. Now, when you want to make a fine impression, call these organs into action, and let them have a full expression. The person thus experimented upon will enjoy your company exceedingly and think you have given her an opportunity to display her powers.

One of the most popular women I ever knew explained the secret of her power to me in these words: "I always find out what the person I am conversing with likes to talk about the most, and then ask questions on the subject." On the other hand, the most insufferable bore is the man who

insists on talking about his own affairs or the subjects he alone is interested in.

2. When dealing with a receptive and attentive listener who encourages you with questions, let yourself out, and be as entertaining as possible. But be sure you know something to say.

3. When you see that your associate is excited, vivacious and anxious to talk, become negative at once and receptive and show a lively sympathetic interest.

4. Never talk for the sake of talking and keeping up the conversation. If you have nothing to say, keep quiet. It is a sublime test of congeniality for two persons to be in each other's company for half an hour and be able to be happy without talking.

5. Never giggle. It is the most exhaustive action young people are guilty of. A great many young men and women think it is necessary to giggle at everything a friend of the other sex says. This strained effort exhausts magnetism of your brain, and leaves you powerless to say anything really bright. When a bright remark is made, smile serenely or come back in repartee brilliantly, if you can. If it is very funny, laugh heartily.

6. In exchanging kisses and caresses, have an understanding which shall be positive and which negative. Change the conditions as frequently as you please, but do not oppose positive to positive, or negative to negative. While one is declaring his passion and pouring out his love in a positive

carress, the other should be sweetly receptive, but express appreciation; and when the first has exhausted his strain, and become in turn negative, it may be returned with a full measure.

7. The most important fact is to closely observe the proposed consort, and see if she is capable of receiving your love and appreciating it. There is the same difference in capacity in persons as to love that there is among teacups and barrels as to liquids. Some delicate and undersized capacities are overwhelmed, surfeited, and disgusted by the expressions of those of larger and perhaps coarser organizations, while these in turn are starved by the inability of their consorts to give them the full, rich expressions for which they crave. Measure the capacity carefully, but do not overtax it at first. Many a woman has been disgusted by the extreme passion of a man, who would have responded fully to it if she had been given time to comprehend it. It is a fine art—to know just how much passion to express so as to fill the measure of happiness, but not to overflow and surfeit it. Sexual passion is like the appetite for food, or any other appetite. It is attractive while it is hungry; it revels in satisfaction; but it is repulsive when surfeited. Love your sweetheart passionately and devotedly, but do not overdo it. Keep your dignity. Give kisses and caresses freely where they are gratefully received, but be on your guard and quit at the right time. Go home before midnight, and leave her in a condition in which she will welcome your next visit.

How to Preserve the Harmonies When They Have Been Secured

1. Remember that the present form of marriage ceremony is absurd, and that because a woman has promised to love and honor you, it does not follow that she can do it, even if she tries. You must be lovable and honorable in your conduct, and, in the words of the new marriage ceremony given in "Love and Cherish," **PRESENT YOURSELF TO HER DAILY IN THE MOST LOVABLE AND COMPANIONABLE ASPECT OF WHICH YOU ARE CAPABLE.** This rule, conscientiously applied on both sides, will pretty nearly solve the problem.

2. Do not remain constantly in each other's society. The electro-magnetic conditions will neutralize in spite of all you may feel to the contrary. Be together enough to have a delightful companionship, get all the enjoyment and satisfaction there is in it; but do not withdraw from the society of other good men and women. By going into society you exchange magnetism with others, and come back to each other constantly renewed. It is the hardest thing in the world to teach the average married man and woman that the reason they have become stale and flat to each other is because they have been too much together; and have not renewed their electro-magnetic conditions by coming in contact with others of the other sex. It is the prevailing habit even in

social gatherings for the married men to get together and the married women to flock by themselves. This form of social intercourse is better than nothing, but married women need the companionship, conversation and social contact of *other men than their husbands, and married men need the contact of good women in the same way.* Of course all the prudes will throw up their hands in holy horror at this last sentence, but I am writing scientific truth, not caring at all for your criticism.

3. In applying the foregoing rule, do not slight your consort. Have a distinct understanding when and where you shall indulge in association with others, and at such a time if it happens that you come in contact with your consort, show the most distinguished consideration.

4. In your intimate social contact never forget the proprieties. I really think most married couples lose more on this point than any other. In matters of the toilet and at all times when you appear at a disadvantage preserve the strictest privacy. I know a great many good but ignorant people who think that any indecency is permissible between persons who are married. The present form of marriage undoubtedly educates people to forget all the decencies as soon as the contract is made. But love cannot exist except under constant culture, and wretched are they who forget this rule.

5. Sleep in separate beds and only sleep together on occasions of special indulgence. Make the general rule of your sexual intercourse kisses,

and caresses correspond to the facts set forth in the fourth section of this instruction, and let your entire association be a magnetic courtship, never carried to a surfeit, never characterized by the indulgence of lust, but always a feast of unselfish, considerate love.

Causes and Cure for Jealousy

Jealousy is the legitimate child of the modern form of marriage, in which the man and wife are educated to believe that each is the *property* of the other. A great many men and women are naturally selfish and suspicious. The selfish idea dominates, and when a selfish individual purchases a desirable consort in the matrimonial market he naturally wishes to deprive all others of the pleasures she may be able to bestow. The man or woman who submits to the selfish dictation of such a consort is a coward and a slave and sacrifices all happiness and self-respect as cowards and slaves generally do.

When the association of the consorts is entirely exclusive, as it usually is in marriage, and sexual intercourse is indulged in an extent which creates a surfeit, a species of insanity is developed and the individual is guilty of absurd and insufferable actions. He treats his consort with suspicion, and acts as if he believed she were a prostitute, ready to make an appointment with the first man she meets. Bear in mind that all my remarks on these subjects apply equally to both sexes. Jealousy of this kind usually happens where the victim (the

jealous person) is inflicted with an inferior organization. I pity the man or woman who is obliged to live with such a consort. Life is too short to spend it with lunatics or barbarians.

The cure for jealousy, where it is not caused by insanity as above stated, is the enforcement of the doctrine that all men and women are free, and that no one is entitled to love unless he can win it by good behavior and genuine loveliness. No man or woman should be required to love another one moment after that person has become hateful. As soon as this doctrine is accepted jealousy will disappear, because it is in itself disagreeable and prevents love. As long as disagreeable persons can claim love as a right granted by law, and not to be deserved by good action, jealousy will be a popular pastime among inferior, selfish and suspicious men and women.

The True Philosophy of Divorce

I will not here enter into an argument, but will simply state the proposition.

The only reasons why a man and woman should ever join in a compact of marriage are these:

1. Their mutual gratification of love and enjoyable companionship.
2. The production of offspring.
3. Mutual support of themselves and offspring.

If the union has become insupportable to either part mutual gratification of love and enjoyable companionship has disappeared, and the first of these objects is a failure.

If perfect love and mutual gratification is destroyed the production of good offspring is impossible and the production of depraved offspring is assured, and the union should be dissolved in the interests of humanity as well as of the parties.

When the parties have become antagonized mutual support of themselves is in a large measure destroyed, their improvement and progress is arrested, and their offspring already in existence neglected. But consideration of future offspring should overbalance consideration of those already existing, as it is better for a well organized child to suffer neglect than for one to be born of an unhappy union foreordained to suffer all his life the ills of an unnatural condition of organization.

I do not advocate the capricious rupture of the domestic relations for trivial pretences, but I hold that every man and woman is the final judge of the question of his or her relationship, and should not suffer a disagreeable condition or to appeal to the courts for a remedy. And I hold further, that the knowledge that either party is free to rupture the union puts the other party on his good behavior to maintain and preserve it. Most of the tyrannical and disagreeable actions of husbands and wives which produce the misery of matrimony grow out of the inability of the other party to escape.

When this philosophy is recognized, and sexual associations is placed upon the plane of love, instead of being as now a commercial commodity, happiness will be possible, and education will make

it a certainty; and when a matrimonial mistake is committed, the parties will be permitted to rectify it, and after a divorce is granted, they may remain good friends, promoting each other's welfare by every means in their power, instead of degenerating into hateful enemies as is usually the case under the present system.

The careful observation of the rules contained in this instruction will reduce the possibility of divorce to a minimum, because under the conditions herein directed to be produced, the constant growth of love will be a fact.

Beloved reader, you may be able to comprehend it, and so live that you will be worthy of a beautiful and harmonious consort, the sweetest and best of all of Nature's gifts to man. And when you have thrilled with the transports of the indescribable ecstasies of a correct sexual association, and have prolonged the harmonies through many years of delicious experiences, as a consequence of this instruction, you will have realized the hopes and experienced the joys of life.

THE MASTER KEY OF LOVE

FOURTH DIVISION

The Embarrassments of Wedlock and Their Removal

Conditions Essential to Perfect Happiness

If reproduction is the highest privilege of mankind, as it surely is, then certainly as much attention should be paid to the intelligent study of the act of reproduction as to any subject within the intelligent grasp of mankind. The instructions herein given are based upon the following cardinal propositions:

That the perfection of offspring is always in exact proportion to the pleasure experienced by the parent in producing them.

The act of copulation is designed not only for reproduction of offspring, but also for the fortification and reproduction of the powers of the participants.

Following this line of argument I wish to show:

The conditions essential to perfect production.

The conditions essential to the highest development of enjoyment.

The evils attendant upon excessive, unnatural and immoral use of the sexual functions.

The benefits derived from the correct use of these powers in the perfection of offspring, the enjoyment of sexual relations, and the development of self-control.

There is no more fruitful source of human misery than an improper sexual intercourse. There is no pleasure so ecstatic as that which accompanies the creative act, when surrounded by proper conditions.

Nothing is so conducive to health, happiness, longevity, and prosperity as a proper sexual condition and association with a companion of the opposite sex who is the sexual affinity.

These postulates are accepted by the entire scientific world.

Read and ponder, all who seek enjoyment; beauty, virtue, love, offspring, health and prosperity, and if you can bring one single, natural fact to militate against the principles herein propounded, do so and let me know.

The Conditions Essential to the Perfect Development of Sexual Harmony

Nature has ordained that the best possible conditions of reproduction should be attendant with the highest possible degree of pleasure. It is therefore true that by learning to enjoy sexual intercourse fully, man is doubly rewarded by ex-

perienicing the escstatic emotions and at the same time insuring the perfection of his offspring.

The male and female must be mature and of appropriate age, and of the same race.

Mature age in the male is usually reached at twenty-five, and in the female at twenty, within the meaning of this article. As a general rule an appropriate age between the parties consists in the male being from three to five years older than the female. This rule will vary much according to the constitution and habits of the parties, and the influence of climate, but for the best results should not be more than ten years and the female should always be the younger. Intercourse between different races is always degrading and if offspring results, it will be inferior to either parent.

The parties must be free from disease.

In proportion as either party is diseased, the pleasure of sexual intercourse and perfection of offspring will be impaired. Diseases of the sexual organs are always destructive of enjoyment, and take away the reciprocal pleasure which is a paramount condition of sexual happiness.

The Parties Must Be Adapted to Each Other in Relation to the Size and Proportions of the Organs of Reproduction and in Sexual Magnetism or the Mutual Attraction and Repulsion Which Exists Between Certain Temperaments of the Species.

The parties must be adapted in sexual magnetism. This sexual magnetism exists in all persons to a greater or less degree, and it attracts or

repels according as the conditions of temperament and mental calibre are favorable or unfavorable to the production of perfect offspring.

The Act Must Be Entirely Voluntary on Both Sides, and the Enjoyment Must Be Reciprocal.

Sexual intercourse must be voluntary, and must be entered into by both parties with the liveliest anticipations of pleasure on both sides, and a sympathetic desire to confer pleasure. This explains why intercourse between parties who have married for financial or social reasons merely, is attended with such dire consequences. Where it is merely a commercial transaction, as with a prostitute, who does not manifest attachment and pleasure, it is simply double masturbation. Wives who simply submit passively to their husbands, and from prudery or other motives, refuse to enter fully into the spirit and passion of intercourse, are guilty of a crime against nature, and reap their reward in unfaithful husbands, sometimes brutal treatment, and always in the loss of the greatest pleasure in existence, and produce inferior offspring, if any.

The Act Should Be Performed at a Time When Vitality and Sexual Magnetism are at the Highest Degree.

In a perfect sexual interview, vitality and magnetism must be at their highest degree. This prohibits intercourse whenever disease or temporary

injury has reduced vitality, whenever the system is strained and tired from exhaustive labor, whenever the mind is wrought upon by excitement, grief, or anxiety, or any other condition which would interfere with enjoyment.

Sexual Intercourse Should Always Be a Prolonged Enjoyment and Should Always Be Performed Under Circumstances Which Involve a Perfect Security, Happy Frame of Mind, Freedom From Apprehension of Any Unpleasant Consequences, Complete Comfort, and Which Allow Plenty of Time for Its Commencement and Completion, According To The Rule Herein Set Forth.

It is a fact that more than seventy-five per cent of men are unable to properly prolong the sexual act. It is an almost universal experience, that as soon as the sexual organs are brought into contact, the emission of semen occurs, and the female is left unsatisfied. If the male is unusually strong in sexual power, he is able in a short time to produce another erection and emission, but these repeated orgasms are always injurious and unnatural. Where the male is unable to do this the female being left in an excited and unsatisfied condition, experiences the most painful disappointment, and diseases of serious nature are engendered.

The only correct intercourse is that in which both parties reach the form of satisfaction desired. To be able to produce this is an accomplishment worthy of the most patient and conscientious effort to ob-

tain. I have been repeatedly consulted by men who believe that the inability to retain the semen and to have a satisfactory intercourse was the result of disease, "lost manhood," and a great many men believe it to be the natural condition and hence never take any pains to overcome it. Personal experience and the years of observation, practice, and instruction have convinced me that all of those views are erroneous. While it is true that debility of the sexual system might be attended with this result, I have found hundreds of men who were in excellent health in every way, who are unable to control the orgasm for any length of time until instructed, when the difficulty immediately disappeared. In the majority of cases this embarrassment arises entirely from ignorance. This ignorance will be removed by the contemplation of the following facts:

The sexual organs are organs of sense. As an eye senses light, so the sexual organs sense gender. The delightful sensations of the act of sexual intercourse are simply the intense impression of the sexual magnetism received from the companion. Where the companion is not well-sexed and very little magnetism is given or received, the sensations are very tame. The sexual organ of the male is strictly analogous to the eye in construction. The parts of the female are strictly adapted to those of the male. Those sexual eyes receive and transmit the gender of the companion in precisely the same way that the eye receives and transmits the impression of the light of an image, and it follows

that the sexual organs are subject to the same conditions as those which govern the eyes.

If you were to treat your eyes the same as the average man treats his sexual organs, you would be blind in less than a week. Imagine the eyes covered with hot, sweaty flannel, bandaged from contact with air and light, seldom bathed, and the circulation of all the surrounding parts impaired, and you can imagine that, after a few days of such treatment, they would be in such a condition that, if exposed to the light and required to perform their duty, they would be utterly unable to respond. In such a case precisely the same results would happen to the eyes that occur to these sexual organs. The eyes would be dazzled by the light, the person would be unable to control the vision, and there would be a spasm of nervous action entirely beyond the control of the owner. This is precisely what occurs to the owner of sexual organs which have been kept in the usual condition, swaddled in a roll of flannel or cotton with the circulation impaired by tight-fitting clothing, deprived of light and air, and frequently in a condition of filth which only those who make professional examinations can fully appreciate. It is proper to add here that the almost universal sentiment, that the sexual organs are dishonorable, and to be held in contempt, and that there is something inherently nasty about them, has in a large measure caused this condition. Convince a man that a part of his body is naturally filthy and he will allow it to become so in fact.

The loss of pride in sexual strength which this doctrine has inculcated is almost incredible.

It is also true that the majority of men are habitually constipated. In nearly every case there is an habitual accumulation of foecal matter in the rectum, which presses against the delicate nerves and blood vessels of the sexual organs and produces a temporary paralysis, which sometimes becomes permanent.

While this constipated condition lasts it is impossible for any man to properly control the sexual organs. When the bowels are open and free from accumulations, the sexual nerves perform their functions, self-control is possible, and greater pleasure is sure to be experienced. There is also greater room for the accumulation of semen, as the seminal reservoirs are directly between the bladder and the rectum.

From the foregoing facts I have reduced the following propositions, which furnish a solution of the problems before us:

First, get into proper condition. Second, remove the constipation. Third, practice the art of self-control.

To get into proper condition it is necessary to remember that nudity is the natural condition of man and that the wearing of clothing is an unnatural habit, contracted through the excursions of our ancestors into those climates to which they were not accustomed, through their greed of acquisition of territory and conquest. While custom compels us to retain the practice we can in a

measure counteract its effects. Practice carefully the following rules:

1. Expose the body to sunlight, air, and friction as much as possible. Bathe frequently and practice alternate shocks of cold and heat in bathing. Be sure that the sexual organs have plenty of exposure, friction, heat, cold, light and sunshine. Bathe the sexual organs at least twice a day in cold water and see that all sebaceous matter is removed from under the foreskin.

2. Wear loose clothes and see that the sexual organs are suspended on their own muscles and not supported by the pantaloons or swaddled in rolls of underclothing. Let them hang loose and receive the friction of the clothing in walking. Wear as light clothing as can be worn with safety and comfort, especially in summer, and have the shirt so short that it does not cover the sexual organs. Let the pantalons hang low and be careful that no article of clothing is worn that will in any way impair free circulation. Sleep under light bed-clothing and accustom the body to exposure.

3. Those who are in any way debilitated from the effects of self-abuse or inherent weakness should never resort to the ignorant methods of quacks and attempt to restore vitality by the use of pernicious drugs. The best remedial treatment possible to bring permanent and lasting results will be found elsewhere in this work.

To remove constipation do not take pills, but use exercise and massage, which will be explained more

fully elsewhere in this work. Always empty the bowels and bladder at frequent intervals, which will give you greater freedom and thus enable you to prolong the act of intercourse and greatly increase the possibilities of pleasure.

To reach perfect control of the sexual act some special drill is often necessary. It is true here as elsewhere that practice makes perfect. Very few men ever approach the act of sexual intercourse except in a blaze of passion which makes any form of deliberate action impossible. To all such persons I commend the following rules:

1. Keep cool. Do not be a fool, and do not disgust the female by your evident desire to satisfy your passion at her expense, without considering her enjoyment. Be deliberate in all your actions and do not be in a hurry.

2. Spend *at least* fifteen minutes in caressing endearments before you begin intercourse. This will enable you to compose your nerves and to obtain greater control and will allow the lubricating fluids which are secreted in both sides to begin to flow. If the female does not furnish a copious flow in this length of time, which will sometimes be the case, anoint the penis thoroughly with vaseline or sweet oil, especially under the foreskin.

3. Begin intercourse by making up your mind that you will control yourself and that you will not emit the semen until you get ready to do so voluntarily. Resolution is a great aid to the accomplishment. Press the penis gently but firmly into the

vagina, being careful not to be rough or impetuous. After the entrance is effected and the penis has passed the constriction of the lips there is less danger of losing control. If you feel doubtful of your self-control, withdraw, lie down and cool your nerves until you feel that the tendency toward the emission has been overcome, then repeat the process. The entrance and withdrawal of the penis should be practiced until you can do it with perfect impunity, and if you fail at first and have an emission, do not be discouraged. Keep up the practice, and every attempt will increase your power of self-control, until at last you will be able to enter and remove as freely as you desire without losing control. When you reach this stage, you are a master of the situation.

The exchange of sexual magnetism is the prime factor of all pleasure, the creative force which begets all offspring, and in proportion as it is intense or weak will sex pleasure be intensified or destroyed, and offspring perfected or deteriorated. In view of these facts, the value of other principles herein shown which describe the adaptability to produce the most force of this magnetic element may be appreciated.

A period of preparation, before intercourse begins, is absolutely necessary to the generation of this magnetic fluid. It is most easily excited by the contact of these parts which are best supplied with nerves of sensation. The sexual organs themselves, the hands, the eyes, the breast of the female, the testicles of the male, the lips and tongue, are

all filled with nerves, all connected with the organs of love in the brain, and from this fact we see the philosophy of kissing, loving glances, clasping hands, manipulations of the breasts and sexual organs, as well as other parts of the body, all of which are necessary preludes to this intercourse, and should be indulged in freely and reciprocally for at least a half hour, or any limited time, to bring about proper magnetic conditions, before the act of coition.

The neglect of this preliminary exercise is a frequent cause of premature emission in healthy males who copulate with properly adapted females, because the magnetic influence has not been allowed to generate. Nature abhors an intercourse without this magnetic element and sets her seal of disapproval upon it and endeavors to prevent the creation of offspring, who are sure to be inferior without it, by causing the male to throw off the semen before the female reaches the climax whenever intercourse is attempted without this preparation or by parties sexually related, between whom there can be no intense magnetic exchange. Every healthy female reaches the climax slowly in order to give time for the magnetic generation. When the magnetic exchange is at its height the male should have perfect control of himself and may postpone the climax until the female is fully ready. The female, likewise, should have control of the sexual emotions completely. And thus the act may be prolonged at pleasure and may be terminated by a mutual climax when both parties have been fed

to satisfaction by the mutual and reciprocal exchange of sexual magnetism, which should never be less than one-half hour after entrance, and may be prolonged to one or two hours with no worse effect than the ecstatic gratification of both.

Positions, manipulations, and caresses are important factors in proper intercourse. Ignorance of these details is the most frequent cause of unhappy results between parties mutually adapted. The recumbent position of the female with the weight of the male upon her is fatiguing and cannot be maintained for the time necessary for proper intercourse. It also prevents her having the free use of herself necessary for the proper movement for the act. She should lie upon her back at first, spreading the limbs well apart, and presenting the vulva to the free access of the male. Many wives fail in this and from prudery and other motives keep the limbs close, which delays entrance and disappoints the male to whom nothing is more delightful than a free entrance. When entrance has been well effected the male should ease himself over and recline upon his back or left side upon the bed with his face toward her, lifting his right leg and carrying it over with her left leg. At the same time she turns slightly upon her right side and clasps her limbs closely around his left leg. This positions may be maintained without fatigue to either, or may be reversed by changing sides. The parts are thus brought more closely together and, what is more important, the testicles are lifted from contact with the cold sheet and

clasped in this warm embrace of the limbs when, at every moment, warm, strong pressure is brought to bear upon offspring, who are sure to be inferior without it, by causing the magnetism redoubled. If the testicles are suffered to come in contact with a cold substance, or if they are not pressed continually, the male magnetism is checked and his pleasure is lost.

The left hand of the male should clasp the neck of the female under the organ of amateness, which will be greatly excited thereby, while his right hand should continually caress her face, hair, breast, etc. Endearing words and lively conversation, laughter, etc., should be freely used, and the eyes should be employed in endearing glances, each feasting on the personal charms of the other, hence intercourse should best not be indulged in the dark, or under any circumstances not permitting the utmost freedom of proper expression.

Most men ruin the pleasure of intercourse by violent strokes and movements in the first stages. For some time after entrance the movements should be slow and gentle, and should be more dependent upon the movements of hearty caressing than used to excite the penis and vagina.

Caresses are indispensable and should be constantly employed during the entire duration of the intercourse. Kisses should be freely exchanged with the perfect abandon of passion. The lips and tongue are furnished with innumerable and most susceptible nerves which when brought in contact

produce the most exquisite sensation. The fluids of the mouth are far superior to the most delightful nectar when tasted under the circumstances of perfect sexual intercourse. To render it so, and to make this perfect intercourse absolutely delightful, involves, of course, habits of scrupulous cleanliness in respect to the mouth and teeth, as well as attention to proper food, digestion, and the condition of the stomach. This rule of cleanliness, of course, applies to all parts of the body. Any neglect in these particulars may cause disgust on the part of the companion, and, however temporary, is destructive of enjoyment.

Frequency of sexual intercourse should be regulated by the feeling of the parties and may be readily determined after a few trials. It should never be indulged in to such an extent that the parties lose the peculiar feeling of exaltation and exuberance which always results from a proper intercourse. *Sexual intercourse may be terminated without the climax and on either side, with the happiest results to both, provided the act has been properly performed, so that each has been fully fed with sexual magnetism.* The Actual climax will be found to be only a small part of the pleasure of such an inaeview as this instruction contemplates. *The retention of the semen is highly beneficial to the male,* provided it is not effected by artificial compression of the natural channels of egress. And furthermore, any excess in the loss of this semen is detrimental and often brings about a feeling of disgust toward the person on whom it is wasted.

THE MASTER KEY OF LOVE

FIFTH DIVISION

The Evils Attendant Upon Excessive, Unnatural, and Immoral Use of the Sexual Functions

For lack of instruction upon the principles enunciated in the preceding section, the greatest abuses of the sexual organs have occurred and have gone on for centuries without any intelligent effort being made to correct them. As a consequence, the human race has deteriorated and man has been made a slave of his passions. It is impossible to enumerate all of the evils, but the following have impressed themselves upon the author as being the most deplorable and at the same time, most easily corrected in the light of intelligent instruction:

Excessive Sexual Intercourse. Men and women who do not get a satisfactory experience in sexual joys do not experience a satisfaction of the passion. It is impossible for the average man to have correct intercourse, as has already been said, he does not know how. Consequently he indulges to a ruinous extent and thus produces an irritated and inflamed condition of the sexual organs which goads him on to still greater excesses. As a consequence, the majority of men are much more fitted for a hospital than for the marriage bed, and their wives are compelled to submit to an inordinate demand for sexual gratification, which produces a fearful train of female diseases, besides impairing the functions of maternity and rendering the woman, depraved, and

maternity and rendering the woman unfit for motherhood. There are hundreds of weak, depraved, and deformed children, caused by these sexual excesses of the parents. The excessive indulgence weakens the organs at last to such a degree that a natural and satisfactory enjoyment is impossible.

The Benefits Derived from the Correct Use of These Powers and the Development of Perfect Self-Control

The greatest benefit conferred by this instruction will be realized in the perfection of offspring. As before stated, Nature has ordained that the conditions which produce the greatest pleasure to the participants in sexual intercourse results in the highest perfection of offspring. But when he refuses he reaps most condign punishment, not only in the loss of his pleasure, but in the actual destruction of his powers. The prolongation of the act as herein described enables him to arouse and employ during that act of sexual intercourse every organ of his brain and every expression of his powers, if he has intelligence enough to do so. When he does this he transmits these powers to his offspring, and the child comes into the world with a splendid inheritance of intelligence and happiness. So absolute is this fact true that I will undertake to describe to any individual not only which parent he resembles, but what the condition of that parent was at the time of his conception, and which parent enjoyed the greatest amount of pleasure in the act of intercourse in which he was conceived. The

reason is that the person who enjoys complete pleasure produces offspring with complete heads, while those who destroy the pleasure of intercourse by improper conditions in the same ratio destroy the completeness of the offspring resulting from such intercourse.

For it goes without saying that the pleasure of intercourse will be greatly increased by the careful obedience of these instructions. But very few persons realize the actual amount of pleasure that can be experienced. In other departments of human effort the pleasure derived from correct actions are publicly enjoyed and all persons are inspired to emulate a similar experience, but in sexual relations all this is changed, and those persons who do experience pleasure are deterred from giving their experience publicly by the sense of shame by which this whole subject is enshrouded.

It has been demonstrated through experience that the brain organs have been developed and enlarged and actual increase of power becomes noticeable under the conditions and the stimulus of sexual activity, and it is within the power of any man who wishes to adhere to the instructions herein given to generate greater power physically and mentally than that of which he has heretofore conceived.

Perfect Offspring
How They May Be Created, and the
Regulation of Sex

The highest consideration for the welfare of the human race, the comfort and safety of individuals,

and the protection of families from privation and want, demand that the conditions which surround pregnancy should be better understood. Science has demonstrated that the production of idiots, deformed, depraved and diseased offspring are the result of ignorance of parents of the great physiological facts surrounding the beginning of the new life.

To furnish parents the knowledge by which they can have the kind of offspring desired, to make the production of superb offspring a possibility, to reduce the number of paupers, idiots, criminals, cowards, and invalids in the next generation, to increase the pleasure and benefit the sexual strength of its favored readers is the object of this work.

In order to understand the theory of conception and pregnancy it is necessary to explain a portion of the anatomy of the female. The womb is a small, hollow, pear-shaped organ, forming the vehicle in which conception takes place and the child is carried. The ovaries are two small sacs in which the life germ originates in the form of an *ovum*, or egg. The ovum at maturity is itself no larger than a pinhead, but is surrounded by a protecting envelope resembling a clot of phlegm or mucus, slightly discolored and fringed and making the whole about the size of a pea. In a healthy female at regular periods of about twenty-eight days, one of the ovi, or eggs, matures and passes through a tube connecting the ovary with the womb into which it is discharged and where it remains during a period varying in different females from

an immediate discharge to fifteen days. If, during the period while the ovum remains in the womb, the semen of the male is brought in contact with the ovum, which is the natural result of coition, at such time, the ovum is *impregnated*, and immediately attaches itself to the walls of the womb and begins to grow and gradually assumes the form of an infant.

The expulsion of the ovum from the ovary and its passage from the womb is attended (in a healthy female) with a slight discharge of discolored mucus from the vagina, a small quantity of blood, and general feeling of lassitude (bearing-down pains), etc., which should not last more than three days. This is the process of menstruation and at the period of three days and the cessation of the symptoms, the ovum should be in the womb ready for impregnation, the female is more likely to desire coition at that time because she is in a condition to become a mother. By some authorities it is contended that the ovum may be fecundated while it is passing through the fallopian tubes, or while it is in the tube itself.

The process of impregnation or fecundation takes place when the semen of the male is brought in contact with the ovum by the act of coition. The penis of the male in coition is brought in close contact with the mouth of the womb, and at the moment of climax, or when the passion of the male reaches culmination, a nervous spasm ensues, followed by the ejection of about one-half ounce of whitish fluid called semen. Under the microscope

this fluid is found to contain innumerable little animalcule called *spermatozoa*, which unquestionably are the vehicles of the life principle. These spermatozoa resemble tadpoles and move at the rate of about an inch in two hours.

At the moment of climax on the part of the female she experiences a similar nervous spasm, and the glands of the womb and its appendages secrete a fluid copiously, which forms an excellent medium for the preservation and nourishment of the spermatozoa after they have left the body of the male. At the same time the mouth of the womb dilates to receive the semen, which is thrown into the womb with considerable force. The spermatozoa come in contact with the ovum, enter it, and unite with it and the ovum attaches itself to the womb and begins to grow. Impregnation has been effected and new life has commenced. Its destruction after the moment of impregnation is murder. The mere contact of the semen and the ovum, while unquestionably necessary to conception, is not all that is necessary. The creative force which molds the child is magnetism, which originates in the body of each parent, passes through every nerve, and culminates in the union of two forces, negative and positive, in the womb of the female upon the ovum and the spermatozoa. There are really four elements necessary to conceptivity in one parent, and positive magnetism from the other all uniting under favorable conditions to form a child. The total absence of any one of these elements will defeat conception; the inferior quality

of any one of them will produce an inferior result in the offspring, which may be idiocy, deformity, depravity, stupidity, or disease, according to varying conditions.

Causes of Barrenness

The theory of conception and pregnancy being thus explained I shall proceed to discuss the causes of barrenness.

1. In order to obtain a perfect conception, insuring perfect offspring, it is necessary that the constitution of the parents should be adapted to each other. That is, that the excesses and deficiencies of development in each should be balanced by a different constitutional condition in the other. If the constitutions are similar in development, if both have the same weaknesses, or excesses, or the constitutions are so neutral to each other as to be devoid of magnetic attraction, the creative act is shorn of its powers and total barrenness will result. If these conditions exist only in a degree the result will be partial conception, the child will only be partially made, something will be left out, and congenital deformities will result.

2. Barrenness may be caused by an improper marriage, where the parties have such a maladaptation of the sexual organs as to make coition painful or prevent the female from reaching the climax. The intercourse of persons of harmonious constitutions result in delightful coition and perfect offspring.

3. Barrenness may be caused by congenital malformation of the womb and its appendages, or by

an arrested development during childhood, caused by paralysis, which is of course in some cases incurable. Many females who are in this condition marry with most unhappy results.

4. A fourth case is found in a deliberated condition of the sexual organs producing a physical incapacity on the part of the female to furnish a healthy well-formed ovum, or to retain it in the womb, and on the part of the male of a physical incapacity to furnish healthy and impregnating semen. This may or may not be curable according to the individual case.

5. Non-participation in the climax of coition on the part of the female is a frequent cause of non-conception and barrenness. It may be wilful, or it may be because of inability to work up her feeling to the extent of passion, thereby interfering with conception, both through lack of magnetism and the failure of the womb to dilate and receive the semen. Many women conceive without participating in the pleasure of coition because the mouth of the womb is in such cases dilated by a relaxed condition of the system caused by disease.

6. Premature emission on the part of the male is another frequent cause of non-conception. If the emission takes place before the female has had a reasonable time to reach the climax, the design of nature is frustrated.

7. Some females discharge the ovum during the menstrual flow. In such cases, when offspring is desired, copulation during the early stages of menstruation, just before flow commences, or immedi-

ately after its cessation, will often have the desired effect, particularly if coition is refrained from for two weeks previously to enable the semen of the male to reach its full vitality. In such cases, the offspring will probably be female. The ovum is likely to pass at the close of menstruation and be discolored with menstrual blood, and mistaken for a clot of it.

The mere statement of the foregoing causes of barrenness and the causes of deformity and disease in offspring, carries with it the irresistible conclusion that it is necessary that all married persons should beget their offspring intelligently. They should have absolute control of the time, place and circumstances attending conception, and no child should ever be forced into the world the unwelcome offspring of parents who have ceased to love each other, or who for any reason are not in the most perfect condition of parental effectiveness and mutual desire.

Children should be begotten at a time when the condition of the parents is at the highest point favorable to reproduction, and when surrounding circumstances have been intelligently arranged to endow the child with the best possible organization.

Whenever men and women learn the truth as explained in this volume, there will be brought into the world healthy matured, properly formed children.

The first great lesson which every man must learn is that sexual intercourse is the highest of life's great functions, and is only to be used for the

benefit of himself, his consort, and his offspring. *In the absence of instructions, nothing is more natural than for him to acquire the habit of indulging merely for the gratification of morbid feelings which are usually due to inflammation of the sexual organs.* Most unhappy is the lot of a woman who is bound for life to a man afflicted with such desire, who is unwilling to learn or to practice any rule of life which interferes with his ignorant and lustful pleasures. *Such men never reach a comprehension of the highest joys of sexual pleasures and they are the real destroyers of society.*

The Master Key of Sex Control

As soon as the fact of conception has been established then all exercise of bridal rites should at once cease; but if the man has been generated so badly himself that he is controlled by his passions he still should strive to control himself, at first, *at least* for 30 days, then for 40 and so on. After the child has been born, then in the name of mercy forbear to molest the mother so long as the child continues to draw nourishment from the maternal fountain. But if he must resume bridal rites, then wean the child from the mother at the end of six weeks and nourish it on good cow's milk. A child thus born will be able to continue continent for 60 days as easy as you did for 30 and his child and his child forego, etc., and so on until in nine generations a man may be produced who would abhor to solicit his wife during either gestations or lactation.

THE MASTER KEY OF LOVE

SIXTH DIVISION

How to Produce Perfect Offspring, Their Creation, and the Regulation of Sex

The Philosophy of Correct Generation

The first three great laws of reproduction are as follows:

I.

In reproduction the offspring is the composite product of the transmission and combination of all traits and conditions of the composition of all previous ancestors.

II.

The temporary condition of the parents at the time of conception becomes the permanent condition of the offspring by transmission.

III.

The temporary condition of the mother during pregnancy becomes the permanent condition of the offspring.

I have already remarked that the creative force which molds the child is magnetism which originates in a body of each parent, passes through the nerves, and culminates in the union of two

forces, negative and positive, in the womb of the female upon the ovum and spermatozoa. I will now elaborate this explanation.

All matter radiates magnetism. All space is receptive to magnetism and receives it as it is radiated from matter. This is a general statement of the creative force as it exists in all nature and as it produces all the manifold changes in matter which constitutes life.

Electricity is the generative passion of love of space for matter. The corresponding degree of generative passion or love which matter radiates into space is called magnetism. The radiation of magnetism from matter gathered into a current by restraining forces is erroneously called electricity. It should always be spoken of as magnetism. A correct understanding of these terms is necessary to a comprehension of the philosophy. I shall give enough of it here for the reader to understand how to apply it.

The phenomena of electricity are composure, respectivity, coldness, darkness.

The phenomena of magnetism are radiation, vibration, heat, and light.

The electric state is negative, the magnetic state is positive. All bodies, human beings included, are organized and are composed of molecules which are held together by electro-magnetic affinities. All growth is caused by changes in the condition of electricity and magnetism is the environment. The conception and growth of human beings are subject to the same great laws.

A man or woman is in a electric or negative state when the body is composed, receptive, and cool. Brunettes are more subject to these conditions than blondes, hence they are called electric, or of the electric temperament.

A man or woman is in a magnetic or positive state, when the body is vibrating, radiating magnetism, and warm. Blondes are more subject to these conditions than brunettes, hence they are usually called magnetic, or said to belong to the magnetic temperament.

It must be borne in mind, however, that all persons are subject to either condition under the proper circumstances. The difference is simply in the amount of magnetism generated, the period necessary for it to reach the highest culmination, and the facility with which the change from one state to the other is effected.

Any person can become negative by becoming composed, remaining passive, and allowing the body to become receptive and cool. Conversely, and person can become positive by becoming sufficiently excited, vibrating the body in violent exercise and radiating magnetism and this is true whether the excitement is pleasant or unpleasant. When the reader has thoroughly mastered these definitions of electric and magnetic conditions he will be prepared to follow me through the most important discussion of the correct conditions of parentage ever submitted to intelligent consideration.

There are four forms of sexual intercourse. They may be properly designated as: (1) Male Positive (2) Female Positive. (3) Double Positive. (4) Double Negative.

In the Male Positive intercourse, the female becomes negative, remains as composed as possible, giving little or no expression to emotion, allowing her passion to be passive, and moving the body no more than she can avoid. She should be in an easy recumbent position sustaining as little weight as possible, and perfectly free from all unpleasant fears or emotions of any kind. At the close of the intercourse, if conception is desired, she should experience the orgasm, but should allow it to occur without any great excitement. The male, on the contrary, should cultivate and express the most intense emotion and passion, vibrate the body with such caresses and exercises as will generate a great amount of radiation and magnetism and be in a position where he will have perfect freedom of action for this purpose. He should culminate the act with a strong orgasm, but should exercise restraint over this function until he is certain that he has called out in his actions an expression of every one of his faculties of intelligence. If conception is desired, he should have the orgasm at the same time that the female experiences it. In this form of intercourse, the magnetism of the male is most powerfully generated and is poured into the body of the female, who will be greatly benefited thereby, and if the female is weak or exhausted from nervous excitement, or any cause, it will be found to

have a wonderful strengthening effect. If the male is in a high state of vitality and good health, the expenditure of his magnetism in this form will also be beneficial to him, if repeated until he reaches a full recuperation of his powers.

In the Female Positive intercourse, these conditions are exactly reversed. The female expends her magnetism in a powerful expression of emotions and action, while the male remains passive. In this form, the male should not permit the emission of semen to occur unless conception is desired, and in that case it should only occur quietly and without violent emotion or expression. In this form the magnetism and strength of the female is transferred to the male, who will be correspondingly benefited.

In the Double Positive intercourse, both parties are positive and the magnetism is wasted. This is the form usually practiced by the passionate man and woman who are ignorant of the laws of generation. In this form neither party is benefited, except by the discharge of magnetism from the body. If both are in a high state of magnetic strength, such an intercourse may be permissible, as it is permissible to waste a surplus of steam in an engine by opening the safety valve, but no conception of offspring should ever occur in a double positive intercourse.

The Double Negative intercourse is simply an embrace of the parties in which the sexual organs are brought into contact, but neither party experiences the orgasm or expends much force. Such an em-

brace is often delightful for the purpose of restoring an equilibrium to the brains of both parties after mental exercise which has been prolonged, affecting the frontal lobe. The moderate sexual excitement of such an embrace draws the blood to the posterior lobe of the brain and relieves the congestion of the frontal lobes, often inducing sleep when all other methods fail. The conception of offspring should never occur in a double negative intercourse.

Having in the foregoing paragraphs explained how the four kinds of sexual intercourse may be performed, and briefly alluded to their effects upon the participants, I will now explain their philosophic bearings upon the production of offspring. All creation is effected by the union of negative and positive forces, and it is a general rule to which science furnishes no exception, that the strongest creation occurs when the most complete negative conditions are opposed by the most powerful force or forces, from all of which I deduce the fourth great law of reproduction.

The best offspring results from intercourse in which one parent is very completely negative and the other very powerfully positive.

Of course it is impossible for either parent to be entirely negative, but the nearer this condition is approximated, the more perfect will be the result. The importance of this fact will be more appreciated when the reader has comprehended the tremendous facts disclosed in the next section.

The sex of offspring is governed by the application of this great law. In order to maintain the

equality of the sexes in numbers and quality, nature has ordained that in each succeeding generation the elements of human character shall cross the line of genesis. The history of the world reveals the fact that men do not transmit their characteristics to their sons. Neither do women transmit their characteristics to their daughters. No great man has ever yet appeared above the horizon of mediocrity who did not have a mother who embodied in her character the elements which made him successful. No woman has ever astonished the world with her genius who was not the offspring of a father who possessed the germs of the same genius. Differences in environment, in education, and immediate conditions have of course had their influences, but as far as the law of inheritance furnishes a cause of observed effects, there are no exceptions to this rule. In any apparent exception where a son has followed in the footsteps of his father with success, it will be found that the mother possessed the elements of character which made the success possible. In all ages men have mourned the fact that their sons were unable to follow in their footsteps, while the current theology and social customs of society have relegated their daughters, because the occupation in which those talents would shine have not been considered within "woman's sphere." And so the development of humanity has been retarded and set back until another generation after decades of disuse and suppression, the talent has appeared in the grandson. It is in the same way gifted and talented boys, inheriting

from sensitive and refined mothers the grace which would have made them brilliant musicians, accomplished painters, and incomparable poets, have been compelled to adopt commercial pursuits for which they were utterly unfitted, in order to succeed to their father's business. And so the miserable in-harmony proceeds.

The fifth great law of reproduction may be stated as follows:

The positive parent governs the sex and reverses it, and if the positive parent is very positive and the negative parent very negative, the result will be a child of the opposite sex from the positive parent, but possessing that parent's qualities of character in the highest degree of perfection possible to that parentage.

According to this law, a negative female and a positive male will produce a female child, and that child will resemble her father and be like him in character; and being like him, will be as perfect as it is possible to produce a female child, for it is impossible for the mother to transmit her qualities to her daughter, who resembles her in any degree, it is because she was partly positive and so far opposed her positive force to that of the father, defeating his creation and to that degree impairing the perfection of the child. It is universally true that boys who resemble their father and girls who resemble their mother in any degree are to just that degree inferior. This resemblance to the parent of the same sex is often superficial and frequently exists only as to the color of the hair and

eyes, while the formation of the brain and the essentials of character are properly inherited from the right parent. It is not unusual to find such cases referred to as "the very image of her mother" or "the picture of his father," when the truth is in the reverse. It is a fact, however, that all persons who resemble the parents of the same sex in brain formation and the essentials of character are the result of either double negative or double positive intercourse, in which the forces were nearly equally opposed, but having just enough preponderance on one side to effect the creation. If the forces were exactly equal in opposition, no creation could result. It follows that as the opposition decreases the creation becomes more perfect.

According to this same law, a negative male and a positive female will produce a male child, who will resemble his mother and inherit her characteristics, and will be as perfect as it is possible for the couple to produce a male child. Such is, in fact, always the case.

The sixth great law of reproduction naturally follows as a corollary to the second:

The more perfect the receptivity of the negative parent and the greater force generated by the positive parent, the stronger will be the offspring.

Both the negative and the positive conditions are enjoyable. Both should be made the subject of careful study and practice by all prospective parents until it is possible to assume either at will and enjoy it thoroughly. Unless this is done, when the time comes to generate offspring they will probably

fail in producing the desired results from lack of practice. It is just as necessary to practice in this great art of production as in any other. The greater the harmony existing in the temperament and constitution of the parents, the easier it will be for them to establish harmonious positive and negative conditions. Here again is seen the inestimable value of perfect harmony of sex. For this reason, it is possible with such a consort to enjoy a high degree of pleasure in all social and sexual relations, and because of this reciprocity to have more perfect offspring than can possibly be obtained by any other combination. And this brings us to the enunciation of the seventh great law of reproduction.

The conditions of pleasureable enjoyment of the act of sexual intercourse are always in direct proportion to the conditions favorable to the perfect creation of offspring. I have frequently been assailed by hostile critics who have contented that I dwelt too much upon the pleasures of intercourse and that my philosophy tended to make man sexual. My answer has always been the enunciation of this great law that follows logically from the others we have considered, and I have always declared that as long as I knew that my doctrine would continue to add beauty to children yet unborn, I would continue to teach this great law and let the critics do their worst.

These ideal conditions are possible and easy of attainment between all persons who are physically fit and willing to make lust subservient to love. *Love is simply the attraction felt by one person for*

another, restrained and directed so as to produce the greatest good for the loved subject. Lust is the same attraction unbridled and indulged irrespective of the welfare of the object. Ponder on these definitions and decide which form you are experiencing.

In order to carry out the philosophy of this system and to reap the benefit of a knowledge of the laws herein expounded, it is necessary:

First. The male should secure perfect control of his sexual powers to the extent that he can be negative or positive at will, that he can control the emission of semen perfectly, so as to prolong sexual intercourse to a necessary extent, and be able to terminate the act with or without emission, or with a violent orgasm or a gentle one, according to his desire, and the object to be obtained.

Second. The female must be in possession of a knowledge of her condition as to possibility of impregnation, the exact stage of her menstrual period, and be able to control her own condition of negativeness or positiveness, and to terminate the act with or without orgasm, violent or gentle, according to her desire and the object to be obtained.

Men who have never experienced anything but the violent and abortive effects of the positive form of intercourse usually indulged in by the uninformed will be inclined to look upon the requirements of the male as above stated as impossible. But in the light of instruction there is nothing unreasonable or even difficult to obtain in these requirements. A more full and complete discussion of the method of cultivating self-control is found

in another chapter of this great work; but for the application of the principles herein discussed I consider the following suggestions necessary. To attain these requirements, it is necessary that the sexual organs should be in a perfectly natural condition, that the bowels should be kept open and free from accumulations, and that intercourse should never be attempted when these precautions have been neglected. When a man puts himself in this perfectly natural condition, he is fit to become the father of offspring, and not before. Then all that is necessary is a comprehension of the laws and practice in their application. If you are not able to reach all the requirements with a reasonable degree of practice, there is something wrong, either with your organs or your method of practice, or the adaptation of your consort. You will find great benefit in any case from the information contained in another part of this work.

Females as a rule have very little trouble in controlling their negative and positive conditions and in regulating the force of the orgasm. I attribute this to the fact that the sexual organs of the female are not so much restricted by unnatural and debilitating clothing as those of man. Much as has been said to the contrary, there is more need of dress reform among men than among women.

But very few women understand the various stages of menstruation or their condition at each state, as to negativeness, or positiveness, or liability to impregnation. The following instructions

are indispensable and should be comprehended by every woman before sexual intercourse is attempted under any circumstances.

The menstrual month of the female who is healthy and regular consists of twenty-eight days, continuing from the commencement of one flow to the commencement of another. There are slight variations from this rule, but they are not numerous. When there is a great variation, it is evidence of disease and treatment is required to establish regularity. This month of twenty-eight days is divided into three periods, viz., the period of flux, the period of retention of the ovum, and the period of sterility. These periods are all variable in different women, but generally invariable in each case, and when established become sources of great convenience in the management of proper sexual relations.

The period of retention of the ovum properly begins about two days before the menstrual flow, includes the time of its flow and extends for a number of days beyond it. The ovum ripens in the ovary just before the beginning of the menstrual flow and it is possible for the impregnation to take place if intercourse occurs at that time. After the menstrual flow ceases, the ovum remains in the fallopian tubes and uterus for some time, varying in different females from three days to fifteen days. In each female, however, the discharge usually occurs about the same number of days after menstrual flow ceases, so that if the period is once

established, the female may look for its repetition with tolerable regularity.

When the ovum is discharged the period of sterility begins and continues until about two weeks before the next flow commences, when, as already stated, it is possible for the female to conceive with the ripened ovum which is then in the ovary.

To enable a woman to surely understand her conditions, and to conceive her offspring at a proper time and under proper conditions, she must know exactly when the ovum is discharged from the uterus and when the period of sterility begins. To accomplish this observe the following instructions carefully.

As soon as the menstrual flow ceases, carefully cleanse the vagina with warm water at about blood heat. No other injection should ever be used. Now carefully notice all discharges that come from the uterus, and for this purpose it is desirable to wear a thin cloth, not heavy enough to heat the parts, but upon which all discharges from the uterus may be caught and examined. It is desirable until the period has been established, to strain the urine through a thin cloth and observe. When the ovum is discharged there is nearly always a flow of mucus, or this watery fluid, from the vagina more than usual. Just previous to the appearance of the ovum there will be a feeling of contraction and bearing down in the uterus, as in menstruation. The ovum will be discharged in the form of a grayish clot about the size of a small pea, and of a firm and elastic texture. The ovum itself is

only about the size of a small pinhead, but it is surrounded by enveloping matter and mucus which makes it clearly visible if the observer is careful.

As already remarked, the period of retention varies in different females from three to fifteen days. Just a very few females discharge it during the menstrual flow, and some on the first day or second day, but these cases are very rare. No case has ever been found where the ovum has been retained beyond the fifteenth day, so females who from any cause are unable to detect the passage, may with certainty rely upon the fifteenth day as establishing the period of retention whether discovered or not.

The female being in possession of the knowledge of her condition, the act of sexual intercourse becomes perfectly easy to regulate. She will find, however, that immediately after the cessation of the menstrual flow, and for several days thereafter, she will be more negative than positive, hence if she conceives at such a time, the result will be a female offspring, unless for some reason the positiveness of the male is still more reduced. Such a conception would, of course, be disastrous to the offspring by the creative force being reduced to a minimum. But if female offspring is desired and the male is magnificently positive, it is the most desirable time. The female will begin to manifest her most positive condition after the seventh day following the close of the menstrual flow, hence this would be the most favorable time to conceive male

offspring, provided the ovum has not been passed previously.

Another point that is worth noticing is that when the female offspring is desired after the intercourse, the female should lie quietly and sleep, thus prolonging her negativeness. When male offspring is desired, she should move about and prolong her positiveness by cheerful occupation, pleasant companionship, active movements, and gayety.

The greatest difficulty I have experienced in teaching my philosophy of the sexual relations is the unwillingness of man to believe there is any pleasure in sexual intercourse except that which is derived from excitement of the orgasm and the discharge of semen. As a general rule, the man measures his pleasure by the number of orgasms he can force in the length of time he has possession of the female. It is this view of the sexual relations which makes it hard to enforce or to accomplish anything in behalf of the great number of women who are bound for life to masses of organized selfishness known as husbands. I am driven to despair frequently when some beautiful woman to whom I have given my instructions returns to me with tears and says: "It is no use. I believe all you say is true, but my husband says it is all humbug, and I cannot even persuade him to try your method. All he seems to think of is gratification of his passion, and when we have intercourse, all his pleasure consists in the excitement and the orgasm, and that is so quickly over that I experience no pleasure at all. And he requires so much that

he keeps me in a family way all the time, and as soon as I am through nursing one child I am pregnant with the next."

Now this is simply barbarous. And yet it is the unhappy condition of thousands of families all over the world, resulting in the production of thousands of ill-made children, destroying the health of the mothers and making them incapable of producing healthy offspring, and not less certainly destroying the health of men who practice the outrage and causing them to sacrifice all the real pleasure there is in true sexual embrace.

The man who has not learned to control himself, so that he can have satisfactory intercourse without any emission of semen is uneducated and unfit to be the companion of any woman. When he does learn this degree of control, he experiences pleasure infinitely beyond the comprehension of the man who experiences only the usual abortive form of intercourse. In fact I do not believe that any man has ever experienced true sexual joys until in the exercise of his manhood and self-justification, he has caused himself and his loved consort to thrill with ecstatic emotions which may result from the intelligent use of sexual functions when held under this complete control. The same rule applies here which is true in music, or in any other accomplishment. Skilled performances give joy, while unskillful discords produce misery.

The emission of the semen in coition is never necessary except for propagative purposes. By the cultivation of self-control, and by adhering closely

to habits of living, diet, etc., promotive of sexual vigor on the part of the male, he may enjoy coition to the fullest extent, prolong the act for an unlimited time and withdraw without emission, with full feeling of satisfaction, both to himself and consort, provided that the conditions surrounding the act are proper and natural.

I am aware that this statement will be received with great incredulity by those who have never experienced anything but an abortion coition—attempted under circumstances contrary to the law of nature and all conditions of enjoyment. That nature intends the discharge of semen to be entirely under the control of the male I have not the shadow of a doubt. The fact that I have met hundreds of well-sexed men who have been able under my instructions to duplicate my experience prove the fact.

A great many magnetic men are able to prolong the act of coition to a satisfactory extent, but find it necessary to eject the semen at the conclusion of the act, which may take place after withdrawal without injury, provided the coition has lasted half an hour or more and the male has been fed by the magnetism of the female and has experienced the feeling of satisfaction which enables him to close the act without a severe nervous spasm inducing prostration. Any man of average physique and sexual vigor should be able to reach this degree of self-control. To attain to a higher degree in which no secretion of semen occurs and no feeling of discomfort arises, requires excellent health, perfect

sexual vigor, and strongly developed habits of self-control, with the ability to elevate the feeling above mere selfish gratification, and to so sublimate the act as to make it the highest degree of mental enjoyment as well as physical.

To attain the full degree of satisfaction in this method of coition, the act must be performed under the following conditions:

1. The husband and wife must be adapted to each other in harmony, with physiological principles, in order to have correct sexual magnetism, natural attraction, and enjoyment.

2. The parties must live in harmony with the laws of nature as to diet, bathing, habits, sleep, etc.

3. The act must be performed in the proper way, at a proper time, when both parties are highly qualified to enjoy it, and with all disturbing conditions removed.

A full discussion of these topics is referred to in another division of this work, but with reference to the methods of cultivating self-control, the following suggestions are here given:

The male should accustom himself to entering the female and remain quiet for some moments, then withdraw without emission. This may be repeated frequently until the male has become accustomed to exercising this restraint, which is highly beneficial. At each interview the period of contact may be increased in duration and the male accustom himself to gentle movements, always being careful to terminate the insertion before emission is imminent. This discipline may be kept up for some time with

the assistance of the female until the habit of self-control is established. The act may then be prolonged by continuing the movement until emission seems to be imminent, when both should cease all movements, allowing the penis to remain in the vagina and rest, in the meantime cultivating a lively conversation on agreeable topics. When the feeling of the approaching orgasm has subsided, the movement may be renewed.

The male should accustom himself to seek the gratification of his mind in the beauty and conversation of the female, in loving caresses and endearments, and enjoy the self-control which he is striving to maintain. As far as possible, make the act a reciprocal enjoyment and remove the thoughts from the contact of the organs. When the habit of self-control is thus established, and the male is able to prolong the act and enjoy it mentally, if it is properly accomplished and the rules as given in another division properly obeyed, the enjoyment on both sides will be delightful in the extreme, and so far transcend the pleasure of the mere orgasm that the participants will never again resort to improper methods.

The most perfect results are obtained by those who pay the closest attention to the reciprocation of negative and positive conditions. During the period of retention the female is most likely to desire intercourse. If she refrains entirely from fear of conception, she will suffer a certain degree of sexual starvation. During the period of sterility, many females have no passion at all, and when

they are required to perform intercourse in a positive way, it is at considerable expense to the nervous system. My philosophy gratifies both at the proper time. During the period of retention, let the female be as positive as she likes, but let the male be negative and retain the semen. During the period of sterility, let the female be negative, if she desires to be, and let the male extend his force as freely as his health and temperament require. During the menstrual flow, decency requires complete abstinence.

The physical effects of such coition are in the highest degree beneficial: I have yet to find a man who has appreciated and adopted it who has not been greatly improved in health and appearance by the practice. Its beneficial effect upon the female is equally good, and she should accustom herself to the same mental enjoyment and terminate the act without orgasm and its accompanying nervous spasm.

The performance of the act of coition under these conditions places the matter of conception entirely in the hands of the parents and enables the wife to enter fully into the enjoyment of the act without fear of unwelcome offspring. In practicing this theory, the male should be careful to withdraw whenever he feels the approach of the orgasm to such an extent as to render it beyond his control. If the act has been prolonged, it will not be in the least injurious to let the emission take place outside, but it is better to retain the semen if possible.

A most important fact to be borne in mind is that the mental condition of the participants and their state of conscientious conviction exert a very great influence in the final effect which will be felt. A great deal has been written by ignorant persons concerning the injurious effects of "incomplete intercourse," and withdrawal, etc. "As a man thinketh, so is he." If a man believes he is injuring himself by any act, it will injure him in fact, no matter how harmless the act may be in itself. A gentleman once complained to me that "incomplete intercourse," this is, terminating without emission, was very injurious to him, although he had practiced it for years to save his wife from unwelcome offspring. He was asked, "Who told you so?" "My family physician," he replied. He was informed that his family physician did not understand the case. It is not only not injurious, but that the retention of the semen will cause one to be less nervous and to increase in weight. He followed my advice and reported in three months that he had gained fifteen pounds and that his nerves were much stronger.

The Cure of Sexual Weakness; Manhood Restored

SEVENTH DIVISION

A Brief Review of the Conditions Generally Described As Sexual Weakness, Lost Manhood, Nervous Debility

Degeneracy of the sexual organs exists in some cases and may frequently be remedied by proper treatment. Degeneracy would be indicated by deficiency in size or by malformation. For actual malformation amounting to inability to sustain sexual relations there would be no remedy, but such cases are extremely rare. The most common form of malformation, which is, remediable, is phymosis. This is a condition in which the foreskin is long and the opening is so contracted that it cannot be drawn back over the glands. This causes a lack of growth of the organ and a filthy condition which breeds disease and is frequent cause of nervousness and idiocy in boys. An examination by any competent and reputable surgeon will settle this question and provide a remedy, which is usually found in circumcision. This is the only condition in which I recognize the act of circumcision as being in any degree necessary.

Deficiency in size of the sexual organs is a much advertised condition upon which the quacks reap a fruitful harvest. Nearly all young men are anxious to have a vigorous condition of these organs and naturally the size seems to be an indication of power, as in the case of the rest of the body. But as very few men have an opportunity of comparing sizes of development, and most of them are filled with distrust of their own conditions through reading quack advertisements, it is not to be wondered at that many a man comes to believe that his organs are small and weak when in fact, they are well-proportioned. It must also be remembered that the sexual organs have two conditions, flaccidity and erection, and that the size of the organs in flaccidity is no indication of their size in erection. Hundreds of men contemplate their sexual organs in a state of flaccidity size in that condition and being worried over their distrust and lack of confidence, have arrived at the conclusion, that they are hopeless degenerates, when in fact they are vigorously sexed.

When there is an actual deficiency of size in the organs the best remedy is found in their legitimate use and in massage and remedies hereinafter described. But if a satisfactory sexual relation is experienced there is really no reason for worry over the size of the organs. Women differ in size of these organs as much as men and where the parties are properly mated, there is not great disparity in size, and the action of the organs are harmonious. It is of far greater importance that

every man and woman should secure the knowledge which enables each to make a correct selection of a sexual mate than to submit to treatment for deficiencies which may have no existence except in the mind of the victim.

It is safe to say that a large majority of boys learn to practice the vice of self-abuse to some extent. While this is true that a great many injurious effects result from this practice, and in the misguided expressions of a great many moralists such emphasis has been laid upon the injury and so little practical instruction has been given as the real power and use of sexual organs that a great injury has been done. I am constantly coming in contact with a class of men, young and middle-aged, who have been so impressed with the awful consequences of self-abuse, that they believe they are hopelessly ruined because they have indulged in it to a limited extent. This imagination is really the cause of the breakdown. In most cases where there is an inordinate desire for sexual excitement and an actual practice of self-abuse to an injurious extent, *the cause will be found in an unnatural diet, in filthy habits, neglect of the bath, constipation and indulgence in stimulants, and the act of self-abuse is a resulting symptom, instead of the cause of the trouble.*

When this condition exists and there is a continuation of the practice, the remedy is found only in total abstinence. Adopt the proper diet, avoid all forms of meat, stimulating foods and drinks, eat fruits, nuts, and vegetables, of the right kind,

and temperature, according to your temperament, bathe properly, seek agreeable companionship, wear loose clothing and learn the current of your magnetism and control it. All of these practices are taught fully in physical culture magazines. If you have discontinued the habit and still have some fears that your sexual strength has been diminished by the practice of it, the best thing to do in any case is to dismiss this fear and proceed to develop and enjoy your functions regardless of a past which you cannot recall. The probabilities are that as soon as you adopt this mental attitude and dismiss fear, you will have no further trouble.

Where there is really any deficiency in size of the organs, or a debility resulting from sexual bause of any kind, the first thing to do in any case is to improve the general health. The study of the functions of generation, depuration, nutrition, circulation, observation, respiration, and reflection, and the improvements of the functions according to directions given in other portions of this work, will greatly increase the force of your gender.

Varicoccele results from the relaxation of the muscles of the scrotum caused often by keeping the affected region in a hot, sweaty condition by an excess of clothing, frequently of an unwholesome character. The remedy for this condition is found in the massage and cold compress hereinafter described, frequently applied and in reducing the amount of clothing surrounding the scrotum, exposing the parts to air and sunshine, removing all suspensories and other bandages and keeping

the scrotum muscles contracted by cold applications. It is especially important that the parts should be exposed constantly to ventilation and air currents, which can easily be accomplished by correcting the clothing.

Total or partial *failure of erection* may occur from two causes, the debility of the sexual organs and the lack of control of the current of magnetism, in some cases both causes exist. Where there is a debility of the sexual organs, correct the general health according to natural methods and apply the massage and cold compress hereinafter described, vigorously and frequently. This treatment has been known to restore vigorous erectile power to the sexual organs of men of advanced years who have not known such a power for intervals of five and ten years. In such cases, the circulation was good and all that was necessary was to direct it specially to the sexual organs.

Where the failure of erection is due to the disturbance of the current of magnetism, the correction of the condition is only a matter of intelligent effort. This will be fully discussed in subsequent pages.

Premature Emission of Semen, or the ability to prolong the act to a satisfactory termination may also be due to these causes. Where there is debility of the organs, follow the directions carefully and vigorously, the same as for the failure of erection. The conditions arising under the current of magnetism will be fully discussed under that head.

The inability to reach a satisfactory prolongation of the sexual act results in mutual disappointment and reversion of affections and is a *serious cause of marital unhappiness, as well as the deterioration of offspring*. Unless the sexual emotions are entirely under control in both parents, the offspring are sure to be seriously impaired in functionality, irritable, nervous, and short-lived. The inability to control the act, however, is so general that I have found the greatest difficulty in convincing a large class of intelligent people that it is necessary to have the sexual emotions under the same control that is required in all other forms of human action, where effectiveness is desired. Briefly stated, however, the causes which give rise to this lack of self-control and cause the impairment of sexual effectiveness are as follows:

1. Debility of the sexual organs and of the general constitution.
2. Ignorance of the current of magnetism and how it may be controlled.
3. Constipation, causing a partial paralysis of the sexual nerves by compressing the tissues of the sexual organs.
4. Lack of temperamental affinity in the companion.
5. Disturbing influences, such as fear, anger, distrust, or interruptions.
6. Ignorance of the fact that such form of intercourse is profitable and consequent lack of effort to reach and enjoy it.

7. In the absence of intelligent co-operation between the parties to secure the best possible results to each other and to the resulting offspring.

As stated in previous chapters, many nervous troubles can be successfully treated through proper understanding and practice of coition.

Briefly stated, the sexual organs of most men are small, deficient in circulation, unclean, and inefficient in the performance of the function of generation. Few men experience anything near the normal pleasure in sexual intercourse, and very few are able to exhibit any degree of control during the performance of the act of copulation. Many complain of the failure of erection, others of premature discharge of semen, others are entirely impotent in generation, while the consciousness of weakness in any form is destructive of character by reducing self-confidence, destroying ambition and making the unhappy victim a prey to misery worse than death.

All involuntary seminal emissions are the effect of constipation accompanied by nervous excitement of some kind.

All debility of the sexual organs not directly due to inherited general debility, of the constitution, is caused by uncleanness and the wearing of clothing in such a manner that the organs are deprived of the conditions of growth.

All lack of self-control, premature emission in the sexual act, failure of erection and similar embarrassments result from the continued unnatural conditions in which the sexual organs are kept as

a result of the neglect, contempt, and general dishonor inculcated by a depraved sentiment.

The foregoing statements are made, of course, with reference to men who have originally possessed normal conditions of health and who do not come under the following classifications; which may be considered as having acquired sexual weakness from diseased ancestors or from causes which may be directly traced. In the following cases the causes may be more easily determined when the facts are known, but the remedy is the same in all cases.

1. General Heredity Weakness of the constitution, resulting from parental incompatibility, parental disease, or an improper condition or method of sexual intercourse at the time of conception of the parent, resulting in small or undeveloped sexual organs, weak and excitable nerves and the inability to properly perform or prolong the act of copulation or to become the parent of perfect offspring.

2. Effects of Acute and Chronic Diseases of the reproductive organs in male and female, such as gonorrhea, syphilis, stricture, or inflammation of the bladder, leucorrhea, womb disease, or the effect of injuries received by accident or otherwise.

In all of the above forms the general results are the same in the end, viz.: a general debility of the nervous system, failure of erection, seminal emissions at night or in the urine, palpitation of the heart, failure of memory, aversion to society, loss of sexual enjoyment.

In all cases of sexual debility the fact must be borne in mind that the sexual organs are organs of sense. Man has seven senses, to-wit: gender, touch, taste, hearing, sight, smell, and clairvoyance. The sexual organs are the organs of gender, and the exquisite pleasure which is derived from their correct uses is due to their perception and sensibility to the vibrations of magnetism in the lowest stage, which constitutes the sensation of gender.

If man would subject his eyes, ears, nose, or mouth to the abuses with which he afflicts his sexual organs, he would soon lose the senses of sight, hearing, smell, and taste. Because these senses are necessary to his daily vocations, he has learned to keep the face and hands practically exposed and these organs have nearly normal conditions. But he is not supposed to use his sense of gender at all, and it is possible to live without it, he has been instructed to keep it covered with several layers of dry goods, to neglect the exposure of the organs of gender, to neglect cleanliness, to think of it only with shame and to suppress all talk concerning sexual pleasure. Is it any wonder that men and women are sexually blind?

The remedy is obvious. Subject the sexual organs to the same treatment that you would apply to the eyes if they weakened by the continued application of bandages accompanied by conditions of filth, constriction, and impaired circulation.

The following rational system of cure is based on the principle of avoiding all causes which produce these results and the substitution of con-

ditions tending to produce development of the other direction. There is always present in nature a grand force directed toward recuperation. Nature is constantly employing impulses toward the building up of health and normal conditions. Disease is the result of the recuperative forces being interfered with, or the extraordinary effort which nature makes to expel abnormal conditions.

Civilization has its disadvantages and the prevailing fashions of wearing clothing are a fruitful cause of debility and disease by causing pressure on the organs, obstructing circulation, and causing abnormal conditions in both sexes.

The Vital or Recuperative System of the body consists of the digestive organs and the blood vessels, the heart and lungs, and the various glands, such as the liver, stomach, spleen, kidneys, testes, etc., and it is by means of the circulation of the blood manufactured in the bowels from the food, circulation by the heart and blood vessels, and purified by the lungs and glands, that disease and wasted tissue is thrown out and new life injected into all the organs of the body.

Exposing the sexual organs to natural conditions, regulating the digestion, and promoting circulation will cure ninety-five per cent of all sexual debility. By these simple measures we secure the proper nourishment of the parts and the disposition of all diseased, dead, or unnecessary accumulations.

Exposing the sexual organs to fresh air, sunshine and friction as much as possible, every day,

and apply plenty of hot and cold water in the form a general bath over the whole body once a day, and a special bath of the sexual organs as hereinafter set forth as often as is convenient.

Fresh air and sunshine are just as important to the sexual organs as to any other form of growth. If you deprive your eyes of these conditions you would soon be blind. It is because you have deprived your sexual organs of natural conditions that you are dazzled, sexually, whenever you come in contact with the gender of the other sex, and you are unable to control the action of these organs, as you would in the case supposed, be unable to control your eyes.

Be nude as much as possible, expose the sexual organs to a sun bath at least an hour each day if you can spare the time. Bathe as directed and at all times cultivate the feeling that your sexual organs are as respectable as any other part of your body. Be proud of them and keep them in natural, healthy, and clean condition, and never prostitute them to base uses.

Wear clean underclothing and never wrap the sexual organs in fold of shirts or underwear of any description. Let the scrotum hang on its own muscles, and let the sexual organs have the friction of the clothing as you walk. If you get chafed you will soon get over it. Persevere. Have your trousers and drawers made loose and do not have your shirts long enough to necessitate wrapping the fold around the sexual organs.

It is desirable to change the underwear every day. If this makes too big a laundry bill, have suits so you can change very frequently and allow the former garments to air until you have made the round.

Promoting circulation in diseased parts will enable Nature to use her own forces, which are always employed for health and enjoyment. This magnificent principle is the secret of every cure made since the foundation of the world. The only rational use which can be made of medicine is to assist nature in the application of this principle, and the less one uses drugs of any kind, the better they are off physically.

The following directions will enable the intelligent reader to succeed in promoting circulation.

1. The cold sponge bath should be taken as frequently as possible, either in the morning or evening. Apply cold water to the entire person and immediately rub with a rough towel until the whole body is aglow. Dress quickly and take brisk exercises. The cold bath should be taken in a warm room.

2. A cold foot bath and hand bath should be taken on retiring. Plunge the hands and feet into the coldest water obtainable. Repeat the plunge once or twice. Dry quickly and then rub and slap the hands and feet for five minutes. Jump up and down and rub the feet on a piece of brussels carpet until they are in a glow; jump into bed and cover the feet warmly. This process will produce a reaction of circulation and make the hands and feet

hot, unless the patient has a very impoverished heart action and condition of blood, and when it fails to produce the proper effect, the patient should use hot water and sleep with the feet in contact with something warm until reaction does set in, keeping the soles of the feet hot and the body comfortably covered. If the case is urgent and hot applications cannot be conveniently obtained, rub a small quantity of cayenne pepper on the soles of the feet and ankles with the hands and cover warmly in bed. The foregoing directions are sufficient in most cases to cure any case of acute catarrh or cold.

The Massage of the Sexual Organs. At night, after the foot bath, and in a comfortable room, protected from cold draughts of air, and with proper privacy, perform the following exercise: Subject the entire pelvic region to a vigorous slapping and punching exercise, as follows, avoiding any part that may be inflamed or sore; slap the penis, the scrotum, and the testicles (gently) until they are red and glowing with increased circulation; slap the groins, the entire surface of the abdomen and upper part of the thighs, the anls, and in cases of females, particularly the region of the ovaries and lips of the vulva. Slap rapidly and smartly with the open hand for five minutes, and then roll, punch and knead the parts another five minutes. Follow this up with another round of slapping and then another round of punching and kneading until every part has been thoroughly treated. It will be found less painful to slap the

penis if the latter is drawn up on the abdomen with the left hand and stretched while the right administers the massage. The outer skin of the scrotum may be drawn and stretched over the left hand while treated, with best results. When this has been done for at least twenty minutes—don't guess at it—then apply—

The Cold Compress, a towel wet with the coldest water obtainable, applied directly to the sexual organs. In male cases apply around the scrotum and testicles; in females, to the vulva and wrap around with another dry towel and let remain for twenty minutes. By that time there should be a vigorous reaction of circulation, a profuse perspiration of the parts, and the sexual organs should be hot. If on several applications this reaction is not obtainable, suitable hot water and cold alternately for several nights. When the reaction is obtained, the compress may be left on all night. If not, or if considered inconvenient, the compress may be removed after twenty minutes and the parts wiped clean and dry. The object to keep in view is the reaction or quickened circulation, which calls a large volume of healthy blood to the weakened parts, sweating out the diseased matter and local inflammation and restoring healthy vigor.

Persons possessing a magnetic temperament with good circulation, will find no difficulty in following this treatment with the coldest water obtainable, and such persons are benefited by frequent plunge or tub baths in very cold water. They are also benefited by eating cold food and

drinking copiously of cold water. Persons who possess the electric temperament are more easily chilled and should resort to tepid or hot baths, use warm food, drink hot water, and the use of the compress on the sexual organs hot. All persons are benefited by the slapping, punching and kneading exercise.

In every case a certain amount of experiment and observation are necessary to adapt the treatment to each individual temperament and constitution.

General Directions

The bowels should be kept in a normal condition, and where the habit can be formed, it is best to evacuate them before retiring. Empty the bladder on retiring and establish the habit of awakening toward morning and emptying the bladder the second time. The presence of accumulated matter in the rectum and of urine in the bladder creates a pressure upon the seminal reservoirs, which are situated directly between the bladder and rectum; and this pressure is a fruitful cause of seminal emissions.

Cultivate a happy, cheerful frame of mind, seek a healthful and congenial occupation, pleasant associates, and don't indulge in moody reflections upon your condition or your indiscretions.

Association with virtuous persons of the opposite sex is highly beneficial. Be continuously in the society of the other sex as much as possible. Avoid exclusive association with persons of your own sex

as far as practicable. Avoid all lewd conversations, jokes, or associations. Cultivate gallantry, love-making, kissing, caressing, etc., to the full extent of purity.

Refrain entirely from sexual intercourse for the first three months, and in extreme cases, six months; and avoid everything which inflames the passion or excites lascivious desires, especially lewd imaginations. There is a vast difference between love and lust. Cultivate love to the fullest extent and expel lust in all forms.

The cold foot and hand bath may be used to good advantage daily. The cold compress and massage may be used as often as benefit is derived. Your own feelings are the best guide. If emissions take place at first as a result of the treatment they should not be regarded with any alarm but the result of increased activity of the organs, which will soon disappear.

When varicocele exists, the greater amount of the treatment should be expended in promoting circulation in the scrotum, and the cold compress should be used frequently. Do not wear a suspensory, as it weakens the muscles of the scrotum and increases the complaint.

By adhering closely to the foregoing instructions and practicing cleanliness, which is very essential, in all bodily treatments, and by giving special attention to the thought current, and bearing in mind that proper thinking goes a long way toward establishing healthy and harmonious conditions of the body.

One of the essentials in the enjoyment of sexual intercourse is the quietude of mind and nerves, as when these elements are disturbed nature cannot perform her normal functions.

The practice of the principles herein laid down will prove beneficial to thousands of readers, if properly adhered to.

Introduction by Dr. Don Cabot McCowan, M.D., The Endocrine Glands

The Endocrine gland or the glands that have an Endocrine Secretion. This secretion is also called a hormone. The glands that are best known and their functions determined are: Pineal Aut V Post Pituitary Thyroid. Parathyroids, Thymus Mammary, Liver, Spleen, Lymph glands, Pancreas Adrenals, Testicles, Ovaries, Prostate and Corpus Lantum. The Pineal has to do with the development of the testes and ovaries. The pituitary governs the nervous system. The Aut Pituitary stimulates the brain cells, growth and the gonads. The Thyroid stem, the Post Pituitary and combats toxins. The Thymus regulates the growth of the long bones. The Liver Spleen and Lymph glands all work together to combat toxins bacteria and deleterious substances in the body. The pancreas which regulates the sugar. The Adrenals regulate muscular tone and strength; they also act in conjunction with the gonads to regulate growth and produce the sexual characteristics. The gonads (testicles in male and ovaries in female) stimulate every gland in the body, but especially do they work in harmony with the

Aut Pituitary Thyroid and Adrenals.

A hormone from a gland is a secretion that stimulates the secretion from some other gland or antagonizes it or holds it in balance, therefore if any gland is deficient in the production of its normal amount of hormone secretions, other glands are immediately thrown out of balance. The interaction and co-relation of the secretions from these glands are very important in the body economy, so much so that a man or woman is what they are because of their glands.

The Sex Hormones

If one were to ask a group of physicians which class of remedies recently discovered had proven of the greatest value in medicine, the almost unanimous verdict would be: "The hormones from the glands and organs of internal secretion!" And in justification of this decision, we need only cite, as examples, thyroid extract for myxedema, the internal secretion of the pancreas, in the form of insulin, for diabetes; adrenalin, pituitary extract, etc.

The failure of the organism to produce any of the hormones mentioned above may readily result in death; therefore, the use of potent remedies that contain the hormones or autacoids in question may be life-saving in character.

One by one the glands and organs of the body are offering up their endocrine secrets to the physiological chemists.

The latest achievement is the solution of the riddle of the sex glands.

So common are the disturbance due to an insufficient or perverted internal secretion of the gonads that the average physician is confronted with them every day in his practice. Indeed, it is probable that few persons go through life without at some time suffering, temporarily at least, from symptoms due to disturbance of the gonadal endocrine function.

The Endocrine Function of the Testicles

That the internal secretion of the testicles has a profound influence on man's welfare is no new theory. In the seventeenth century, Bordeu, physician to King Louis XV, promulgated the idea that the male sex glands discharge some substance into the blood which influences the well-being of the entire body. Subsequently, physiologists supplied the proof of Bordeu's contention.

As a matter of fact, the effects of castration on the bodily structure and character of the male have long been known. Among some sects, removal of the testicles was practiced quite commonly as a religious tenet.

The ancient orthodox Mohammedan belief regarded women as articles of property without souls, provided by Allah for the physical pleasure of the male. Consequently it was only natural that the male servants in the harem should try to steal some of the master's property. Hence arose the custom of emasculating men as the only safe means of fitting them for employment in the harem.

The eunuch possesses no sexual desire, as he is usually castrated before puberty, and sexual power

is lacking. Many of the female attributes are prominent in his make-up. His hips are large and rounded and his skin smooth and hairless. There is an abundant growth of hair on the head, but the chin remains as smooth as a woman's. Eunuchs practically never become bald; the bald head has been regarded as a sign of virility.

Not only the body but also the temperament of the eunuch is profoundly affected. He lacks aggressiveness, is evasive, even cowardly, in his character.

The voice of the castrate is like that of a woman. Indeed, it was at one time the practice of church choirs to secure their male sopranos by having promising boy singers castrated before puberty.

Very much more common than complete eunuchism, and proportionately more important to the practising physician, is a partial loss of the endocrine function of the sex glands. This is a condition that few men escape, especially after middle life.

After the age of sixty, a marked diminution in the endocrine function of the testicles often occurs. This period has correctly been termed the male climacteric. It marks the time when the sexual life of the average man ceases, when his desire wanes, and his power to complete the sexual act is lessened. Diminution of the sexual life is due to the gradual failure of production of the hormones or autocoids of the gonads; that is, to an atrophy of the glandular structures that make a man a man.

Diminished potency after the age of sixty may be physiological, but it is not always logical. It is just Nature's way of doing things on a wholesale scale.

But there is many a hale and hearty man over sixty with soft arteries and a good heart, and in his case, the onset of the male climacteric is not a safeguard but a distinct misfortune.

Impotence in Younger Men

Young men in the prime of life sometimes suffer from functional defects of the internal secretory glandular structure of the testicle. The result is impotence, which may be temporary or sustained, according to the gravity of the disturbance. There may be an inherent weakness of the endocrine cells of the testicle, for, unquestionably, some men are decidedly more virile than others. As a result of infectious diseases or other debilitating causes, the internal secretory function may be temporarily in abeyance. Gonorrhea and other inflammatory conditions may result in an absence of the male sex hormones.

Impotence does not long remain merely a symptom of failure of the genital apparatus. It soon affects the entire mentality. The impotent man suffers from a deep sense of inferiority; there is no shortcoming of which he is more keenly sensitive. His mental perturbation soon makes him a neurasthenic.

The same is true of the syndrome of sexual neurasthenia. In this disturbance, there is not only sexual apathy, but loss of power of mental concentration, forgetfulness, and a lack of the vim and energy required to carry on business properly. In the background of this clinical picture of sexual neurasthen-

ia, the essential factor is the cry of the body for the necessary hormones or autacoids from the testicle.

Testicular Hypofunction in Brief

Physicians have long recognized definite bodily and mental changes in the make-up of the eunuch. Whether castration is performed as a religious or social custom or for therapeutic purposes, the result is identical. There is a great group of everyday disturbances due to a partial defect of the endocrine function of the testicle. These conditions include the male climacteric, the various forms of impotence, sexual neurasthenia, and general debility in the aged.

Mother! To Her Child

Out of my body was fashioned the whole of you
 Life of me, breath of me, soul of my soul.
 Get we no part in the Miracle soul of you,
 How can I dare to call you my own.
 Out from the sea and the starlight and flowers,
 Out from the magic of God given Spring,
 Out from the dusk of twilight hours
 Sprang forth your spirit, that God given thing.
 Pale was my gift in the sight of that other,
 Mine was the infinitesimal part,
 God will forgive the vain pride of a mother,
 Calling you her's as you lay at her heart.
